So in reciprocation lies the art of success, but Ronald never talked much to me save on natural history subjects. I suppose he regarded me as a Sassenach and a foreigner, but I obtained much useful information from him. One day he was accompanying me in the car to a neighbouring river, where he was to initiate me into some of the secrets of salmon lore, and on the way he told me of some of his narrow escapes. On one occasion, returning from a poaching affray at night time, he misjudged the crossing where he had to ford the burn, with the result that he was whirled off his feet and carried two hundred yards on the flood waters.

He escaped death by hanging to the trunk of a dead tree overhanging the stream, almost at the brink of a fifty-foot fall. Ronald pointed out the exact spots where all this happened, and though the icy immersion was nothing to him since he was accustomed to standing half the night up to the shoulders in the *sna' bru'* when the salmon were running, it must have taken the strength of a Hercules to drag himself out at the point he indicated. Indeed, he was as fine a sample of manhood as one would meet anywhere.

On another occasion Ronald wounded a roebuck, and thinking it was about to escape, he rather rashly closed with it. There followed what must have been a pretty deadly struggle, for the old buck was far from being dead, and by accident or design it planted one of its dagger horns through Ronald's right calf, so that he could not free himself. The scar of the wound and lacerations marked his leg on both sides.

But Ronald, who had lived by manly ways, went eventually by a road more open than he had chosen to follow in the past, and to-day his name is engraved at the base of a monument in a lonely Highland glen—a kilty, whose boyish face, open as the day, is raised towards the skies, instead of being downcast in sorrow. The winds and the rains and the sleets and the snows lash that face, yet it smiles on, its cheerful greeting to others who tread the hill road, an emblem which is unmindful of what lies behind, and eagerly heedless of the mysteries ahead. And the boys of the village say, half chaffingly, half in earnest, that when at the end another clay-bedaubed kilty peered into Ronald's face, all Ronald had to say was—'Haud yon net up, laddie!' Then he crossed the March.

SCENES FROM MOROCCO—FEZ.

PART II.

III.

THE following day was a Saturday, and we had received an invitation from the Grand Rabbi to the Sabbath midday meal. Even at the risk of appearing too much interested in food, I cannot omit a short description of this ceremony. The Jewish rule of doing no work on the Sabbath day is still kept in Morocco with remarkable strictness. The meals for that day have, therefore, to be cooked on Friday. The courses are then placed together, one on top of the other, in an immense pot. After this the lid is put on, and hot embers are heaped up all round. Just before twelve o'clock on Saturday the ashes are cleared away by Mohammedan servants, who then open the pot and remove the food, course by course. The meal, which is called *aadafina*, is then served.

Our host, who has recently died, was a most pleasant old man. A painter would have delighted to use him as a model for a picture of Abraham or any other of the Biblical patriarchs. He received us with great courtesy, and introduced us to the various members of his numerous family. In Morocco, Jewish married women are not allowed to show their hair, and they hide it partly with a silk scarf, and, in front, with a kind of horsehair wig plastered down close to the head. One result is that they tend to look much alike, and I could not help recalling an early impression of Dan Leno as the 'Widow Twankey.'

The interiors of Jewish houses are semi-westernised, and the effect is far from pleasing. Their occupants display too great a liking for tawdry decorations, mostly made in Birmingham. The quaintest contrivance I ever came across

was a decanter, which, on being tipped up, played alternately 'The Bluebells of Scotland' and 'Home Sweet Home.'

We were first received in a room in which the most notable article of furniture was an enormous four-poster bed. From the top of the posts curved rods rose and supported a large golden crown. On the walls were somewhat crude oleographs of his majesty King George V., M. Clemenceau, Mr Wilson, and Maréchal Foch.

We were served with remarkably potent liqueurs distilled from dried raisins, and after two glasses each, we proceeded to the dining-room. When we had taken our places at a long table, the Grand Rabbi and his son sang grace. This rite has to be performed with the head covered. The son was wearing European clothes, and consequently wore no skull-cap, so his right-hand neighbour placed a napkin on his head. After grace our host took a flat loaf of native bread, and broke it into small pieces. These he dipped in salt, and threw one to each guest. The meal then began, and, contrary to our expectations, proved to be excellent. The various dishes, after being together in the same pot for nearly twenty-four hours, were similar in colour, but this had in no way impaired their flavour. The principal courses were of mutton, and we were relieved to find that there were not more than eight altogether. We drank a strong red wine, made locally by the Jewish community, and two kinds of liqueurs, served in glasses which we found too big for a beverage containing so high a percentage of alcohol. Indeed, we decided it was not only for business that the native Jews had good heads.

After dinner we returned to the room in which we had originally assembled, and were regaled with sweet cakes and more liqueurs, to the accompaniment of Moorish music played on a cottage piano of uncertain tone. At about three o'clock we bade farewell to our host and his family, and then spent the rest of the afternoon indulging in the luxury of a long siesta.

IV.

One street in Old Fez is comparatively straight, and wide enough for two horses to be ridden side by side. The remainder are narrow, tortuous, dark and infinitely fascinating. To provide as much shade as possible the houses are built high, and in many instances the first floor crosses the street. In some cases tunnels more than fifty yards long are thus formed.

The most interesting quarter is that in which are all the native shops. Each shop has a frontage of some five feet. The floor is raised about two feet from the ground, and goes back roughly six feet from the street. The height of the walls is rarely more than seven feet. The whole is closed in by solid wooden shutters, usually secured by a vast padlock. In some instances this padlock is of the old native type

which is said, though I know not with what degree of truth, to have given the idea for the Yale lock.

There are no fixed hours in a native shop in Morocco, no closing time at 8 P.M., no compulsory half-holiday. When the owner thinks it would be pleasant to sell some of his goods, he takes down the shutters, and squats in the middle of the shop, surrounded by his wares. When he feels that a little tea or some other distraction would add to his contentment, he closes up again and goes off in search of his modest requirements. This is surely a most rational method of doing business. The Moor, with a keen sense of the fitness of things, refuses to become a slave to routine. He is like a child playing at shops, and he appears thoroughly to enjoy the pastime.

Merchants selling the same goods are all in the same street. The great advantage for the purchaser is that, if not pleased with one man's goods, he has but to go next door. The shoe street at about four o'clock in the afternoon is filled with a seething mass of shrieking humanity.

The leather shops have always proved an irresistible attraction to me, and just opposite one of the doors of the great Karaouine Mosque is one belonging to an old and venerable man with a gray beard. He is devoted to the sport of bargaining with his customers. Ever since I first visited his shop a strict routine has always been followed with the exactitude of a long practised ritual. First, I shake hands and go through the customary greetings. Then I say that this time I have merely come to see how he is, and really do not want any leatherwork. Then he invites me into his shop, and I squat down beside him. A few book-covers are produced, beautifully worked with conventional Moorish patterns, and I begin to waver in my decision to purchase nothing. However, I try to appear unconcerned, till presently, with gleaming eyes and a finger to his lips, the old man touches me on the arm, with the air of letting me into a great secret. To the accompaniment of a peculiar shrill intake of his breath he finally produces some treasure hitherto hidden away in the back of his shop. Invariably I fall, and I select two or three book-covers. Then begins the bargaining, and this is what he has really been looking forward to all the time. He heaves a few sighs and settles down comfortably in his place. Adjusting his spectacles, of which he is vastly proud, he makes rapid calculations on a small piece of paper with the stump of a pencil. After a while he proposes forty douros as a fair price for the things of my choice. A douro is equal to five francs, and of course the sum is much too big.

'No,' I say, 'that is really ridiculous; you must remember I am an old friend, not a tourist. I'll offer you fifteen douros.'

'Impossible,' says he; 'these are the finest I have in my whole shop. Now, here are some I could sell you at fifteen douros, but I know they are not of the good workmanship you always choose. But, as a special mark of friendship, I'll say thirty-five douros.'

'I never bargain,' I reply; 'I am prepared to pay fifteen, possibly sixteen douros, but not a guirch more.'

Then he throws up his hands with a cry of despair, and starts muttering and making tremendous calculations.

'Thirty-two and a half,' he says, looking at me out of the corner of his eye.

And so it goes on till finally he puts all his things away at the back of his shop, exclaiming that it is impossible for him to sell anything at the price I offer. He would like to do so; he looks on me as a friend, but these particular book-covers cost him thirty-two douros; he is a respectable man with a household¹ to support, and he cannot start selling at a loss at his time of life. After this we shake hands again and I go away contented, knowing that everything is going on capitally. About an hour later I chance to stroll by once more, and as I pass his shop he whispers to me, 'Twenty-five douros'; but I shake my head and continue on my way. After the correct interval I again walk along his street. This time he has the things I selected all wrapped up in newspaper and tied with an amazing tangle of string. 'Twenty douros,' he says, with tears in his voice. Now I agree to the price, and his face becomes wreathed in smiles. I had known all along that he would come down to twenty douros, and he had been equally certain that I would come up to that sum. We are both perfectly well aware that that is the fair market-price, so the game may be said to have resulted in a draw. It would, of course, have been far simpler to have started at the final figure, but that would not have been nearly so amusing.

In various parts of the city it is possible to see the manufacture of articles of clothing, ceremonial curtains, and magnificent brocades. All are, of course, made on hand-loom of primitive design. These looms are just such as existed in Biblical days. They seem somewhat crazy affairs, composed of a rough wooden framework and a confusing tangle of strings. The whole is distinctly reminiscent of the comic drawings of Mr Heath Robinson. In some instances it takes more than a month to prepare the loom, but the brocades which are made on them are of faultless workmanship and remarkable beauty. In Morocco craftsmen still take a pride in their art.

It is interesting to pass through a street where dyes are being made. These are all pro-

duced from vegetable ingredients, and the colours never lose their tone. A Moorish carpet made from wool tinted with native dyes can be washed in the sea without causing the colours to run; but the European substitute never passes this test. The tailors' street provides entertaining sights. In it men are to be seen all day busily embroidering the principal garment of Arab attire, which much resembles a cassock. Each man is assisted by a small boy apparently about four years old, and rarely more than three feet in height. This infant usually stands just outside the shop, holding a looped thread in each hand. These threads he continuously passes from hand to hand with an air of tremendous solemnity.

Alone of all streets, that of the butchers is unpleasing. There the proprietors sit in their shops, attempting, mechanically but ineffectually, to drive away the flies from the meat which is displayed for sale. Generally this is of the kind optimistically described as edible offal.

It would be possible to go on almost indefinitely describing the multifarious things of interest to be found in this wonderful city of Fez. Gorgeous trappings for Arab steeds, leather cushions of many kinds, embroidered hangings of finest work, copper kettles, and trays of brass, Moorish lanterns in quaint designs, all these and many others are to be found by those who seek. However, if I were to give details of each and every attraction, there would be no end to my tale. But there is one street of which I cannot omit a short description, and that is in the potters' quarter.

For many centuries Fez has been famous for its pottery. This is somewhat crude in colour and design, but the general effect is decidedly pleasing. The article most usually made is a large round plate, and the colours most commonly employed are blues and greens. The shops, side by side, all filled with pottery, form a very picturesque sight. At one point just off the street is a kind of courtyard in which are many jars of various shapes and strange designs. All are made of unglazed porous earthenware, and they are uncoloured, though some are decorated with curious patterns in tar applied with the potter's thumb. This retired spot is almost always deserted. The owners of the diminutive shops appear to think it is not worth while to sit there for more than an hour or so each day. I have a particular affection for this quiet secluded corner. The pots and jars have an almost human air about them, and they bring to mind the lines from Fitzgerald's translation of the verses of Omar Khayyam:

Shapes of all sorts and sizes, great and small,
That stood along the floor and by the wall;

And some loquacious vessels were; and some
Listen'd perhaps, but never talk'd at all.

THE END.

¹ The Moors always refer to their wives impersonally as the 'household.'

Chambers's Journal

SEVENTH SERIES

REVERSION TO TYPE

By Brigadier-General C. DALRYMPLE BRUCE.

PART I.

I.

IT was in London that I first made 'Sandy' Ling's acquaintance, for so he was known to his intimates. His proper name was San Ti-Ling. He was, of course, a Chinaman.

At the time we met he occupied the pleasant and far from arduous post of Assistant Secretary at the Chinese Legation in Portland Place. 'Sandy' and his bosom friend and inseparable companion 'Polly Kerr' were well known and equally popular in London society. 'Polly'—Poli-Ka to give him his proper name—was generally considered to be 'Sandy's' twin-brother, possibly because to Englishmen all Chinese look alike, as do we to them on first acquaintance. Nor is this to be wondered at—to the majority of people all foxhounds in a pack appear to be brothers and sisters. 'Sandy' and 'Polly' were no relations.

Why the two young secretaries were so much run after by certain ultra-smart society ladies, who should have known better, is hard to say. The reason may have lain simply in the present-day craze for any kind of novelty. Or was it still the age-long lure of sex? Both lads were in their way most attractive, had the charming manners of all well-bred Chinese, besides possessing to the full that virile air of the dominating male common to many Oriental races. It was also possible that the cause of their popularity with the fair sex lay, to some extent, in the fact that both 'Sandy' and 'Polly' sought their amusement for choice among their male friends. But to this rule, as to most, there was an exception.

For the whole of one brief season, that is, if the hectic round of social pleasures occurring between the 'Varsity boat race and Cowes week may still be called a season, the 'twins' might have been seen everywhere in close attendance upon Lady 'Bunty' Knightsbridge, that high-spirited, somewhat riotously-inclined young society representative, herself the daughter of a well-known British diplomat.

There were few things Lady Bunty in her brief career had not managed to do. Still fewer that she was not at a moment's notice prepared

to do if challenged. This irrepressible offspring of British diplomacy never failed, for example, to turn up on a gala-night at the National Sporting Club. When 'Dinky' Lewis was taking on 'the Frenchie,' backed, moreover, to knock out that gallant Continental at all costs in ten rounds, Lady Bunty was, of course, there.

'Such a cheery little fight, my dear. I *do* like blood,' she remarked to one of her intimates after it was over, and the Frenchie's broken thumb and minor facial dilapidations had been put right. When the ever-courteous and exceedingly efficient representatives of Scotland Yard raided a notorious gambling hell in Soho Street one summer night, it was commonly reported that only one of the players present escaped; further, that that one was a very well-known society lady, who, flinging her cloak over the head of the inspector in charge of the raiding party, dived past him on the back staircase, and escaped just as the electric lights were turned out. At the various night-clubs where Society with a big 'S' danced and drank as late as post-war regulations permitted, as well as on every race-course within a motor-run of London, who so well known among society stars as Lady Bunty Knightsbridge, the much-photographed, much-puffed heroine of many a good story? And she was indeed worth photographing.

Above the ordinary height, and exquisitely proportioned, with her brown luxuriant hair always beautifully coiffured, her free lithe movements, her delicate skin and lovely colouring, her go-to-the-devil well-bred air, how could such a type of British aristocracy not be run after? 'Polly' and 'Sandy' were far from the only two who had fallen under the spell, and it was quite plain that Lady Bunty liked the handsome pair.

Returning from one escapade or another, the folding seats of the girl's big limousine—or, to be correct, her doting father's—were as often as not occupied either by 'Sandy' or by 'Polly,' not infrequently by both, for the object of their joint admiration was as reckless as she was incorrigible.

'Oh! there's safety in numbers,' she was wont to retort with her gay laugh when some

old friend offered a word of warning. Lady Bunty forgot, perhaps, that it takes two to make a quarrel—may take three—especially where Orientals and the female sex are concerned.

'Polly' and 'Sandy' were no longer boys, youthful as their appearance and hairless faces might lead anyone to think. Two years at Oxford had entirely obliterated—to outward seeming at least—the Oriental in the two secretaries. The process had already been begun at the English University at Hong-kong. It is true, at that excellent half-way house, where Oriental and Occidental educational methods have been judiciously combined, the outlook of the collegers had been carefully safeguarded. But at Oxford? Well, as the saying goes, they hadn't missed much.

Upon first meeting them, either 'Sandy' or 'Polly' might have been taken for the finished product of an English public-school or university education. Entirely self-contained, adaptable as all educated Chinese are to any environment, the pair were as perfect specimens of the Europeanised Oriental as England can produce. And to her possible eventual undoing she has produced a good many. But we know the leopard cannot change his spots.

II.

It was a hot summer night in London towards the end of July. A single loafer, who had carefully hidden himself in the Green Park overnight, was already waking as the dawn began to break, and a cooling westerly breeze to sweep gently down from the top of Constitution Hill. The three inseparables, as her intimates were already beginning to call them, were seated, 'cooling off,' as Lady Bunty described it in her expressive vernacular, in her own den in her father's house in Arlington Street. She herself was reclining almost at full length on a low settee piled with black silk cushions. Against this sombre background the yellow of her low-cut almost armless frock stood out a brilliant splash of colour. As the girl lay fanning herself slowly every curve and line of the lithe figure showed up. An electric lamp, heavily shaded in orange silk, stood on a small black wood table, throwing a soft half-light over the low, narrow room. 'Polly,' as cool and calm as usual, had fallen gracefully into a big arm-chair, covered with Persian saddle-bags; while 'Sandy' had taken up a position at the far end of the room, almost in semi-darkness.

The three had been dancing most of the night as usual, a night of bitter hell to 'Sandy,' who with murder in his heart had watched Lady Bunty in 'Polly's' arms, sailing away gracefully and without effort through the crowd of dancers at the Ritz.

How dared she neglect him? Black thoughts of hatred and murder boiled in 'Sandy's' brain,

though the other side of him, the Oriental, sat outwardly passive and self-contained as ever.

Somehow to all three the evening had not been the usual success. Lady Bunty for once was out of gear; so she expressed it in her somewhat involved vernacular. What was the cause? The girl, had she been asked, could hardly have answered. She looked across at 'Polly's' smiling face as he sat sucking a cooling drink through a long straw. Inscrutable as always, the secretary's eyes met hers frankly. 'Sandy' still sat silent. The only sign of the storm raging within him was the quick puffs of a cigarette through his flat nostrils.

'What's up, Lady Bunty?' 'Polly' asked, taking the straw from his mouth.—'Got a cigarette, "Sandy"?''

'Nothing's up, "Polly"; why should there be?' the girl answered. She let her long sinuous body sink lazily farther back on the black cushions, putting both arms behind her head. 'Sandy' tossed his friend a cigarette, which 'Polly' deftly caught and lit. The eyes of both men were concentrated on the beautiful figure on the settee. 'Sandy's' mask of a face grew even colder in expression. The light in 'Polly's' eyes there could be no mistaking.

Lady Bunty—female intuition at work—looked quickly from one to the other.

The girl knew she had lied in answering 'Polly's' question. Felt deep down in her heart that there *was* 'something up.' Her colour deepened. A crimson flush spread over neck and bosom. She turned away as she lay on the settee, though luckily her face was almost invisible in the deep shadow.

For a few moments Lady Bunty felt herself poised on the edge of an abyss. She closed her eyes and lay quite still. Then her will rallied. It must *not* be possible. She could not be in love with 'Polly'? With a Chinaman? No; such things were not done, not even thought of, in her class, among her kind. But as Lady Bunty let her eyes rest once more on 'Polly' the girl felt—they could be. They almost had been! Of course it was madness, sheer madness, and as that thought surged uppermost in her brain the girl broke into a peal of mirthless laughter. Swinging herself off the settee, Lady Bunty walked rather unsteadily to the window. With an abrupt movement she swept aside the heavy curtains.

'Got the pip, "Sandy"? Buck up!'

There was something challenging in the sound of her voice, and Lady Bunty knew it. But the girl knew also that she must at any cost create a diversion from the whirl of thoughts that thronged her brain. 'Sandy' looked up. For a moment it seemed as if his invariable composure was about to forsake him.

'No, there's nothing wrong, thank you, Lady Bunty,' he said, after a distinct pause. The voice was almost too quiet and restrained. The

girl in the yellow frock turned to face 'Sandy.' She stood, one upraised arm holding the curtain, her back to the coming dawn.

'There's something up with "Polly," though,' Lady Bunty went on. 'Look at him! Why, he's fallen asleep, or has he fainted?' Her voice rose rapidly. The girl took three or four quick steps to where 'Polly' lay, seemingly lifeless, in the armchair. 'Sandy' stood up abruptly, but did not move. What Lady Bunty had said was only too true. 'Polly's' head had fallen back as he sat, the cigarette still clasped between his fingers. The slim figure looked limp and helpless. His dress shirt had slightly crumpled as he collapsed.

Something altogether unusual in the young secretary's face struck the girl as she bent over him and took hold of one arm. She noticed an extraordinary change. The deadly pallor of the yellow skin in the half-light frightened her. From 'Polly's' half-open lips came some muttered words. Lady Bunty thought she heard 'Opium! Opium!' As she passed one arm round 'Polly's' shoulders 'Sandy' sprang like a wild-cat across the room. The girl felt herself jerked to her feet, felt both wrists seized as in a grip of steel, felt 'Sandy's' hot breath on her cheek. Saw his distorted features almost touching her face, and saw, for the first time, the real Oriental convulsed with passion, capable of anything.

'D'you think I haven't seen it all along?' The words came hissing from the clenched lips. 'D'you think I don't know you love him? But he sha'n't have you; I'll kill him first.' 'Sandy's' grip tightened like a vice. Any other woman would have shrieked with the pain. Lady Bunty was frightened for, perhaps, the first time

in her life, but she was brave enough. Her kind are not easily upset. For what seemed to her an age the two faced one another—the tall yellow figure held in a vice by the claw-like well-manicured hands. Then, as always hitherto in the age-long struggle between the two, West dominated East. 'Sandy's' eyes lowered. His grip relaxed.

'Let me go at once, you Chinaman! How dare you?' Lady Bunty spoke very quietly; she hardly recognised her own voice, such was the volcano raging within her. The lash of the words caught 'Sandy' like a whip across the face. He let go suddenly of the girl's hands, reeling slightly backwards.

'You fool,' Lady Bunty went on, speaking in the same restrained, hard tone. 'Don't you know I have only to ring the bell, and you would be thrown out like a dog? After all, you are no better.' She glanced down, nodding her head at 'Polly's' figure. 'So *this* is your work, is it? Now go before I do ring!' With an unconscious gesture the girl pointed to the door. 'Sandy' did not answer. After looking once at the speaker, he walked straight to the door and opened it. Then he turned and spoke. Lady Bunty instinctively faced him. She saw a thin wiry figure holding the half-opened door, a civilised man in evening clothes he looked, until 'Sandy's' eyes met hers. Then the truth revealed itself. She was gazing into the face of a wild animal balked of its prey, relentless, pitiless, cruelty in every line.

'Wait!' The single word shot from between the compressed lips like the fangs of a cobra.

'Sandy' went out, closing the door very quietly behind him.

(Continued on page 410.)

A JUNE NIGHT ON TWEED.

By 'PISCATOR.'

IT is a June evening. All day the sun has shone in a blue sky, and in the clear, fine water of Tweed, at low summer level, no trout has moved. We have lain happily for long hours upon the bank, basking and drinking in the beauty of hill, wood, sky, and stream, watching the birds—the cheery little water ouzels, the graceful wagtails, the jolly, fussy sand-pipers, the sand-martins—so industriously feeding their young, and catching a glimpse of that most gorgeous living jewel, the kingfisher, as he darts round a bend of the river. The sight of him always gives a curious thrill of pleasure. He is the veritable Blue Bird.

Now, the frugal dinner over, we sit in the garden with pipes and coffee, looking over the hedge, with the line of crimson poppies against the green, away down the peaceful valley, and talking about the fishing in April, when Scrape

stood white with snow, and the bitter frost of morning made gloves and double sweaters necessities rather than luxuries; when Tweed ran big, strong, and very cold, and the trout showed little, and when even the big ones condescended to a sunk fly. And we recalled the rare gleams of sunshine in the middle of the day, bringing up the fine hatch of March Browns; then the quick change to dry fly, and the graceful arch of the big one as he took the lure and made the reel screech in his mad run down the pool, to show himself in all his glory in a succession of wild leaps. Yes, April fishing was good, if rigorous.

But now the sun has sunk behind the western woods—nine o'clock has come; we don our waders, take up our rods, and, with a final slap at our pockets to see that nothing has been forgotten, we stroll down to the darkling river.

Will there be a rise to-night, and where? I choose the long pool under the lime trees, a favourite haunt of one who loved Tweed even as we do, but who, alas! fishes it no more. As I wander through the wood, I see only a few small fry jumping at the tail of the pool. The water is still clear as crystal, every stone showing in the shallows. No use to fish yet awhile. So I seat myself in the lush grass by the great clump of yellow marigolds and listen to the sand-piper's call, 'chee wee-wee,' as he flies from the gravelly bank, and watch the play of blues and greens on the water where the run breaks into the pool. And now the western sky reddens, the red deepens and spreads in long horizontal bars across the sky. The river, too, becomes encarmined, and all is a riot of glorious crimson. But only the small fry break the surface. The glory fades and dies, the pool becomes dark and mysterious, and the 'plop, plop' of rising trout worthy of the name begins. The line shoots out, sending the fly under the willow at the end of the run. There is a gleam in the dusky water, and a splash. The line tightens, and, after a moment's pause, the reel screeches, to tell that this indeed is

one of the proper sort—no mere half-pounder—and I dimly see him leap far down the pool. Gradually his rushes become less fierce, and there is time to notice that other goodly trout are jumping. If I am to make more of the rise he must be brought to the net without delay. So all the pressure that the tiny black spider will warrant is put upon him, and at last he shows his big side and is netted, a good pound trout in the pink of condition. And so to work again in the pool, ever darkening and becoming more mysterious, till a pale light shows through the trees, and a silver pattern appears on the water, and the moon has risen above the shoulder of Scrape. The rise is over. Eleven o'clock—'the hour after sunset' is nigh over—so, reeling in the line, I again plunge into the wood, dappled now with pale lights, and emerge into the glory of the full moon riding high above the hills. And so, up the field, through the little plantation, with the bloom of the rhododendrons and the broom showing a queer, pale, unearthly colour, through the little gate, through the garden exhaling some strange subtle scent, to the lamp-lit parlour, and—to bed.

THE YELLOW FIELD.

PART IV.

v.

'WHY are you distressed?' I asked. 'Save for Michael, who rests untroubled, what need for distress?' And, knowing that she was not frightened of me, I took two easy steps and so stood near her—she keeping her eyes on my face, with no afraidness in them, as I had expected, but with tears brimming and overflowing.

'I did beg my lord to get you by some means,' she whispered, very intent, I could perceive, to tell me of the snare. 'My lord vowed there were no means—but I did beg him. . . . My lord declared your name was found out . . . and that he would be pleased enough to—to lay you by the heels (so he spake), for government reasons, because you were begun to be mischievous—so my lord did say of you.'

I smiled, but could win no trace of smile from her wet eyes. She looked down at the grasses in her hand; with her free hand she touched a flower or two amid them; then she turned the crests of some of the grasses betwixt her fingers. And, with those little sobs of hers under her breath, she whispered on: 'Yet there were no means to get you, my lord said . . . though he was truly fain to, because you did *dare* (so he spake) to set hands on me, and because you might have endangered me with the government, from it being thought that my

striving with you was a pretence, and I helped you. . . . My lord would have guarded me, were I endangered, but he did believe you would not stir from France to me were I put to prison and to trial . . . since men have little honour in these days—my lord did warrant.'

I saw her move her shoulders in a tiny, miserable way; I could see her wet, dark eyelashes shivering fast from tears. And though I was most curious to know what she would tell me next, yet, since she was so pained, I made quick, urgent protest that enough was told, and that rather should she speak of whether she could give me some pardon.

But she whispered, of her tale, 'I shall tell you! I shall tell you!' And, keeping her face toward the grasses, she whispered it with persistence, steadily save for her breathed sobs. 'My lord vowed you would not stir; and I did believe him. . . . And then my lord looked on a newspaper that was beside him ('twas at his house in London); and he cried of a sudden 'twould be easy enough to prove you, by having a false lie printed in a newspaper, which my lord could have done with no trouble. . . . But 'twas not worth setting the snare, my lord said, for 'twould never take you, who would value yourself above me. . . . And I did believe; yet I did most instantly entreat . . . and beg my lord to lay the snare—because I had loved Michael . . . and

because, against all belief, you might come, and so pay hard for Michael. . . . But my lord said no, 'twas not nice for his honour to do it—though you deserved no better. But anon my lord spake of it, and of my begging, to some other lords—they of the Queen's Council; and they were all for it . . . because some thought you mischievous, and some were angered that you killed Michael. . . . And 'twas done, and a newspaper sent to you. . . . *And you are come!*'

Her face went lower; her fingers bent some of the grasses, breaking them. 'I would liefer be in prison . . . in a blackest prison,' she whispered, 'than I had set my lords to cheat you hither.'

My own voice was not much above a whisper when I answered her; for her whispering did somehow lead me to speak so. 'You did not set them,' I said. 'Twas my lord's device, and 'twas all done by him and the others . . . Nay, what counted your begging?' I said, on her whispering again of that. 'Those lords that thought me mischievous were fain to catch me for their own ends; they would have followed the plan when 'twas shown them, whether you had begged or no.'

She shook her head, keeping it very bowed, so that I could discern scarce anything of her face.

'Besides,' I whispered lightly, 'what harm is done? I stand here safe, with none threatening me—' I glanced at the road, seeing it void of any man, then looked again at her. 'And I am glad indeed to be here.'

From the veering of my voice she had known of my glance to the road. She lifted her head an inch and looked thither—lifted one of her hands to press it back-handed to her tears, then kept the hand at her brow, shading her eyes. 'You do *know* that you . . . are in death danger . . . here in England,' she whispered.

'Twas as though she reproached me for my lightness; but, to hearten her, I spoke lightly again. 'Nay, nay, nay,' I said; 'there is nought worth calling danger to-day. I shall go no farther into England than this—and there is no whit of danger to be seen here.'

I glanced anew at the road; glanced carefully all round me, being far less confident than my words sounded (since potent fingers had set the snare, and I had flaunted my French hat in Hastings), but feeling very steady of courage.

Then my eyes returned to her. Her face was quite hid—by her hood and by the hand shading her eyes. The hand was trembling against her hood-edge, and its little, slim back, which was not much sun-browned, was all streaked with the wet of tears she had pressed it to. I knew the tears were as much for my having been brought to England, as for memory of Michael, and verily was I hard put to at this instant not to whip out my own hand and

take that poor little streaked hand and hold it gently tight—this being apart from all thoughts of how pretty she was.

And then, her hand still up, she whispered, 'Where—when—came you to shore?'

'At Hastings, about seven to-day,' I answered.

'No man spoke closely to you—or seemed to follow you?' Her breath of a voice quivered.

'Not even a custom-house man came to me,' I said.

'One of the lords hath sent some men to these parts—against you should come—to watch, and take you before you find out the lie. . . . 'Tis a great mercy that you came through them, a great mercy and strangeness that you rode here to me, who shall send you back. . . . Yet how shall you best get to sea with most security? I know not.'

'Why, madame,' I answered, 'twill be easy from Hastings presently, where the fisherman who landed me is. Those men do not look to find me in Hastings town in broad day, 'tis very plain—else I had been taken this morning.' I glanced around me, musing of my chances. 'And I think they have not told any Hastings folk of me,' I said—'perhaps because there are a few guineas offered for me, which they would earn for themselves. . . . So 'twill be the easiest thing from Hastings, madame; and the wind will be good about noon hour.'

'Noon hour?' she said quickly, her voice become a little stronger. 'Nay, be to sea before then—before then! Go now; ride for Hastings now! . . . Oh, I have done most wrong—to let you stay here for these minutes. But I was all thoughtless, all distressed!' She took her hand from her eyes, showed me her face—wet-eyed, wet-cheeked, full of insistence that I should go. And she put her hand a little way toward me, as though she meditated to touch me to start me on my way.

Both my hands, which were holding the edge of my hat, gripped more firmly upon it; for 'twas hard to restrain them from going out to meet, to touch, that small hand of hers; and I had no excuse in the world for touching it. 'Pray do not bid me go, madame,' I said. 'I cannot think a half-hour will peril me—if you would speak with me for that?'

She shook her head swiftly, her eyes urgent. 'Go!' she said. Her eyes went to the road, then returned to me. 'Go!' she said again, with deep entreaty.

Yet for a space I held my ground. Verily I could not force myself to do otherwise. For she, in this brief while, with her prettiness, with all of herself, was so binding me to her that now there could be no more thought of any French mademoiselle for my wife.

'You will forgive me a little one day, madame—for Michael?' I asked.

She looked for an instant on the field about us; then, with her hand which had been toward

me sinking down, she looked back to me. 'Twas to save your life you took Michael,' she said, her voice a whisper again. 'I was wicked to hinder you from him—but I loved him. . . . I do quite forgive you—now. I do know I do.'

'Know?' I could not forbear to ask, for she had said it strangely.

She looked at the field again. 'This was Michael his field,' she whispered. 'I had it hedge-planted to mark it as his. I had thought to see him so happy in the grass when 'twas this high. . . . I will not suffer my father to cut the grass for other horses. For 'twas Michael his grass. . . . I can look on it and say I forgive. So I do know I forgive.' She took a quiet, great breath, with fresh tears sprung in her eyes.

And her little simple words, and these tears, so smote me that I knew there were near to being tears in mine own eyes for the second time this morning.

'Madame,' I said, very honestly, 'I believe you will put me to crying, in all my happiness, if you speak more thus.'

'All your happiness?' she asked, with a sob.

'Ay,' I said; 'happiness that you are safe, that you forgive, and for something else that, by your leave, I will tell you.'

I fell silent for a moment or two, shaping what I would say—she yet looking at the field.

'On *that* morning,' I said, 'I was out of my senses with fear, blind with fear—I cannot tell why. I did not see you in any real manner. But to-day I see you clearly—and I am made very happy by seeing you, madame.'

New colour was surprised into her cheeks; whereon I stared down at the grass before me, so that (if she noted) I might seem to lessen my boldness. I was driven to much boldness from knowing that, after to-day, months were like to pass ere I spoke with her again—except I ventured into England at a hazard that might make a final end of my speaking with her. In a few months—I trusted—my lord and his friends would have lost interest in me.

'There are great woods at St Germain-en-Laye, where I live, madame,' I said. 'I am happy to know that when I walk in the woods I shall seem to see you, standing clear in sunshine, before me in the dimness of the woods. I shall be meditating of how and when I shall be able to see your very self again. . . . I greatly wished to tell you this, madame—with one thing more.' I drooped my head somewhat, but with no thought of further seeming to lessen my boldness. With one hand I touched at the tall grass beside me.

'On *that* morning I was a coward wretch,' I said—'base to you, careless of you. . . . I know well by now that I could never more be a coward when near you, or be cruel to you. . . . Why, *I know well* that I would cast away my life before I would give you such grief again.

I am firmly sure—or I would not have spoke in the way I have.'

I looked up. I discovered her sweet face bathed, yea bathed, in deepest flush from my words. I saw her eyes, marvellously blue against the flush, fixed on me. But as I looked she swiftly turned her face and gazed toward the road; and then she spoke, her voice unsteady, but stronger again.

'I think you do try to cast away your life now,' she said, 'by tarrying to say such—such most strange sayings. I do beg you go—and . . . and have some care.'

'If your face could seem to smile in St Germain woods, madame——' I said. 'Bethink you, I have never seen it smile——'

'Nay, you shall *not* delay thus!' she said; and then, for the briefest moment, she looked at me; and though no curve of smile was about her lips, yet methought a littlest something of a smile was there; methought that in her eyes, still wet, a littlest gleam of laughing smile showed.

But now her face was roadward again. 'You will not go!' she said. 'And I am so afraid—so afraid that I shall see men coming to take you! . . . How can I win you to go? Shall I walk with you to your horse? Will you promise me to go then forthwith?'

Her voice had trembled very unhappily midway, so that, despite the hint of brightness that had come into our converse in the last seconds, I could not but discern that her fear was hurting her grievously, and that I was little kind to prolong it. Wherefore I answered very instantly, 'I promise to go then, madame.'

We walked side by side toward the road—silent for some steps, there being no sound save the swish of her gown and of my boots through the grass, with now and again the snap of stalks that were caught by my spurs—she gazing downward, with her cheek high flushed, as I could discern past her hood.

Then, unexpectedly, she asked, 'Do you forgive me that I did beg my lord?'

'Madame, madame,' I said, lifting my chin and laughing in a quiet, tender way, 'there is nothing to forgive. Yet if you deem there is, why I forgive ten thousand times.' Then, sinking my chin, bending my head a thought near her hood, I said, 'Perhaps, to keep very safe from these lords, I were best not come into England for some months hence.'

'Months!' she said quickly. 'You must not come for years. You must not come *ever*, except all is safe for you—if that can be. I pray you do not think to come—for years!'

'Months or years,' I answered, 'there is a thing I have in mind, and greatly wish. 'Tis that you will sometimes care to receive a letter from me, and to write me a letter in return. . . . There is a busy letter-post between St Germain and England—I was a letter postboy till I

spoiled myself for it that morning.—You have heard of our letter-post, madame?

'Yes,' she replied.

'Will you ask your father if he deems 'twould be a danger to you if I sent you letters by the discreetest persons, who would bring yours to me? I cannot think you would be endangered by private letters. So many pass—and nothing is said. Will you ask—and write to me, if he doth consent?'

For a moment she answered not; her head so held that I could not see her face. Then she answered, 'Yes.' And then we passed through the plantlings, and were on the road; and she, going a step beyond me and glancing each way, said, 'I bid you go now.'

I unfastened and turned my horse, and took the cloak from the saddle and covered my court clothes. Then I faced her to make my farewell, discovering a little sweet smile on her lips, and

the light of smiles in her eyes, so blue against her flushed cheeks, and wet still.

'Write to tell me that you are safely come to France,' she said. 'Write that forthwith.'

She held her hand for me to kiss. I kissed it—then turned and swung up into the saddle, and rode for Hastings, rode away very fast, since 'twould please her to see that.

I wrote to her next evening from Fescamp—Collins taking the letter. And sixteen days after, at St Germain, I received the first letter written to me by her who now is my dear, loved wife. For in the December after we stood in the field I slipped into England to speak with her, and in the February following, and then in May—and she was married to me in our chapel at St Germain in July—three years ago this coming month.

THE END.

ALTA VELA.

By HENRY MAXWELL SAVAGE.

I.

SOME years ago, the world's supplies of phosphatic rocks for manufacturing artificial manures were becoming scarce, and it was necessary to seek fresh deposits. This, added to the enormous demand of the German and Central European agriculturists for the supply of fertilisers for their beet fields, made a very acute question, so that European fertiliser manufacturers were eager bidders for any new source of supply of phosphatic rock which could be easily got and transported. It was, therefore, a race between the European countries for the richest deposits, and it is to the credit of Great Britain that in this race she held her own.

Phosphate of alumina, likewise used in the manufacture of artificial manures, was also required, and it was reported that in the West Indies certain deposits were believed to exist, which might become valuable as future supplies for the fertiliser trade.

It was in the month of November 19—, when I was in Russia and Poland, that I received an urgent telegram from London requesting my immediate return, and on reaching the offices of my principals I was naturally eager to know the reason of my so sudden recall. It appeared that during my absence information had been received that a deposit of phosphatic rock existed on an island in the Caribbean Sea known as Alta Vela.

On looking at the map, it may be seen that the island of Hispaniola is divided between two Republics, viz. Hayti and San Domingo, and on the southern side of the island, exactly

where the frontier line of the two countries is shown, a small speck on the map may be seen. This is Alta Vela.

My principals informed me that they wished to have a thorough investigation made of the reported phosphatic beds on that island, but were faced with this difficulty that, although perfectly well known to navigators, Alta Vela was reputed to be unapproachable; moreover, as the governments of both Hayti and San Domingo claimed this island, neither was wishful that investigations should take place upon it, fearing that annexation to one side or the other was the real end in view, although as a matter of fact it is useless to either.

I consulted the best authorities on the subject, and found nothing as to its geological formation. Even the Consul-General for San Domingo, a most enlightened gentleman who knew more about it than anyone else, informed me that only once previously was the island reported to have been visited, and that nothing was known of the place itself except that it was a terror to shipmasters; that for ten months in the year it was covered with blinding spray to a height of 1000 feet, practically blotting it out; that it was surrounded by uncharted dangerous shoals and reefs, with enormous breakers, and that it was considered unapproachable for any human being. The prospects, therefore, were not very encouraging for exploring this place. However, the chance was offered to me of making the attempt, and I agreed to try.

I left London in due course, and, when on board the Royal Mail steamer on the way out, explained to the captain what I intended doing. He showed me his charts, assuring me

that I was on a fool's errand, and that if I ever did reach the island, I should probably never leave it.

II.

After remaining some time in Barbados I found myself at the port of Jacmel in Hayti. A French inter-colonial steamer then ran at odd times from Port-au-Prince on the southern side of the island to Santo Domingo City, and it would be at this latter port that the most reliable information could be obtained as to whether Alta Vela could be reached, it being at a distance of about one hundred and twenty miles away.

I crossed the Haytian mountains on horseback from Jacmel to Port-au-Prince, and caught the French inter-colonial steamer bound for San Domingo, but meanwhile, trouble had arisen between the French Government and the President of San Domingo. It appeared that the President, being in want of money, had commandeered the cash and securities lying in the safes of the bank, the property of the French Government—the cash was being reserved to meet payment of coupons of the loan in Paris. When the French Government heard of the outrage, an ultimatum was cabled to the President, to return the cash at once and deliver up the keys of the bank, failing which a French naval squadron would, within forty-eight hours, leave Martinique to enforce the French demands. The President, however, refused to accede to the French demands, and defied the French Government. The inhabitants, therefore, were anything but pleased to see a French steamer entering the port, not knowing whether it was to be followed by the French Squadron, which they expected was in the offing.

Knowing that there was a passenger (myself) on board for Santo Domingo City, the captain requested me not to land, but I replied that, being a Britisher, I should be unmolested, and insisted on being put on shore. This, after further remonstrance, was done. The crowd on the quayside were decidedly hostile; they hooted and hissed me, but I held out my passport to prove my nationality, and was eventually allowed to pass into the town unmolested, and was soon located in the best hotel.

It was a fairly large red brick building, built after the Spanish style of architecture, cool and roomy. The other visitors were two or three Catholic priests, two American butterfly-hunters for the New York Museum, some Spanish travellers, and a gentleman of German nationality, a long, lantern-jawed, emaciated individual, out at elbows, who had seen better days, and was suffering every now and then from attacks of malarial fever caught on the Mosquito Coast. He was a hard drinker, and liberally helped himself to my bottle of wine, without asking permission. He was, in fact, a 'hanger-on,' but withal an educated man and a very sociable one.

We soon became friends, especially when he found I knew German, and he offered to put himself at my disposal for anything I wanted in the island. He seemed to be eminently the kind of individual who would prove most useful, as he spoke Spanish perfectly, had lived in the country, and knew all the ropes.

After some delay, we found that the only way to reach Alta Vela was by chartering a small trading schooner, and by means of bribes inducing the captain to venture the voyage across to the island. We approached several captains, but they all refused. Eventually we found a half-breed Spaniard who seemed inclined to make the venture, provided it was made worth his while; so, after considerable bargaining, he agreed to allow me to charter his vessel for two months, the understanding being that he was to be able to carry a small freight on his own account as far as the port of Azua, about one hundred and twenty miles from Santo Domingo City, and after having discharged this small cargo, the vessel was to be for my account and at my risk.

The German and myself started provisioning the schooner with the necessary food—that is to say, I paid the bills for the provisions in advance, but up to the last moment they were not shipped. The parties from whom they had been purchased disappeared and could not be found—this, however, was a mere detail. The trouble with the French Government had now become acute, and the recalcitrant President issued a decree that any vessel found leaving the harbour was to be fired upon. This upset all our plans, but we resolved to run the risk, slip our moorings, and get out to sea on the first dark night.

III.

After waiting two days our opportunity came. A terrific tropical storm started with blinding flashes of lightning and deafening thunder, during which I made my way to the German's room to rouse him, to find him sodden with drink. However, there was no time to lose, so dragging him out of bed, I got him to understand that it was a case of 'now or never.' Somehow or other, we groped our way down the hotel stairs, and found ourselves in the street, buffeted by a perfect hurricane of wind and rain. After losing our way several times, we found the schooner and knocked up the captain and crew, and with trouble persuaded them to start working the vessel into mid-stream; we were, however, already observed. The drums at the forts beat to quarters, and we could just discern the gun-crews going to their stations. We kept on, however, and in a few minutes gained the harbour mouth, where we crammed on all sail and made for the open sea, followed by yells and shouts on shore.

Daylight found us scudding along with a

twenty-knot breeze behind us, the schooner tearing through the waters like a racing yacht. I now inspected the schooner and found a large hencoop lashed on deck. This I commandeered as my cabin, and it served the purpose admirably, being dry and having the additional advantage that from inside I could see all that was happening on board.

At dusk we reached the port of Azua, where the cargo was landed, and from that time the vessel was at my disposal. At this place most of the crew deserted when they heard of our destination, and it took the whole of the next day to pick up a scratch crew from any natives we could find. After some difficulty we got them all on board, half a dozen of them, and at last our voyage across the Caribbean Sea to the dreaded island commenced.

IV.

The first day passed without any incident worth recording, but in the evening we brought up at a small island called Beata, and found safe anchorage in a lovely bay. I was sitting smoking and looking over the bulwarks towards the island, when about midnight I thought I discerned something moving on the water, and called the attention of my German friend and the captain. We made out about four or five rough dug-outs paddling towards the schooner. We hailed them, asking their business. They seemingly understood neither Spanish, French, Creole, nor German, but when I hailed them in English, a voice answered in the stillness of the night: 'Have you any rum? We are friends!' I told them to come near, and parleyed with them alongside. They said they were turtle-catchers from Martinique and were stranded on the island, living on turtles' eggs and the cooked flesh of iguana lizards. They seemed a harmless set of fellows, and from them we obtained information that they thought *Alta Vela* could be approached at one point only, but that the navigation was extremely hazardous, owing to sunken reefs and heavy seas, and they warned us that if, by any chance, anyone was on the island and the wind shifted to off-shore, it might be months before any vessel could approach again to take him off. We supplied them with several bottles of rum and they gave us some dried fish.

As we were, however, suspicious of these men, we did not sleep that night, but at daylight we set sail, and soon lessened the distance between us and *Alta Vela* by some fifty miles. About four o'clock the island came fully into view.

V.

Alta Vela is about a mile in circumference at the base, and rises from the depths of the ocean in one perpendicular gigantic mass of rock, 2000 feet high, seemingly inaccessible, its

form being that of a sugar-cone. The place appeared to be surrounded with green rocks, but the terrible seas which were dashing on them sent up clouds of fine spray to an enormous height, so that the island looked as if it were undergoing a constant bombardment from some unknown warship. We shortened sail and placed look-out men on both quarters. I climbed up the forestay, the better to observe the reefs which every now and then we passed, some of them even grating the bottom of the schooner.

As we got nearer, *Alta Vela's* dreadful aspect seemed intensified, and in addition to the gigantic breakers, muffled peals of submarine thunder came from under the sea, with every now and then a sharp, hissing sound as of escaping steam from some broken pipe. These dreadful noises increased until we were within 500 yards of the shore, when we observed to our intense delight a small inlet with moderately smooth water.

It was getting dark, and as the situation was dangerous, we took in all sail and made the crew tow us in the boat, by the anchor chain, into smooth water. We were now only about twenty-five yards from shore, the wind light and puffy, which enabled us to approach some rocks standing out of the water, around which we passed the anchor chain. In this way we tied up and awaited events.

At midnight the wind suddenly rose, the sea became rough, and we were soon straining at our chain in the midst of a whirlpool of terrible waters breaking over the vessel and covering us with spray.

At this moment the German must needs get an attack of fever, and lay shivering and helpless on deck in abject terror. The captain sat with me at the stern, moaning and crying like a baby, and wringing his hands, while the crew in the bows, with terror on their faces, were swearing and cursing, threatening me with death, and incapable of doing anything. In fact, everyone was panic-stricken, myself included.

As if to add to the horror of the scene, the night was inky-black, and the schooner was surrounded with thousands of huge black cormorants, flying round us so near that some almost touched our faces, whilst every now and then they would drop suddenly with a splash into the boiling sea. It was as if all the devils of hell were let loose.

VI.

For three hours we just held on, our teeth chattering with cold, no one speaking, when I observed that the vessel was labouring heavily, and crept forward to examine the chain. To my horror, I found that one of the links was almost worn through—half-an-inch of rusty iron was keeping us from destruction.

I came back and reported this to the captain, and told him that the chain would break before morning, when we should be dashed on the rocks, and all drowned. I asked for a second chain, but he informed me that he had no second chain. There was, however, a piece of rope in the hold which, if it could be got at, could be used to strengthen the worn link. After some difficulty we found the rope, but it was rotten, having lain in the bilge water for weeks.

By dint of a great deal of persuasion I managed to get the crew to climb along the bowsprit and strengthen the chain by passing the rope through the links. This was done. The men were no sooner on deck when there was a report like a gun, and the chain snapped!

We were now riding attached to the rock only by a portion of the broken chain and the rotten rope. In this awful predicament we sat huddled together speechless, waiting for daylight, expecting every moment to be our last, when, to our joy, the wind dropped and the sea became quieter.

I made hurried preparations to land, taking with me three men with bags and pick-axes for the purpose of obtaining samples of the rock, and to ascertain whether indeed any phosphatic deposit actually existed. Every second was precious, so, on reaching shore, I started climbing the mountain with three sailors, and after three long hours of desperate scrambling up the perpendicular face of the rock, covered here and there with scrub, cactus, and indigenous cotton, to which we held on, we eventually managed to reach a spot about a hundred yards from the summit, where I found a large cave. I entered and explored it. Some huge bats flew out, and after digging some rock I wrote a record on a sheet of paper and attached it to the far end of the cave, and there it probably is to this day. It did not take long to do all this, and after filling the sacks, we rolled them down the mountain to the water's edge. To descend the mountain, we had to lie on our backs, sliding down, and in this way ultimately reached the little bay. As the weather was calm, and there were still two hours of daylight left, I started to explore the base of this island, a ledge of slimy green rock standing about a hundred feet above the sea. As I proceeded, I heard directly underneath me the loud peals of submarine thunder—it is evident that the island here is full of submarine caverns or tunnels, along which the enormous billows of the Caribbean Sea were driving, forcing spray, compressed by the driven air, through fissures and holes in the rock to an extraordinary height. No sign of life anywhere, nothing but terrible desolation amidst boiling seas. Retracing my footsteps, I scrambled landwards over some terrible scrub, with enormous spines, which even penetrated the thick leather of my seaman's boots and

broke off in my flesh—so I was covered with blood on reaching the ship.

VII.

I had been quite long enough on the island to realise that this was no place for mortal man, and as the captain was getting impatient, I rejoined the ship, and just in time we cut our rope and were able to get safely out of the bay and make for the open sea, when we steered for the island of Hayti.

The captain now vouchsafed the information that he had no compass or sounding line, nor any nautical instruments of any kind on board, so that we had to risk our way through the reefs. He also informed me that he would not do the journey again for a thousand tons of pure gold.

On reaching the open sea, the crew and captain again got so drunk that I had to take the tiller myself, and by sheer good luck we managed to reach Jacmel with my precious cargo of rock. On landing, I went to the small hotel on the beach, and having had no sleep for three nights, went to bed, expecting to be allowed to rest undisturbed. This was, however, not to be, for about three in the morning I was awakened by hearing voices underneath my room. On peeping over the verandah and looking out, I saw the crew landing packages from the schooner, carrying them up the beach and depositing them somewhere near my bedroom. This seemed strange, as there was not supposed to be anything on board. However, I said nothing then.

Next morning I informed the British Consul of this, when we resolved to make a search of the basement of the hotel. We discovered there was a secret storeroom, where kegs of rum, bundles of native tobacco, sugar, hoop iron, and other produce had been stealthily placed. This evidently was a freight which had been smuggled on board at Azua without my knowledge, and was to be sold privately, the captain, crew and hotel-keeper being in the deal. When it came to settling up for the schooner, I surprised the captain by informing him that I knew of this contraband cargo, on which naturally I would claim freight. Immediately there was a great disturbance. I was threatened by both the hotel-keeper and the captain. Finding myself alone, and powerless to enforce my claim, I sent for the British Consul, and returned to the saloon, to find that the captain and crew, with the exception of a young man, were on their way down to the schooner. I seized this gentleman, pushed him into a chair, and held him as a hostage until my account was settled, while the British Consul was threatening to call in the police. The captain, observing that one of his crew was missing, came back, and finding that discretion was the better part of valour, after some terrible

wordy warfare, we eventually came to an understanding, accounts were settled up, and I had the satisfaction of seeing the last of the captain and his crew of rascals.

My companion, the German, I heard afterwards, had several bouts of fever, and with that exception was none the worse for having

accompanied me, and was in pocket by a good many silver dollars.

Unfortunately the results of my voyage were practically nil, as analysis of the rock in London proved that it had no value for commercial purposes. Should anyone desire to visit Alta Vela my narrative may possibly be of service!

JOHN MACNAB: A COMEDY FOR POACHERS.

CHAPTER XII.—*continued.*

ALREADY the mist had gone from the foreground, and the hills were clear to half-way up the rocks of Sgurr Mór and Sgurr Dearg. Archie had his glass on the Beallach, in the throat of which a stray sun-gleam made a sudden patch of amethyst.

'I see some one,' Janet cried. 'On the edge of the pass. Have you got it?—on the left-hand side of that spout of stones.'

Archie found the place. 'Got him. . . . By Jove, it's Wattie! . . . And—and—yes, by all the gods, I believe he's pullin' a stag down. . . . Wait a second. . . . Yes, he's haulin' it into the burn. . . . Well done, our side! But where on earth is Charles?'

The two lay with their eyes glued to the patch of hill, now lit everywhere by the emerging sun. They saw the little figure dip into a hollow, appear again, and then go out of sight in the upper part of a long narrow scaur which held the headwaters of a stream—they could see the foam of the little falls farther down. Before it disappeared, Archie had made out a stag's head against a background of green moss. 'That's that,' he said. 'Charles must be somewhere behind protectin' the rear. I suppose Wattie knows what he's doin', and is certain he can't be seen by the navvies. Anyhow, he's well hidden at present in the burn, but he'll come into view lower down when the ravine opens out. He's a tough old bird to move a beast at that pace. . . . The question now is, Where is old John? It's time he was gettin' busy.'

Janet, whose glass made up in width of range what it lacked in power, suddenly cried out. 'I see him. Look! up at the edge of the rocks—three hundred yards west of the Beallach. He's moving downhill. I think it's Mr Palliser-Yeates—he's the part of John Macnab I know best.'

Archie found the spot. 'It's John, right enough, and he's doin' his best to make himself conspicuous. Those yellow breeks of his are like a flag. We've got a seat in the stalls, and the curtain is goin' up. Now for some fun.'

There followed for the better part of an hour a drama of almost indecent sensation. Wattie and his stag were forgotten in watching the efforts of an eminent banker to play hare to the hounds of four gentlemen accustomed to labour rather

with their hands than with their feet. It was the navy whose post was almost directly opposite Janet and Archie who first caught sight of the figure on the hillside. He blew a whistle and began to move up-hill, evidently with the intention of cutting off the intruder's retreat to the east and driving him towards Haripol. But the quarry showed no wish to go east, for it was towards Haripol that he seemed to be making, by a long slant down the slopes.

'I've got Number Two,' Janet whispered. 'There—above the patch of scrub—close to the three boulders. . . . Oh, and there's Number Three. Mr Palliser-Yeates is walking straight towards him. Do you think he sees him?'

'Trust old John. He's the wiliest of God's creatures, and he hasn't lost much pace since he played outside three-quarter for England. Wait till he starts to run.'

But Mr Palliser-Yeates continued at a brisk walk, apparently oblivious of his foes, who were whistling like curlews, till he was very near the embraces of Number Three. Then he went through a very creditable piece of acting. Suddenly he seemed to be stricken with terror, looked wildly around to all the points of the compass, noted his pursuers, and, as if in a panic, ran blindly for the gap between Numbers Two and Three. Number Four had appeared by this time, and Number Four was a strategist; he did not join in the pursuit, but moved rapidly down the glen towards Haripol to cut off the fugitive should he outstrip the hunters.

Palliser-Yeates managed to get through the gap, and now appeared running strongly for the Doran, which at that point of its course—about half-a-mile down stream from Janet and Archie—flowed in a deep-cut but not precipitous channel, much choked with birch and rowan. Numbers Two and Three followed, and also Number One, who had by now decided that there was no need of a rearguard. For a little all four disappeared from sight, and Janet and Archie looked anxiously at each other. Cries, excited cries, were coming up-stream, but there was no sign of human beings.

'John can't have been such a fool as to get caught,' Archie grumbled. 'He has easily the pace of those heavy-footed chaps. Wish he'd show himself.'

Presently first one, then a second, then a third navvy appeared on the high bank of the Doran, moving aimlessly, like hounds at fault.

'They've lost him,' Archie cried. 'Where d'you suppose the leery old fox has got to? He can't have gone to earth.'

That was not revealed for about twenty minutes. Then a cry from one of the navvies called the attention of the others to something moving high up on the hillside.

'It's John,' Archie muttered. 'He must have crawled up one of the side burns. Lord, that's pretty work.'

The navvies began heavily to follow, though they had a thousand feet of lee-way to make up. But it was no part of Palliser-Yeates's plan to discourage them, since he had to draw them clean away from the danger-zone. Already this was almost achieved, for Wattie and his stag, even if he had left the ravine, were completely hidden from their view by a shoulder of hill. He pretended to be labouring hard, stumbling often, and now and then throwing himself on the heather in an attitude of utter fatigue, which was visible to the pursuit below.

'It's a dashed shame,' murmured Archie. 'Those poor fellows haven't a chance with John. I only hope Claybody is payin' them well for this stunt.'

The hare let the hounds get within a hundred yards of him. Then he appeared to realise their presence and to struggle to increase his pace, but instead of ascending he moved horizontally along the slope, slipping and sprawling in what looked like a desperate final effort. Hope revived in the navvies' hearts. Their voices could be heard. 'You bet they're usin' shockin' language,' said Archie, and Number One, who seemed the freshest, put on a creditable spurt. Palliser-Yeates waited till the man was almost up on him, and then suddenly turned down hill. He ran straight for Number Two, dodged him with that famous swerve which long ago on the football-field had set forty thousand people shouting, and went down the hill like a rolling stone. Once past the navvy line, he seemed to slide a dozen yards and roll over, and when he got up he limped.

'Oh, he has hurt himself,' Janet cried.

'Not a bit of it,' said Archie. 'It's the old bird's cunning. He's simply playin' with the poor fellows. Oh, it's wicked!'

The navvies followed with difficulty, for they had no gift of speed on a steep hill-face. Palliser-Yeates waited again till they were very near him, and, then, like a hen partridge dragging its wing, trotted down the more level ground by the stream side. The pursuit was badly cooked, but it lumbered gallantly along, Number Four now making the running. A quarter of a mile ahead was the beginning of the big Haripol woods, which clothed the western skirts of Stob Ban and stretched to the demesne itself.

Suddenly Palliser-Yeates increased his pace, with no sign of a limp, and, when he passed out of sight of the two on the rock, was going strongly.

Archie shut up his glass. 'That's a workmanlike bit of business, if you like. He'll tangle them up in the woods, and slip out at his leisure and come home. I knew old John was abso-lute-ly safe. If he doesn't run slap into Macnicol—'

He broke off and stared in front of him. A figure like some ancient earth-dweller had appeared on the opposite bank. Hair, face, and beard were grimed with peat, sweat made furrows in the grime, and two fierce eyes glowered under shaggy eyebrows. Bumping against its knees were the antlers of a noble stag.

'Wattie!' the two exclaimed with one voice.

'You old sportsman!' cried Archie. 'Did you pull that great brute all the way yourself? Where is Lord Lamancha?'

The stalker strode into the water, dragging the stag behind him, and did not halt till he had it high on the bank and close to the car. Then he turned his eyes on the two and wrung the moisture from his beard.

'You needn't worry,' Archie told him. 'Mr Palliser-Yeates has all the navvies in the Haripol woods.'

'So I was thinkin'. I got a glisk of him up the burn. Yon's the soople one. But we've no time to loss. Help me to sling the beast into the cawr. This is a fine hidy-hole.'

'Gad, what a stag!'

'It's the auld beast we've seen for the last five years. Ye mind me tellin' you that he was at our stacks last winter? Come on quick, for I'll no' be easy till he's in the Crask larder.'

'But Lord Lamancha?'

'Never heed him. He's somewhere up the hill. It matters little if he waits till the darkenin' afore he comes hame. The thing is, we've got the stag. Are ye ready?'

Archie started the car, which had already been turned in the right direction. Coats and wraps and heather were piled on the freight, and Wattie seated himself atop like an ancient raven.

'Now, tak a spy afore ye start. Is the place clear?'

Archie, from the rock, reported that the hillside was empty.

'What about the Beallach?'

Archie spied long and carefully. 'I see nothing there, but of course I only see the south end. There's a rock which hides the top.'

'No sign o' his lordship?'

'Not a sign.'

'Never heed. He can look after himsel' braw and weel. Push on wi' the cawr, sir, for it's time we were ower the hill.'

Archie obeyed, and presently they were climbing the long ziz-zag to the Crask pass. Wattie, on the back seat, kept an anxious lookout,

issuing frequent bulletins, and Janet swept the glen with her glass. But no sign of life appeared in the wide sunlit place, except a buzzard high in the heavens and a weasel slipping into a cairn. Once the watershed had been crossed Wattie's heart lightened. 'Weel done, John Macnab!' he cried. 'Dod, ye're the great lad. Ye've beaten a hunner navvies and Macnicol and a', and ye've gotten the best heid in the countryside.—Hae ye a match for my pipe, Sir Erchie? Mine's been in ower mony bogholes to kindle.'

It was a clear, rain-washed world on which they looked, and the sky to the south was all an unbroken blue. The air was not sticky and oppressive like yesterday, but pure and balmy and crystalline. When Crask was reached the stag was decanted with expedition, and Archie addressed Janet with a new authority. 'I'm goin' to take you straight home in the Hispana. You're drippin' wet and ought to change at once.'

'Can't I change here?' the girl asked. 'I told them to send over dry things, for I was sure it would be a fine afternoon. You see, I think we ought to go to Haripol.'

'Whatever for?'

'To be in at the finish—and also to give Lady Claybody back her dog. Wee Roguie is rather on my conscience.'

'That's a good notion,' Archie assented. So Janet was handed over to Mrs Lithgow, who admitted that a suit-case had indeed arrived from Glenraden. Archie repaired to the upper bathroom, which Lamancha had aforetime likened to a drain-pipe, and having bathed rapidly, habited himself in a suit of a reasonable newness and took special pains with his toilet. And all the while he whistled and sang, and generally comported himself like a madman. Janet was under his roof—Janet would soon always be there—the most miraculous of fates was his! Somebody must be told, so when he was ready he went out to seek the Bluidy Mackenzie, and made that serious-minded beast the receptacle of his confidences.

He returned to find a neat and smiling young woman conversing with Fish Benjie, whose task had been that of comforter and friend to Roguie. It appeared that the small dog had been having the morning of his life with the Crask rats and rabbits. 'He's no' a bad wee dog,' Benjie reported, 'if they'd let him alane. They break his temper keepin' him indoors and feedin' him ower high.'

'Benjie must come too,' Janet announced; 'it would be a shame to keep him back. You understand, Benjie found Roguie in the woods—which is true, and handed him over to me—which is also true. I don't like unnecessary fibbing.'

'Right-o! Let's have the whole bag of tricks. But, I say, you've got to stage-manage

this show. Benjie and I put ourselves in your hands, for I'm hanged if I know what to say to Lady Claybody.'

'It's quite simple. We're just three nice, clean people—well, two clean people—who go to Haripol on an errand of mercy. Get out the Hispana, Archie dear, for I feel that something tremendous may be happening there.'

As they started—Benjie and Roguie on the back seat—the Bluidy Mackenzie came into view, hungrily eyeing an expedition from which he seemed to be barred.

'D'you mind if we take Mackenzie?' Archie begged. 'We'll go very slow and he can trollop behind. The poor old fellow has been havin' a lonely time of it, and there's likely to be such a mix-up at Haripol that an extra hound won't signify.'

Janet approved, and they swung down the hill and on to the highway, as respectable an outfit as the heart could wish, except for the waterproof-caped urchin on the back seat. The casual wayfarer would have noted only a very pretty girl and a well-appointed young man driving an expensive car at a most blameless pace. He could not guess what a cargo of dog-thieves and deer-thieves was behind the shining metal and spruce enamel. . . . Benjie talked to Wee Roguie in his own tongue, and what Janet and Archie said in whispers to each other is no concern of this chronicle. The sea at Inverlarrig was molten silver running to the translucent blue of the horizon, the shore woods gleamed with a thousand jewels, the abundant waters plashing in every hollow were channels of living light. The world sang in streams and soft winds, in the cries of plover and the pipe of shore birds, and Archie's heart sang above them all.

Close to Haripol gates a tall figure rose from the milestone as the car slowed down.

'Well, John, my aged sportsman, you did your part like a man. We saw it all.'

'How are things going?'

'Famously.'

'The stag?'

'In the Crask larder.'

'And Charles?'

'Lost. Believed to be still lurkin' in the hills. Look here, John, get in beside Benjie. We are goin' to call at Haripol and restore the pup. You'll be a tower of strength to us, and old Claybody will be tremendously bucked to meet a brother magnate. . . . Really, I mean it.'

'I'm scarcely presentable,' said Palliser-Yeates, taking off an old cap and looking at it meditatively.

'Rot! You're as tidy as you'll ever be. Rather dandified for you. In you get, and don't tread on the hound.—Bloody, you brute, don't you know a pal when you see him?'

PINK PINAFORES.

A KERB-SIDE STUDY.

By Lieut.-Colonel C. P. HAWKES.

I.

A SOUR November day in Twynning Street, North Kensington. Outside the 'Victoria and Albert' public-house stands a tattered nondescript, whose chest is decorated with two war-medals and a cardboard placard announcing that he is an 'Ex-Service man badly shell-shocked,' and whose drink-sodden eyes are fast fixed on the swing-doors of the tavern, while he leans against a small hand-barrow, from which a battered gramophone with a badly-dented horn grinds out a ragtime inanity of the music-halls:

My dear old home way down in ole Virginny,
Dat's whar I played as a l'il piccaninny,
Dere's whar dey live, my Mummy an' my Dad,
I long to be back dere, an' it makes me sad!

On the flagstones between the ex-warrior and the well-trodden threshold two little girls, apparently of about ten years of age, dance to this wheezy cacophony. Both of them grubby and touzle-haired—the one dark, with a pale and precociously-intelligent face, the other fairer, with a broad and unwashed but rosy countenance; they turn and twist, their eyes sparkling, their lips parted in ecstasy, their bodies bending responsive to the rasping lilt, their feet, in pathetically worn-out boots, tapping the pavement in time to the raucous mechanical rhythm.

Up and down, back and forth, hands on hips, tongues extruded in rapturous abandonment, they hop and skip across the sidewalk; their grimy pink pinafores, obviously cut from the same faded material, splashing the London gray with a touch of faint and incongruous colour.

II.

My dear old home way down in ole Virginny,
Dat's whar I played as a l'il piccaninny . . .

babbles the gramophone in a querulously nasal falsetto. Twynning Street, North Kensington, is an interminable double row of fallow-complexioned brick-built houses, which shuffles its way north westward in the inauspicious direction of Wormwood Scrubbs Prison. The verb is used advisedly, because it best describes the indeterminate meanderings of this squalid *cul-de-sac*; from the comparative respectability of its beginnings off the tram-choked thoroughfare of the Sibthorpe Road, along the seedy deterioration of its half-mile course of twists and turns and crossings, until it terminates with a sort of jerry-built dejection on the edge of some waste ground, across which looms the sullen ominous mass of the prison. The street seems to have shambled along there in a slipshod

fashion, uncertain as to which direction it should take, its indecisive halts marked at every crossing by a public-house, until it last it stops, with a sort of boozy misgiving, in sight of the gaol. Its end is blocked by the decrepit skeleton of a vast hoarding, bespattered with mouldering posters, and riddled by yawning gaps, whence long ago the planking has been filched to fill the cheerless cast-iron fireplaces of the slovenly houses. Along its forbidding perspective slatternly matrons, with wispy hair screwed up in metal curlers, seem to spend all day and half the night in whispering mouth-to-ear on unscrubbed doorsteps, or in bawling blasphemies and highly-seasoned scandal across the roadway, on which a clutter of shrill-voiced urchins disport themselves amid the garbage.

III.

Dere's whar dey live, my Mummy an' my Dad . . .

whines the gramophone with husky reiteration. Over the doorway of Number 237, midway between the 'Victoria and Albert' and the 'Load of Hay,' is nailed a notice-board, on which in tremulous lettering is emblazoned the following legend:

ADOLFUS JEALES CHIMNYS SWEPT
UNBAKABLE OVENS CURED.

Here, in the uncleanly tenement thus adorned, live Mr and Mrs Jeales, their twin daughters, 'Dawriss' and Ann,—our two pink dancers,—and half-a-dozen lodgers and sub-tenants, who maintain a precarious existence on the upper floors, while their landlord and his family occupy the ground-floor and basement.

Mr Jeales is a chimney-sweep and 'general odd-jobs man,' whose work on weekdays begins at 3 A.M. and ends about 3 P.M., when he retires, sooty and somnolent, to the only bed of which the establishment can boast, whereon he snores till awakened about 6 P.M. by the newsboy crying the '7 o'clock Star.' He then essays a meretricious toilet and sallies forth to the 'Victoria and Albert,' where he remains until, surly and incoherent, he is ejected at closing-time.

On Sundays Mr Jeales stays in bed all day, absorbing current history—as recorded in the divorce and police-court reports and the racing and football news, which fill the columns of his favourite *Reynolds's*—until the time arrives for his vesper visit to the 'Load of Hay.' For Mr Jeales is open-minded on the subject of beer, and distributes his patronage evenly between the two malodorous hostelryes.

His marital and paternal duties sit lightly

upon him, and he seldom speaks to his wife, except to put up a full-flavoured but unavailing defence in the ceaseless wrangle that is their married life. 'Carn't get a — word in edge- wyse!' he will complain. His children he never addresses, except with such occasional and endearing admonitions as 'clear aht of it, — yer!' or 'stop yer — row!'

This perpetual warfare between the authors of their unwelcomed existence is regarded by 'Dawriss' and Ann with a sort of impartial but malevolent neutrality. It means but little difference to them whether victory smile on the brute force of the husband or on the shrill vituperation of the wife. If at all, their sympathies incline, in loyalty to their sex, slightly towards their mother's side. But filial affection is foreign to them, constantly reminded as they are that they are only '— little nuisances,' and that their presence at home is merely tolerated until they shall be old enough to earn their own keep and to contribute something to the support of their parents' declining years. Meanwhile, the 'Welfare-centre' and the school authorities look after their health, and the taxpayers provide them with a sketchy education and one good meal a day, the others mainly consisting of the remains of the 'fish and chips' brought home of evenings by Mrs Jeales from the fried-fish shop round the corner, and the lower layers from the salmon-tins, whose triumphant advent signalises Mr Jeales's infrequent victories over the street bookmaker outside the 'Load of Hay.'

As for Mrs Jeales, no one has ever seen her at home without a small cloth 'cricket-cap' pinned insecurely on to her straggly hair. She probably removes it at night, and presumably resumes it again in the early morning; but such operations invariably take place in the dark, for most of her coppers find their way into the till of the 'Victoria and Albert' or that of the gaudy picture-palace in the Sibthorpe Road, rather than into the slot of the gas-meter. Mrs Jeales is always busy, always *en négligé*, with permanently dirty apron and permanently rolled-up sleeves. She perpetually complains that she never has time to finish her 'work,' with which, in her own phrase, she never seems able to 'kitch up.' The completion of her household duties forever eludes her, continually interrupted as they are by ceaseless colloquies, amicable and otherwise, with her friends and neighbours—terms which, in her case, are by no means synonymous.

Her part in these procrastinating and breathless conversations consists of a dramatic narration in *oratio recta* of enigmatical dialogues between herself and a mysterious 'she,' in which that shadowy female invariably suffers monotonous discomfiture.

'So I sez to 'er, quite quiet-like, I sez, "Wot the 'ell 's it got to do with you?" I sez. "Oh,"

she sez, "for the matter o' that," she sez, "an' if that's the wy you tyke it, Mrs Jeales," she sez, "it's *my* biz'ness an' not yours," she sez. "An' *that's* a lie," I sez; "an' wot's more," I sez, "I've somefin' better to do than to stan' 'ere listenin' to a *woman* like you," I sez,—and so on, *da capo*.

Mrs Jeales's thwarted devotion to her household duties leaves her but little leisure for attention to the niceties of fashion. When she attends a funeral or 'the pictures'—her favourite diversions—she pins a bedraggled 'picture-hat' on to her unkempt *coiffure*, and slips over her 'working'-dress an opulent but sporadically mangy fur coat, made, apparently, by stripping from some uncatalogued specimen of the larger carnivora its apricot-coloured pelt. And thus attired, she becomes at once a model worthy of George Belcher or Phil May.

IV.

Dat's whar I played as a l'il piccaninny . . .

gasps the gramophone of the ex-warrior, with wheezy and appropriate insistence, and round and round whirl the two pink pinafores outside the unsavoury threshold of the public-house. 'Dawriss' and Ann attend the Council school in the Colquhoun Road. They spend their days there and on the roadway in Twynning Street, and their nights on a flock mattress beneath the kitchen-table at Number 237.

'Dawriss,' the elder by some fifteen minutes, is pretty, pert, and precocious, and, at ten years old, already excels in the art of protective 'back-chat' that is the defensive armour of the London slum-child. Malnutrition, neglect, and the usual infantile disorders seem to have had no other effect upon her than to sharpen her shallow, quick intelligence, and to keep her body thin and wiry. Her nose, however, is already developing a sneering tilt, and the little snarling lines have already graven themselves at the wings of her nostrils, while her upper lip is beginning to curl downwards, so that you can almost hear the scurrile Cockney whine before she speaks. Her brilliant eyes already tend to narrow meanly at the corners, and seem to glint with a contemptuous, calculating gleam; suspicious, challenging. She has a shock of pretty, dark-brown hair, in which, bobbed though it is, she seems to take a pride: and the whole effect of her small, pale face is intriguing and vivacious, though its cheeks too often betray a hereditary partiality for soot.

The boys of Twynning Street have learnt to respect her stinging palm and still more stinging repartee; for she can hold her own with her companions, and even with her elders, by her assertive independence and shrill readiness of tongue. With her insatiable appetite for the thrilling animation of the streets, she is essentially a London type; her individuality is redolent of the glamour of crowded pavements,

the noisy excitation of traffic, the rabid howl of newsboys.

Already a contest has arisen between 'Dawriss' and her mother as to what calling the girl shall follow after leaving school. Mrs Jeales, with an eye to her share in larger profits, has already suggested 'the drypery'; a proposal scornfully rejected by 'Dawriss,' who sees herself in some six years' time a haughty, white-aproned waitress in a 'kaffy,' a cloud-cuckoo-land of frilly frocks and open-work silk stockings, wherein she shall disdainfully dispense, at her convenience, cocoa and buttered eggs to a worshipping crowd of fag-sucking adorers. 'None of yer stuffy drypery-shops fer me!' she screams, 'with livin'-in, an' all, an' me fingers worn ter the bone ten hours a dye with sewin'! I'm goin' where I can be a *lydy* after hours, I am! I want a job where there's fun ter be 'ad. Drypery! *Slyvery*, I calls it!' and she snorts and shifts the bullseye which bulges her scornful cheek.

An intrinsic difference from her sister in type and character distinguishes Ann, who seems to have thrown back to some eternal housewifely original. Ann's face is broad and honest, and utterly expressionless, with small dull eyes set wide apart over prominent cheek-bones. Her mouth is large and unsmiling; her arms are muscular, with big, capable hands; her expression docile and unintelligent; and she has thick, lank, yellow hair, like the wig made by some inexpert *perruquier* for an ancient Briton in some minor provincial pageant.

Slow of speech and mind, Ann takes life pretty much as she finds it, and she bears with stolid unresentment the discipline of claps which falls to her lot as the junior member of the Jeales household. At school, in her painful pilgrimage through the standards, she can never compete with 'Dawriss'; but she has many friends among the quieter children, and her chief interest seems to lie in the execution of much unauthorised and unacknowledged housework, rather than in any emulation of her sister's predominance in the social life of their gutter-playground.

Slow-moving, but with a tireless energy, Ann soars no higher than housework, which with her, however, is an absorbing passion. She will develop later into the sort of woman whose prototype tidied his cave for some neolithic hunter, smoked his venison for some medieval franklin, or scoured the brass of one of Franz Hals's burghers. Suggestive of the immemorial hearthside of the human family, her like persists in every land and in every age; a type too fundamental ever to be vulgar—the eternal peasant-woman. 'Ann?' her mother confides to a doorstep crony. 'Ow, *she's* ony fit fer *Service*, she is! As I sez to 'er the other dye, "Me gurl," I sez, "soon as ever I can git yer awye from school, inter *Service you* goes," I sez. "Yer can't 'elp bein' a *fool*," I sez, "but if yer

lets me dalin an' loses yer plice, Gawd forgive yer'," I sez, "fer it's more than yer mother will!"'

V.

I long to be back dere, an' it makes me sad!

buzzes the gramophone with unmusical irony, as the two pink pinafores gambol and gyrate over the greasy flagstones.

Such is the environment of their wearers' present. What of the future? All things considered, they are comparatively happy now; far happier, indeed, than most philanthropists would imagine possible. For the London poor, especially in early youth, are true philosophers; and a little street music, an occasional glint of sunshine, and now and again a penn'orth of sticky sweets, will often drive from the doors of their memory such werewolves as semi-starvation, cold, and cruel ill-usage. Their joys are simple; their sorrows accepted as the common lot; and for them, at any rate, life is seldom dull. Inured to squalor, they regard it from an angle imperceptible to tender-hearted observers bred in softer surroundings. Thousands of lads, brought up in circumstances like those of Ann and 'Dawriss,' were schooled in this way to laugh at hell in the Salient's trenches, to play mouth-organs, and joke about the stretcher-parties, while the very sky rained death on the filthy rat-infested dug-outs which at any moment might prove to be their tomb.

So 'Dawriss' will probably be as happy in her tea-shop as she is at present, playing hop-scotch, or dancing on the pavement in Twynning Street. And Ann will find in Service the congenial work that her instinct well fits her to do; and after a protracted courtship on the area steps, and a series of saturnine 'walkings-out,' will probably plight her troth to some stolid young butcher. For each of the girls has thus early nailed to her mast colours which epitomise a totally distinct ideal and outlook. And while 'Dawriss' is ready to cross the bar of youth and to brave the wind and tide of circumstance in search of a 'good time,' the haven of Ann's quest is a good home.

Though tinged with a few regrets, such memories of Twynning Street as they may retain will not be altogether unhappy. For the poor live mainly in the present, and waste as little time in retrospection as they do on forethought.

And Mr and Mrs Jeales? Well, they belong to a generation which has almost ceased to matter. For them are old-age pensions, the poor law, and the continued, though more carefully state-regulated, consolations of the pint-pot.

Meanwhile, the gramophone stops, and the two pink-pinafores dancers sink, panting and radiant, upon a neighbouring doorstep; while the thirsty veteran, leaving his barrow and instrument in their charge, sidles at last within the portals of his paradise.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

JUNE for London, still as for ages past. And certain conditions have arisen in the town calling for contemplation, with a measure of anxiety. How strangely this matchless city changes! The famous and pompous Samuel Johnson, who so arrogantly laid down the law upon the good of London, the bad of Scotland, and the varying quality of much else on earth, left as imperishable dicta a number of declarations upon this city that became accepted as major principles. 'Sir,' he said to the admiring Boswell, 'when a man is tired of London he is tired of life, for there is in London all that life can afford.' This idea afterwards became established in the minds of settled Londoners, and they feared to confess to friends that they wearied of existence in town and would leave it, for then behind their backs there would be a shaking of heads, and sympathy upon the senile decline of such poor bodies as would retreat from the heart of civilisation, from the centre of enlightenment. Indeed, I should have been afraid to admit to myself that I tired of London, since by that I should be making a surrender to time that for the sake of life and action must be deferred till days for sticks to lean on, with grunts and gasps. And for pride's sake no confession of mental and spiritual fatigue by London was made to the country people or the foreigners. But these are days when we take down the old gods from their pedestals, and examine them closely to see of what they consist. One begins to doubt, indeed, if it is not easy and good for the true lover of London to absent himself from it for long periods, and enjoy it in short and intensive spells, as indeed, in this way, I still delight in London. The case is now that no city in the world is easier to leave, and none so attractive for the return. A friend, a true London man, has lately changed his place of abode from here to a spot some eighty miles away, saying that the sincerest and oldest lovers of London can no longer find it in their hearts to live in it, and see the dire changes that are happening therein.

* * *

In this idea is much truth. Others are feeling it. In Johnson's time, as even in my own
No. 757.—VOL. XV.

early period in London, the town was delightful for its social circles, sparkling in intellectual quality, but they have been scattered by circumstance and a somewhat vulgar cosmopolitan intrusion, and the new substitutes lack much of the ancient charm. One returns to London partly to seek these friends, and hear what they cleverly say, what they ingeniously think, and marvellously do, to visit the good and essential shops, and, for the rest, maybe to enjoy a spell of solitude, for, as against the losses, the delights of absolute and perfect solitude may now be practised in London as at no other time or place. Any of Johnson's friends to escape him could not have done it as now; nor could I when first I knew London at the end of the Victorian era, nor now but for experience. The insistent friends would have interfered. Friends, the most intimate, in any grade or class of London society, no longer call too early in the morning, such an intrusion really being of the essence of human sympathy; nor on returning at night to our own retreat do we find them, uninvited, curled up in slumber there. The spirit of such intimacies has departed, and when they are practised now, they may be regarded with disfavour. Londoners are warping; machinery and materialism and the crowds that come crushing in are withering their social soul. The old insistent friends no longer call, but use the telephone instead. This instrument has been a foremost agent in the social destruction of London, having much reduced the habit of the personal visit. Our friend telephones to discover if we be at home ere he ventures further, and perhaps finds that even so the visit may be unnecessary. The rush of London now is greatly adverse to the ancient pleasures of personal calls, made in the way of a stroll about the town. How sweetly mellow were those happy tranquil days, picking up a hansom here and there as fancy willed! Now we rush and rattle. We have greater regard for our personal abode, as we must when surrounded by a whirling mob of strangers. Thus enters the scheme of solitude. At the true centre of social London, abiding in a pleasant flat, one can enjoy a larger and completer measure of absolute and more soothing solitude than in any other place, with all the advantages of a desert island,

[All Rights Reserved.]

MAY 30, 1925.

and none of the inconveniences, such as liability to discovery. As one who has dwelt in the Sahara desert, deep in it, at the oases and away from them, I say that more positive solitude can be gained in London, but only by old townsmen, and not in the way and sense of strangers who are gloomily warned that they can be lonelier in London than elsewhere. Loneliness and solitude are different states. The solitude of a thinking man in London, whose atmosphere is so intensely charged with human effort and achievement, may be a splendid stimulation; but loneliness is death. A friend, in some things like myself, and dwelling at the social centre, in good health and spirits, has the record for himself of living happily and well, and in the best intellectual and spiritual enjoyment, for a period of eleven days without having seen a single human being. And this man is clever, with strong human interests, a keen fellow for talk at table, and even something of a social butterfly. Conditions that make possible such solitude would not have suited Johnson, who so much loved to hear his own dictatorial voice, and selected the places for practising it.

* * *

What are two hundred years when the scientists now say that it has taken a thousand million or thereabouts for London, as we see it, to evolve from the rawest, newest state of the earth on which we live? And think that two hundred years ago a person might shoot a woodcock in the country where traffic now swirls and stops at Regent Circus! And now the old Regent Street—Nash's wonderful, graceful Regent Street itself—has passed through a full term from beginning to end, and, after scarce more than one hundred years, has been demolished. Ladies and gentlemen coming to London for delights of its summer season will find much of Regent Street, along which they walk—as they are sure to walk no other—a mass of builder's ruins. Recently, our senior London lady, Miss Elizabeth Underwood Lisle, who, eighty years ago, was presented at the Court of the youthful Victoria, and to whom Dickens and Browning took their books for her to read aloud, so sweet was her youthful voice, was celebrating her hundred and fourth birthday at a house in Portman Square, when she said, 'I should like to see London once before I go. They say that poor Regent Street is being entirely pulled down. The pity of it! You young people will leave nothing as it was!' And Miss Lisle spoke wisely and with truthful point. Yet, for brief seasons, rather than for regular and uninterrupted lodging, London retains its lure, a changed lure as it may be. Johnson said that 'a county gentleman should bring his lady to visit London as soon as he

can, that they may have agreeable topics for conversation when they are by themselves.' The twain come for the season in a thousand times the numbers that Samuel Johnson ever dreamt of; and they are wise, for London in June, for its show of life, is fascinating and matchless still, though it is the lady who leads the way, and not to gather topics of conversation, which are provided by the aerals at home, but that she may walk up Bond Street and study things and fashions, and have agreeable costumes for wearing when they are by themselves and others visit them. June for London, yet I wish it had fewer people then. Numbers spoil London now; too many mad creatures rushing and crushing and disturbing the old-timers' comfort. They feel that the Wembley show, which was meant to bring folks along to town from all parts of the earth and start a new London vogue, was wrong for the overcrowding that it made, and the numbers who have refused to go home again, staying beyond their welcome and, indeed, conducting themselves as if London were theirs instead of ours. To the minds who grapple with it the London traffic problem seems insoluble; and these experts in order and arrangement wring hands when contemplating this strange welter of wheels and humanity. They perceive the lumbering mass of a brewer's lorry with two fat horses resting in the middle, waiting its turn for dragging casks of stout along Piccadilly, while statesmen, bishops, dukes, and my lowly self and friends make slow procession in the rear. All the time London increases. Wembley revives and calls for more, and we read that in one street in Kensington as many as 2500 people are living in 140 houses. And yet, again, London has its lure, its changed lure. It is so smart. Here, for the delight of the children and our country friends, the news of the world, quick upon the happening, may be read in moving flaming letters on the tops of high buildings in the west end. And it is the retreat where an old Londoner like myself, one who wanders far, likes to be in June for a quality of peace and quietness only discoverable here, and only by such as we are.

* * *

Having surveyed the ruins of a part of Regent Street, each pair who come to town may reflect upon the disappearance of poor Eros from Piccadilly Circus. The blank will catch them instantly. The change, small in material importance as it may be, is more conspicuous to visitors, as indeed to us, than any other of recent times. The people of London are not persuaded of its necessity. Progress, it is said, demands it, and by progress is meant London traffic, and underground at that. I am tiring of this god Progress, and no longer reverence him, for he is a destructive Moloch into whose voraci-

ous jaws the mellow features of our old tranquil life are pitched for sacrifice. Allowing their advantages, I preferred the sight of winged Eros on his fountain pedestal, the flower-women encircling it at the base, to a complete network of railways below the ground. Besides, it appears to me, using such simple imagination as many of the worshippers of this Moloch seem not to own, that these gigantic constructions underground, long draughty holes for little tubes of trains, are too late; for development and invention being quick as they are, and all thoughts being for the air, is it not sure that this traffic problem will solve itself, and the London streets become calm again, because of vehicles taking to the air? As sure as that we live and die is this, and the time is not distant. The new spell of intensive burrowing under the earth for railway-making, while air-cars dart above it, seems to me like a mistake in time, a defiance of discovery. It reminds me of the Moslem student, the *tolba*, with whom I talked one afternoon in his small lone cell in the college at Fez, who murmured that the best doctrine of his own religious world at the present time is to turn back the mind and heart towards Mahomet, to endeavour to recapture the atmosphere, the spirit, the actions and full simplicity, steamless and unelectrified, of the prophet's time, for in that grand retrogression were they convinced that all progress towards happiness lay. Small heed, perhaps, was paid to Eros, standing tiptoe on his fountain, and being like the centre spot of London life, until the tragedy was enacted, and the bronze figure, with its seven feet span of wings, was lowered by the workmen inconsiderately down, as if some common travelling show were being dismantled, and lay upon the ground like a stricken bird. It was the most vulgar official thing that has been seen in London for long past; the pictures of it in the papers were distressing. The people then realised that if they had seldom definitely and consciously observed this pleasant Eros, god of Love, they had always felt its presence, and that it had perfectly and harmoniously landmarked a favoured spot. The Eros of this tragedy was a great inspiration. A monument to the good philanthropist, Lord Shaftesbury, was desired. Boehm, fashionable sculptor of the Victorian time, passed on the commission to his pupil Gilbert, who, seized with a hot fancy to shape a beautiful symbol rather than set up a Shaftesbury in frock-coat and trousers, made the first clay model in a single afternoon. In a few months the work was completed, but the creation of this lightsome Eros, and of the fountain on which he poised, was not an untroubled business. Authority was mean. Old guns were promised for the bronze, but were undelivered, and the fountain had to be six feet lower than proposed, while many intended jets of

water would have been too expensive for the ratepayers! Yet, if the whole idea was not consummated, what appeared was good. 'As to the figure surmounting the whole,' said Gilbert some time later, 'if I must confess to a meaning or a *raison d'être* for its being there, I confess to have been actuated by a desire to symbolise the work of Lord Shaftesbury, the blindfolded Love sending forth indiscriminately, yet with purpose, his missile of kindness.' Now Piccadilly Circus is a desolation without it. Some time it shall come back, it is said, but the statement is only half believed. The flower-sellers at the base, women in brown shawls and black straw hats, have been moved on to some other place. Quaint looking little bodies they were, sitting on the fountain steps, selling the pretty posies arranged in their baskets, yet they were civil and honest, and brought a certain sincerity to their work. Something in the business, bringing these sweet and simple touches of nature in her lovely colour to the core of Babylon, seems to exalt those who practise it and to warrant the sympathy of the passers-by. They are an institution of a kind that cities should preserve. When we visit Rome how pleasantly and with what sympathy we look upon the flower-sellers on the steps of the Piazza di Spagna; and what should we say of Rome were its controllers to banish them from those steps and clear away the adjacent fountain with its boat, that room might be made for a new contraption of this mechanical age?

* * *

The case of St Paul's Cathedral is a more overwhelming and national sadness. Strangers who, on coming to town, have been accustomed to assume St Paul's, rather than journey east to see it, may never now have the opportunity to comprehend by vision its beauties and glories in normal conditions and circumstances, since years must pass ere it is fully restored again. Great architects seem occasionally to blunder into some of their best effects, and Wren, perhaps, scarcely knew what he was achieving in a feature that has always appeared to me as one of the chief beauties of the interior, the gentle golden light that softly falls from the windows beneath the dome upon the choir and altar, while the rest of the cathedral is set in varied shades of gray. And here we have a sense of smooth and polished order as not in the Abbey, and the visibility—to use a word of more frequent use now than once—is good, and so are the effects of light and shade. It often seems to the common mind that the architectural aim to a heavenly solemnity is made through gloom, because, perhaps, it is the easy way. The supreme example of much light and high visibility in a great ecclesiastical work is St Peter's at Rome. In different years I loitered in St Peter's again and again, wondering why

this tremendous work did not stir me as it ought, and as I wished it. It never did. Piece by piece, artistically, architecturally, historically and in other senses, it seemed magnificent, its spaces noble, but at each time of leaving I experienced a sense of failure and something missed. In such matters as these, having no expert knowledge and trusting largely to the integrity of my emotions, I am properly inclined to condemn myself for ignorance and search for greater knowledge forthwith, but here after all I hesitated, for my senses had been tested on many architectural masterpieces, and had acquitted themselves fairly well. Take the case of the cathedral at Seville. I do not forget the overwhelming awe that fell upon me as I crept into the full magnificence of this incomparable interior, whose columns seem of themselves to grasp the soul of the beholder and swing it through mists above to heights beyond. I had scarcely considered this cathedral in advance, by reading or otherwise, and the effect upon me would have been the same had I been carried blindfold to Seville, and there, not knowing my whereabouts, had my sight restored. Two years ago in Rome the idea flashed upon me that it was weakness in light and shade that I marked, a too prevailing flatness, a lack of brilliancy here and profound depth of darkness there. Then I discovered, or seemed to discover, that everywhere about the cathedral there was confirmation of my fancy, and for my own mental and emotional case at all events I was satisfied. This may be like nonsense to others more learned than myself in such matters, but there it is. The lighting effects of our St Paul's Cathedral seem to me more effective than those of the gorgeous church of Rome, and, pursuing my own fancy, I have found them solemnly delightful.

* * *

Being in the city and somewhat retired from the general sight-seeing track, the historical interest of the relics of St Paul's has not been appreciated by the common people as it should have been. To a simple and faithful patriotic mind this crypt is more fascinating and impressive than the Abbey tombs. Here the statesmen, whose works are sometimes meretricious and least enduring, are less exalted; here are the graves of those who spread delight around. Some great painters, like Lawrence and Landseer, are here; and Turner, dying, pleaded that he might be buried as near to Sir Joshua Reynolds in St Paul's as might be, and so it was. Here musicians rest; the most popular of the moderns, Arthur Sullivan, is one of them. And some who were once our own special friends have their memorials; the journalists who have fallen in great causes, here, if not elsewhere,

being given their due. Some warriors add the martial tone; yes, warriors! Nelson and Wellington, the two of them, are near each other. The funeral chariot of the victor of Waterloo is a rare and grand contrivance. The often-quoted declaration of Nelson at the battle of the Nile: 'a peerage or Westminster Abbey,' contained a touch of vulgarity that makes it less pleasant for remembrance than other famous sayings of the hero, even though peerages of that period were not the same titular stuff as those which have been marketed in recent times; but here is Nelson at St Paul's, and not at Westminster. Collingwood lies beside this happy hero. Great is the glory of St Paul's, and great the love of it. Every man or woman who, when young, comes wonderingly from some other place to live in London feels at once some sense of a new possessive intimacy with this great cathedral. Shrine it is of the matchless city, as could be no other. Before the Abbey we stand in profound and respectful awe; but London loves its cathedral, and showed its love when quarter of a million pounds asked for its repair were yielded instantly. When first I came to London, back in Victoria's ending years, it was the spring, it was May, and I had printer's ink to smell all through Saturday nights, and then walk to my lodging along streets strangely still and wonderful, at about five o'clock in the morning. And the splendid vision remains in memory as clear and beautiful now as then of the dome of St Paul's glowing in the loveliness of the Sunday morning's sun above the smooth slope of Ludgate Hill. Even in those days people talked of danger; and perhaps I first, having inquired of deans and architects, made some public report upon it in the popular newspapers. Though I believe not in omens and signs, and superstitions do not catch me, yet if St Paul's were to crumble, as some have prophesied, I should tremble for the people and the empire, for, were this no sign, there could never be a sign to men. The friendliness of the cathedral here in the heart of business London is grateful to the spirit of its people. In serene tranquillity it stands, while the traffic of the town swirls round its Yard. For its near neighbours it has the Bank, the Royal Exchange, the Guildhall, Mansion House, and Post Office. And at four in the afternoon of all the business days, just when the work is done, when the banks are closed, there is a service in the cathedral. The *Nunc Dimittis* and *Magnificat*, with choir and organ, Stainer in E, or Travers in B minor—the end of the City day. The speed and noise outside are quickening as the home-going hour approaches; here within are stillness and a soft solemnity. It is the City's daily harvest festival. No other city in the world contains a monument that is of its own tissue, its very soul, as this.

THE PASSING OF THE FLEET.

By 'TAFFRAIL,' Author of *Pincher Martin, O.D.*; *The Little Ship*, &c.

'The night, clear and starlit, is dark, with no moon.'

TO one looking down from the hill-top behind the town the great expanse of the anchorage is blotted with the deeper shadows which represent ships—battleships and light cruisers, an auxiliary or two, and close inshore two flotillas of destroyers. Their hulls are picked out in tier upon tier of shining pin-points of light cast from many scuttles, while here and there the brilliant constellation is punctuated by the bluish-white glare of an arc-lamp. Masts, funnels, and heavy upperworks are all but invisible against the sombre background of sea.

It is calm and windless; but from a height the glassy water does, not reflect the light shoreward. Instead, each vessel seems to float squat and ponderous in a separate, scintillating radiance of her own making.

The ships talk incessantly one to the other. Hardly a minute passes without the frenzied winking of a signal-lamp stabbing the darkness with the longs and shorts of the Morse code. Sometimes, when the flagship herself becomes communicative in three different directions at once, the conversation becomes general and the lights flicker in and out, out and in, all over the bay.

Spangles of diamond and ruby and emerald, with semi-luminous trails of disturbed water and breaking ripples stretching far behind them, move ceaselessly from ship to ship and ship to shore. They are the drifters and steamboats and motor-boats about their business, and so still is the air that the swishing sound of their movement travels even to the hill-top, a full mile away. Occasionally the harsh chatter from the exhaust of a refractory motor-boat disturbs the peace with a staccato popping like the fire of a distant machine-gun.

In the flagship, the large vessel nearest the shore, a band is playing. The tune is indistinguishable and the music very faint; but the thrumming of instruments comes travelling softly across the water. The admiral has a dinner-party.

Sometimes there comes the sudden blare of a bugle, sometimes the shrill twitter of a boat-swain's pipe and the sound of distant orders as a boat is hoisted. And every half hour is marked by the bells, some deep-throated and mellow, some shrill, as ship after ship takes up the tale and the sound goes rolling round the bay to fade away in the distance.

There comes a golden flash and a cloud of smoke from the flagship—the nine o'clock gun. The sharp report reverberates in and out among the cliffs, to set the gulls chattering. The echoes

have not died away before the long, drawn-out wail of the 'Last Post' is sounding from every ship, the fanfare of bugles, harmonious in the distance, seeming to travel on and on in interminable waves of sound, mournful but very beautiful. Then silence.

All day long the little town has been full of men on leave—chief petty-officers resplendent in peaked caps and brass buttons, bluejackets and marines. Some, for the sake of the exercise, have gone for sober and economical walks in the country. Others, the care-free bachelors, have spent their money with seaman-like prodigality, and restaurants, houses of refreshment, cinemas, and picture-postcard shops have all done a thriving trade.

The fleet has been at anchor only for three days; but the attraction of the uniform is fatal, and its wearers are not slow in making friends. Many a male civilian has had his nose temporarily put out of joint by those fascinating trousers, cut loose over the ankles, and the picturesque jumpers with their flapping collars and black silk handkerchiefs knotted in front. Many a sailor and a girl have spent the afternoon together coyly talking—perhaps, after dark, linking arms or clasping waists with their heads very close together. Numbers of the men, returning to catch the last boats, have been accompanied to the landing-place by other people's sisters.

For three afternoons the golf-links have been invaded by officers, and the roads filled with motor-bicyclists new to the district. Garages have done good business, and provision shops have been well-nigh gutted by stewards, mess-men, and canteen managers. There is hardly an egg in the town.

The fleet is very welcome.

Four bells—ten o'clock—chimes out from ship after ship. The last drifters and liberty-boats leave the shore, and again there comes the chirping of boatswain's pipes as the men are 'piped down' to their hammocks on the crowded mess-decks. The band no longer plays. The music ceased some time ago in a faintly-heard National Anthem.

Five bells. Soon, round the flagship's brilliantly illuminated accommodation-ladder, there appears a little cluster of lights, red and green and gold, as the boats come and go. The dinner-party is over. The admiral's guests are leaving. And before long the lights in the scuttles start gradually to fade away. The outlines of the ships become more clearly visible against their background of deep indigo. Steamboats no longer pass to and fro. Everything is still. A floating town of nearly fifteen thousand inhabitants—

admirals and able seamen, callow striplings and veterans of the war, officers and men of every different trade and calling, is temporarily at rest.

But the navy never really sleeps. Watch is being kept, and occasionally a ship flickers into life as her winking lamp spells out a message. There are men awake on deck, on the bridges, in wireless offices, boiler-rooms and engine-rooms—men whose duty it is to watch while their ship-mates slumber. The tang of burning oil-fuel in the air and a smudge of black smoke obscuring the stars show that ships are raising steam for the work of the morrow.

Eight bells—midnight. The watchers are relieved, and go yawning to their cabins and hammocks.

The dawn comes slowly out of the east in a glow of misty pink and citron. The calm water of the bay reflects the pale colouring like a sheet

of burnished steel. It is early; but already the air is full of the clanking murmur of cables slowly coming home.

There comes a flutter of flags and a winking light from a destroyer leader, and the flotillas, the first to move, turn fussily on their heels and steam rapidly seaward. They are followed by a squadron of shapely light cruisers—the cavalry of the sea—then by the battleships, their huge hulls sliding through the water with hardly a ripple, and the musical cry of the leadsmen in their chains echoing across the water.

‘And a ha-a-a-alf ten!’

Within an hour, before the majority of folk ashore are out of bed, the anchorage is deserted save by a solitary destroyer depot-shop. A little later, and the fleet is nearly out of sight—nothing but a blur of masts and funnels overtopping the clear horizon under the risen sun.

JOHN MACNAB: A COMEDY FOR POACHERS.

CHAPTER XIII.—HARIPOL—AUXILIARY TROOPS.

HALF-WAY down the avenue Archie drew up sharp. ‘I forgot about Mackenzie. We can’t have him here—he’ll play the fool somehow.—Benjie, out you get. You’re one of the few that can manage him. Here’s his lead—you tie him up somewhere and watch for us, and we’ll pick you up outside the gates when we start home. Don’t get into trouble on your own account. I advise you to cut round to the bothies and try to find out what is happenin’.’

On the massive doorstep of Haripol stood Lady Claybody, parasol in one hand and the now useless dog-whip in the other. She made a motion as if to retreat, but thought better of it. Her face was flushed, and her air had abated something of its serenity. The sight of Janet—for she looked at Archie without recognition—seemed to awake her to the duties of hospitality, and she advanced with outstretched hand. Then a yelp from the side of Palliser-Yeates wrung from her an answering cry. In a trice Wee Roguie was in her arms.

‘Yes,’ Janet explained sweetly, ‘it’s Roguie, quite safe and well. There’s a boy who sells fish at Strathlarrig—Benjie they call him—he found him in the woods and brought him to me. I hope you haven’t been worried.’

But Lady Claybody was not listening. She had set the dog on his feet and was wagging her forefinger at him, a procedure which seemed to rouse all the latent epilepsy of his nature. ‘Oh, you naughty, naughty Roguie! Cruel, cruel doggie! You loved freedom better than your happy home. Master and mistress have been so anxious about Wee Roguie.’

It was an invocation which lasted for two and a half minutes, till the invoker realised

the presence of the men. She graciously shook hands with Sir Archie.

‘I drove Miss Janet over,’ said the young man, nervously explaining the obvious. ‘And I took the liberty of bringin’ a friend who is staying with me—Mr Palliser-Yeates. I thought Lord Claybody might like to meet him, for I expect he knows all about him.’

The lady beamed on both. ‘This is a very great pleasure, Mr Palliser-Yeates, and I’m sure Claybody will be delighted. He ought to be in for tea very soon.’ As it chanced, Lady Claybody had an excellent memory and a receptive ear for talk, and she was aware that in her husband’s conversation the name of Palliser-Yeates occurred often, and always in dignified connections.

She led the way through the hall to a vast new drawing-room, which commanded a wide stretch of lawns and flower-beds as far as the woods which muffled the mouth of the Reascuill glen. When the party were seated, and butler and footman had brought the materials for tea, Lady Claybody—Roguie on a cushion by her side—became confidential.

‘We’ve had such a wearing day, my dear,’ she turned to Janet. ‘First, the ruffian who calls himself John Macnab is probably trying to poach the forest. The rain yesterday kept him off, but we have good reason to believe that he will come to-day. Poor John-son has been on the hill since breakfast. Then there was the anxiety about Roguie. I’ve had our people searching the woods and shrubberies, for the little darling might have been caught in a trap. . . . Macnicol says there are no traps, but you never can tell. . . . And then, on the

top of it all, we've been besieged since quite early in the morning by insolent journalists. No. They hadn't the good manners to come to the house—I should have sent them packing—but they have been all over the grounds, and button-holing our servants. They want to hear about John Macnab, but we can't tell them anything, for as yet we know nothing ourselves. I gave orders that they should be turned out of the place—no violence, of course, for it doesn't do to offend the Press, but quite firmly, for they were trespassing. Would you believe it, my dear, they wouldn't go! So our people had simply to drive them out, and it has taken nearly all day, and they may be coming back any moment!—Something should really be done, Mr Palliser-Yeates, to restrain the license of the modern Press, with its horrid, vulgar sensationalism and its invasion of all the sanctities of private life.'

Palliser-Yeates cordially agreed. The lady had not looked to Archie for assent, and her manner towards him was a trifle cold. Perhaps it was the memory of her visit, a fortnight before, when he was sickening for smallpox; perhaps it was her husband's emphatic condemnation of his Muirtown speech.

At this point Lord Claybody entered, magnificent in a kilt of fawn-coloured tweed and a ferocious sporran made of the mask of a dog otter. The garments, which were aggressively new, did not become his short, square figure.

'I don't think you have met my husband, Miss Raden,' said his wife. Then to Claybody, 'You know Sir Archibald Roylance. And this is Mr Palliser-Yeates, who has been so kind as to come over to see us.'

Palliser-Yeates was greeted with enthusiasm. 'I heard you were in the North. Delighted to meet you, sir. Funny that we've had so much to do with each other indirectly and have never met. . . . You've been having a long walk? Well, I know what you need. Cold tea for you. We'll leave the ladies to their gossip and have a whisky-and-soda in the library. I've just had a letter from Dickinson on which I'd like your views. Busy folk like you and me can never make a clean cut of their holiday. There's always something clawing us back to the mill.'

The two men were led off to the library, and Janet was left to entertain her hostess. That lady was in an expansive mood, which may have been due to the restoration of Roguie, but also owed something to the visit of Palliser-Yeates. 'My heart is buried here,' she told the girl. 'Every day I love Haripol more—its beauty and its poetry and its—its wonderful traditions. My dream is to make it a centre for all the nicest people to come and rest. Everybody comes to the Highlands now, and we have so much to offer them here. . . . Claybody, I may as well admit, is apt to be restless when we are alone. He is not enough of a sportsman to

be happy shooting and fishing all day and every day. He has a wonderful mind, my dear, and he wants a chance of exercising it. He needs to be stimulated. Look how his eye brightened when he saw Mr Palliser-Yeates. . . . And then there are the girls. . . . I'm sure you see what I mean.'

Janet saw, and set herself to cherish the innocent ambition of her hostess. In view of what might befall at any moment it was most needful to have the Claybodys in a good humour. Then Lady Claybody, one of whose virtues was a love of fresh air, proposed that they should walk in the gardens. Janet would have preferred to remain in the house, had she been able to think of any kind of excuse, for the out-of-doors at the moment was filled with the most explosive material—Benjie, Mackenzie, an assortment of fugitive journalists, and Leithen and Lamancha somewhere in the hinterland. But she assented with a good grace, and, accompanied by Roguie, who, after a morning of liberty, had cast the part of lap-dog contemptuously behind him, they sauntered into the trim parterres.

The head gardener at Haripol was a man of the old school. He loved fantastically-shaped beds and geometrical patterns, and geraniums and lobelias and calceolarias were still dear to his antiquated soul. On the lawns he had been given his head, but Lady Claybody, who had accepted new fashions in horticulture as in other things, had constructed a pleasure of her own, which with crazy-paving and sundials and broad borders was a very fair imitation of an old-English garden. She had a lily pond, and a rosery, and many pergolas, and what promised in twenty years to be a fine yew walk. The primitive walled garden, planted in the Scots fashion a long way from the house, was now relegated to fruit and vegetables.

Lady Claybody was an inaccurate enthusiast. She poured into Janet's ears a flood of botanical information and mispronounced Latin names. Each innovation was modelled on what she had seen or heard of in some famous country-house. The girl approved, for in that glen the environment of hill and wood was so masterful that the artifices of man were instantly absorbed. The gardens exhausted, they wandered through the rhododendron thickets, which in early summer were towers of flame, crossed the turbid Reascuill by a rustic bridge, and found themselves in a walk which skirted the stream through a pleasant wilderness. Here an expert from Kew had been turned loose, and had made a wonderful wild garden, in which patches of red-hot poker and godetia and *Hyacinthus candicans* shone against the darker carpet of the heather. Roguie led the way, and where Roguie's yelps beckoned his mistress followed. Soon the two were nearly a mile from the house, approaching the portals of the Reascuill glen.

(Continued on page 428.)

NATIVE LABOUR IN THE MALAY STATES.

I.

THE prosperity of the Malay States, for, in spite of the present depression of the rubber industry and fluctuation of tin, this country is one of the most prosperous in the world, is founded upon the enterprise and energy of two races, the British and the Chinese. The Malay, though a wholly charming individual, is a negligible quantity in the worlds of industry and finance. Two other races play a great part in the commerce of these States, the Tamil, or Southern Indian, whose importance in the field of labour is daily increasing, and the Javanese. The latter is gradually disappearing from the more progressive estates. It is upon these three races, Chinese, Tamil, and Javanese, that the European relies to get his work done.

Sir Frank Swettenham once said very truly, that if a statue were to be erected to the pioneer of industry in Malaya, it ought to represent John Chinaman, with his big straw hat and long-handled hoe or *chungkol*. He is undoubtedly a very remarkable figure, and one to be found in every street, village, field, estate, or mine, in some capacity or other. In nine cases out of ten, he makes your clothes and washes them, makes your boots and brushes them, sells you your food, cooks and serves it to you, provides your vegetables and fruit, makes the bungalow you live in, and repairs the car you drive. He penetrates everywhere. You will find Chinese on the Federal and Municipal Councils, in the Chambers of Commerce, and in subordinate Government positions. In every business house of any importance, in every bank, wherever positions of trust are to be filled, the Chinese is usually preferred to any other Asiatic. He is a strange anomaly, both progressive and conservative, devoid of ambition, yet *intensely ambitious*: infinitely cunning, yet square and honest in business.

An outstanding example of the achievement of a Chinese coolie was the case of the late Mr Loke Yew, who died recently at Kuala Lumpur. He started in the Straits as a ricksha puller, earning a dollar or two a day. He had no education, as we understand it, yet Towkay Loke Yew left to his trustees a fortune of some nine million sterling, in land, tin, house property, and rubber. Twice during his career he was broken and bankrupt, yet every cent of his debts was paid in full on each occasion. The industry, ability, and business insight necessary to compile such a fortune, the courage needed to go on in spite of failure, call for the most profound admiration.

The Chinese to most Europeans is a mystery. Language is the great bar to a completer

understanding. He speaks the most difficult language in the world, one in which the dialects vary so much that a Hokkien Chinese cannot understand a Cantonese, or a Cantonese a Hylam.

It is a curious fact that the European who can speak Chinese well is four times out of five usually a little 'queer' in the head. So it comes about that the language of intercourse between Chinese and European is invariably Bazaar Malay. This is an easy language to learn and speak, one that covers the ordinary needs of every day, but not adequate to the more interesting matters of philosophy, customs, and religion.

So, to the vast majority of British in the East, John is a smiling, pleasant enigma. His common-sense and money-sense are his two most outstanding characteristics, the next his industry. He is a creature of surprises. The manager of a large rubber plantation once contracted with a Chinese to eradicate some four hundred acres ofalang grass on his estate. It was a big contract and ran to about \$14,000 in all. Not till the contract had been satisfactorily carried out did he discover that the contractor was merely the sub-agent of a principal, who turned out to be his own house-boy, a domestic servant to whom he paid some \$30 a month.

The Chinese has no administrative ambition. He is content to allow anyone to run the country so long as he can go on accumulating wealth undisturbed, and, though he arrived in Malaya centuries before the British, is happy and contented under their rule. Lower class Chinese provide the bulk of the labour for mining purposes, and about one-half of the labour on rubber estates. They are worked chiefly on the N.C.O. system. A European has no dealing with the coolie direct; his orders are given to the mandor, or overseer, who is usually also a contractor. Contract labour suits the Chinese best, and nearly all their employers adopt this system—which eliminates any personal contact with the individual coolie.

In certain respects the Chinese seem to us extraordinarily callous. They have little regard for human life—except their own. A crowd of Chinese, though some of them were excellent swimmers, have been known to stand on the bank of a river and allow two of their number to drown without making any attempt to rescue the unfortunates. Indeed, their struggles seemed to cause more amusement than anything else. A domestic servant, when washing clothes in the morning, fell into a hole and was drowned. The first intimation given to his master came from the cook at dinner-time. Thus: 'Sir! the water-carrier has fallen into the river—shall I go and get another?—he's dead!'

The honesty of the merchant does not extend to the servant class. They will cheerfully rob and swindle as best they may. If discovered, they accept punishment with perfect equanimity, and think all the more of the person who finds them out. There is no moral sense perceptible among this class—each for himself. Watch your own interests.

Two other sides of the Chinese character deserve attention, the passion for gambling, and the craving for opium. The former is universal. Chinese of every class are ready to gamble within their means. They begin at a very early age, and will bet on anything, but preferably on their own games, *mein po*, *fan-tan*, and others. The craving for opium forms a favourite gambit of some of our sensational novelists. It is exaggerated out of all proportion to reality. Opium smoked in moderation seems to be as harmless as tobacco. Generally speaking, the smoker is a more reliable workman than the non-smoker. Of course, extreme cases are to be found—but they are the exception, not the rule. John wants his opium, and usually gets it legally and easily. There is no more romance or mystery about a Chandu shop than there is about the public-house where the British workman buys his glass of beer.

II.

The Tamil is a widely different individual, but, like the Chinese, has made himself indispensable to the European in Malaya. The higher caste, Jaffna Tamils, are largely found in Government offices, as doctors, dressers, clerks, and minor railway officials. Their commercial activities are very small, and usually confined to the Tulakan, or Mohammedan Tamil, who is often a shopkeeper in a small way. This class of Tamil invariably speaks English of a sort, and copies English manners, wears European clothes, and apes the European. It is a responsible and, to a certain extent, reliable class—but, on the whole, vain and childish.

Its love for things European leads it into strange errors of speech and correspondence. There is a classic story of the meeting of two Tamil clerks, one of whom had just returned from a holiday in India. 'Well, well, Mr Cumarasamy, how well you are looking! Your holiday has made you the new man, you are looking so rosy!' Or, again, the following letter to the manager of an estate from his dresser:

'GRACIOUS SIR,—I beg your permission to forthwith chase my absent wife, who has this four months been monkey tricking up her sleeve with your second clerk. Both have absconded.

Your obedient Servant,

R. PILLAI.

P.S.—I am most hellish fed up.'

As a whole they are plodders, lacking initiative, and absolutely devoid of the larger vision of the

Chinese, but content with their lot and faithful according to their lights. But the great bulk of this race are employed on rubber estates as labourers, where, at a daily wage of forty cents for men and thirty for women, they can live well and save money for their families in India. The tie of family is, to them, a very strong one, and their relationships are known and worked out to the most distant cousins possible, even further than those of an ardent Scottish genealogist! They are a simple folk, and, as long as they are treated as such, will produce excellent results. But to obtain these results, exactly the same close personal supervision is required as a master gives his form at a public school. A mixture of chaff and severity is the best recipe. Like the school-boy, the Tamil watches his master closely, and immediately takes advantage of any signs of weakness.

With Tamil labour it is not enough to issue orders to overseers, as it is with Chinese. It is always necessary to see to it in person that orders are carried out. This, naturally, entails learning their language—which is not an easy one. Patience, however, brings its own reward. Once the confidence of a Tamil labour force has been definitely won, it remains with its possessor to an almost embarrassing extent. Advice on every sort of subject is sought. Every kind of dispute is brought to the European for settlement, and a curious, semi-affectionate relationship is established. The low caste Tamil is not truthful, but is devoid of the Chinaman's cunning; and although he will lie, blatantly and valiantly, he invariably contradicts himself and gives the show away. He has none of the Chinese love of personal cleanliness—he smears his black skin with evil smelling coco-nut oil instead of using soap and water. Physically he is much inferior—yet he is a more human and lovable creature by far.

By religion he is a Hindu, very superstitious, and believing in every kind of devil and demon. He will never stir outside after dark without lights, and much shouting and singing to keep the devils away. It is no uncommon thing for a Tamil coolie to refuse to work in a certain field, because it is inhabited by a devil who beats him—the true reason being that a branch of a tree has, at some time or other, fallen on his head. Drink is his principal vice, but even that he indulges in but twice a year. Given understanding and encouragement, a Tamil is an excellent workman—but for those who take neither time nor trouble over him (and there are too many such Europeans in the East) he will do nothing.

The Javanese are the least satisfactory form of labour. They are akin to the Malay, and individually a most pleasant race, spotlessly clean in person, and of engaging manners. But

they have a passion for getting into debt—and have queer migratory fits. They do not care to settle too long in any given place, which makes them unsatisfactory from the employer's point of view.

In Java, where the Labour Laws of the Dutch are such that the employer can count on every assistance from Government, they provide practically all the labour on coffee, tobacco, and rubber estates, and give excellent results. This makes it probable that the best type of Javanese remains in his own country and does not emigrate. Consequently the Javanese is dis-

appearing from the Malay Peninsula. At one time, before the State-aided recruiting of Tamil labour from Madras was inaugurated, he had things much his own way; but the lower scale of wages demanded by the Tamil, combined with the reasons stated above, have restricted his sphere of employment, and he is no longer the important factor that he was some years ago. Rubber estate managers are looking more to Madras and less to China and Java than of old, but the Chinese grip on the tin industry is alone sufficient to assure his position in the future of Malaya.

REVERSION TO TYPE.

PART II.

III.

EXACTLY a year has passed since the incident in Lady Bunty's boudoir in London. The scene has changed. The three who took part in it are far removed from London. 'Sandy' and 'Polly' are back in their own country, and the fates have willed that Lady Bunty should all unwittingly have followed them, her father having been posted as British Minister to Peking.

It is once again a hot summer evening in July, and to travel in July in North China is something to avoid if possible. In spite of the intense heat, however, a small party of Europeans, guarded by Chinese soldiers, has just arrived outside the massive walls of Hai-hsi-tou, the centuries-old capital of the province.

For some months there had been serious disturbances in China. These had culminated in an attack by brigands upon English and American travellers, ladies as well as men having been carried off up into the mountains. So serious was this outrage considered that a special mission, headed by the British Minister in person, had gone to investigate. As the journey included a visit to the provincial capital, situated in a very wild and unfrequented portion of the province, and as, moreover, it promised excitement, Lady Bunty—unofficially, of course—decided to accompany her father.

For five days the little party had braved the broiling heat, travelling partly by canal and boat, partly on horse-back. No railroad had as yet touched Hai-hsi-tou. Riding wearily through the sparsely-inhabited uplands, still more depopulated by the depredations of the many brigand bands, the members of the Mission looked eagerly forward to reaching their destination that evening. Even though the rays of the sun slowly lost their intensity and the evening breeze began to sweep the hills, it was with intense relief that the party saw in the valley below the crenellated walls of the hoary

old capital, ancient when London first became the abode of men.

Picking their way down the stony hillside, the guard of the Mission began to pull themselves together for an imposing entry—Chinese fashion—under the huge stone archways which, blocked by iron-studded wooden gates, gave access to the city. Upon the ramparts were loopholed, brightly-painted wooden towers of considerable strength, which added to the picturesque effect.

As the leading soldiers of the guard rode up to the huge stone gateway they were met by grave and sedate-looking individuals garbed in the usual long Chinese robes. One of these venerable-looking underlings accepted from the hands of the captain of the guard a two-feet long red official envelope. Custom in China ordains that this envelope with enclosures shall be borne as a means of introduction by any mission, or in front of any single individual of importance. These picturesque aids to identification and self-glory contain the style and titles of all important personages. The less-important the personage, be it said, the larger, more often than not, the red envelope. Gravely waving the escort inside the archway, the venerable officials mounted their mules, then turned to show the way through narrow, picturesque, stone-flagged streets. A short ride past lines of open shops offering wares of all kinds brought the Mission to the precincts of the impressive-looking Yamen. Here the crowds were even more tightly packed, for though, as a rule, in Chinese cities no notice is taken of Europeans, at Hai-hsi-tou this was the first occasion upon which many of the inhabitants had seen a white face.

Though pressing close upon the Mission, and eaten up with curiosity as the Chinese lower orders always are, the crowds were orderly, due, as the captain of the guard was careful to inform the Minister, to the wonderful reputation of the new Governor as a strong man and fearless enforcer of law and order. Rumours had already reached the Mission of the doings of this com-

paratively young official. Of the wonderful 'clean up' he had already made. Also, and not quite so enthusiastically from the mouths of the gossips, of his drastic methods of suppressing disorder; for the profession of bandit in China had until lately retained all the halo surrounding modern Robin Hoods. The Governor had failed as yet, so rumour ran, to effect the capture of the chief bandit, to whose daring and resourcefulness had been due the capture of the Europeans and the subsequent payment of a heavy ransom.

Dismounting in the inner court of the Yamen, the official residence and office combined of the Senior Magistrate, the members of the Mission were ushered with all due ceremony through various picturesque court-yards, stone-flagged, into an inner holy of holies. In passing through circular stone or marble archways from court to court, Lady Buntly had time to take in and admire the vast extent and romantic aspects of the ancient Yamen. Each of the inner courts had its garden among the flags, and some their fountains containing gold and silver fish. As the party passed, more retainers stood lining the verandahs of the courts—soldiers in modern equipment saluting, long-robed clerks and minor officials gravely bowing.

While the members of the party waited in the reception room the Secretary of the Governor did the honours. Tea was served in European fashion, the ante-room itself being furnished entirely in European style. The Minister was solemnly informed that the Governor was 'hastening to meet him'; also that he 'regretted not at once being able to prostrate himself.'

Tired and travel-stained, the members of the party sat waiting. Lady Buntly had selected a quiet corner. Suddenly, by some unseen hand, a heavy yellow curtain was drawn aside at one end of the reception room. Through the arched doorway stepped the slight, upright figure of a man dressed in well-fitting khaki uniform. Instead of the familiar red staff tabs, Lady Buntly noticed he wore tabs of the old Imperial Chinese Yellow. The low talk of the company instinctively ceased as the young Governor—for it was this much-belauded official himself—walked straight up to the Minister with outstretched hand.

'Good-day, Excellency,' he said in perfect English. 'I am highly honoured by your visit. May this auspicious event settle all differences between our respective nations. Am I to have the honour of being presented to your suite?' Said by an European, these high-flown compliments might have sounded overdone. Spoken by a Chinese official, in perfect English, they seemed quite natural. From the corner where she had ensconced herself unseen, Lady Buntly had watched the entry of the Governor. It required the self-control and training of a lifetime to pull herself together for the meeting she

knew must be faced. Her first thought had been one of sheer wonder. Could this be 'Sandy' Ling? Yet there was no mistaking the figure, the pose, that voice. Lady Buntly's thoughts flew back to the scene in her boudoir in London. She remembered the animal-like face with its ruthless, cruel expression. But the girl knew she must face the music. As her father turned to present her she wondered if he, too, recalled the former Secretary of Legation; then she set her teeth. To give him his due, it was 'Sandy' who first recovered himself. With a bow, and the hard smile Lady Buntly had seen before, he held out his hand.

'A most unexpected pleasure, Lady Buntly,' he said, as if there had been no such scene just a year ago. 'Who would have thought that we should meet again in China?' Lady Buntly bent her head in acknowledgment, but did not speak, and the presentation was got through in due form.

When tea was over the Governor remained a few minutes in conversation with the Minister. He seemed perfectly at ease as he told in barest outline of the state of the countryside. 'But,' Lady Buntly heard him say, 'you will be very pleased to hear that the chief offender has at last been caught; in fact he was brought into the city this morning. He is a well-known brigand and a brave one. He fought hard before being taken. But your Excellency has had a hard day, and the Mission will doubtless be glad to rest. To-morrow we meet officially in the Great Hall of Audience, and I shall have much pleasure in showing you the offender who planned and carried out the latest outrage on your compatriots.'

IV.

Tired as she was, Lady Buntly's sleep that night was not her usual dreamless repose. Vague shadowy figures floated before her closed eyes—evil-looking men with human bodies and the heads of tigers, fierce, weird figures who seemed to be chasing her through dim forests. At other times disembodied lifeless spirits appeared, which she found herself endeavouring to avoid while she danced on the arm of a pale-faced, corpse-like figure. Suddenly she woke with a start, cold and chilled in spite of the heat of the night. As the girl lay listening she fancied she heard the smothered sounds of human voices. Cries as though men were being tortured. Appeals for mercy in tones she thought she recognised, but in a language she did not understand.

As the gray dawn of the July morning began to creep into the verandah of the inner courtyard on to which her room gave, Lady Buntly's thoughts swept her back to that parting scene in London. For the past year she had done her best to forget her own 'mid-summer madness.'

By ten o'clock the Mission had been ushered

with all due ceremony into the Great Hall of Audience. The Minister himself and his two Secretaries of Legation were conducted to seats on a slightly-raised dais. The rest of the party occupied a prominent position immediately in front of and almost touching the dais. The Great Hall was densely crowded with a very picturesque and orderly assemblage, carefully controlled by a strong detachment of smart-looking Chinese troops.

After a pause of a few minutes the heavy yellow curtains, suspended from massive beams brilliantly painted in dull gold, were slowly drawn apart. Preceded by a small guard of soldiers and several secretaries, the young Governor walked quietly and with dignity up to the central seat upon the dais. The soldiers lined up behind the Governor. Upon his left hand sat His Excellency the Minister, upon the Governor's right his deputy and two other officials of the old type in long silk robes. A low, heavily-carved, handsome blackwood table stood in front of the seats upon the dais.

Speaking in his own language, the Governor addressed the assembled audience at some length, his remarks being translated by an interpreter for the benefit of members of the Mission. After a reply by the Minister the Governor again spoke. For a moment as he began—almost by chance it seemed—he glanced towards Lady Bunty. Their eyes met.

'I will now,' the Governor continued, 'prove to all concerned the good faith of the Chinese Government, in that they have by strenuous undertaking already captured the instigator of the recent attack on the Europeans. He will be brought before this honourable Mission.'

Again, it seemed to Lady Bunty, the eyes of the Governor sought hers. There was a stir throughout the vast hall. Phlegmatic as the Chinese are, the appearance of such a notorious character as the bandit chief moved even their cold-blooded natures. The Governor bent towards the Minister, speaking in low tones. The huge assembly waited in dead silence.

From behind the yellow curtains an usher suddenly appeared, carrying a small square wooden box carefully sealed with large red seals. This he passed to one of the secretaries. Dropping upon one knee, the official handed the box to the Governor. Taking it, the latter stood erect, spoke a few words in Chinese, held up the box to the assembly, then placed it on a low table facing the vast hall.

Lady Bunty had been listening indolently to the harangue in Chinese, far more interested in the momentarily expected arrival in person of the brigand chief. As the box was brought in she wondered casually what it contained. As it was placed on the table she noticed the box had a glass front a foot square. As she bent forward idly to examine it, the girl was horror-struck to see the gory newly severed head of a man whose

glazed sightless eyes seemed to seek hers from a few feet away. A cruel, jagged sword-cut ran obliquely across the pale, bloodless face from one temple to the tip of the other ear. The congealed blood had run in dark streaks down each cheek.

For one dreadful moment the girl gazed at the awful spectacle facing her on the table, then, for the shock was too much for even Lady Bunty's courage, she fainted dead away.

It was 'Polly's' head—and 'Sandy's' revenge.

Both had reverted to type.

THE END.

CONNEMARA.

O FOR the sound of the great salt sea!
O for the smell of the sweet brown peat,
Fresh cut and stacked, or lying a-free,
Making a carpet for sunburnt feet—
For mine and others—asthore, machree,
Out where the green and the rainbow meet.

O for a sight of the speedwells blue,
And the quiet pools, and the tumblin' rills,
The foxglove openin' to catch the dew
In its little mouth that a raindrop fills;
And the trees your eyes go a-peepin' through,
And the cattle away on a thousand hills.

Bog-cotton bobbin' along the moor
And clusterin' white in feathery piles,
Flowers in the hedges to cheer God's poor,
And never a cottage for miles and miles;
The slant o' the sun the only lure
To the cottar's home, where the baby smiles.

There's a fuchsia hedge by a crumblin' wall,
And a beetlin' rock where the red fox cow'rs,
And colt's-foot ruddy, and hemlocks tall,
And spreads of wild convolvulus flowers;
God or the Fairies planted them all,
For never a seed or a spade was ours.

Lake and mountain, ye are my friends—
The shoeless foot has no tread for town.
I trudge the road where the river bends
And washes the stepping-stones so brown;
And finches flit where the hill descends,
And stop to peck at the thistle-down.

The homing instinct of all my kind
Strains at the heart that is worn and old,
And eyes with tears in them look behind,
When the door is shut and the kine are sold;
God, of Thy mercy temper the wind,
For the flock is shorn, and the fields are cold.

Heart o' my heart! I feel your ache,
I know your hunger, I hear your beat,
For strange is the road I soon must take,
And no one guidin' my stumblin' feet!
And never again my home I'll make,
Where the Irish green and the rainbow meet.
NANNIE POWER O'DONOGHUE.

THE MONTH: SCIENCE AND ARTS.

A LONG-TERM PARAFFIN LAMP.

THERE is no reason, except the charring of the wick, why a paraffin lamp should not burn for any length of time, provided that the oil container is big enough. If a fresh surface is continuously presented to the burner as the wick becomes charred, a lamp will burn so long as oil reaches the wick. Special lamps have been made with wicks in the form of endless bands which are rotated very slowly by clockwork, bringing a new portion into contact with the burner as the wick chars. These lamps, which were at one time used for unattended coast lights, will burn for long periods. A small domestic lamp for places where only a dim light is required has been brought out recently, in which fresh wick is passed under the burner in a different way. A wide, flat wick is contained within a tube which swings edgewise on pivots just inside a big top cover to the container. Stout wires fixed to this wick tube carry a cork float at one side. The upper end of the wick tube is curved so as to form part of a circle having as its centre the centre of the pivots. It is covered by an inverted curved trough, having a rectangular hole that exposes a small part of the wick. This trough is hinged at one end, and rests on the wick tube, but, being very light, it allows the tube to move freely as the cork float rises or falls. On the top of the trough is a clip ring for a small opal glass chimney. When the container, which holds a quart, is full, the cork float is at the top, and has swung the wick tube over so that burning begins at one side. As the oil is consumed the float falls, and gradually presents fresh wick to the hole in the trough until the other side of the wick is reached, which happens when the float rests on the bottom. If kept alight continuously, the lamp will burn for fourteen days. Used during the hours of darkness only, it will burn from one to two months according to the time of year. The lamp is made entirely of polished brass.

A CONCEALED-BED SETTEE.

In these days, when most of us have to make shift with less house-room than that to which we have been accustomed, any devices which will economise space are valuable. An interesting invention of this type is a settee which can be opened out into a bed for an extra guest. It presents the usual appearance, and no one unfamiliar with it would imagine there was a bed inside, with room for the storage of bed-clothes. To open out the bed, the back of the settee is raised, when a loop appears at the rear of the seat. A pull on this loop

opens out the bed, while the seat turns over and is supported by metal feet. The bed consists of a steel frame, hinged to double up under the seat, and provided with a spring mattress and a wool overlay. It measures 6 ft. in length by 4 ft. in width. These settee beds are made up in a variety of shapes and designs.

A COMBINED COAL AND GAS COOKER.

Few housewives have a good word to say for the old-fashioned kitchen, at any rate for use in small houses in which economy has to be closely studied. Under the liberal stoking of the average servant a coal-range consumes an extravagant amount of coal for the results achieved in hot water, cooked foods, and heat. Again, the coal fire is not wanted in the summer if gas is available for cooking; consequently two separate systems are often installed for heating and cooking respectively, coal being used in the one, and gas in the other. A combined hot-water boiler and gas cooker, which has obvious advantages, was to be seen at the recent Ideal Home Exhibition. The coal- or coke-burning hot-water boiler is a separate entity from the gas-cooker, although the two are placed side by side, and are so connected that the hot gases from the coal-fire can be passed round the oven of the gas-cooker and under a hot-plate at the top. Constructed in the form of a square pillar which stands in a tray, the stove burns as an open fire when a door in front (having the usual mica panel) is let down. If closed, slow combustion takes place, and the fire will keep in all night. A shaking-grate, worked by a handle, for shaking the ashes out into the ash-drawer, is provided, together with an adjustment for minutely regulating the draught, as is usual in slow-combustion stoves. A flue at the side leads the hot gases to the space round the oven of the gas-cooker. In this way the oven is heated to a temperature sufficient for many purposes; but if a greater degree of heat is necessary, the gas may be lighted for a few minutes until this is reached, when the gas may be turned off, and the heat *maintained* by the hot gases from the fire. The cooker is very similar to the ordinary type, except for the flue round the oven, which terminates in a pipe at the back for connection to the chimney. Another special feature is the hinging of the top, which carries the gas-rings and griller, so that it can be turned up out of the way, leaving clear the hot-plate heated by the hot-water boiler. At the back of the boiler are the 'flow' and 'return' water connections. Either anthracite, coke, or coalite may be burnt in the stove. According to one user, 'the stove keeps the house going in hot water for the kitchen, the lavatory, and the

baths, and does all the cooking, besides heating one or two rooms; it is in use day and night, and consumes from 2 cwt. of anthracite a week upwards.'

SOMETHING NEW IN IRONING-BOARDS.

An ironing-board that grips firmly with a plier-like action the edge of any table without screws, clamps, or other fastening is one of the latest domestic novelties. The board itself, which is 4 feet long, is made in two widths of 10 inches and 14 inches respectively. The top is well padded and covered with strong calico. A slot is cut in the end that grips the table. Through this slot projects the end of a leg, which is pivoted under the board and slopes down to the floor. The edge of the table is gripped between the end of the board and the top of the leg, which is notched to take it. The arrangement, as already suggested, is similar in principle to a pair of pliers, the board representing one handle, pressure on which tends to close the nipping ends on the table edge. To suit different heights of the table and thicknesses of top the leg is made quickly adjustable for length. Both board and leg are made of well-seasoned hard wood.

A HOME BUTTER-MAKER.

Novelty is not claimed for the general design of a home butter-maker which has been lately invented, but the rotating agitator is new in form and in principle. The complete machine consists of the usual glass jar with a rotary agitator mounted on a vertical shaft, which is worked by a handle through the medium of multiplying gear. The gear is of the friction type, in which a rubber pinion is driven by a metal disc. The gear, with the handle, is supported on a metal pillar, which is screwed to a wood base having a recess for the glass jar. Two steel plates, horizontally fixed at the end of a tubular spindle, form the agitator. These plates are made from square pieces with the corners turned over at a right angle, so that they become octagonal. Each corner has a round depression punched into it. If the two plates are placed facing each other, the corners of one can be sprung over the corners of the other, the depressions interlocking and holding the plates firmly the one to the other about half-an-inch apart. The upper plate is fixed permanently to the spindle, but the lower one may be pulled off for cleaning. On the spindle, just above the jar, are two air-scoops, through which air can pass into the spindle to escape between the plates. When the machine is worked the cream between the plates is thrown out by centrifugal force, and air passes down the spindle, the device working like a centrifugal fan, with the result that the cream is continually aerated as well as agitated. We timed a demonstra-

tion of this machine, when butter was formed in $1\frac{1}{2}$ minutes. Moreover, the cream was just out of cold store, a very unfavourable condition for butter-making. All the metal parts of the machine are first copper-plated and then thickly coated with nickel.

A MEASURING TEA-CADDY.

The advantages of a tea-caddy that measures the tea in spoonfuls are obvious. A very simple canister which does this is now obtainable. Outwardly it is a cylinder with a cone-shaped lid having the apex cut off to leave a hole. Inside, with a space between the two, is a similar cylinder, but inverted, so that its cone-shaped end is close to the bottom of the outer cylinder. The top of this inner cylinder is fitted with a flat lid, which is exposed when the cone-shaped lid of the outer cylinder is removed. The inner cylinder can then be filled with tea, of which it holds comfortably a quarter of a pound. A spoonful of the tea runs through the hole in the cone-shaped bottom of the inner cylinder, and rests on the bottom of the outer cylinder. When the canister is turned over the spoonful passes down between the two cylinders, and pours out at the cone-shaped end. By turning the caddy upright, and then reversing it once more, another measured spoonful is poured out, and so on. These measuring caddies are well finished in English gold lacquer with black lettering.

A NON-SPILLING ACCUMULATOR.

In these days, when batteries are used in so many homes for the listening-in set, an accumulator that, even if it is knocked over, cannot spill acid on the tablecloth or other article of furniture, has undeniable advantages. Non-spilling accumulators have been with us for years, but this immunity from damage when they are upset has hitherto been obtained by considerably increasing the height of the case. Devices have been invented lately which prevent the escape of the electrolyte without any alteration to the dimensions. These consist of two narrow compartments fitted with baffles, the one under, the other above, the top of the case. That below extends from end to end of the cell. It is about $\frac{1}{2}$ inch wide by $\frac{5}{8}$ inch deep. A slot at one end communicates with the inside of the case, from which the bottom of the compartment slants upwards to the other end, where another slot communicates with a chamber above, also with a slanting floor. A hole in the middle of the top of the upper chamber leads into the compartment on the top of the case. This is placed at right angles to the lower compartment, and extends to the full width. It is fitted with two slanting baffles on similar principles to those in the lower compartment, the final vent-hole being in the middle

of the top of the upper chamber and very small. The result of these baffles is that the accumulator may be knocked over in any direction with impunity so far as any risk of spilling is concerned. As a matter of fact, the case can be turned upside down without spilling any of the acid, unless the case is shaken or squeezed. In this connection it is interesting to note that a special type for aeroplanes is made in which the vent is automatically closed by a tiny valve when the machine loops the loop. Another very useful result accruing from these baffles is an entire absence of creeping of the acid when the accumulator is being charged at the maximum rate. Under these conditions the acid in the ordinary accumulator creeps out of the vent and extends over the top of the case, the result being corrosion of the terminals. The small vent with the baffle path to the inside of the case also checks evaporation to such an extent that it is almost non-existent, and making up with distilled water is not needed. These accumulators, the invention of Mr Rowland Edwards, are especially suitable for motor cycles, as well as for aeroplanes and listening-in sets. They have been favourably reported on by the Faraday House testing laboratories and by Mr John Henderson, D.Sc., F.R.S.E., M.I.M.E.

A BRITISH-MADE WICKLESS OIL-STOVE.

Users of wickless oil-stoves have been accustomed to foreign makes for so long that they have ceased to wonder at the absence of British competition in this field. As a matter of fact, British wickless stoves have been on the market for many years, but they are not so well known as their merits warrant. As with many other goods, the wickless stoves produced at home are of more substantial construction than their foreign rivals, and one of them, at least, which has recently been brought to our notice, also possesses several important features that are not to be found in the cheaper imported types. It is of what is known as the 'silent' pattern, only a very slight buzzing sound being audible when it is burning. The container, which is of thick brass, and is capable of withstanding high pressures, holds much more oil than that of other wickless stoves, being about twice the usual depth. This feature allows of mounting the air-pump, which is housed in the container, at a steep inclination, so that pushing down the plunger does not tend to move the stove. Another good point is that the complete pump is removable along with the valve. In addition to the pump, the container is fitted with an air release-valve and a simple indicator which shows when the normal working pressure has been reached. Instead of being soldered to the sides of the container, the three legs that support the top plate are removable, being merely pushed into sockets in a casting

under the burner. The vaporiser is a straight tube of steel with a cup brazed to it about two-thirds of the way up. At the top of the vaporiser is the usual fine jet. In the ordinary burner this jet is a constant source of trouble, particles of carbon, which are deposited in all paraffin vaporisers, becoming detached, and blocking it up. Hitherto such stoppages have been overcome by pushing a very fine wire, known as a pricker, down the jet from the outside. Naturally this process forces the carbon particle back into the vaporiser, where it is liable to give further trouble. In the stove we are describing there is a needle valve inside the jet and vaporiser which also serves the purpose of a 'pricker'; but instead of forcing the carbon back into the jet it pushes it upwards and outwards. This combined valve and pricker is supplied with the vaporiser. It is pushed up by turning a knob at one side of the spigot into which the vaporiser is screwed, a cam on the knob spindle, surmounted by a tiny ball, performing the actual operation. After about four hundred hours of use the vaporiser becomes choked with carbon and must be renewed. But the cost is small, and the renewal can be effected with the fingers, no spanner being required. Outside the vaporiser is a perforated iron casting surrounded by a steel shield, and surmounted by a perforated brass cap. The vapour from the jet impinges on the underside of the cap, which is blank, to be deflected through the holes round the side, outside of which it forms an intensely hot blue flame. A small portion of the vapour is projected downwards through holes in the iron casting and on to the upper part of the vaporiser above the cup. The cup serves to concentrate the flame on the tube, and to support the iron casting and shield. The only part liable to oxidation is the cap, but this is loose, and can be renewed at a trifling cost, as opposed to the perforated part, solid with the complete burner, in the foreign stoves. A draught shield is provided for outdoor use.

A CHAIR MUSIC-STOOL.

As a seat a music-stool affords little comfort. When not in use, therefore, it is merely an encumbrance. A new form of music-stool, which is almost instantaneously convertible into a chair or an occasional table, has, however, recently made its advent. This device consists of a somewhat low chair, of which the four legs are extended upwards well above the seat. Between these extensions at each side are four horizontal bars. The seat, which is upholstered, rests upon a box having a considerable capacity for pieces of music; the chair is completed by an upholstered back. When required for a music-stool, the seat is slid out from its position over the music-box, and slid back between any two bars at the sides according to the height required. To convert the contrivance into a

table, the seat is turned over and slid into place on the top bars, the bottom of the seat, which is polished, forming the table top. These music-stool chairs, of British manufacture and handsome in finish, are made of several different woods, are upholstered in various materials, and present considerable variety of design in the turning of the legs.

WATER CLEANING BRUSHES.

That the cleaning of a muddy car is a dirty job no one will deny who has tried it. Moreover, with the usual sponge and bucket of water, it is exceedingly difficult to perform the operation without scratching the glossy surface. A brush with a water jet in the middle of it bids fair to revolutionise the cleaning of road vehicles. One form of this device consists of a ring of ten sets of bristles, mounted in a hollow aluminium casting to which water is supplied by a hose. The water issues from a ring of holes inside the various sets of bristles. A tubular handle with a black wooden grip has, at the top, a hollow spigot for the hose. This handle is connected with an extension that projects from the casting at an angle rather bigger than a right angle. The extension has two passages in it—one to the brushes, the other to a plain jet that may be used independently. By turning the extension on the handle, the water may be directed to either. A thick rubber ring round the edge of the casting prevents it from scratching the paint work that is being cleaned. When one of these brushes is being used to clean a car the mud is first soaked by playing water on it through the plain jet, after which the extension is turned on the handle to direct the water to the brushes, when the mud and the dust can be removed quickly without risk of scratching the varnish. A small water brush for spokes is also made. The saving in time effected by the use of these brushes compared with that taken by the older method is very marked.

A WATER-COOLED LARDER.

It is common knowledge that the evaporation of liquids in air has a cooling effect. This effect is intensified by exposing a thin film of liquid over a big surface and by setting the air in motion. Ether will fall far below the freezing point of water if air is blown upon it. Even water assumes quite a low temperature if a thin film is exposed to a current of air. This fact is taken advantage of in a larder which is cooled by drawing air through wet cloths, which serve to filter out dust and germs. The top and the bottom, the back and the shelves, of the larder are of slate, which is hygienic and easily cleaned. Teak is used for the sides and for the folding doors that form the front. A large panel in each side is covered with

gauze. Overlapping the gauze on the outside is a strip of absorbent cloth which is wound on a roller at the top. The end of this cloth is pulled down over the gauze and passed round a roller in a trough of water. A cord attached to it goes over a pulley above the top roller to the inside of the larder, where it passes round another pulley and is fastened to the door. Every time the door is opened, therefore, the cloth is pulled through the trough of water and well soaked, to pass back over the gauze as the door is closed. Over the top of the larder is a tiny electric motor coupled to a centrifugal air exhauster which draws air through the larder, the air entering through the wet cloths. Not only is the larder cooled by these means, but the air discharged from it cools the room in which it is placed—a great advantage in hot weather. The amount of electric current used is exceedingly small. Even if the motor be kept running day and night for a week the cost from power mains at 2d. a unit should not exceed 9d. If desired, the sides can be made of slate instead of teak, and plate glass panels can be fitted to the doors.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (a) a reply post-card, or (b) a stamped and addressed envelope or post-card, be sent to the Editor, *Chambers's Journal*, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

THE ENDING OF THE STORY.

THERE, where the trumpet sounds no longer,
And the voice of war is still,
Springs there a blade of wheat the stronger
For all the blood upon that hill?
There lay a battle-field before ye,
Swept by the cannon's stabbing flame;
Springtime has covered all the glory,
Springtime has covered all the shame.

So, when the mists of darkness blind us,
And our race in life is run,
Little we do remains behind us,
Few were the battles that we won.
This is the ending of the story,
Deep in the earth from which we came;
Springtime shall cover all the glory,
Springtime shall cover all the shame.

A. C. SAWERS.

* * * TO CONTRIBUTORS.

All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

For its return in case of ineligibility, a stamped and directed envelope (or postage-stamps) should accompany every manuscript.

To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

SEVENTH SERIES

THE LIVING BRANCH.

By ALAN SULLIVAN, Author of *Man's Work*, &c.

CHAPTER I.

I.

IT had been a successful house-party. Week-end gatherings at the Jennisons always were successful, being composed of an assorted and hand-picked lot, drawn carefully from that larger circle in which Jennison and his wife were admittedly conspicuous figures. The latter never made mistakes, and when, finally, she sent off her notes, she knew to a hair what each guest would contribute. The net effect would be a cheerful *mélange* in which age, sex, temperament, pursuit, predilection, and sport were comfortably balanced. The result was that one felt safe beneath her hospitable roof.

The present occasion was Connie Seymour's second week-end at Marchmont, and, lying slack in a big chair in front of her bedroom fire, she knew that it was probably her last. The past two days had savoured of the dramatic. She smiled rather ruefully at this thought, and drawing up her knees, clasped her hands round them, and stared musingly into the ruddy grate. She was tall, with a long, lank, graceful body and slim round neck. Her bones were large, but she avoided angularity by the sheer freedom and balance of every movement. Men invariably found her attractive, even the worst of them. It may have been the beauty of her face, with reddish-brown eyes that were far apart, and bronze hair that glinted yellow in the light; or perhaps it was something deep, rich, and inexhaustible that she unconsciously expressed, something to feed on and draw on, in which body and spirit were unmistakably blended. At any rate the effect was nearly always the same where men were concerned.

At the moment she was thinking of two men: one who had left Marchmont, recalled by a telegram—she smiled at the transparency of it; the other who had stood at the foot of the great Marchmont staircase when she came up half-an-hour previously. And it was perhaps the one who had gone—George Pirbright—that occupied her thoughts the more. She was under no misapprehension as to what she had put aside there in exchange for something that would raise an incredulous smile amongst her

own intimates. She was too well aware of what money could do to undervalue it. Most of the people she knew had money. And of them all George Pirbright had the most.

This was what she had declined only the day before. It was what money, or his particular use of it, had made of Pirbright that Connie objected to. But she did not feel critical about him, and now, in a sort of wistful retrospect, found herself praying that what she believed to be her principles were sound enough to see her through the decision to which she had abruptly come on the evening of the day when Pirbright left. He had been rather too assured in the way he put it. Yachts, moors, London seasons, and the world as a football—these were not mentioned, there being no need for it; but in the manner of his speaking there had been a tone that she dimly put down as selective, as though she were the prize virgin of her tribe, and might well be proud of the proffered distinction. And there were incipient lines in his good-looking, over-indulged face that clashed prophetically with his thirty years.

At bottom she sensed that he considered her desirable and ornamental to his position, but, in a way, neither absolutely essential, nor, if needs must, entirely irreplaceable. Even at the end of it, when he used the not infrequently effective plea that she could do more for him than any woman alive, she had felt that the argument was put forward as much to justify his proposal as to move her to consider it. Then he had gone off, his sixty thousand a year intact, and hard on his trail had come Merivale.

II.

There had been no finesse in this case, but a large, somewhat uncouth, and perfectly obvious love, with hardly anything to back it up except the honest and almost shamed hesitancy with which it was expressed. That had appealed to Connie's present mood. The girls she knew said quite frankly that they could not afford to take Merivale seriously, or they would fall in love with him—which was beyond their means. Connie, perceiving what he felt about her by the way he had avoided her for months, had

not taken him seriously either till he bobbed up at the Jennisons. Then the look in his eyes had rather hurt. He had six hundred a year, instead of the sixty thousand at her feet, but this pigmy income seemed somehow enlarged to reasonable dimensions when mirrored in the pool of reflection in which Pirbright's departure had left her.

It was a startling but all-sufficient thing to discover that this time she cared, and in some queer fashion Merivale seemed to divine it, but even at that he stammered like a boy when he spoke. He was horribly proud, the sort of painful pride that is measured inversely to money, too proud, in fact, to say much that did not deprecate himself and draw attention to his own scanty income. From what he said there was left out a great deal, and the very omission of this implied on his part an understanding that left Connie not a little surprised. She liked the way his instinct worked in that moment. It assured her amazingly, for she saw that this same instinct would colour the type of his love.

She was lingering over this, and getting from it a definite and heartening comfort, when there came a tap at her door.

'May I come in?'

A girl entered, and, settling in another big chair, opened a tortoiseshell case and passed it to Connie. 'Do smoke, and tell me all about it. I hear Jack Merivale looks as though he'd seen the Holy Grail.'

Connie laughed, and lit a cigarette. 'You're very complimentary. I've promised to marry him.'

'Connie, you can't afford it!'

'I know I can't, but—yes—I think I can.'

'What on earth will you do, and how will you do it?'

'We haven't quite come to that yet.'

Sybil Hope gave her a quick glance, got up, kissed her impulsively, put a cigarette to her own rather carmine lips, then for a moment sat silently. She was not so tall as the other girl, and was more beautifully made. Her eyes, very large and dark, seemed lustrous beneath finely-pencilled brows; her nose was small and very straight. There was a touch of artlessness about her, which those who knew her best perceived to be the quintessence of art. She gave the impression of a highly-bred, sensitive racehorse, in whose repose was the quivering suggestion of blood and speed. Her voice, low-pitched, held an effective note of huskiness.

III.

'Of course,' Sybil went on presently, 'it's a bit surprising. I can't quite picture you Jack's wife—with all it involves.'

'Do you mean all it doesn't involve?'

Sybil nodded. 'Yes, just that.'

Connie made a little moue. 'My dear, do you imagine I haven't been thinking of that?'

Sybil did not answer at once. She was secretly convinced that this affair was, primarily, a terrific waste, and pictured the Mrs Jack Merivale of the future, still lovely, still attractive, but inevitably revealing that wear and tear of life, the very thought of which was repellent. There were so many others of coarser fibre, better designed to take the brunt of things, to whom it would have meant no sacrifice to marry Merivale. She pitched back over the last few years, measuring the bond between them. Connie had always been, in a way, braver than herself, with a sort of faith in the general dispensation of things.

'I think,' Sybil said reflectively, 'that it's awfully easy for a good many girls to be swayed by their impulses and emotions, and afterwards have to try and make their real tastes and desires fit in. Just as often as not they won't fit. Honestly, Connie, what do you expect out of this? I'm frightfully interested, and of course you two are going to be inseparable, because your kind sticks to a man—I know that—and it's all rather splendid, and Jack's a dear—but what else?'

Connie nodded. 'That's just what I can't exactly tell you. I think it's the promise of things that one believes in at the back of one's head. It's promise rather than possession. It will be a bit stiff at first, and perhaps always stiff for both of us, but what helps most now is that I'm not sobered by the fear I've missed something, though I know I'll feel the pinch.'

Sybil regarded her with undisguised interest. The thought really uppermost in her mind was that George Pirbright remained still unappropriated, and this meant to her far more than she was prepared to admit, at least at the moment. She loved Connie as much as she could love any woman, and made no mistake in underestimating the feminine panoply to which so many men had turned so instinctively. Of late it had seemed that Pirbright, the most eligible *parti* she knew, was succumbing to the challenge of the reddish-brown eyes, whose depths were now so calm and wistful. But on this score she breathed more freely.

Her views of marriage were different, because her own impulses marched comfortably with her tastes, of which they were indeed the offspring. She saw herself as a highly-finished twentieth-century product; took a luxurious pleasure in her own refinement, and had no intention of wasting any of her undeniable charms in untempered surroundings. Were it suggested that she had a capacity for ruthlessness or cruelty, she would have been amazed.

IV.

'I rather thought it was going to be George Pirbright,' said Sybil with sudden daring.

Connie shook her head for answer. She knew perfectly well that in Sybil's mind she

had been for some time a serious rival for the Pirbright millions. To tell the whole story now was unnecessary, and to explain her refusal would be more difficult than it had been to make it. Sybil was welcome to Pirbright, if she could get him. At this stoical conclusion Connie pitched her mind forward, because it required further stoicism and was to some extent invigorating. 'We're not going to live here, you know,' she said evenly. 'We're going to Canada.'

Sybil expressed a genuine sympathy. 'How awful! You'll freeze.'

Connie laughed. 'I don't think so. It's British Columbia. Jack has some property out there that needs developing, and——'

'It will be developed at your expense. Oh, my dear, I've heard of that sort of thing—brave young hearts venturing forth, and all the rest of it. Don't you do it, Connie. Live in Italy or Greece, or where you can get along quite well on six hundred a year. Did you see Mary Mostyn when she came back from Canada?'

'No.'

'I wish you had. Her face like leather—and you know how pretty she was; and most frightfully out of it because she'd been away five years and her crowd had all broken up; and distressingly practical, with none of her old allure, which seemed to have worn out rubbing against rocks and trees and things; and dressed, well, like a Colonial, you know. Of course, it's frightfully cheeky of me to speak like this, but you're the only one I can talk to absolutely freely.'

Sybil was feeling a little exalted, and she could afford to. The picture of Connie in British Columbia, becoming seasoned and weathered, for it must have that effect, gave her a novel and luxurious enjoyment in her own smooth and silken beauty. She had always admired this tawny-haired goddess, and now she admired her the more, just as the man old enough by a few months to escape conscription yields unstinting respect to his junior by a year when the latter answers the summons of his country.

'I think it will be rather nice, once the hard part of going is over,' said Connie thoughtfully. 'I was never sure till now what I should get out of marriage, but I think I always knew what I hoped to get. As to the climate, I hear it's wonderful, and there are lots of our sort over there, and for the same reason that we're going.'

'Just where will you live?' Sybil's ideas of geography had always been vague.

'On the coast, above Vancouver. Jack says we can make it as comfortable as—as Marchmont.'

Sybil's expression reflected her doubts. Marchmont for her. 'Will you have to do your own hair—and things?'

'Of course, and especially "things"—at any

rate to begin with.' Connie paused with a laugh that sounded a little uncertain, then went on, 'Don't think for a minute that my eyes aren't wide open, or that I'm doing this as a sort of *faute de mieux*, because really I'm frightfully keen. You see I've been rather afraid of late that I was ceasing to feel things, though I know that if one does stop feeling it amounts to a sort of protection; but I don't want to be protected. I'm ready for adventure. I can count on Jack to the limit, and rather expect to make discoveries, principally in myself.'

v.

Sybil nodded sympathetically. Privately she thought Connie a little mad. As for discoveries after marriage, she proposed none for herself that she could avoid if she could be merely conscious of them without actually making them. Should it be George Pirbright, she had a shrewd suspicion as to the character they would take. No! She preferred to explore the ground first so far as one safely could, and take the rest for granted when the die was cast. Discoveries meant emotion, and emotion was too upsetting. And she had by this time explored herself so completely that there was nothing left to unearth. As to ceasing to feel things, she wondered for a moment whether she had ever begun.

'I suppose,' she said slowly, 'that we're too unlike to agree; and you strike me as being a sort of gladiator who gives the royal salute when he goes into the arena. I often wondered why you didn't marry before this, and know how easy it would have been, but I think I see now. We look at happiness differently, because I feel it with all of me at once, body and mind, and my body can make my mind quite comfortable. But you can be happy and forget about your body. Perhaps it's the other way on with me, for I'm a good deal of a sybarite. For instance, if I had all the world offers except love of the right kind, I think I'd be fairly content. You wouldn't. I suppose we're made like that, and can't help it. Here you are now, looking regal and perfectly ravishing, yet you talk about living somewhere near the arctic circle, without turning a hair, while the mere thought of it appals me. You're going to marry a dear good-natured, awkward thing with six hundred a year, while—and this is terribly frank, Connie—I'd jump at the chance of George Pirbright, and in, say, five years match my idea of happiness against yours. I suppose this is all a bit cheapening, but it's a very ordinary thing in the world that produces people like us. That's my world, and was yours if you wanted it, and it's only because you don't that I've cut loose and talked like this. After all, we're neither of us children, and we know perfectly well that when the first flush and excitement is over what we most want is a similarity of taste and

interest. It prevents one from being bored. And,' she concluded a little defiantly, 'that's where George Pirbright comes in.'

Sybil got up, stood for a moment by the fire, then, leaning forward, put her hands on Connie's shoulders and kissed her. She knew that this

would be their last talk for a long time. 'Good-night, you—you Trojan.'

The red-brown eyes looked up at her with complete and friendly understanding. 'Good hunting, Sybil.'

(Continued on page 438.)

STARS AND THEIR WIRELESS MESSAGES.

I.—STELLAR WAVE-LENGTHS AND SIGNALS.

By Professor GEORGE FORBES.

I.

'GOOD evening, everybody!' In such words does the king of 'broadcasters,' in this age of wireless telegraphy, greet the 'listeners-in' at the beginning of his conversations. He himself is in the transmitting or broadcasting station—2 LO—in London, from which place an ingenious electrical apparatus is broadcasting ether-waves, all at the wave-length 365 metres, continuously, in all directions. These waves are not carried through air like sound, but, like light, through the ether which fills all space.

The broadcaster speaks to a microphone, and the microphone modulates the ether-waves so that the speech can be picked up on a telephone by any listener-in, provided his set be tuned to the ether wave-length 365 metres.

The telephone is nothing more than a very valuable accessory required, not for detecting the ether-waves, but only for reproducing the music and speaking. The marvellous part of the invention is that ether-waves of a chosen wave-length can be radiated from the station, and be picked up by a properly-tuned set at a distance of hundreds or thousands of miles.

These ether-waves are the same as the light-waves that come from the sun; and Sirius, Capella, Betelgeuse, and all the stars that we see are signalling to us in the same way. To some of us they almost seem, in their twinkling, to be saying 'Good evening, everybody!' All sentiment aside, however, this is a marvellous truth—that the stars are for ever broadcasting ether-waves of the same kind as 2 LO does, only with a different wave-length.

The retina of our eye is so constructed that it acts as a receiver for these ether-waves and gets from them the sensation of light and colour. The stars, ever since they began to shine, have been broadcasting all kinds of signals by wireless telegraphy. Astronomers are now learning the codes for deciphering some of these signals. It was only sixty-six years ago that the principal key to their signalling code was discovered. Now, every year we are becoming more familiar with their secret signal-codes. The spectroscope is to-day in constant use by astronomers for measuring the different wave-lengths that are

being broadcast by each particular star. After that, the signal-code is used for interpreting the message sent by that star.

Amongst the messages about itself that each star is forever broadcasting, we have already decoded many tales of extraordinary interest. By wireless telegraphy the stars actually tell us stories about the stuff they are made of, and this will be the main subject of the present article. Many astronomers believe that the stars have told us all about their life from infancy, and how they grew up to the full vigour of manhood, while some have passed to old age and even to second childhood. The stars tell stories, too, about their movements and their dances, their wanderings through the depths of space, their revolutions round invisible partners, and their rotations about an axis, like the earth's daily rotation; also weird tales about whirling hurricanes that convulse their atmospheres; and they are proclaiming their dimensions, and the distance they are away from us. They tell us the temperatures that would be measured by a thermometer on their surface, and one of them tells stories even about its north magnetic pole, just like the magnetic pole on our earth that makes a mariner's compass point to the north.

Incredible as it may appear, all these true romances of astronomy, and more, are being continually notified by wireless to all inhabitants of the universe, and the spectroscope has enabled astronomers to register the messages and often to interpret them.

II.

To-day, the newly-acquired art of listening-in brings pleasure to millions of people, old and young. We enjoy seeing the keen schoolboy, wearing his head-phones, in front of his box of tricks. He turns a knob to pass his pointer over a circular scale of wave-lengths, and so he tunes his receiver to the wave-length of Edinburgh, Glasgow, London, or elsewhere.

Every boy knows that Glasgow's wave-length is 420 metres, London's 365, and that of Edinburgh is 326 metres. The stars use very much shorter wave-lengths. Here a metre would be of no use as a unit. For measuring stellar wave-lengths we use a minute, invisible

unit, called an ångström, after a celebrated Swedish experimenter. The ångström is so small that ten thousand million of them are needed to make up one metre.

It is truly a wonderful fact that our rough, clumsy human hands should be able to make instruments for broadcasting ether-waves whose length is measured in metres. But it is only the Creator who could make instruments for broadcasting the minute ether-waves that are measured in ångströms. The human instruments are called *triadic valves*; the Creator's instruments are called *atoms*. There are hydrogen atoms, iron atoms, and distinct atoms for all of the chemical elements. Each sends its own special wave-lengths, just as 2 LO does. It is perfectly astounding to learn, as we do, that the wave-length radiated by a hydrogen atom is found to be the same, whether the atom be in our laboratory, in the sun, in a star, or in a nebula. So with other elements. These are 'manufactured articles' of precisely the same construction in whatever part of the universe they may be found.

Our eyes are delicate receiving instruments that can pick up wave-lengths anywhere between 4000 and 8000 ångströms. Each of the wave-lengths sent to us from any source of light is seen by the eye as a different colour; 4000 ångströms looks violet, 6000 looks yellow, 8000 looks red.

So, when we regard a rainbow with its colours laid out in the definite order—red, orange, yellow, green, blue, indigo, and violet—we recognise each wave-length broadcast by the sun as a different colour, all of them that we can see lying between 4000 and 8000 ångströms. Obviously, the eye cannot thus detect minute differences in wave-lengths, for only about seven colours in the spectrum can be surely distinguished from one another. For accurate measurement we use a spectroscope.

Everyone knows that the white light from the sun is a mixture of all these colours that are laid out in a row, according to their wave-lengths, in the rainbow. Instead of using a rainbow, however, we can look at the sun through a three-sided piece of glass called a 'prism.' We then see a band of colours in the same order. We call this coloured band a 'spectrum,' and a wave-length is known by its position on the spectrum.

Prisms can be mounted by an optician to make an instrument called a 'spectroscope' in a form convenient for studying, and even for photographing, the spectrum. The astronomer can apply it to his telescope, and then look through it at the sun or a star and see its spectrum; or, better still, he can photograph the spectrum. So he can measure the wave-lengths that are sent to us from each star, or detect any wave-lengths that are missing from the spectrum. Generally, he sees a spectrum continuous from

violet to red, with gaps appearing as dark lines. These represent missing colours at certain wave-lengths. There are wave-lengths that have been stopped by atoms in the atmosphere of the star. These wave-lengths are nearly always those that we have proved, in the laboratory, to belong to the atoms of chemical substances that are found on our planet.

For example, on looking through a very good spectroscope at an electric spark playing between two bits of iron, we see that the spectrum of iron shines with thousands of bright lines, each of a different colour or wave-length. Next, on pointing the spectroscope to the sun, we find a continuous coloured spectrum with a dark line at each of these iron wave-lengths, thousands of coincidences. Thus we feel sure that iron atoms exist in the sun's atmosphere. So it is with nearly all of the materials found on our planet. They are generally found also in the sun.

Why, then, does iron in the sun show its presence by *dark* lines and not by the *bright* line which we see in the iron electric spark? Here is the answer, and it is the principal key for decoding the wireless signals of sun or stars:

The white-hot body of the sun or a star—whether it be solid, liquid, or gas so much compressed by atmospheric pressure as to be almost liquid—gives off a continuous spectrum from violet to red, for in that case the atoms are so close together that they jostle one another and are not free to vibrate in their own distinctive manner. But the iron or other atoms in a star's upper atmosphere are different, for they are not quite so hot, and they are free, and each of these cooler atoms absorbs the same colours that it would radiate under the electric spark. These colours or wave-lengths are, therefore, so weakened as to look like dark lines in the spectrum.

It comes to this: if we could examine the spectrum of the sun's atmosphere without the bright-coloured background, that is to say, without the continuous spectrum of the sun's body, then we ought to see the lines bright instead of dark.

Now this is actually possible in a total eclipse of the sun. When the dark disc of the moon is passing over the bright disc of the sun, there is a moment when, for a few seconds, the body of the sun is all eclipsed and yet there is a thin line on the border of the sun that gives light, and it comes from the upper parts of the sun's atmosphere that have no background of white light. This 'flash' spectrum consists only of lines that are bright, where at other stages they looked dark on a continuous spectrum.

III.

Now that we know something about broadcasting and about the colour spectrum, let us try to imagine that we can see a man on the moon

who is working with a wireless receiving-set so perfect that he can tune it to detect every possible wave-length, even the most minute. Then we might watch him finding the wave-lengths that are being broadcast as we watched the schoolboy.

First, he would be dealing with our earthly broadcasting. When his pointer is at 2600 metres he exclaims, 'Hello! here is Eiffel Tower!' At 365 metres, 'Hello! London!'; at 326 metres, 'Hello! Edinburgh!' Then, on turning to much shorter wave-lengths, he could catch solar rays. At 5570 ångströms he would shout, 'Hello! here is hydrogen!' Then, in succession, 'Hello! Sodium!' 'Hello! Iron!' as he struck the wave-lengths of these atoms.

This is no joke. It is not used as a mere illustration. It is plain truth that the Creator's atoms are radiating just as are Marconi's valves, only at a different wave-length. Of course, this man on the moon would not be using a telephone, because the sun does not use

speech, and the telephone is not a necessary part of wireless telegraphy.

And now we understand how the spectro-scope has, after much research, enabled us to say positively that the sun contains practically all of the chemical elements that are known to us on our planet. We cannot be on sure ground if we attempt to follow up this discovery too far, because we do not know where the materials that constitute the sun, the earth, and the planets originally came from. Certainly, if they were made out of materials originally existing in the form of meteorites, or comets, or nebulae in the part of space now occupied by the solar system, this would explain why the earth and the sun are made of the same materials, and we should expect to find that a majority of the nearest stars would be similarly constituted, and would show a spectrum resembling that of the sun, where all the metals are conspicuous, and calcium particularly so. Later we shall see that this is probably true.

THE MURDER GANG.

By Lieutenant H. P. CINNAMOND, M.C. (late Frontier Force).

MOUSSA KHAN, Adam Gul, Malik Hosein, Barik Shah, Lala Reza, and Hyder Abbas, each in turn, took the Holy Book, kissing it and pressing it to breast and forehead. After which, with grim, determined faces, all six set out for the British border.¹

But the British border lay sixty miles distant, and, the month being August, the days were very hot; so that the little band did not disdain the shelter offered by wayside hamlets. It must, however, be made plain to the villagers what manner of men they were to have the honour of entertaining; both because the tribesman is naturally a boastful creature, and because the Ahmed Khel Wazirs, who composed the party, are not *personae grates* in the stretch of land lying between their homes at Wana and the Derajat. So at the first village Moussa Khan, the most venerable of the six, held forth. 'Verily,' he began, 'ye will do well to treat us bountifully; for it may be that, if we are pleased, we will speak a word for thee in the ear of our lord Mohammed, upon whom be peace.'

'And what will the word of an Ahmed Khel avail?' asked the village *malik* (headman) unpleasantly. 'Surely it were as well——' But the other interrupted.

'Were it only that we are of the Ahmed Khel it were enough, for such are the salt of the earth,' he replied modestly. 'But there is

more. Know that we are Ghazi; we have taken the oath upon our salt and upon our swords, upon our hair and upon the Book. When we return this way there will be six *gorah-log* [white men] the less; and *afsar-sahibs* [officers] only will we touch.—Is it not so, my brethren?' he appealed to his companions.

'Verily, by the Koran, it is true,' attested the others. 'By the grace of Allah, the Compassionate, the Merciful, it is as thou hast said.'

The villagers looked at the little band of desperados with new interest, the *malik* ordering a lamb stuffed with pistachio nuts to be roasted whole and set before his guests. But he was something of a Job's comforter, for, while enjoining the Ghazis to 'eat, drink, and be merry,' he did not forget the context—namely, 'to-morrow ye die.'

'The *gorah-log*,' he concluded a long harangue, 'are not now so easily befooled as they once were; and yet it is not they who are wise, it is our own people who betray us. They come amongst us as friends and spy upon us; then, retiring, they report all our sayings and doings to the *askari* [police].'

'I would that I might catch one such,' snarled Moussa Khan, his ancient countenance assuming a slightly less venerable appearance. 'His death would not be an easy one.' He glanced at a small group of villagers collected beneath the usual chenar tree. 'Are all these good men?' he inquired abruptly.

The *malik* cast his eyes about. 'There is one I do not know,' he answered, pointing to

¹ Though all the characters in this little sketch are fictional, none of the incidents is at all overdrawn; exactly similar events have occurred, and are occurring, on the North-West Frontier of India.

a tall man, light-coloured, with gray eyes. 'The rest are of mine own people.'

'What!' The man pointed out leapt to his feet, his voice raised to a furious shriek. 'Sayest thou that I am a spy? I, Isa Mohammed of the Ata Khel! Dog! I will pour thy bowels upon the ground.' Drawing a blade which would have done credit to a scythe, he rushed upon the *malik* to make good his threat. But half-a-dozen villagers threw themselves upon him, pinning him to the ground, whence, in bellowing tones, he issued challenges to all and sundry.

This violence was not without effect—it convinced the others of the angry one's good faith; and, with muttered apologies, not too generously accepted, the chief told him so.

After their meal the Ahmed Khel men continued their journey. But, only proceeding until a shoulder of the hill hid them from their late hosts, Moussa Khan halted and addressed the party. 'That *malik* spoke truth,' he began. 'There are many spies amongst us, and I am convinced that that stranger is one. He says that he is an Ata Khel Wazir, and he wears their cummerbund. What of that? Are there not spies among the Ata Khel, as amongst others? Let us be wise; we will here take up position, and slay the man if he passes, as, if he is a spy, he must do, for is not this the path to the Angrezi border?'

'Thy words are the words of wisdom,' agreed another of the party. 'But, bethink thee, it were better that we move a little farther from the village, lest, enraged at our slaying one so lately their guest, the people attack us.'

This suggestion being adopted, the party moved a couple of miles farther down the pass along which their route lay, where, taking up a position, they awaited the coming of the alleged spy.

Nor had they long to wait, for a bare half-hour later Isa Mohammed came swinging down the path. He appeared, however, not to be altogether at ease; and as he walked his eyes roved anxiously, searching the broken hill-sides all about.

But even then it was his luck and not his suspicions that saved the man. He was already almost within the trap, when one of the ambushers drew back a belated bolt, the result being a click, not very loud, yet loud enough to frighten the already nervous Isa Mohammed, who was doubtless well acquainted with the sound. Without wasting any time on unnecessary investigation, he wheeled about and tore back the way he had come. Further concealment being now pointless, six angry Ahmed Khel warriors rose to their feet and emptied the contents of their magazine Lee-Enfield rifles after the flying figure. Then, deeming pursuit unprofitable, they continued their journey towards the border. While this was still some

twenty miles distant the party broke up, each to pursue his object in that way which seemed best to him.

Ghulam Mohammed Khan, *askari*, a tall man, light-coloured and gray-eyed, lurched wearily into a little fort situated high up on the Gomal Pass; he carried one arm in a sling, and blood showed through a bandage improvised from a portion of his puggree.

A dozen Waziristan scouts, under the command of a havildar, held the place; and these greeted the new-comer without enthusiasm. They did not know who the wounded man might be, nor did the wounded man intend that they should. These men were all, no doubt, sufficiently loyal to their salt, but—if one doesn't know one *can't* tell. Therefore, stating that he was an *afsar*-sahib's servant who had been wounded while on leave, he asked permission to use the field-telephone with which such posts are supplied, in order that he might obtain an extension of furlough.

But it was not to an officer—at least not a military officer—that Ghulam Mohammed addressed himself, after being assured that none of those within hearing understood English; it was to the district superintendent of police at Dera Ismail Khan, and to him he spoke but a few words. After which, informing the havildar that his sahib, who, like all sahibs, was a *sheitan* (a devil), would not grant him leave, he lay down and slept for some hours, when, having had his wound tended, he proceeded towards cantonments.

Only a few words had been uttered over the telephone, yet many a thoughtless subaltern doubtless found it in his heart to curse the utterer, for they were portentous words, and they produced the following:

'Station Order, No. 423.—It having been brought to the notice of the General Officer commanding Derajat Brigade that a band of six Ahmed Khel Wazirs have left their country under oath to slay British Officers, the following precautions will be taken until further orders:

'1. All officers proceeding from their quarters after dusk will be accompanied by an armed orderly.

'2. A sentry, with appropriate reliefs, will be appointed to guard each officer while he sleeps.

'3. At dinner a guard will be posted over the mess-house.

'4. No officer will leave cantonments alone under any circumstances.

'5. Officers will carry revolvers at all times, and, where possible, will be accompanied by armed orderlies.

'NOTE.—The commanding officer would impress upon individual officers the necessity, notwithstanding the above precautions, of maintaining extreme vigilance by day and night

until these men have been dealt with. The Ghazis were last seen in the vicinity of the Gomal Pass; the frontier is being watched, and it is hoped that the miscreants, who are personally known to the police, will be arrested before they can carry their criminal purpose into effect.

Yet, in spite of the fact that the frontier was being watched and that the men were personally known . . . well, the Waziri frontier for 120 miles is conterminous with our own; and hillmen are slippery customers at the best of times.

Barracrough of the Royal Engineers surveyed his job with pleasure; he didn't think that even the Indus would make its way through *that* bund. Once Dera Ghazi Khan had suffered, when, by some strange freak, the great river had swung six miles from its course, wiped out half the cantonment, and then swung west again to its old channel. Such a thing should not happen again, thought Barracrough, as, with justifiable pride, he viewed the ten-foot bank with its fifteen-foot base which had grown under his orders. Glancing at his watch, he called to a foreman: 'Hey! Abdullah! You can knock off now—it's six o'clock. Come to my bungalow later—there's one or two things I want to settle.' He turned about and strolled away, the released coolies streaming past him *en route* to their quarters.

As the sapper lounged along it suddenly occurred to him that he would be unable to see his foreman that evening, owing to certain engagements; therefore, with a courtesy not always practised in the East, he turned to revoke his order. Even as he turned the great knife rose, and only a perfectly miraculous spring backwards saved Barracrough from a blow which must have cleft him to the middle. He gave his assailant no opportunity to deliver a second; springing in, he buried his fist to the wrist in the native's most vulnerable spot, the plexus; and, like an empty sack, the latter collapsed.

'It is Adam Gul,' stated Ghulam Mohammed, later, when called south to identify the prisoner; 'and——'

'*Barikallah!* God is all powerful,' said Adam Gul resignedly.

Guest night in the Rajput's mess. *Apéritifs* have been disposed of, and the band is playing 'The Roast Beef of Old England.' Now the officers have trooped into the mess-room, and are awaiting the president's pleasure. A waiter follows them in—a waiter! whence, then, the rifle that swings to his shoulder? A report, and the guest of the evening drops across the table, his shirt-front suddenly stained.

'It is true,' remarked Moussa Khan, as he slowly rose from the floor, 'that I am an old man; yet, *Alhamdilallah!* Thanks be to God,

who has, even in my old age, permitted me to perform that which is pleasing in His sight.'

The hard crack of a rifle: Lieutenant Riordan leaps to his feet, and, drawing a revolver from beneath his pillow, dashes out into the night. 'What's the row, Gurdon Singh?' he demands.

'It is nothing; the sahib should not have arisen,' answers the huge Sikh. 'This *soor* [swine] would have disturbed your honour'—he touched something upon the ground with his foot—'and so I have slain him.'

Thus Malik Hosein paid the penalty which is exacted from those who blunder in the great game.

'See now, if the sahib will but give me ten rupees, I will show a wonder—a wonder which many sahibs would wish to see. Yes, truly, to your honour, who is kind to the very poor, will I show the marvel, and for ten rupees only. Most true, sahib, a very rare thing.'

'I say, Johnston!' Captain Marlin called to a passing subaltern. 'Here's an old fakir who says that he can show us the rope-trick; what d'you think?'

'By jove! can he? Then let him jolly well do it,' replied the other excitedly. 'Everybody talks about the thing, but I've never met any person who has actually seen it done. Trot it out, old scout; if it's all I've heard, I'll give you ten chips myself.'

'Nay,' replied the old man sulkily. 'I will only show my wonder to this sahib, who is a good sahib,' and he pointed to Marlin.

'Ho!' ejaculated the disgruntled subaltern; 'and what sort of a sahib am I?'

To this the man made no reply, other than to repeat his former assertion in muttered tones.

'Why will you not show this sahib your trick?' queried Captain Marlin angrily. 'Come, no nonsense! Let's see your performance, or get out!'

'Very good, sahib, I going,' and the old man, calling to a boy who accompanied him, stalked towards the compound gates.

'I say,' put in the subaltern, 'don't let me spoil the show. If the chap can really show you the rope-trick you're in luck. Call him back; I'll clear off.'

'Well, I'd certainly like to see his effort,' admitted the other. 'But—damn his impudence! However, some of these people are peculiar; and, if you're certain you don't mind, I think I will call him back.'

'Do,' said Johnston. 'See you later and hear all about it.—Go back!' he ordered, as he passed the fakir. 'The *good* sahib will see your show, while the bad sahib bids you farewell.'

Calling his attendant urchin, who had run ahead, the man retraced his steps.

'Not here, sahib!' protested the conjuror.

'All would see. Let it be at the back, where there is privacy. Now, before I proceed to the great wonder, I will show the sahib a small trick, all to be included in the ten rupees. See, the boy will get into this basket, and I will pass my sword through—'

'Oh, bosh! I've seen that trick hundreds of times. Get on to the big one, and don't waste any more time.'

'The sahib is impatient, yet I would crave his attention one breath.' The fakir approached a little closer, confidentially. 'This basket is not as other baskets, nor is this sword,' producing the weapon from beneath his robe, 'like other swords—' He paused in bewilderment, for the sahib had vanished, but only for a second; now he reappeared. Allah! Allah! what was this! In the hand of the good sahib was a long-barrelled Webley revolver, the muzzle of which—if he could believe his eyes—pointed straight at a most sensitive portion of his, the fakir's, person.

'You are right,' acknowledged the good sahib, and his voice was hard. 'The sword is *not* an ordinary one for a juggler, it is a hill weapon; you ought to know that the carrying of such within cantonment limits is a crime.'

'Nay, sahib, I am a poor man; do but look at it—'

'Drop that knife on the ground. That's better; now you come along to the *thana* [police station], and we will see whether the police know you or not.'

'It is, indeed, one of them,' said Ghulam Mohammed Khan. 'Barik Shah, it is. Yes, sahib, a great offence to carry weapons without permit in time of peace! Oh! very nasty, sahib. A crime for which there will be much punishment.'

Lala Reza—who must have been weak in the head—tried to pass some Ghurka sentries who lay between him and his quarry. Now there is no Lala Reza.

Hyder Abbas, a man of no originality in his ideas, yet, perhaps, not altogether a fool, contented himself with lying up in the hills by day; coming down by night to take pot-shots at any incautiously exposed lights in cantonments. In this manner the tribesman easily convinced himself that he had slain at least twenty-five officers; when satisfied, he returned to Wana—alone.

THREE MONTHS IN THE SERTÃO OF BRAZIL.

By ASHMORE RUSSAN.

I.

A YEAR or two back it was the writer's experience to travel by the Bahia Central Railway from São Felix, which is the starting-point of the line, to Machado Portella in the interior of the State of Bahia, and then to ride, day in, day out, on horseback, or muleback, from *fazenda* (farm) to *fazenda* for weeks, sometimes through *Catinga*, which name does not signify perfumes of Araby by any means, but is the Brazilian term for the worst kind of scrub forest imaginable—full of rattlesnakes, cacti of the spiniest, and thorns that can only be matched in some mediæval picture of the crowned Christ; sometimes over vast cattle-plains; but always under the necessity of seeking hospitality at the end of each day, for otherwise there would have been no help for it but to go hungry and thirsty to bed under the stars, with an upturned saddle for a pillow.

Except at the *fazendas*, scarcely any water or food was to be had, so whether the distance from one halting-place to the next were forty, fifty, or more miles—and some of the *fazendas* comprise more than a hundred thousand acres—the journey had to be made. In consequence, we were continually turning up unexpectedly at sundown, or thereabouts, at the houses of *fazendeiros*, to whom we were utter strangers.

Such a jaunt enables one to write of the *Sertanêjos* (inhabitants of the *Sertão*, or wild country), and of their hospitality, with very particular knowledge. In addition to arriving unheralded, our party numbered about a score, so that each visit was an invasion!

Here it should be mentioned that the job we were engaged upon was the inspection of vast areas of Maniçoba Rubber Forests, not a perilous one in the ordinary way; but our guide, who was the principal vendor of the properties, which ran to many square leagues, had got involved in a *Sertão* feud. In a boundary dispute, and in defence of his life, he had been compelled to shoot and kill a *Sertanêjo*, whose family had sworn vengeance upon him, for which reason we were accompanied by a guard of three negro soldiers under a lieutenant, and watched over by two officers of higher rank. The constant surveillance that resulted, if kindly meant, was exceedingly unpleasant at times. Three of us were Europeans, but not one of the three could separate himself from the party more than a few yards without a negro soldier following close behind. The object of the feud, whose life was actually in danger, carried a double-barrelled shot-gun, which never, or very seldom, left his hands when on the road, occupied his hammock, or bed, at night, and stood between his legs at meals. His special guard was the

lieutenant, who was a personal friend, while the writer and an old Scottish botanist, who was of the party, were in the special care of the black soldiers. Strict injunctions we had from the officers—never to sleep in the line of fire from a window; never to wander off into the woods; the reason being that the members of the camarilla, as a clan, had never seen the man whose life they had sworn to take, and would be likely to shoot any European stranger on the maxim of 'Shoot first; questions can be asked afterwards.' At much inconvenience, and, at the cost of many discomforts, the injunctions were obeyed, and the camarilla never had a chance to avenge their dead friend. As nothing untoward happened, the writer is consequently free to devote this brief sketch to the hospitality we met with in the *Sertão* and elsewhere, under the none too favourable circumstances mentioned.

II.

Not once in all those weeks was our welcome anything but hearty. No sooner had we dismounted than our tired animals would be led under shade, watered, and fed, ourselves conducted into cool rooms, and supplied with an abundance of fresh sparkling water just fetched from the 'tank,' often an artificial lagoon of a score of acres, and given foot-baths—full hospitality for the jaded! Then *vagüeiros* (cattlemen) would mount and scurry away; fires would be lighted in the great domed baking ovens, always built a few yards from the houses, for such heat within would be unbearable in the *Sertão*, where the sun blazes from its rising to its setting, and the radiated air dances before one's eyes and blurs the vision most of the day.

Busiest at such times would be the *Senhora*, bustling amongst her ebony maids, for the State of Bahia was once a great cotton country, and the great majority of the *Sertanêjos* are descendants of African slaves, long since freed in Brazil. Nearly all the *fazendeiros*, however, are white, descendants of the cotton planters, whose chief industry was brought to an end when the slaves were set free—not immediately, perhaps, but in course of time. Not willingly does the negro work in countries where a patch of mandioca will yield *farinha* enough for a family, or a maize *milpa* sufficient *tortillas*; or, as in the *Sertão* of the State of Bahia, where meat may be had almost for the asking, and *cachaça* (cane-spirit) in exchange for a tin of rubber milk. *Maniçoba* rubber-trees (*manihots*) grow wild in their thousands in the Bahia *Sertão*, and the thirsty native, craving for something stronger than water, had, at the time of our visit, only to tap a few of the multitude, and barter the milk at the nearest store.

Many were the feasts given in honour of the strangers, but for several reasons the most notable was that at Esmeralda, a long, low,

white building with about a dozen front doors, of which more hereafter. The house stands, or stood, on the highest ground of a vast *fazenda* of about 300,000 acres; and, like all similar residences, it had its own water-supply, spacious corrals, and out-buildings, with many shade trees. It is rather curious that all the reservoirs in the *Sertão* should be called 'tanks,' but so it is.

At the time of our invasion our host at Esmeralda had no wine (*vino vermelho*) and to offer plain water or the native *cachaça* only was to him unthinkable. So in three directions black cattlemen galloped, with orders to buy or borrow, but not to return without *vino* for all. That one or more of them were successful was evident enough, for each guest had a bottle set before him holding about a pint and a half. The table was very long, if not quite so long as the many-doored house, and the row of bottles arrayed upon it was nearly as long as the table. The *fazendeiro* was jubilant at the success of his messengers, and by his orders deft-handed ebony lasses drew the corks.

Alas! the Italian storekeeper who had been appealed to was also out of wine, but he had done his best. A consignment of French absinthe and Italian vermouth had just been received, and he despatched the whole to the *fazenda*. And we were expected to empty those bottles! Somebody explained. We Europeans partook of an *apéritif* or two, and all was well, but what happened to those of our host's many relations who drained their bottles and ours, one does not like to remember. One by one they stole away, but their presence at the long table at every meal explained the house's many doors. The big *fazenda* was held in common, as is frequently the case. All the members of the family—fathers and mothers, uncles and aunts, sisters and brothers, nieces and nephews—dwelt in the long house, and each sub-family appeared to have a separate door. The ownership of the huge *fazenda* was a matter of percentages, for the property had never been divided, and the possessor of the largest percentage was the head of the family and our host.

A large roasted armadillo was the *pièce de résistance*, specially provided as a great delicacy. It tasted something like pork, but some of us had seen the burrows of its kind in the graveyards; and, well, there was more than a sufficiency of beef, venison, goat's flesh, and stewed chickens, flavoured with a variety of very hot peppers in the pod, *farinha*, and fresh rolls of the whitest bread. The table groaned, but not for long, for the house was densely populated, and vacant places were speedily filled.

Almost equally notable was the hospitality we received at the small town of Maracas, near where resided one of our officer guards—a

colonel, by the way—who owned a *fazenda* a few miles distant. As it was necessary for us to remain in the town, he furnished an empty house there of his own, stocked it with supplies from his farm, and placed the whole at our disposal free of charge. Neighbours kept the house clean, and cooked our meals. What we lacked they provided. All the principal townspeople gave parties, and invited the strangers.

Every evening some entertainment or other was afoot, and when we remained at home they serenaded us in mass, brought guitars and sang, and danced the *maxixe* until cock-crow!

Maracas might be in the *Catinga* in the *Sertão*, many leagues from a railway station, and on a road to nowhere in particular, but its people were bent on showing that it was no one-horse village of the wilds. It had to maintain the reputation of Brazil for hospitality heaped up and running over, and it did. But it was everywhere the same in the *Sertão*. Those who had been generous with their possessions; those who had not, lamented their lack, but not on their own account.

III.

Hospitality where one pays to be able to take one's ease—that is, 'at one's inn'—may be looked for as a matter of course, but it is not always ungrudging. There is no Ritz, or Savoy, or Waldorf-Astoria in the *Sertão*, but on its borders flourished, and, it is to be hoped, still flourishes, a 'Hotel of All the Nations'; and, as more than one of the party declared that there his life was saved—for, as may be imagined, the spaces between the *fazendas* were both wide and hungry—'All the Nations' must not be omitted. The hostelry whose sign proclaims that it caters for all the peoples of the earth, or for such of them as are a nation, is situated at Cachoeira (waterfall), the limit of steam-boat navigation up the Rio Paraguassú from Bahia, and opposite São Felix, the terminus of the Central Railway. Returning after our many weeks of most fatiguing travel, it occurred to a wag of the party to order by telegraph a most elaborate dinner at 'All the Nations,' to be ready half-an-hour after the arrival at São Felix of the tri-weekly train from the interior. The telegram, despatched from a station some hundred and fifty miles down the line, specified various *hors d'œuvres*, soups, oysters, lobsters, fish, porterhouse steaks, omelettes, &c. sufficient for six people, and various wines and liqueurs for the same, everything, in short, that its compiler could think of as impossible or unattainable.

It was a screaming joke, of course. But 'All the Nations' rose to the occasion. I believe every item mentioned in the telegram was forthcoming, for on receipt of it our host had taken the boat to Bahia and ransacked the city. So half-a-dozen famished travellers feasted right

royally, but, as our hostess declared, never before had she set such a meal before six ragged *négres* (negroes)—no, not even in the Hotel of All the Nations! The fierce sun of the *Sertão* had burned our faces and hands almost black; the thorns of the *Catinga* had torn our clothes to tatters. But at Bahia, where we arrived next day, renewed respectability was assured.

Within half-an-hour of our reaching the city we received an invitation to breakfast the following morning with a prominent townsman, who, to do us honour, despatched a boat before sunrise across the beautiful Bay of All the Saints to the Rio Paraguassú, there to obtain for our delectation a certain famous freshwater fish, large as a salmon, delicate as a trout, whose name escapes, but whose flavour is a delicious memory. Only in clear, sparkling waters beyond tidal limits is that fish supposed to reach its greatest perfection, and, as our host insisted, nobody ought to leave Bahia without having experienced this epicurean delight. He also had the city scoured for pipless oranges, which, carved in shape of water-lily buds and blooms, and served on a snow-white napkin, were famous in Bahia generations before the American wizard, Luther Burbank, is supposed to have invented them. Guava jelly, and other *dulces* too numerous to record, our host set before us, finally presenting each of us with a box of cigars, grown in the State and made at Cachoeira, of an aroma and flavour that Cuba never surpassed—some say, never equalled. As in Bahia, so, with its small differences, in Rio; so at Santos; so at Pernambuco, where, if he will, the guest may depart garlanded—laden with a king's ransom of blossoms, armfuls of purple and mauve *Cattleya* orchids, and of scented roses such as England's June might match but not excel.

But it is in the *Sertão* that the native hospitality of the Brazilian finds its best expression, for there it is commonly exercised under difficulties. There are no fine shops within a stone's throw in the *Sertão*; no pipless oranges in *Catinga* scrub. Orchids there certainly are on the few trees that stand up from the prickly undergrowth, but, lacking axes or dynamite cartridges to topple down the trees, they are generally unattainable by the hurrying traveller, who, for good reasons, seldom cares to lag in the *Catinga*.

A WAVE AT KYNANCE.

A FLASH as of green on the peacock's sheen,
Or of emerald, wash'd in light;
As vivid as ray of the opal, seen
In a moment's tranced sight.

For an instant poised, with a sunlit dome,
Till the water's agleam with gold;
Then the emerald breaks into fairy foam,
And the jewel-wave's tale is told.

V. M. BROWN.

JOHN MACNAB: A COMEDY FOR POACHERS.

By JOHN BUCHAN, Author of *John Burnet of Barns, Greenmantle, &c.*

CHAPTER XIII.—continued.

SIR EDWARD LEITHEN left Crask just as the wet dawn was breaking. He had a very long walk before him, but at that he was not dismayed; what perplexed him was how it was going to end. To the first part, a struggle with wind and rain and many moorland miles, he looked forward with enthusiasm. Long lonely expeditions had always been his habit, for he was the kind of man who could be happy with his own thoughts. Before it became the fashion he had been a pioneer in guideless climbing in the Alps, and the red-letter days in his memory were for the most part solitary days. He was always in hard condition, and his lean figure rarely knew fatigue; weather he minded little, and he had long ago taught himself how to find his road, even in mist, with map and compass.

So it was with sincere enjoyment that his legs covered the rough miles—along the Crask ridge till it curved round at the head of the Doran and led him to the eastern skirts of Sgurr Dearg. He knew from the map that the great eastern precipice of that mountain was towering above him, but he saw only the white wall of fog a dozen yards off. His aim was to make a circuit of the *massif* and bear round to the pass of the Red Burn, which made a road between Haripol and Machray. He would then be nearly due north of the Sanctuary and exactly opposite where Lamancha proposed to make his entrance. . . . A fortnight earlier, when he first came to Crask, he had gone for a walk in far pleasanter weather, and had been acutely bored. Now, with no prospect but a wet blanket of mist, and with no chance of observing bird or plant, he was enjoying every moment of it. More, his thoughts were beginning to turn pleasantly towards the other side of his life—his books and hobbies, the intricacies of politics, the legal practice of which he was a master. He reflected almost with exhilaration on a difficult appeal which would come on in the autumn, when he hoped to induce the House of Lords to upset a famous judgment. He had begun to relish his competence again, even to take a modest pride in his fame; what had been tasteless in his mouth a few weeks ago had now an agreeable flavour. Palliser-Yeates was of the same way of thinking. Had he not declared last night that he wanted to give orders again and be addressed as 'sir,' instead of being chivvied about the countryside. And Lamancha? Leithen seriously doubted if Lamancha had ever suffered from quite the same malady. The trouble with him was that he had a large streak of bandit always in his composition, and must now and then give it play.

That was what made him the bigger man; perhaps Charles might take an almighty toss some day, but if he didn't he would be first at the post, for he rode more gallantly to win.

'I suppose I may regard myself as cured,' Leithen reflected, as he munched a second breakfast of cheese-sandwiches and raisins somewhere under the north-eastern spur of Sgurr Dearg.

His orders had been to get somewhere on the Machray side by eight o'clock, and he saw by his watch that he was well ahead of his time. Once he had turned the corner of Sgurr Dearg the wind was shut off and the mist wrapped him closer. He had acquired long ago a fast but regular pace on the hills, and, judging from the time and the known distance, he knew that he must be very near the Machray march. Presently he had topped a ridge which was clearly a watershed, for the plentiful streams now ran west. Then he began to descend, and soon was brought up by a raging torrent, which seemed to be flowing north-west. This must be the Red Burn, coming down from the gullies of Sgurr Dearg, and it was his business to cross it and work his way westward along the edge of the great trough of the Reascuill. But he must go warily, for he was very near the pass, by which, according to the map, a road could be found from Corrie Easain in the Machray forest to the Haripol Sanctuary—the road which, according to Wattie Lithgow, gave the easiest access and would most assuredly be well watched.

He crossed the stream, not without difficulty, and climbed another ridge, beyond which the ground fell steeply. These must be the screens on the Reascuill side, he concluded, so he bore to the right and found, as he expected, that here there was a re-entrant corrie, and that he was on the very edge of the great trough. It was for him now to keep this edge, but to go circumspectly, for at any moment he might stumble upon some of Claybody's sentries. His business was to occupy their attention, but he did not see what good he could do. The mist was distraction enough—in it no man could see twenty yards ahead of him; but it might clear, and in that event he would have his work cut out. Meanwhile he must avoid a premature collision.

He avoided it only by a hairbreadth. Suddenly that happened which at the moment was perplexing Wattie Lithgow and Lamancha a mile off. Corridors opened in the air—dark corridors of dizzy space and black rock seamed with torrents. Leithen found himself looking into a cauldron of which only the bottom was

still hid, and at the savage splinters of the Pinnacle Ridge. He was looking at something less welcome, for thirty yards off, on the edge of the scarp, was a group of five men.

They had been boiling tea in billies in the lee of a rock, and had been stirred to attention by the sudden clearing of the air. They saw him as soon as he saw them, and in a moment were on their feet and spreading out in his direction. He heard a cry, and then a babble of tongues.

Leithen did the only thing possible. He strode towards them with a masterful air. They were the real navy, the hardest race in the land, sleeping in drain-pipes, always dirty and wet, forgetting their sodden labours now and then in drink, but tough, formidable, and resourceful.

'What the devil are you fellows doing here?' he shouted angrily.

At first they took him for a gillie.

'What the hell's your business?' one of them replied, but the advance had halted. As he came nearer they changed their mind, for Leithen had not the air of a gillie.

'My business is to know what you're doing here—on my land?'

Now Machray forest was not let that season, and this Leithen knew. If any arrangement had been come to with Haripol, it could only have been made between the stalkers. It was for him to play the part of the owner.

The men looked nonplussed, for the navy, working under heavy-handed foremen, is susceptible to the voice of authority.

'We were sent up here to keep a lookout,' one answered.

'Lookout for what? Who sent you?'

'It was Lord Claybody—we took our orders from Mr Macnicol.'

Leithen sat down on a stone and lit his pipe.

'Well—you're trespassing on Machray—my ground. I don't know what on earth Lord Claybody means. I have heard nothing of it.'

'There's a man tryin' to poach, sir. We were telled to wait here and keep a lookout for him.'

Leithen smiled grimly. 'A pretty lookout you can keep in this weather. But that doesn't touch the point that you're in a place where you've no right to be. . . . You poor devils must have been having a rotten time roosting up here.'

He took out his flask. 'Here's something to warm you. There's just enough for a tot apiece.'

The flask was passed round amid murmurs of satisfaction, while Leithen smoked and surveyed the queer party. 'I call it cruelty to animals,' he said, 'to plant you fellows in a place like this. I hope you're well paid for it.'

'We're gettin' a pund a day, and the man that grips the poacher gets a five-pund note. The name o' the poacher is Macnab.'

'Well, I hope one of you will earn the fiver. Now, look here. I can't have you moving a yard north of this. You're on Machray ground as it is, for my march is the edge of the hill. I don't mind you squatting here, and of course it's no business of mine what you do on Haripol, but you don't stir a foot into Machray. With this wind you'll put all the beasts out of these upper corries.'

He rose and strolled away. 'I must be off. See that you mind what I've said. If you move, it must be into Haripol. A poacher! I never heard such rubbish. Better my job than yours, anyway. Still, I hope you get that fiver!'

Leithen departed in an atmosphere of general goodwill, and as soon as possible put a ridge between him and the navvies. It had been a narrow escape, but mercifully no harm was done. He must keep well below the skyline on the Machray side, because there would be watchers elsewhere on the Haripol ground, and he was not ready as yet to play the decoy-duck, for it had occurred to him that he was still too far east for his purpose. Those navvies were watching the pass from the Red Burn, and had no concern with what might be happening in the Sanctuary. Indeed they could not see into it, because of the spur which Sgurr Dearg flung out towards the Reascuill. He must be farther down the stream before he tried to interest those who might interfere with Lamancha; so he mended his pace, and, keeping well on the Machray side, made for the hill called Bheinn Fhada, which faced Sgurr Mor across the Reascuill.

Then the mist came down again, and in driving sleet Leithen scrambled among the matted boulders and screes of Bheinn Fhada's slopes. Here he knew he was safe enough, for he was inside the Machray march and out of any possible prospect of the Reascuill. But it was a useless labour, and the return of the thick weather began to try his temper. The good-humour of the morning had gone, when it was a delight to be abroad in the wilds alone and to pit his strength against storm and distance. He was growing bored with the whole business, and at the same time anxious to play the part which had been set him. As it was, wandering on the skirts of Bheinn Fhada, he was as little use to John Macnab as if he had been reading Sir Walter Scott in the Crask smoking-room.

It took him longer than he expected to pass that weariful mountain, and it was noon before he ate the remnants of the food he had brought in the hollow which lies at the head of the second main Machray corrie, Corrie na Sidhe. Here he observed that sight which at the same moment was confronting Lamancha on the Beallach looking over to Crask. The mist was thinning—not breaking into gloomy corridors, but lightening everywhere with the sun behind

it. The wind too had shifted; it was blowing in his face from the south. Suddenly the top of Stob Coire Easain in front of him stood clear and bright, and its upper crags, jewelled with falling waters, rose out of a rainbow haze. Far out on the right he saw a patch of silver which he knew for the sea; nearer, and well below, was an olive-green splash which must be the Haripol woods. And then, as if under a wizard's wand, the glen beneath him from a pit of vapour became an enamelled cup, with the tawny Reascuill looped in its hollows.

It was time for Leithen to be up and doing. He crawled to a point which gave him cover and a view into the glen, and searched the place long and carefully with his glass. There must be navy posts close at hand, but from where he lay he could not command the sinuosities of the hillside below him. He saw the nest of upper corries which composed the Sanctuary, but not the Beallach, which was hidden by the ridge of Sgurr Mor. . . . He lay there for half-an-hour, uncertain what he should do next. If he descended into the glen it meant certain capture, for he would be cut off by some

lower post. The only plan seemed to be to show himself on the upper slopes and then try to draw the pursuit off towards Machray, but he did not see how such a course was going to help Lamancha in the Sanctuary. The plan of campaign, he decided, had been a great deal too elaborate, and his own part looked like a wash-out.

He made his way along the hillside towards that Machray peak which bears the name of Clonlet, the wide skirts of which make one side of the glen above Haripol, the opposite sentinel to Stob Ban. He had got well on to the slopes of that mountain when he detected something in the glen below: men appeared to be moving down the stream—three at least—and to be moving fast. His sense of duty revived, for here seemed a task to his hand. He showed himself on an out-jutting knoll, and waited. The men below had their eyes about them, because he was almost instantly observed. He heard cries, he saw a hand waved, then he heard a whistle blown. . . . After that he began to run.

(Continued on page 434.)

THE VORACITY OF FISH.

By ERNEST PHILLIPS.

I.

THERE was a certain amount of comment in the papers over a news item illustrating the voracity of fish. An angler had caught a trout measuring $11\frac{1}{2}$ inches in length. He saw the tail of another protruding from its mouth, and on pulling this trout out discovered that it measured $7\frac{1}{2}$ inches. That a fish should attempt to swallow a brother only four inches shorter than itself did seem a somewhat remarkable fact, but all who have any experience of angling know that so far from such an incident being uncommon it can be easily capped by much stranger incidents. Why, as I write these lines I have before me a photograph of a couple of small pike which were found dead on the shore of a river in the south of England. One of them had tried to swallow the other and failed. Unable to rid himself of his 'prize,' he had choked, and they were washed ashore locked together in death. The real point of the story lies in the fact that a baby pike of $\frac{1}{2}$ lb. had tried to swallow a larger pike of $\frac{3}{4}$ lb. It was, of course, a physical impossibility; the larger fish could not have been accommodated in the stomach of the smaller one. It was, in the homely words of the old English saying, a true exemplification of the glutton's 'eyes being too big for its belly.'

The fact is that fish are extremely voracious; like most wild creatures, they eat when they can. African hunters tell us of lions that gorge

themselves on a 'kill' to such an extent that they are hardly able to walk away, and thus they fall easy victims to the gun. Fish have much the same disposition. They will eat till the food reaches the top of the gullet and actually protrudes from the mouth, and even then they are known to take an angler's bait. Pike, of course, are the most common examples that can be quoted in proof of this gluttony; and when it is remembered that there is a strong element of savagery in their disposition, and that they will attack any moving or glittering object that comes within their range of vision, it is not surprising that angling records are full of strange tales. The difficulty is to convince the general reader of the truth of many of these stories. It has been a hobby of mine to collect and compile records of out-of-the-way incidents in fishing. I have verified as many as possible. Where it was feasible I have had photographs taken. Thus the stories that follow are offered as genuine, and the reader may be assured in advance that he may take any of them without that grain of salt which is supposed to be indispensable to the digestion of fishermen's yarns.

II.

Let us look first at a few pike stories. The non-angling reader must grasp the idea that the pike is a savage and ruthless enemy of nearly all other kinds of fish. Not for nothing is he called the fresh-water shark. He does not

spare even his own kind, for pike prey one upon another just as readily as they prey upon other species. It is reckoned that a pike eats his own weight of food every week. Thus a 20-lb. fish will require 20 lb. of fish-food per week. He will take toll of salmon, trout, roach, bream, eels, or anything else; if these are not available he will make shift with rats, ducks, pheasants, stoats, or anything that dares to encroach upon his preserves. A 2-lb. pike has been found with another of a pound in his inside. One of 3½ lb. contained a trout of 1¼ lb. A very small pike, only about 1 lb. in weight, had eight roach in his stomach when an angler caught him by using a ninth roach as bait. A *Fishing Gazette* photograph showed a pike of 2½ lb. choked by a young salmon of exactly the same weight, but an inch and a half longer than the pike. Another, 3 lb. 6 oz., was choked by a pound trout. Still another, weighing 27 lb., contained two sea trout, one 3½ lb. and the other 1½ lb. One of 14½ lb. had in him a salmon of 3 lb. Then there is the authenticated case of a 10-lb. pike in a Brighton aquarium, which for weeks lived in amity with a brother of 4 lb. One morning when the keeper arrived he found the smaller one missing, and the distention of the survivor's stomach left no doubt as to his unhappy fate. In further proof that they prey upon their own species, one or two other events may be recorded. A 21-lb. pike was found dead on the Welsh Wye, with another of 6 lb. fast in his gullet. The big one had to be cut open to release the victim, and it was then seen that the smaller fish was itself over two feet long. A similar incident is recorded from Lake Windermere. A pike was observed floating on the surface in a helpless state. When netted it was seen that it had another pike firmly wedged in its gullet. The bigger fish weighed 11 lb., and it had tried to swallow one of 4 lb. In Ireland an angler hooked and was reeling in a pike of 8 lb., when he saw a bigger pike seize it by the tail. The second fish got away, but the first bore several new gashes on his body, and the size of the teeth marks suggested they had been made by a monster fish. An English angler in the Midlands lost a pike this way. He hooked one, about 4 lb., and was reeling it in, when he saw a bigger fish dart from the depths, seize it in his jaws, and wrench it from the hooks.

III.

Now to turn to other victims. Dozens of pike have been caught with rats in their inside, some of them so recently seized that the tail was hanging from the mouth of the fish when the angler made his capture. They will take even that blood-thirsty little creature the stoat. A shepherd's dog once started a stoat out of the flags at a river-side, and it took to the water; but a yard or two away it was seized by a pike,

and a few bubbles on the surface told the tale of its end. Ducklings fall an easy prey, and so do water-hens. Even wild-fowl and pheasants, shot overland, have been seen to collapse over a stream and fall into the water, and instantly a pike has darted up and taken them. On the Irish Shannon shooting men say they lose numbers of wood pigeons the same way. On a Norfolk Broad a keeper shot a wild fowl, which fell into the water, and it was instantly seized by a pike. He shot another, which dropped into the lake, and it too was taken by a pike. But this time the keeper was ready. He shot the pike, and retrieved both it and the bird. It was not the same as the first fish, for no bird was found in its stomach, but it held two ordinary-sized rats!

Many a pike meets its end through its insensate savagery. In Ross-shire an angler was drawing in a 2-lb. trout. A pike attacked it, would not release its hold, and was netted. This is so common an experience that further instances need not be given. But here is something rather different. When coarse-fishing, anglers put small fish into what is called a 'keep net.' They hang this so that it rests in the water, the intention being to release the fish when the day's sport is over. Many a pike, seeing these small fish, has attacked them, and has got his teeth so firmly fixed in the net that it was easy for the angler to lift him on to the bank. In one such case, however, the pike got away. He simply wrenched the net off its staple, and bolted with net and contents. Then again, there are plenty of stories of how one pike has been caught by two fishermen at once. It has seized a bait, and as it was being reeled to the side it has seen the second bait. Despite the rough usage it was receiving, in its anger it has turned on the second bait and grabbed that too, and thus been twice hooked. When this occurs in a fishing match it is a fine point for the judge to decide to which of the two anglers the fish belongs.

Strange things, apart from fish and birds, are found in the inside of pike. I have seen a four-inch meat-hook taken from a pike of only medium size. What became of the butcher? A pike of 32 inches, caught on Barton Broad, contained two roach, two pieces of wire, a steel spanner, and two keys tied together; while the stomach of an Irish pike contained a rosary, a pocket handkerchief, and a rubber purse containing twenty sovereigns. How did they get there? A 24-lb. pike out of Rydal Water, that held a duck, a rat, and a 2½-lb. pike; and one from Staffordshire that had swallowed 274 small bream and roach, are other examples.

There are quite a number of stories of pike attacking human beings. Many of these lack proof, but there are others that appear quite genuine. A correspondent in *Country Life* wrote that as he was bathing in the Leicester-

shire river Soar his hand was bitten by a pike, and the teeth marks were shown in proof. Mr Cholmondeley-Pennell, the angling author, wrote that after he had landed a Thames pike the fish sprang from the ground and bit him on the leg. A Yorkshire angler, fishing the Yore, was trying to land a pike without a net, when it bit him so badly on the hand that he had to have the gash stitched up by a doctor. But the story which best illustrates the savagery of the pike is that of a boy who, after bathing in a stream at Pickering, Yorkshire, sat on the bank and dangled his feet over the side, and though they were some distance above the water-level he maintained that a pike jumped up and bit one of them. Confirmation was supplied by the local doctor, who was sent to the lad, and who deposed that the gashes corresponded exactly with what he believed were wounds made by the teeth of a fish.

IV.

Other fish beside the pike show a similar tendency to voracity. The salmon is not usually credited with this disposition; indeed, scientists tell us that salmon do not feed in fresh water, yet occasionally they are found with rats and frogs in their inside. There is, however, one case of a salmon biting a human being. An angler wrote to the *Fishing Gazette* to say that after he had landed a salmon from a Devonshire river it turned on his gillie and bit him through the thumb. The gillie said that in an experience of thirty years he had never met or heard of such an experience before.

If there are not many instances of salmon voracity there are plenty when we come to consider the case of the trout. On the Devonshire Otter a trout was found dead with an eel half down his throat and the other half round his gills—and I might have quoted more than one similar case in dealing with pike. The fact is that the trout is by way of being somewhat of a glutton. A Leeds angler once took a 1½-lb. trout with a rat sticking out of its gullet. That the dainty trout should eat rats will come as a surprise to many, but the fact is well established. At a fish-breeding establishment with which I was connected the owner recognised this weakness. At threshing-time he gave coppers to the farmers' lads for every live rat they brought. These were liberated at the side of a breeding-pond containing trout up to 8 lb. apiece. The rats started to swim across, but not one in a dozen reached the opposite bank. The trout were waiting. They came up with a rush. There was a squeal, a flurry, and all was over. Trout will eat frogs and toads, and a specimen of 5 lb. was once found choked by a very big frog which he had tried to swallow, but which had got a leg through a gill, and could move neither backward nor forward. Indeed, trout are really very big eaters. Lord Buxton tells of one caught

in the mayfly season which contained 960 mayflies; and he caught another which had 79 minnows neatly packed away in its inside. A trout of ¾ lb. caught in the river Frome, Dorset, contained 46 minnows; and one of 1½ lb., caught in the Herefordshire Wye, yielded up 35 minnows, 1 gudgeon, 3 salmon smolt, and a few eyed ova. Trout will even go for pike, which is turning the tables with a vengeance on their hereditary foe. More than one big trout has been caught with pike in its stomach. This leads to the conclusion that the trout is by no means the timid creature some anglers regard it. As an example, a Scottish angler once hooked a trout. It broke away after a desperate struggle. His bait was still in the water. Instantly the trout, as though thinking it was the cause of its trouble, turned on it and seized it again, and this time the fisherman landed it. There are other instances that show boldness on the part of trout. A Derbyshire angler, on the Derwent, hooked a trout on a minnow. As he played it, the minnow was hanging outside the mouth of the fish. A second trout came up, pecked at the minnow, and finally hooked itself. It rounds the story off to say that the angler landed them both. A Devonshire angler was landing a dace of about nine inches in length. A trout seized it by the head; then a second trout seized it by the tail. They wrenched it from the hook, and the last the angler saw of his dace was the two trout gripping it firmly as they sank out of sight. Like a pike, a trout is attracted by glittering objects. Thus a picnic party, in a boat on a Scottish loch, lost a nine-inch dessert knife overboard. As it descended into the depths, spinning and gleaming, a 5-lb. trout rushed up and took it. Later, the trout was taken, and the knife recovered.

The eel, too, is a very voracious fish, and specimens are often found dead through attempting to swallow fish too large for the throat. Small fish are frightened of eels. An angler caught a small eel, and put it alone in a can with a number of small roach. Instantly they jumped out on to the grass. He put them back, and they jumped out again. Then he threw the eel into the river, and peace was restored. Indeed, there is hardly any British fish which need be absent from this collection. The perch is a very bold biter, and can be frightened away only with difficulty. Many a time have I hooked a perch, marked him before release, and caught him a few minutes later. But the perch story that caps all others is an incident told by a well-known angler. After catching a perch, he was liberating him, when by accident he tore an eye out on his hook. After putting the fish in the water he dropped in his hook again, baited as it was with the eye. In less than a minute he had caught a perch, and lo! it was the one he had just put back. It had taken its own eye as bait!

Chambers's Journal

SEVENTH SERIES

ON THE WATERWAYS OF FRANCE.

By Captain H. T. MUNN, F.R.G.S., Author of *Tales of the Eskimo*.

THE good-looking captain of the river steamer plying from Le Havre to Rouen was very serious when I suggested to him that our canoe should be taken to Rouen. 'But,' he exclaimed, 'a bateau! There is no room for such a thing.' He laughed heartily when he saw our 15½-foot Canadian canoe. 'Pouf!' he said; 'that toy! We will hang it in the saloon as an ornament'—an arrangement later modified by lashing it inside the rail of the steamer.

Soon after 8 A.M. on 15th September we put our little craft in the water in the presence of a small crowd of interested observers. W. W. H.—whom I will call A. for short—had explained to the porter at our hotel the previous evening that we were going to canoe to Paris. 'Ah,' he said, 'it is a little boat with a motor, doubtless?' A. explained carefully that the propelling forces were our paddles and our arms only. 'To Paris, and with the arms!' exclaimed the incredulous porter; 'but, m'sieu, *why?* Is there not the train four times a day?'

Gustave—the assistant—ventured it would be 'good for the biceps,' but the porter shook his head and turned gloomily away. 'These mad Englishmen are going to drown themselves,' he muttered; it was no affair of his. Similar gloomy forecasts were made by the onlookers at our start.

The Seine is tidal to the first lock, about fifteen miles above Rouen, and when it is running out it is a swift and eddying river. A small canoe on the Seine is not for beginners at the game.

A. said he had a faultless French accent, but a small vocabulary; like the curate's egg, it was good in parts only. I think it was at Elbeuf that we made our first déjeuner. A. mentioned that 'soissons' on the menu was obviously a new sort of Swiss cheese (it was in the place 'cheese' would occupy on an English bill-of-fare). When a large dish of haricot beans arrived his 'Menu French' received the first of many jolts.

To canoe leisurely up the Seine—or better, down it—is a wonderful voyage. Such places as Pont de l'Arche—beloved of artists—Les Andelys or Mantes are mediæval towns of surprising beauty, and at Les Andelys Richard Cœur de Lion's noble castle fascinated us. 'Ah,

but she is beautiful, my daughter of a year,' exclaimed Richard; and it is easy to believe the warlike monarch worshipped this impregnable castle, as it must have been in the twelfth century.

Paris and the bridges of the Seine! Anyone making a voyage up or down the river through Paris becomes confused with the number, the beauty, and the variety of these splendid bridges; also from the Seine the finest view of Notre Dame may be obtained. In Paris the Seine water is extremely unattractive; in the eddies at the sides are countless thousands of corks, scores of dead dogs and cats, and other flotsam suggestive and significant; we decided we would not be upset in the Seine hereabouts.

We made Choisy-le-Roi our first evening beyond Paris. Here died Rouget de Lisle, author and composer of that greatest of all war-songs, 'The Marseillaise.' At the inn of that name pretty Marie and Germaine entertained us with accounts of the passing of the American soldiers in the war—they were small school-girls at the time—and repeated many of their queer phrases and slang expressions.

Past the forest of Fontainebleau, and the wireless station on the Seine at Moret, we turned off into our first canal—or canalised river—the Canal du Loing.

Nearly a month on the canals, paddling twenty-five to thirty miles a day, has left us still uncertain where the most beautiful scenery was found. Rather than canals—as we understand the word in England—those of France are gracious tree-embowered waterways, vista after vista of surpassing beauty and varied scene. Bird life, with two exceptions, is conspicuously scarce, one being the magpie and the other the kingfisher. The latter beautiful little birds are in surprising numbers, and I saw some in the heart of Paris itself; they are plentiful on most of the canal-ways we travelled, and always a joy to watch.

Beyond Nemours—a wonderful old mediæval town—we passed the height of land between the Seine and the Loire, and descended to the magnificent aqueduct which spans that river by the Canal de Briare. Once on the left bank of the Loire, we travelled parallel to it by the Canal Latéral through a rich farming and

vineyard country, halting a couple of days at Nevers, and recrossing the Loire at Decize. The Loire was in full flood, and I think we disappointed a small crowd of Sunday fishermen who watched us enter it from the canal lock, to be whirled like a leaf down its course and under the fine old stone bridge. 'They are mad,' I heard an old gentleman affirm; 'and the bodies will not be found for weeks!'

The divide between the Canal du Nivernais and the Yonne river was one of the beauty-spots of the journey. We emerged from a tunnel, the approach to which was so dainty and well-kept we thought we had got on to a private water-way to some château. Inquiry proved we were still on the Canal du Nivernais, and the farther side of the tunnel found us overlooking a beautiful landscape of vineyards and distant hills, the green fields of the valley dotted with the white Nivernais cattle.

Here we descended twenty-five locks within about three miles, portaging them all, this being much quicker than locking through. I think it was the next day I had a conversation with an old peasant woman, who told me that her age was eighty-six; that she had worked all her life, and was now going to her little garden to get up her potatoes. 'The good Lord gave me a good stomach, m'sieu,' she said, 'and that is still very good—but the back and the legs! alas, they are getting old and worn out.' We always found the peasants and the country folk charmingly courteous and anxious to give us advice or assistance.

In due course the Yonne took us once more to the Seine, and our 'promenade' was down the river we had previously ascended.

The Seine fishermen deserve a passing reference. Never have I seen so many people fishing so earnestly and seriously with such meagre results, for a tiny fish the size of a sprat seemed the usual, though infrequent, catch. Once we saw a fisherman land a fish about the size of a herring. His shout of triumph brought his friend (fishing a hundred yards below him) at the run, and as soon as he saw this prodigy he embraced the lucky man with fervour. I suppose a 7 or a 10 lb. pike would be the occasion of a village festival.

The Seine fishermen are a dour and jealous folk. To come round a corner and find one watching his quill float with intense earnestness often elicited an angry '*au large, m'sieu, au large*' (further out, sir, further out), even if he had been driven up the bank a few minutes before by the wash of a speedy motor-boat.

France, as we saw it, is working, and working hard. All the great factories on the Seine, or at any city we passed, are hives of industry. The village blacksmith's hammer was going at six in the morning, and Sunday gave no cessation of work in the fields and the vineyards. The only idle men we saw were the Seine fishermen—and they would fiercely resent the implication if it were suggested to them.

The permit to travel on the French canals—obtained from the Public Works Department—costs nothing, and no charge is made for the use of the locks. The average cost per day to us, including everything, worked out at less than nine shillings each, nor did we stint ourselves in anything.

I know of no more delightful holiday than a canoe trip on these wonderful French waterways.

JOHN MACNAB: A COMEDY FOR POACHERS.

CHAPTER XIII.—continued.

AT this point the chronicler must retrace his steps and follow the doings of Mr Johnson Claybody. That young gentleman had taken the threat of John Macnab most seriously to heart; he felt his honour involved, his sense of property outraged; and he saw the pride of the Claybodys lowered if the scoundrel were victorious on Haripol, as he had been at Strathlarrig. Above all, he feared the Press, which was making a holiday feature of this monstrous insolence. He it was who had devised the plan of defence, a plan which did credit to his wits. Not only had he placed his sentries with care, but he had arranged for peripatetic gillies to patrol between the stations and form an intelligence service for headquarters. His *poste de commandement* was at Macnicol's cottage, just beyond the gorge of the Reascuill and some two miles from the house.

All morning his temper had been worsening.

The news of the journalistic invasion of Haripol, brought to him about ten o'clock by a heated garden-boy, had been the first shock. He had sent a message to his father, handing over that problem to him, with the results which we have seen. Also, he was lamentably short of the force he had hoped to muster, owing to his mother's insistence on keeping Macnicol and two of the gillies behind to look for her dog. It was not till close on midday that, after a furious journey to the house in a two-seater car, he was able to recover the services of the head stalker. Macnicol, he felt, should have been on the edge of the Sanctuary at daybreak; instead, he had had to send Macqueen, a surly ruffian whom he had dismissed for insolence, but whose hillcraft he knew to be of the first order. Johnson's plan was that towards midday he himself with a posse should patrol the upper forest, so that if John Macnab should be lurking

there he might drive him north or south against the navy garrison. East, Sgurr Dearg shut the way, and west lay the grounds of Haripol, where escape would be impossible, since every living thing there was on the watch. Johnson's blood was up. If John Macnab had made his venture he wanted to share directly in the chase and to be in at the death.

It was after midday before the flying column started. It was composed of Johnson himself, Macnicol, Cameron the third stalker, two selected gillies, and three of the navvies who were more mobile than their fellows. Macnicol had prophesied that the weather would clear in the afternoon, so, though the mist was thick at the start, they took the road with confidence. Sure enough, it began to lift before they were half a mile up the glen, and Macnicol grunted his satisfaction. 'Macnab cannot escape noways,' he said. 'But I do not think he has come at all, unless he's daft. He would not get in; but if he is in, he will never get out.'

Johnson's one fear now was that the assault should not have been made. It would be a poor ending to his strategy if the pool was dragged and no fish was found in it. But presently he was reassured, for at the foot of Bheim Fhada he met one of the patrolling gillies with tremendous news. A man had been seen that morning by the navvies at the Red Burn. He had passed as the laird of Machray, and had given them whisky. The gillie knew that the laird of Machray was a child of three, dwelling at Bournemouth, and he had demanded a description of the visitor. It was a tall man, they said, lean, and clean-shaven, rather pale, and with his skin very tight over his cheek bones. He had looked like a gentleman and had behaved as such. Now, the only picture of John Macnab known to the gillies was that which had been broadcast in talk by Angus and Jimsie of Strathlarrig, and that agreed most startlingly with the navvies' account. 'A long, lean dog,' Angus had said, 'and whitish in the face.' Wherefore the gillie had hastened with his tidings to headquarters.

The news increased Johnson's pace. John Macnab was veritably in the forest, and at the thought he grew both nervous and wrath. There was something supernatural, he felt, about the impudence of a man who could march quietly up to a post of navvies and bluff them. Were all his subtle plans to be foiled? Then, half a mile on, appeared Macqueen, just descended from his eyrie.

Macqueen had to report that half-an-hour before, when the mist cleared and he could get a view of the corries, he had seen the deer moving. The wind at the same time had shifted to the south, and the beasts in the corrie below the Beallach were frightened. He had seen nothing with his telescope—the beasts had been moved some time before, he thought,

for they were well down the hill. In his opinion, if John Macnab was in the forest, he was on or beyond the Beallach.

Johnson considered furiously. 'The fellow was at the Red Burn just before nine o'clock. He must have gone through the Sanctuary to be at the Beallach half-an-hour ago. Is that possible, Macnicol?'

'I don't ken,' Macnicol scratched his head. 'Macqueen says that only the beasts in the corrie below the Beallach were moved, but if he had gone through the Sanctuary they would have been all rinnin' oot. I'm fair puzzled, sir, unless he cam' down the watter and worked up by Sgurr Mor. Yon Macnab's a fair deevil.'

'We'll get after him,' Johnson said, and then he stopped short. He had a sudden memory of what had happened at Glenraden. Why should not John Macnab have sent a confederate to gull them into the belief that he was busy in the Sanctuary, while he himself killed a stag in the woods around the house? There were plenty of beasts there, and it would be like his infernal insolence to poach one under the very windows of Haripol. It was true that the woodland stags were not easy to stalk, but Macnab had shown himself a mighty artist.

Johnson had a gift of quick decision. He briefly explained to his followers his suspicions. 'The man at the Beallach may not be the man whom the navvies saw at the Red Burn. The Red Burn fellow may have gone down the Machray side, and be now in the woods.—Cameron, you take Andrew and Peter, and get down the glen in double quick time. If you see anybody on Clonlet or in the woods, hunt him like hell. I'll skin you if you let him escape. Drive him right down to the gardens, and send word to the men there to be on the lookout. You'll be a dozen against one.—Macnicol, you come with me; and you, Macqueen, and you three fellows; and we'll make for the Beallach. We'll cut up through the Sanctuary, for it don't matter a damn about the deer if we only catch that swine. He's probably lying up there till he can slip out in the darkness.—And, Cameron, tell them to send a car up the Doran road. I may want a lift home.'

It was Cameron and his posse who spied Leithen on the side of Clonlet. All three were young men, and they had the priceless advantage of acquaintance with the ground, while Leithen knew no more than the generalities of the map. As soon as he saw that he was pursued he turned up hill, with the purpose of making for Machray. He had had a long walk, but he felt fresh enough for another dozen miles or so, and he remembered his instructions to go north, even into Glenaicill if necessary.

But in this he had badly miscalculated, for

the whistle of Cameron had alarmed a post of navvies in a nook of hill behind Leithen and at a greater altitude, who had missed him earlier, for the simple reason that they had been asleep. Roused now to a sudden attention, they fanned out on the slope, and cut him off effectively from any retreat towards Corrie na Sidhe. There were only two courses open to him—to climb the steep face of Clonlet or to go west towards the woods. The first would be hard; he did not even know whether the rock was climbable, and if he stuck there he would be an easy prey. He must go west, and trust to find some way to Machray round the far skirts of the mountain.

Cameron did not hurry, for he knew what would happen. So long as the navvies cut off retreat to the east the victim was safe. Leithen did not realise his danger till he found himself above the woods on a broad, grassy ledge just under the sheer rocks of Clonlet. It was the place called Crapnagower, which ended, not in a hillside by which the butt of Clonlet could be turned, but in a bold promontory of rock which fell almost sheer to the meadows of Haripol. Long before he got to the edge Leithen had an uncomfortable suspicion of what was coming, but when he looked over the brink and saw cattle at grass far below him he had an ugly shock. It looked as if he was cornered, and cornered, too, in a place far from the main scene of action, where his misfortunes could not benefit Lamancha.

He turned and plunged downwards through the woods direct for Haripol. There was still plenty of fight in him, and his pursuers would have a run for their money. Those pursuers were not far off. Andrew had climbed the hill and had been moving fast, parallel to Leithen, but lower down among the trees. Cameron was on the lower road, a grassy aisle among the thickets, and Peter, the swifter, had gone on ahead to watch the farther slopes. It was not long before Leithen was made aware of Andrew, and the sight forced him to his right in a long slant which would certainly have taken him into the arms of Peter.

But at this moment the Fates intervened in the person of Crossby. That eminent correspondent, having inspired his fellow-journalists with the spirit of all mischief, and thereby having sadly broken the peace of Haripol, was now lying up from farther pursuit in the woods, confident that he had done his best for the cause. Suddenly he became aware of the ex-Attorney-General descending the hill in leaps and bounds, and a gillie not fifty yards behind on his trail. Crossby behaved like Sir Philip Sidney and other cavaliers in similar crises. 'Thy need is the greater,' was his motto, and as Leithen passed he shouted hoarsely to him to get into cover. Leithen, whose head was clear enough though his legs were aching, both heard and

saw. He clapped down like a woodcock in a patch of bracken, while Crossby, whose garb and height were much the same as his, became the quarry in his stead.

The chase was not of long duration. The correspondent did not know the ground, nor did he know of the waiting Peter. Left to himself, he might have outdistanced Andrew, but he was watched from below by wily eyes. He reached the grassy path, turned to his right, and rounded a corner, to be embraced firmly and affectionately by the long arms of the gillie. 'That's five pund in our pockets, Andra ma man,' the latter observed when the second gillie arrived. 'If this is no' John Macnab, it's his brither, and anyway, we've done what we were telled.' So, strongly held by the two men, the self-sacrificing Crossby departed into captivity.

Of these doings Leithen knew nothing. He did not believe that Crossby could escape, but the hunt had gone out of his ken. Now it is the nature of man that, once he is in flight, he cannot be content till he finds an indisputable place of refuge. This wood was obviously unhealthy, and he made haste to get out of it. But he must go circumspectly, and the first need was for thicker cover, for this upper part was too open for his comfort. Below he saw denser scrub, and he started to make his way into it.

The trouble was that presently he came into Cameron's view. The stalker had heard the crash of Crossby's pursuit, and had not hurried himself, knowing the strategic value of Peter's position. He proposed to wait in case the fugitive doubled back. But suddenly he caught sight of Leithen farther up the hill, and apparently unfollowed. Had the man given the two gillies the slip? Cameron performed a very creditable piece of stalking. He wormed his way upward till he was above the bushes where Leithen was now sheltering. The next thing that much-enduring gentleman knew was that a large hand had been outstretched to grab his collar.

Like a stag from covert Leithen leaped forth, upsetting Cameron with his sudden bound. He broke through the tangle of hazel and wild raspberries, and stayed not on the order of his going. His pace downhill had always been remarkable, and Cameron's was no match for it. Soon he had gained twenty yards, then fifty, but he had no comfort in his speed, for somewhere ahead were more gillies, and he was being forced straight on Haripol, which was thick with the enemy.

The only plan in his head was to make for the Reascuill, which, as he was aware, flowed at this part of its course in a deep-cut gorge. He had a faint hope that, once there, he might find a place to lie up in till the darkness, for he knew that the Highland gillie is rarely a rock-climber. But the place grew more horrible as

he continued. He was among rhododendrons now and well-tended grass walks. Yes, there was a rustic arbour and what looked like a summer-seat. The beastly place was a garden. In another minute he would be among flowers-pots and vineries, with twenty gardeners at his heels. But the river was below—he could hear its noise—so, like a stag hard-pressed by hounds, he made for the running water. A long slither took him down a steep bank of what had once been foxgloves, and he found his feet on a path. And there, to his horror, were two women.

By this time his admirable wind was considerably touched, and the sweat was blinding his eyes, so that he did not see clearly. But surely one of the two was known to him?

Janet rose to the occasion like a bird. As he stood blinking before her she laughed merrily. 'Sir Edward,' she cried, 'where in the world have you been? You've taken a very rough road.' Then she turned to Lady Claybody.

'This is Sir Edward Leithen. He is staying with us, and went out for an enormous walk this morning. He is always doing it. It was lucky you came this way, Sir Edward, for we can give you a lift home.'

Lady Claybody was delighted, she said, to meet one of whom she had heard so much. He must come back to the house at once and have tea and see her husband. 'I call this a real romance,' she cried. 'First Mr Palliser-Yeates, and then Sir Edward Leithen dropping like a stone from the hillside.'

Leithen was beginning to recover himself. 'I'm afraid I was trespassing,' he murmured. 'I tried a short-cut and got into difficulties. I hope I didn't alarm you coming down the hill like an avalanche. I find that the easiest way.'

The mystified Cameron stood speechless, watching his prey departing in the company of his mistress.

(Continued on page 461.)

STARS AND THEIR WIRELESS MESSAGES.

II.—THE SHAPE OF OUR STELLAR UNIVERSE.

By Professor GEORGE FORBES.

FOLLOWING upon the point considered in our previous article, we may be desirous to form true conclusions, from the signals sent to us by different classes of stars, concerning the materials of which they are composed. To do this it is absolutely essential that we bear in mind much of what has been established by astronomers about the distribution of the stars in space and the form of the stellar universe, for it has been noted that the stars are, for the most part, to be found in certain well-defined and limited regions of space. The stars in these regions are now spoken of by astronomers as forming the 'stellar universe.' And these do not seem to extend to anything like an infinite distance, although, of course, stellar distances are always so great as to be unrealisable by human minds.

The greatest fact about stellar distribution is that by far the greater number of stars are found among those constellations that are traversed by the Milky Way. This belt, often called the Galaxy, shows up in its full glory only on a brilliant moonless night. To the naked eye it looks like a broad wash of white paint on the celestial vault. It is an arch going right across the sky from horizon to horizon. It is continued through the constellations of the southern hemisphere, which are below our horizon, and therefore unseen by us. In fact, it forms a flat ring that envelopes the region of space occupied by the solar system.

We can trace it among constellations well known to us. On a summer evening we see it

starting as a double band from Sagittarius and Ophiuchus. It rises up through Aquila to Cygnus, where the two branches join together. Thence it passes as a single band through Cassiopeia, Auriga, Gemini, and Orion. We then follow its course between Sirius and Procyon towards Puppis and Carina, and it continues its way among the southern constellations, going through the Southern Cross.

What looks to the naked eye like whitewash has its wonderful structure disclosed, even in a very small telescope, as consisting of myriads of stars too feeble to be distinguished by the naked eye. Larger telescopes reveal fainter, more distant, stars. The most distant stars in the Galaxy that our telescopes have hitherto reached are ten thousand million times fainter than some of the first-magnitude stars. In the Milky Way we are thus limited only by the power of our telescopes. In all other directions, except on or near the Milky Way, an increase in power of telescopes does not go on adding prodigiously to the number of these faint stars, for the most distant stars in regions clear of the Milky Way are much closer to us than those in the region of the Milky Way. In fact it is now known that, inside the flat, extended ring of space containing the stars of the Galaxy, there is a nearly globular space (generally described as 'bun-shaped') filled with almost all the stars of our stellar universe that are not in the ring of the Galaxy.

The galactic ring contains probably a thousand million stars for every million in the bun-shaped

space, because it extends to a distance so much greater. These recent discoveries about the form and structure of our stellar universe prove it to be based upon the Milky Way as a foundation, and the further we advance in new discoveries, the more clear becomes the fundamental importance of the Milky Way. The bun-shaped region has its own importance as being the region in which our own star, the sun, with the solar system, is situated.

Following upon the discovery of the shape of our stellar system, our interest is raised almost to the point of enthusiasm when we know that in many constellations there are minute luminous cloud-spots, called 'spiral nebulae,' whose form is identical with that which belongs to our own stellar system. They have a bun-shaped central luminosity, surrounded by a ring of spiral luminosities. Each luminosity is due to myriads of minute stars, too close for us to separate them. The resem-

blance to our own system is perfect, and they may be quite outside of, and disconnected from, our own stellar system. These spiral nebulae might be regarded as 'island universes' like our own stellar universe. Some astronomers go so far as to say that an observer on any planet that may exist in one of these 'island universes' would see our Milky Way and bun-shaped nucleus as a spiral nebula.

The photographs of these spiral nebulae taken with very large telescopes are perfectly beautiful and very suggestive. The finest of them all is the 'whirlpool nebula' in the 'Hunting Dogs,' a constellation south of the Great Bear's Tail. This nebula probably resembles our stellar universe more than any other, for reasons that will be told presently. Its special feature is a second glowing mass, like the central one, forming the outer extremity of one of the spiral arms of luminosity.

THE LIVING BRANCH.

CHAPTER I.—*continued.*

VI.

CONNIE sat for a moment, loath to surrender an evening that was the doorstep to something so different. She was glad now that she had said nothing of George Pirbright, and Sybil had run true to form. Such a match would be the most suitable thing imaginable. As to herself, the picture of Mary Mostyn was rather depressing, and she was wondering how she would stand the wear and tear, when there sounded another tap at the door, and Mrs Jennison came in.

'How good of you,' said the girl. 'Do sit down.'

Mrs Jennison took Sybil's chair, declined a cigarette, and gave her guest a quick, approving smile. 'I just wanted to say something there was no chance of saying downstairs. My dear, I do congratulate you both. It's the sort of thing that warms one's heart.' She patted Connie's hand.

'Then you don't think we're foolish young people who have acted on impulse?'

'No—though, to be quite frank, it's hardly what I expected. I rather thought it would be some one else, but when George Pirbright went off this morning I knew what that meant. It must have been a strange experience for him,' Mrs Jennison added reflectively.

'It was for me,' said Connie.

The other woman's lips took on a sudden curve. 'It's all curiously like my own. When Bob and I married we had hardly anything, and I'd just refused some one with a good deal, but the thing that was *me* felt safer with Bob, and

I've never regretted it. Perhaps it's easy to look back from this distance and be pleased with one's own judgment, but I remember a good many heart-searching hours at the very first, and thought that perhaps—'

'It's awfully decent of you to say that. I never knew, and thought that Mr Jennison was always well off. Sybil was here a minute ago. She didn't want to put me up in the air, but she would have if I wasn't so really happy over it all. You see, I know her so well that it wasn't any use trying to say much. What she couldn't understand was what I was going to get out of it. But it isn't that—it's what I want to put in.'

'Yes, I know. I feel that, too. With us the pinch came almost at once. It was the work without apparent results that was hardest, living on one's belief in the future, and being always confident it would come. When a woman sees her husband toiling without the reward she knows he deserves, it's harder on her than on him. One couldn't say that except to a woman, but the man has the work to carry him through. I don't mean that she hasn't a lot on her shoulders—she has; but it isn't what you would call invitational, and she's constantly disciplining herself so as not to stand in any way between him and his objective. It's so hard to remember that this is the same for them both. The result is, she's bound to feel side-tracked now and again. When it's all over she looks back and laughs, and it's the laugh that she must look forward to, the being able to smile at things that at the moment are rather grave. So when I heard about you and Jack, I knew you had this

in prospect. Is all this like a sermon to young wives?’

‘No, and I like it. It—it fits in awfully well.’

‘I’m glad, because I’m taking advantage of my twenty years’ seniority, and haven’t any girl of my own—worse luck. Which reminds me that when you come to England you’re to head straight for Marchmont whenever you want to get away from over-sympathetic relations.’

Connie’s eyes grew very soft. ‘How sweet of you.’

‘Not a bit. We want you, both, as often as possible. And now that everything’s come off so happily, I rather feel like being congratulated myself.’

‘About us?’ asked Connie, wondering a little.

Mrs Jennison nodded. ‘Yes. As a matter of fact I took a bit of a leap, though it wasn’t quite in the dark. It concerns you both, and it’s a nice thing to be able to say to a girl whom you know is absolutely happy and content in her decision. You see, Bob and I know Jack extremely well—we have for years—and about a month ago he came to see me about you.’

‘About me?’

‘Yes; and, my dear, I could have kissed him for it. I rather think I did. He just said that he had loved you for two years, and that as things stood he couldn’t carry on any longer. He blurted this out, looking as awkward as possible—you know that adorable kind of awkwardness; my Bob had it once, and perhaps it helped him a good deal—then said that he didn’t feel justified in asking you on account of his lack of means, because you were accustomed to so much more than he could give. I told him about George Pirbright, of which he seemed to know very little, and he just blinked at me and got rather white and didn’t say a word. Then I got a brain-wave, and talked to him like a mother, and told him I would ask you three for this week-end. That would make even running for himself and George. But I didn’t give George any reasons, because I couldn’t feel a bit like a mother to him. Jack was frightfully anxious that you shouldn’t have to consider him unless you wanted to, and it touched me tremendously when he said that if you accepted George he would go away and never see you again. You see, he didn’t know whether you took either himself or George at all seriously, but he did feel that the odds in ninety-nine cases out of a hundred were on the other man. However, he agreed to stand by and not say a word, and give George the opportunity to speak. Then, if you refused, I told him he would be justified in speaking himself. It was just you, all the way through.’

Connie was leaning forward, lips parted, and in her eyes a light both magnificent and tender. ‘He hardly looked at me till to-day.’

‘Can’t you see why? The poor boy was

being tortured, and didn’t want you to know; but he looked at me once or twice, and of course I knew. His instinct was to protect you, at whatever cost to himself, and if you had refused, you would never have known how it hurt. You can imagine how I felt all this time, and when George got that telegram I could have embraced him. Even at that Jack came back to me, and I had practically to take my oath that now he would be doing the right thing; and oh, my dear, if you had said “no” to him, I——’

Mrs Jennison, dabbing at her eyes, felt the pressure of strong, young arms.

‘You’re a perfect angel to tell me this,’ whispered the girl. ‘You don’t know how it will help in—in British Columbia.’

‘Well, my dear, it’s lovely to be able to tell you; and, if I may suggest it, I wouldn’t say a word about it to Jack. He won’t mention it—his kind doesn’t. And if you know he doesn’t think you know; and if he doesn’t think—well, anyway, it’s rather jolly for each of you to have a sort of secret mental jam-cupboard to go to where there’s always something sweet on the shelf. But I wouldn’t leave the door open. And, child, I’m frightfully grateful to you both, for it has all put a sort of fresh piquant taste into things. And Bob knows British Columbia, and says it’s the land of promise, and that he would go himself if he were Jack’s age.’ She got up, put her hands on Connie’s shoulders, just as Sybil had done, and looked affectionately into the girl’s face. ‘Hold each other close, child.’

CHAPTER II.

I.

IT was some five years later that a white-hulled yacht moved northward from Vancouver, and set her slim bows toward the Alaskan border. This was Pirbright’s idea. It had been carried by the quick enthusiasm of Mollie Thurston, in spite of the mild opposition of her weaker half, and consented to by Sybil with a certain languid indifference. She and her husband had come to California for the winter with the Thurstons, and it was when they reached San Francisco on the way home that plans were suddenly changed. Then the jar of great cities gave way to utter solitudes.

On one side lifted mountains, marching magnificently seaward, rent with gorges where cataracts raised a soft and mellow thunder, and, fed by melting glaciers, swayed their living silver in the light of the afternoon sun. Close up to them crowded the big timber, vast columnar trunks that covered the earth’s rocky ribs with a mantle of prodigious velvet. Higher, the slopes were bare, and higher still were fields of eternal ice, lost for half the year amid freezing clouds. To the west, the outlines of

islands lay in dark bars across the flaming sky ; and between mountains and islands the yacht cut its liquid way through a mirror of deep flat green. There was no sound but the subdued throb of engines, the faintly-borne riot of water-falls, and the lisp along the vessel's smooth hull.

Of all this Sybil felt gratefully conscious. She was bored with California, bored with the Thurstons, and most of all bored with her husband. Mollie Thurston, with her clear skin, her china-blue eyes that looked so opaquely innocent, the little yellow curls above her ears, and the insolent curve of her perfect mouth ; Thurston, with his faultless clothes, his perennial flow of aristocratic slang, and a complexion that any woman would have envied ; George, a little harder than before, fuller of figure, sharper of glance, the purple shade of indulgence on his cheeks, and a predatory touch in his manner.

Sybil was surveying them dispassionately, there being no further discoveries to be made here, when they were joined by the captain of the yacht. He brought with him a chart, and there ensued a short talk. Then they all turned and came toward her.

'It's about to-night,' explained her husband. 'The captain says we can anchor either in Black Cove or Silver Bay, which is a little nearer.'

'And you can get trout-fishing in either of them, sir,' put in the man.

'None of us care which it is,' went on Pirbright, 'so we leave it to you. Mollie and I are going fishing first thing in the morning, anyway.'

Sybil nodded. 'How energetic,' she said dryly. She was about to add that she didn't care which it was, when suddenly a name flashed back. This was Connie's adopted country—Connie of whom she had heard nothing for years ; but surely the sound of 'Silver Bay' was familiar ? She vaguely remembered having thought it somewhat romantic—at least it would be were it in the tropics. She had not forgotten about Connie, even though life was too stuffed with things to leave room for many memories, and now something whispered that Connie was not far away. At that a strange feeling came over her, as though Connie stood on a near-by point, beckoning. Then she knew that she must find the girl. Yes, surely that was the name ? 'Let us try Silver Bay,' she hazarded.

The captain touched his hat and moved toward the bridge, and the other three, after inviting her to make a four, disappeared into the saloon. Two months ago Thurston would have stayed behind, but that was over now. Sybil, thinking of this, gave a little smile and scanned the purple shore, where wind-twisted cedars sent thick, prehensile roots squirming down over the bare rocks to below high-tide level, gripping the bony earth against winter blasts. The channel was narrow here, and on

each side the yacht's following wave crashed musically as it felt blindly against the adamant of the land. Presently came the first dinner call.

II.

Sybil was rather silent that evening, having somehow acquired a sense of unreality that to her was quite new. At dinner she scanned the luxurious cosiness of the saloon, with its dark panelled walls, lustrous mahogany, and burnished silver. The yacht had been built for a wealthy American, and was complete and perfectly appointed, a miniature world in itself. Now it lay motionless as on a lake of quicksilver. The moon was up, and through the nearest porthole she caught a shimmering trail that cut through the loom of overhanging mountains. Mollie Thurston was talking to George in a tinkling voice, and Thurston sat absorbed in his dinner. Beyond the soft clink of glass and china, Sybil heard the seals plunging in emerald depths outside, and the cry of loons that darted through air and water with the speed of bullets. She did not know whether the seals or Mollie were the more unreal, but was sure of one thing—Connie was somewhere close at hand.

She found the captain afterwards, and questioned him. A mile farther back, and through some narrows where there was hardly passage for the yacht, was a farm, and, yes, it was owned by English people. Their names he did not know. They raised produce, for which there was a ready market at neighbouring pulp mills. Produce was scarce here, most of the land being too rocky for cultivation. But this was one of the few good farms on the coast. Sybil tried to picture Connie and Jack selling cabbages to pulp mills, then went to her cabin, opened the portholes, and lay for hours listening to a myriad of tiny unfamiliar whispers that drifted in.

At eight next morning she heard George and Mollie depart with much subdued laughter. Thurston was not up. She breakfasted alone, commandeered the remaining dinghy, and was rowed by one of the American sailors inland through the narrows. There was a frank, boyish admiration in his eyes that rather pleased her.

A stream with meadow on either side, a long, rambling, one-storey bungalow, over which towered a great Norway pine, acres of vegetables where two Chinamen were working methodically, a group of barns, browsing cattle, all bathed in sun and guarded by sentinel mountains. This is what Sybil found in Silver Bay, and instinctively she knew that Connie was here. Then, suddenly, Connie herself, slim and straight, hatless, her bronze hair piled loosely, looking down from the meadow by the stream's bank with all the beauty of the wilderness in her face. The two stared at each other silently, a little breathless at the strangeness of it, till Connie came down with long graceful strides.

THE WEIRDNESS OF WEST AFRICA.

By LAWRENCE G. GREEN.

I.

PINK tints of dawn brightened into the radiance of a new day as I watched the purple mountains of Sierra Leone lifting from an emerald sea. As the steamer's propellers drummed through calm waters the peaks were clipped and a maze of palms stood out against the eastern sky.

Run your finger down the coast of Africa from Cape Verde and you reach a red-painted stretch of country about the size of Scotland, a place that retains the romantic-sounding name given by the old Spanish sea-adventurers, who fared south with their slave-ships so many years ago. Sierra Leone—Lion Mountain! When that purple mass rises from the quivering horizon you see the likeness. It is the one civilised outpost of a grim and savage land, where Death stands chuckling as the black boy hands you the whisky bottle; where the mosquitoes hang in a silver, noisy cloud about the lamps at night, and the cry of a distant leopard comes shrill across the jungle.

The steamer closes in with the shore, and passes the slim white finger of a lighthouse; passes a wreck, with the surf creaming along the rusty sides; red-roofed houses; tin sheds on the waterfront; and crazy native houses built up on piles. Here, then, is Freetown—the so-called 'white man's grave'—sweltering on the mountain slopes that back the shore. To approach it from the sea is beautiful; to live there—we must let the lean sun-tanned men speak of that. Canoes appear, black giants paddling with tireless arms in the race to be first alongside. Narrow-gutted canoes, cunningly shaped from single tree-trunks, and loaded far below the danger-line with tropic fruit and queer leather-covered bottles, monkeys and parrots, mats and brightly-patterned baskets. They shoot quickly into the vision, these salesmen of the jungle, rolling their white eyeballs; screaming to each other in the monkey language; picking up our jettison—broken biscuit and the like—and storing it carefully in their frail canoes. A tug pants out to us. There is a black man on the bridge, smartly dressed in a ludicrous Victorian fashion, and wearing a high white collar. He is in command of the tug, and his appearance conveys to the newcomer an idea of the queer state of affairs ashore. For Sierra Leone is one of those curious places in which negroes set out to copy their white rulers, failing—as they must inevitably fail—grotesquely.

Religion is the mainstay of this pitiful mock-civilisation, and Freetown is more blatantly

Sabbatarian in visible things than any village of Scotland; yet never was there less meaning behind church and chapel-going than in this African town. It is a town of many sects, with the American influence strongly impressed. Black deans in knee-breeches—the very negroes who occasionally preach to wondering congregations in English country churches—walk solemnly among their people; and muscular curates too, wearing horn-rimmed spectacles, and talking earnestly at corners of the tree-lined streets. These grown-up children of freed slaves have even sought to imitate the English public-school system. You see shining black faces beneath straw hats with school ribbons, and little black bodies thrust uncomfortably into blazers and white trousers. Drones of these semi-educated urchins with cricket bats stroll through the town each day, led by smug, elegant negro masters. To a South African like myself, to all who have learned the ways of black races, they form an astounding picture. A problem, too; for the people of Freetown are given much scope for their mimicry. In the courts, barristers and even judges are keen-brained natives; and it is strange to hear Latin phrases and legal jargon from their thick red lips. It is all a nightmare, a shocking phantasmagoria of what we fight against for our very lives in South Africa come true.

II.

I turn for relief to Freetown itself, a jumble of shops when you close your eyes to the ubiquitous missions. Love of barter is no affectation among African peoples; it is the only work they will perform. Even the pot-bellied naked children hawk baskets of fruit, and a boy of six will try to sell you a pair of green squirrels as you walk off the landing-stage. Trade goods from Birmingham and Germany litter every pavement, with negro 'mammies,' splendidly over-dressed, squatting in the shade close by their stalls. A strange array of cheap junk are these street markets—cotton goods and beads, boots, hats and caps, soap and perfumery. Every day bales and cases of them swing up from the lighters to the old wooden jetty, and from the jetty to Freetown, and from Freetown to the unknown jungle. And from the forest depths of the hinterland come palm kernels and kola nuts, palm oil and ginger, all by the most primitive transport, to the ever-hungry cargo boats.

In a town where nearly every house is a store there must be strange shops. I recall one in which the attendants were all very old men, with white turbans round their wrinkled foreheads. A shop where leopard skins lay piled on a mud

floor, and the old men raised their bony claws in frantic entreaty as I looked over their goods; where a ju-ju mask, cast off by some witch-doctor, lolled in a corner so naturally that the twisted face might have belonged to some evil resident of the place. Wonderful cloths, with indelible dyes that are still kept as tribal secrets, hung on the walls; intricately-woven cloths, astonishing squares of brown and yellow colour in wide bands. And much smooth, gray pottery. In the Indian shops—there are only two in Freetown—I saw the curios of the desert, the trinkets of Egypt, and carpets that might have been loaded on camels at the gates of Samarkand. Here were glittering brass trays, silks, and ivory. An oriental touch in a place that is pure Africa. For the cruder African things you go to the native market, a low-roofed, acrid-smelling building on the seafront, where the inevitable negro 'mammies' chaffer across their woven baskets and reed mats. Creoles, the English-speaking negroes of Freetown are called locally, the word being given quite a different meaning from its usage in other parts of the world. And the Creoles twist English too, as you realise when the notice-board outside the Cosmopolitan Bar meets your astonished gaze; for this reeking shanty, where the only drink is vile palm toddy, is labelled 'a home from home.' More truthful, perhaps, is the claim of Alimamy Bungie, the famous 'sympathetic undertaker,' who is mentioned by several authors of West African books. Alimamy Bungie was recovering from the celebration of his fifty-third birthday during my visit; and a local newspaper published his photograph, with this letterpress beneath: 'He preferred presents of good chop and grog than any other gifts.' Other negro traders are more refined than the honest Alimamy; they placard their shops with reminders that they have 'graduated in the U.S.A.,' and urge the native population to 'support a fellow African.' You hear the same cry from mission platforms, and it barely conceals a hatred of all Europeans, born of the impotency to reach real European standards.

III.

Wilberforce Hall! There is history in a name; and there the unhappy second and third generations, victims of slavery still, voice their hopeless aims to-day. There are two governments possible in West Africa. One is by white rulers, and the other by the savage rites that have come down through the centuries and flourish in the hinterland unchecked. But for the educated negro there is no chance of supreme power; he would be kicked into the sea by his 'fellow Africans' of the jungle to-morrow if the white man left—and he knows it.

Little the problems of statesmanship trouble Krootown Road, the main vein of the Creole

quarter. What a garish medley of cotton print dresses around the benzine lamps at night, and how pungent the dried fish smell. Here are fantastic houses; ramshackle, impossible dwellings, with perilously-overhanging balconies, bright roofs of red and green, and luxuriant gardens. Somehow they convey in subtle manner the illusion that they have grown up with the jungle that riots on all sides—and that in spite of their patches of tin and corrugated iron and cracked-glass windows. Dilapidated they may be, but the native, even the topee-wearing monstrosity, usually contrives to build a shack which is essentially part of its tropical surroundings. The shabbiest straw hut is precisely what one would expect to find in such a place as the Krootown Road. These dwellings are so natural that even the European suggestions one sees cannot repel the atmosphere of dark mystery which rightly belongs to the inland forests, and yet is part of this city by the sea; this 'Liverpool of West Africa,' which is guided from Downing Street. Freetown, indeed, leaves quite as vivid an impression of commerce as of frenzied religion and native bartering; and since brains are needed to win the riches of the tropics, young white men sweat their lives away among the dangers of the hinterland.

IV.

One night I met the white traders. In West Africa a newcomer's white face is his passport. The British community is so small that a visitor is sure of welcome and an audience of hungry-eyed, home-sick exiles. I was standing for a moment in the heavy, scented air of night, when a man in white drill came across the dusty street and spoke. 'My name is Brown,' he said, and mentioned the name of a trading company that is famous from Bathurst to the Congo. 'Come up to my rooms and have a drink. Some of the fellows are there, and you may be able to tell us how things are going in England.' So in the high apartment above the store I met other drill-clad men, all traders; and while soft moonlight peered through the jalousies and the monotonous rumble of native voices drifted up from the Krootown Road, they talked. Ice tinkled in the whisky glasses. It appeared that they did not want to hear very much about Leicester Square after all; their own daily round was the most intensely interesting thing in life. They were held by the fascination of trade between two widely separated races. I can see them now, those tense, seamed faces, half in shadow, near the oil-lamp; and even as they spoke the million and a half savages of the hinterland were beating their drums and selling human flesh in open market. Of such things the traders spoke.

They spoke of age-old tongues and codes which no white man may learn; of secret

languages peculiar to each type of craftsmen; and of the unwritten native jungle law, which forbids the names of the things which are daily terrors to be mentioned at all. There was a little hushed conversation about the vice and black magic rites—and other things which the white man cannot explain. Personal experience crept into the talk: the weird story of a trader who found himself growing weaker and weaker among the tribe which had willed him to die. There was the copra buyer's story of a woman sacrificed, her tortured scream, and all to make him leave his hut one night; he told also of the spear that streaked over his head as he doubled up, revolver in hand, to pass through the narrow doorway. But these commercial adventurers cared little for spears. In West Africa it is the unseen things which count. Even the climate seems to be in league with the witch-doctors; for all along 'the coast' white men suffer from wounds which do not heal, and if they are criminal—or blindly affectionate—enough to take their wives into exile with them, they discover something which puzzles the medical profession to-day. No white child is born alive.

I met one of the women exiles of Sierra Leone. A married girl, that is all she was, but the colour had left her cheeks during six months in the steamy tropics. Her bungalow home was at Hill Station, where it is a little cooler than in the town; and from the green mountain heights she could see the yellow funnels of the Elder Dempster liners come and go each week. As we chatted, a vulture, scraggy-necked and revolting, swung down from the sky, to alight with a scratching of talons on a tin roof close by; and the girl shuddered, and told me of her longing to see the rooks in the elms again, to hear the bells of the village church. One of her sad, strangely wise remarks lingers in my memory. 'Africa is grotesque,' she said. 'Everything is twice the size it ought to be, or else incredibly small; and there is nothing permanent except the ghastly spirit of the place.' She meant the exotic Africa of the tropics, of course. And indeed the only Africa she knew uses beauty as a lure, with the most fatal poison never far from the most gorgeous aspect of that beauty.

V.

'Chop' is the universal name of all food in West Africa, from the birthday orgy of Alimamy Bungie to a six-course European dinner; and George's hotel is the best place for 'chop' in Freetown, a restaurant which is quite beyond advertisement. Ships' pursers, a cunning breed of gourmets, tell me there is no other sea-port town along hundreds of miles of West African littoral where such good food is to be obtained. George, who is a Swiss, was prompted by the infallible business acumen of his race to migrate

from Soho to Sierra Leone. He has grown rich, and because he has provided Freetown with an astounding contrast I think he deserves his success. Across the threshold of his hotel you step from the bizarre jumble of life that is Africa into the typical atmosphere of Soho; and though this swift transition is shaken by the fact that the soft-footed waiters are not Swiss, but negroes, the illusion is not destroyed. George, a fat, beaming fellow, heightens the contrast. He advances as you enter, to show you with Soho complaisance to a little table in the corner. You feel at once that for some reason you are a privileged guest, and that something unusual is about to take place in the kitchen purely for your benefit. But do not look out of the window, or Africa will come throbbing back to the senses. Iced soup! You never guessed it until the spoon touched your mouth. Then you realise that on this damp tropical night no other soup would suffice. Fried barracouta next, speared by a native in the bay; with *sauce tartare* it forms delicious comparison with the soft fish from the ship's refrigerator. Then a grill, with potatoes in such slender chips that you wonder at the crispness of them. Meanwhile George has poured out the wine—it came unscathed through the bombardment of Verdun—and the master chef stands gloating in a corner while you drink. There follows a fruit salad in which it is possible to trace the fibrous mango, the bright yellow lime, smooth strips of pineapple, and bananas. That was good. The diner is now in a mood to regard Freetown with a friendly stare. Coffee, with the inevitable condensed milk disguised by a miracle, gives the necessary jolt. The search for excitement and interest may be renewed. George knows the precise moment. 'A native chief of my acquaintance has arranged a dance for to-night,' he murmurs. 'If you gentlemen would care to attend—'

Enough! Already the drums of Africa send their vibrating notes through the heavy air. We took our helmets and followed the guide along mango-bordered lanes until a bamboo fence jutted out of the darkness, with the black loom of huts beyond. The guide whistled, and a little gate swung open. Here the drum-voices boomed loud in their thunderous cycle of primitive notes. Ebony palm-trees formed the wings of this African theatre, with the star-shot night sky as backcloth. The Mendi chief came forward, and we touched hands after the custom of the country. Torches lit the scene, sometimes vividly, often flickering down to pin-points of yellow. Huddled together in a weird, half-seen mass between the huts, the dancers waited for their chief's command; and still the drums throbbed, a hot maelstrom of sound, so that the sticks seemed to kiss the taut skin a thousand times each minute. The very air quivered like

hurt flesh. Ghost-shapes among the huts began to move. From the blackness came six small girls, their shining bodies smeared with white paint. Wide-eyed they stood in the semi-gloom, swaying to the music, like frightened hesitating little animals. More fiercely thudded the drums, and now a dozen calabash pianos, struck with knobs of rubber, joined the tumult of barbaric cadence. Then the six frightened little animals awoke into six little devils. How they spun and whirled and flung themselves into the drama of the dance; how perfect their balance as they flashed before the torches. They had answered the call of the drums, and now they lived the fantastic melody. The drums and calabashes sang on, died, sobbed, and laughed. The very soul of Africa danced under the palms that night.

With dramatic quickness the beating ceased. Again there stood six wide-eyed little girls, not in the least breathless, perhaps a little dazed. It was all magic, making the blood tingle.

VI.

At this point there enters the story—with a bellow of 'O! Boy! bring whisky!'—one whom I shall call Captain Jones. On the shoulder-strap of his khaki tunic are the metal letters that stand for 'Sierra Leone Police.' Sundown in Freetown, and I had been glad to leave the blazing streets for the cool building where every wanderer gets a cordial hand-shake—the Garrison Club. My friend Jones fitted the surroundings, typically West African. Standing on the wide verandah, you look out over umbrella trees and red flowers, across a maze of roofs and huts, to palm-dotted coves and green hills, and yellow sand merging into the blue waters of the bay. Such things make no appeal to Jones. Six years ago he was a rosy-faced youth, laughing on the playing-fields of an English public school. Life was a joke in those days, and even Sierra Leone was 'not such a bad show' when he arrived for the first time. I saw him as he is to-day, pallid beneath the bronze, lines of something more than care under the eyes, head close cropped, fingers trembling as he knocks the ash from his cigarette. A lanky, khaki-clad figure, stretched out in a long cane chair, gazing with half-closed eyes through the open doors to the tropical riot of flowers in the garden, the barrack square beyond, and a lazy native squatting under a tree. And he talked, this square-jawed police officer. His yarns linger. Half-gloom and sluggish water up a West African creek, and untamed men slinking along the banks, watching the little white police-launch, fingering their spears. . . .

The Colonial Office blue-books say little about Ju-Ju, which is West African witchcraft, a real and terrible science. Jones, who knows a great deal more than the Colonial Office, has studied

Ju-Ju. And as the night fell he began his tale, pointing across the bay to the winking lights of Bullom, a native village that sprawls along the water's edge. It is about ten miles from Government House, and in Bullom there is a leopard society, doing its uncanny work by night, and leaving the result for Captain Jones and his men to find in the clear light of day. West African negroes are people of few ideas; and the traditions of their tribe, centuries old, are just as real in their minds as the sea and the jungle. Some of these traditions are cruel blood rites, perpetuated by the leopard societies. Men become leopards (says Jones, his face contorted as with some vividly nauseating memory). The soul of a man goes out, and his body is no longer a human body; and on the corpses of their victims Captain Jones has seen the teeth-marks . . . of leopards!

VII

Lumley Beach! The wizened exiles of Freetown may curse the fate that brought them to West Africa; but the toughest, most cynical of the veterans has a word of praise for the charm of this wide crescent of sand where the Atlantic sweeps in to kiss the wonder of the beach. For three clear miles, from tip to tip of a white, shimmering curve, stretches the sand. I stood in a grove of palms to absorb that fan of radiant colour—the unutterable blue of the sea as the light came through a curling wave; the vivid green of the tangled bush and low-hanging trees; the golden sunpath down the water; the brown village of huts, where salted fish blazed silver as the sun died. Long combers with white ridges hurtled in from the ocean wastes, to collapse in the shallows and break into rainbow spray; break warm and colourful upon the starfish and little pink shells that line high-water mark. There could be no resisting those cool shallows and inviting depths; we stripped, and ran shouting into the foam to jest with the sea-gods of the West African beach. Then a race along the beach to get dry in the off-shore breeze. Even the little gray monkeys in the jungle beyond were excited, and, taking up our cries, they swung from branch to branch in an ecstasy of imitation. Soon afterwards the fishermen passed by. Gaunt people these, with waist-cloths and metal bangles; black figures moving in bold relief against the sunset. The women, marching with easy grace behind their men, carried heavy loads without a sign of weariness. Beach-combers all, happy in their savagery, carrying home the plunder of the sea. Here indeed was Africa, without an alien touch to disturb the mind. Africa as the mysterious continent has always been since time began. So they passed into the creek and the jungle swallowed them up.

In a palm-leaf hut on Lumley Beach you

will find a very old negro, who lounges in the shade all day because he cannot work. The flat-nosed, woolly-headed sons of this old man bring food each day. And sometimes the old man points to his withered arm, and the sons gather round on their haunches, while their father croaks an oft-told tale. . . . A tale of the days when he left Africa in a swift, sinister frigate; sailed as one of a frightened herd to

work in the fields of sugar-cane on a West Indian island. And as the end of the tale draws near, the old man raises his good arm aloft, and brings it down viciously to show how the whip fell on the arm that is withered. The flat-nosed sons of the old man were born in Freetown, under the Union Jack, and they do not understand. But the old man of Lumley Beach remembers.

TALES OF THE GERMAN AIRSHIPS.

I.—THE FIRST AIR-RAID IN SCOTLAND.

By Brigadier-General WALTER B. CADDELL.

I.

ON the morning of 2nd April 1916 Bruce Gower, a middle-aged Scotsman, the head of a well-known Edinburgh business house, seated himself at the breakfast-table with his wife Jenny and his two daughters, and got busy on his porridge. He was in the act of rising to place his empty plate on the side-table, when there was a knock at the door. A servant entered and handed him a telegram. Bruce opened it and read: 'Must discuss most important business with you here to-night.—MACKINTOSH.'

Now Mr Mackintosh was Bruce's partner in London—a cool, level-headed fellow, who would not have sent such a message (especially on a Sunday) unless the matter were urgent.

Bruce handed the telegram to his wife, who at once burst into tears, and his two daughters, on learning the news, joined in the pandemonium. He was entreated, implored, not to leave Scotland; and, to make matters worse, his family became so demonstrative that his button-hole, a frail Marshal Niel rose, born and bred in his greenhouse, was torn from his coat and fell to the floor, where it was trodden underfoot.

For some time Bruce tried to calm his family, and when he eventually succeeded in doing so, was surprised to learn why such an outburst of emotion had been shown by them. He was informed that they had lately read in the papers of the terrible damage caused in London by Zeppelin air-raids, and how much more disastrous in the future raids on that city were likely to be. They feared for his safety there, and again begged him to remain in Edinburgh, which was well out of the track of these monsters.

Bruce was able to bring his family to their senses by pointing out to them how ashamed they would really be of him if he were to shirk what was so clearly his duty by staying in Edinburgh because of a possible air-raid in

London. He reminded them of the men—the millions of men—who had answered the call of duty without a moment's hesitation, and with no thought of the risks likely to be encountered.

He confided in them that the telegram did not refer to private business but to work of national importance, and even went so far as to commence the recitation of a poem that runs, 'Theirs not to reason why. . . .'

In fact, he recited and spoke so well that his family felt proud of him—and incidentally he felt proud of himself. So tears were wiped away and brave faces appeared.

His bag was packed, a taxi ordered for him, and, accompanied by Jenny and his girls, he arrived at Waverley Station in good time for the 11.15 A.M. express to King's Cross.

His family, alas! were not able to maintain their composure, for, as the time of departure drew nigh, their feelings again got the better of them and the tears came back.

Jenny beseeched him not to stay with his brother John in Seymour Street, London, and as the train left, said, 'Bruce dear, do for our sakes sleep somewhere underground if you have to stay the night in London; and remember that our thoughts are with you, as we shall be safe and sleep soundly here when you are in that perilous place.'

II.

Gower arrived in London at 8 P.M., went straight away to his partner's office in Threadneedle Street, and sat there—with refreshments—until 3 A.M. on the morning of the 3rd of April.

He reached his brother John's house at 3.30 A.M., was admitted by a very sleepy butler, and, giving him instructions not to call him until 11 A.M., went to his room and was soon fast asleep. At 11 A.M. his early morning tea was brought in to him, and on the tray was a telegram. Bruce opened it lazily, thinking it was likely to contain some news from his

partner; but the office of origin was Edinburgh, and it read as follows:

Terrible Zeppelin raid here last night. All safe. Envy you in London.—JENNY.

Bruce Gower lay back with a sigh—the outward expression of his thankfulness—but otherwise, except for the slightest suspicion of merriment in his eyes, his features remained impassive and composed. The gods had bestowed on Bruce Gower their greatest boon and comforter—a sense of humour.

At breakfast Bruce was amazed to read in the *Times* that, while he was sitting quietly in his partner's office about midnight, a military airship, either the LZ.88 or the LZ.90, was dropping bombs near Waltham Abbey in Essex. The raid warning in London had fallen on deaf ears, for neither he nor his partner had heard a sound.

III.

As a matter of fact, just about the time that Bruce Gower was eating his porridge on the morning of 2nd April 1916, the four Zeppelin naval airships L.13, L.14, L.16, and L.22 were being prepared for what was known in the British Isles as an air-raid, but in Germany more often than not as a naval reconnaissance.

There are many cases on record where the commanders of naval airships on such duty wirelessly to their director at Nordholz asking for permission to carry out an attack on Harwich, Ipswich, London, or other towns. In such instances, when the director had agreed, a squadron of ships was collected, and these frequently had their rendezvous at a point in the Bay of Heligoland, 20 nautical miles N.W. of Borkum. In the raid in question, however, so far as is known, the four ships previously mentioned came from Nordholz and Hage, in that part of Germany which, on the coast-line, lies between the rivers Ems and Elbe.

The commanders of L.13 and 16 had no part in the tragedy that followed, for their craft never reached Scotland; indeed they may not have been ordered to go there. The commander of L.22 hardly appeared on the scene at all, so that evidently the principal part was played by the commander of L.14. That officer before the war was a ship's captain on the Hamburg-American line, and in that capacity had been to Edinburgh. He knew the geography of the Firth of Forth and the position of Edinburgh as regards Leith, and it may be taken for granted that, when L.14 was over these places, he knew well where she was. The same officer had made himself famous in the air-raid of 31st January 1916, when he reached the most westerly point in England—namely Shrewsbury—ever flown over in the attacks on the British Isles by Zeppelin airships. On the occasion of that raid his ship was actually flown over British soil for ten hours. He was captured on the L.33 in September 1916.

The steersman of L.14, who was also captured with his commander on the L.33, admitted under examination that he had known perfectly well he was over Edinburgh on the night of 2nd April. He was acquainted with the fact that that city was unprotected by anti-aircraft guns, and, knowing he would not be troubled by their fire, purposely brought L.14 down to a height of 2000 feet, to make the dropping of bombs easier and more effective than would have been the case had he kept his craft at a greater altitude.

IV.

It was early on the morning of 2nd April 1916 that the four commanders received their orders to get their ships ready. At that time they did not know their destination, for their final instructions did not reach them until the moment of departure.

Gas-bags were filled up with hydrogen; gallons and gallons of petrol were taken on board; wireless was tested; engines were tuned up to give their maximum horse-power; and bombs of the high explosive and incendiary types were carefully fitted into their carriers. Such work takes a long time, and it was not until about 11 A.M. that the director of airships was informed that the craft were in perfect condition and their crews on board.

A blast on the whistle was the signal for the landing parties to move the craft out of their hangars, and, guided by ropes, the ships slowly emerged, a trumpet-note being sounded when their sterns were clear of the sheds. The ships were then brought into the wind, and there they gently floated, controlled by many strong arms. The ropes were let go, and the hand-rails on the gondolas released on the command, 'Hands off, ease up the guys,' and the ships, after remaining motionless for an instant, began to soar upwards. 'Hold on' was given, and the ships were gradually pulled back to earth again, when their commanders went aboard, having received their instructions as to where they were to sail. The airships were then finally set free, pushed upwards by hundreds of willing helpers.

L.13, 14, 16 and 22 thus set forth on their adventure, and the word 'adventure' has been fairly chosen, for it was a 'remarkable incident' that, while the commanders of L.14 and 22 were given secret instructions to attack the dockyard at Rosyth, they, in fact, bombed Edinburgh, Leith, and some remote places in the extreme south of Scotland.

V.

The weather conditions were favourable when the ships reached their rendezvous near Borkum—the wind was light—and these conditions lasted throughout the day and night of 2nd April 1916. The four craft left their rendezvous

about noon with the intention of making the coast-line of Northumberland. The distance from Nordholz to Berwick-on-Tweed is about five hundred miles, a journey that took the ships between eight and nine hours' flying to complete.

Whatever may be thought of the actions of the Zeppelin commanders, however much their exploits may be deemed to have been unworthy of members of the civilised community, it is meet and right that a tribute should be paid to the wonderful skill they showed in navigating their vessels at night over hundreds of miles of water. They were, of course, assisted by directional wireless, but very often the results obtained by such a method were at complete variance with the actual positions of the ships.

L.14 and L.22 must have flown nearly fifteen hundred miles during this raid, and must have been in the air for some thirty hours. It is probable that, on nearing the British Isles, the ships split up into two sections, L.14 and L.22 heading for Scotland, L.13 and L.16 for Northumberland, their object being to attack Newcastle and the docks on the river Tyne.

L.13 turned back without making the coast-line; L.16 did not get north of the river Tweed. Those two ships, therefore, are finished with, so far as this story is concerned.

L.22 was the first of the ships to reach the coast-line; she was sighted off Bamburgh at 8 p.m., but turned back and headed out to sea again. At 9 p.m. she reached Berwick-on-Tweed, and at Lamberton Farm, three miles north of that town, dropped fourteen bombs—a salvo that may perhaps be regarded as notifying Scotland of her arrival and, incidentally, as introducing herself to the Scottish people. She then proceeded inland to Chirnside, and at 9.15 p.m. dropped six more bombs in the neighbourhood of that place; a further eight bombs fell in an open field near East Blanterne Farm. No damage of any kind resulted from any of these air-missiles. She then turned east, following the river Whiteadder, and over Clarabad Mill dropped a parachute flare, which lighted up the countryside for miles. She was evidently trying to spy out the land and check her position.

She passed out to sea south of Lamberton at 9.45 p.m., and for want of something better to do dropped five incendiary bombs into the sea. L.22 again appeared over North Berwick at 10.30 p.m., passed over Dirleton, and dropped an incendiary bomb on the golf-links near Archerfield House. (As a large crater was made by that bomb, it is to be hoped that golfers were allowed to pick up out of it without penalty.)

The course she steered brought her over Gullane, Aberlady, Portobello bay, and after passing over Tranent and Leith, she arrived at Edinburgh about 11 p.m. L.22 flew slowly

round Edinburgh on the south side, and dropped three high explosive bombs. These fell at Slateford, at Comiston, and at Bridgend near Craigmillar, but only a few windows were broken. At 12.30 a.m. she went out to sea near Portobello, flew down the Firth of Forth, and returned across the North Sea to her base at Nordholz. Such is the brief chronicle of the part played by L.22 in this the first airship raid on Scotland. The damage she did was, comparatively speaking, small, and, had she been the only airship to reach Edinburgh, Mrs Bruce Gower could scarcely have thought it worth while to waste money on a telegram to London.

VI.

L.14—the heroine of many previous raids—was first sighted off St Abbs Head at 9.30 p.m., and it was due entirely to her handiwork that the night of 2nd April 1916 was made hideous for Mrs Gower, her family, and the inhabitants of Edinburgh and Leith.

The steersman of L.14, when questioned later on in 1916, confessed that he had tried to find Rosyth, but, failing to make that dockyard, had steered for Edinburgh. 'It was easier,' he said, 'to bomb Edinburgh than Rosyth.'

L.14, after leaving St Abbs Head, followed the coast to Dunbar, and flew in a northerly direction across the Firth of Forth. She picked up her bearings at the Isle of May, where she was sighted, and, turning west, she flew over Elie on the south shore of Fife at 11.15 p.m. She then steered in a south-westerly direction, passed over Inchkeith, and arrived over Leith at 11.30 p.m. She immediately set about her business by attacking the Edinburgh Dock, sinking two small boats and breaking the skylights in two Danish steamers there. It is to be hoped that the latter damage was included in the Danish reparations account. She then proceeded to discharge on the Albert Docks a sample of her foreign wares, but in this case no harm was done. A grain warehouse was next destroyed by a high explosive bomb, and the quay wall was damaged.

Commercial and Sandport Streets now were the recipients of some of her cargo, where four bombs fell. At 14 Commercial Street an incendiary bomb crashed through the roof of an apartment occupied by an old lady, and through the floor of her room to the room below, where it burst into flames. The old lady calmly got out of bed, seized the jug from her basin, and poured water through the hole made by the bomb in her floor until the flames underneath were extinguished.

Determined to enforce prohibition on Scotland, the eleventh bomb was dropped on the roof of Messrs Innes and Grieve's whisky bond warehouse, which was destroyed, and with

it the whole of its contents. The damage amounted to over forty thousand pounds sterling. The house of Saint Thomas's Kirk was set on fire and practically gutted by an incendiary bomb, but its inmates, of whom there were three, had a miraculous escape. The eighteenth bomb fell in a court off Bonnington Road, and the nineteenth on the railway line close to Bonnington Tannery, but did not explode. Unfortunately the tannery itself was considerably damaged by the twentieth bomb. It is evident that the steersman of L.14 had accurately followed the course of the Water of Leith in his flight from the docks, and at 11.50 P.M. the airship arrived over Edinburgh.

A vacant piece of ground at Bellevue Terrace was the first of Edinburgh's soil to receive her greetings; the roadway at the Mound was next demolished, and the roof of a house in Lauriston Place was then blown away, without injury to any of those inside. The fourth bomb fell in the grounds of George Watson's College; the fifth in the Meadows, south of the college.

VII.

It was now 11.50 P.M. and the airship had evidently decreased her height to obtain more accurate results. Marchmont Crescent was attacked, a bomb falling on one of the tenement houses there, going through the roof and coming to rest in the basement; fortunately there were no casualties. The airship now circled to the east, and a building on Causewayside was bombed and wrecked, six persons being injured. Gardens at Blacket Place and Hatton Place were shorn of their spring flowers, and, having caused their owners this inconvenience, the airship steered again for the centre of the city. The grounds of the Royal Infirmary were next despoiled by an incendiary bomb, and the Grassmarket pavement immediately in front of the White Hart Hotel was blown to pieces, four persons being injured. Castle Rock then had the first experience in its later history of discovering something more powerful than itself, and the County Hotel in Lothian Road and the Princes Street terminus of the Caledonian Railway were badly shaken by the bursting of a high explosive bomb in their vicinity.

L.14 now circled to the west and flew over Haymarket Station. She dropped three bombs as she was passing north-eastward over the Water of Leith near Mill Lade and Donaldson's Hospital School. Little damage was done, however, beyond the breaking of glass and the slight shifting of a portion of the embankment of the Water of Leith. The airship again came over the middle of the city, flying from west to east, and the greatest tragedy of the whole raid occurred when six people were killed and seven injured by a bomb that fell near Marshall Street.

L.14 gave further evidence of her anti-alcoholic tendencies by destroying a spirit store in Haddon's Court, Nicolson Street, where three people were wounded. A tenement in St Leonard's Hill was ruined, and, alas! in this case the innocents suffered, for a child was killed and two persons were injured. At a quarter past midnight the airship passed over the southern slopes of Arthur's Seat, where she dropped three bombs. These fell on the King's Park, throwing down part of the boundary wall and breaking some window-panes in a building there. The last bomb fell in the grounds of Prestonfield House, and the raid ended. L.14 disappeared towards the eastward, and was seen flying over Tranent at 12.40 A.M., Haddington at 12.45 A.M., Dunbar at 12.55 A.M., and Cockburnspath at 1 A.M.

L.14 and L.22 between them dropped twenty-six bombs on Edinburgh and its suburbs, and twenty on Leith. It is remarkable that only thirteen persons were killed and twenty-four persons injured in all, when we take into consideration that the only defences in existence at the time of the raid were one Vickers and one Lewis machine-gun at Arthur's Seat. Naval sea-planes at East Fortune and Dundee, though they flew for some time during the raid, were unable to find either of the airships. On the other hand the damage done to property was severe, and especially so at Leith, where several houses of importance were destroyed.

It would not, perhaps, be out of place to say in conclusion that our friend, Mr Gower, never left Edinburgh for London during the remainder of the war without Jenny and his daughters.

DAWN.

A BIRD awoke in the woodland,
And opened his sleepy eyes
As the first faint flush of the dawning
Crept over the dreaming skies.

He murmured a drowsy greeting:
A flower in the meadow heard,
And whispered the tidings softly
While over the hills there stirred

A little soft breeze, so tender,
It seemed but a lingering sigh,
That, kissing the earth in passing,
Went home to the clouds to die.

The gold in the East grew brighter;
A cloud like a drift of snow
Was bathed in a rosy splendour,
While up from the fields below

A lark with a rapturous greeting
Rose swift on her joyous way,
Till the air was aquiver with music,
And lo! 'twas a summer day!

SEVENTH SERIES

BRIGSHAW'S MONKEY.

By CRAVEN HILL.

PART I.

I.

VIGOROUSLY, animatedly, like a thing alive, the Bombay Mail sped on its way across the scorched and dusty plains. It was the hottest hour of noon, and the express that thundered over the endless rails seemed curiously out of place in that wilderness of sunlit somnolence. Even the solitary man who occupied the last compartment but one lazed indolently in his wicker arm-chair, a five-weeks-old English magazine lying forgotten on his knees, and mopped his brow feverishly at intervals. The heat of the carriage was appalling. Mercilessly the oriental sun blazed down upon the double roof, and even the electric-fan which whirled unceasingly in one corner of the roomy compartment failed to mitigate the intense heat of the dust-laden atmosphere.

Lieut. Peter Brigshaw, on six months' home-leave from his depot at Calcutta, took down his suit-case and extracted a clean handkerchief for the tenth time that day. Then, divesting himself of his tunic and Sam Browne, he let down his berth, which had been folded up against the wall, and climbed laboriously into it.

For some time he lay there in comparative ease, gazing out of the opposite window at the sleepy Indian countryside, which slipped by in an ever-changing panorama. The diminutive stations were few and far between, and for the most part the countryside consisted of rolling tracts of open land, dotted here and there with quaint little native villages, and here and there a belt of dense woodland. He was passing through one of the latter now, and noted with a mild interest the troops of long-tailed monkeys which swung from tree to tree, gambolling in the joy of freedom. Some were engaging in a species of the trickiest acrobatics; others were merely sitting still upon the boughs, close up one behind the other, as if seeking and finding the pleasure that comes from companionship the world over. Others again were busy fighting, chattering excitedly and pulling playfully at each other's tails—all within a few yards of the passing train.

Brigshaw was watching these denizens of the

trees when, with a shrill whistle, the express began to slow down. His interest aroused, the man climbed from his berth and, leaning out of the window, saw that the train was approaching a tiny wayside station, at one end of which stood a mighty tank with a large canvas connection hanging in readiness to replenish the engine with much-needed water. Throwing on his tunic, he prepared to descend to the platform. He had brought with him very little in the way of refreshment, and here, he knew, there was a buffet tucked away in one corner of the station, kept open especially for thirsty wayfarers like himself, where he could obtain the necessary.

As the train drew slowly into the station, Brigshaw opened the door and ran off to the buffet. After five minutes he reappeared with one or two other travellers who had left the train. At one end of the platform a Eurasian guard was frantically waving a discoloured flag, and even as Brigshaw stepped into his compartment the train began to move slowly out of the station.

II.

It was not until he had been in the carriage for five minutes that he noticed his topee was missing. He knew he had left it upon the small green baize table which was fixed to the wall at one end, and, though he searched for it closely for a few minutes in every possible cranny and corner, it still refused to come to light. It was the only helmet he had brought with him, and its loss was serious. Evidently some peddling native had stolen it. Now that he came to think of it, he remembered seeing in the station an old and wizened Indian who was offering bananas along the train. It must have been he, without a doubt. Ah well, it was too late to worry about that now; he must give the topee up for lost.

With a comprehensive curse which embraced all the dusky inhabitants of the land of Ind, Brigshaw climbed back into his bunk and composed himself for a siesta. Wooed by the heat and the monotonous whirring of the electric-fan, he had just arrived at that state of comfortable

coma bordering on sleep when a slight noise at the window brought him post-haste to consciousness. Propping himself up on one elbow, he looked in its direction and blinked stupidly. Was he still in the land of Nod and dreaming—or—or *was* that actually his topee dangling down just outside the carriage? He pinched himself to make quite sure that he really was awake; then, convinced of the fact, hopped out of his berth and made a dash to the window, just in time to see the helmet swung upwards out of his reach. Fortunately it was quite a soft drink that Brigshaw had had at the wayside station, or he might perhaps have wondered if he was quite sober. As it was, he muttered, 'Did I see that topee, or—or was I . . . ?'

As if to convince himself, he stood upon the lower berth, and, hanging perilously out of the carriage window, strained himself upwards to discover the cause of the mystery. And then, with something like a shock, he saw. A monkey was running along the tops of the carriages in the direction of the engine, leaping from one carriage to the next, and brandishing aloft triumphantly the missing topee!¹

Evidently, thought Brigshaw, the creature had boarded the train at the last station, had invaded his compartment in his absence, and had somehow conveyed his topee up to the roof. Like the conscientious fellow that he was, Brigshaw at once took back his curse on all India and the Indians. But, meanwhile, what about it? There was the monkey dashing along the top of the express, making its way engine-wards unnoticed. How was he to recover his precious headgear?

Although he stood up for a while and craned his neck as far upwards as he could, Brigshaw had only fleeting glimpses of the thief as it ran along his side of the train, and after a time it vanished altogether, and did not reappear. He therefore sat down again, transferred his curse to the monkey tribe in general, and pondered on the matter. And the Bombay Mail thundered on its way westwards.

III.

It was about four o'clock the next afternoon when the outskirts of Bombay were reached. Kalyan was passed; the Western Ghats, with their lines of large pipes running from the reservoir in the heights to the towns below, were left behind; Kurla and Parel stations slipped by in a flash; and soon the long mail train steamed in under the mighty glass roof of Victoria Station.

Brigshaw at once got out, collared a dusky porter, and gave his luggage in charge, then, hatless, walked up beside the train towards the engine. The platform was crowded with jostling travellers of all nations, each striving

in indifferent Hindustani to procure a porter for his belongings; but he got there at last, and discovered the occupants of the engine—an Englishman and a half-caste stoker.

Almost before he reached them he found the driver, who had seen him coming, holding aloft in one hand his topee; in the other, the culprit. 'Caught 'er on the tender, sir,' the man explained to Brigshaw. 'I guessed the topee belonged to one uv our passengers, so thought as I'd take charge uv it *and* this 'ere li'l devil. You might like 'er as a souvenir, sir. We often get 'em on the train during this run.'

'Thanks so much.'

Brigshaw took over his property and the struggling monkey, tipped the driver, and hastily made his way along the platform to see the porter about his luggage. On his head was now the long-lost helmet; in his hands, cursing all the human tribe, and punctuating her remarks with defiant stares—the monkey.

IV.

Beneath azure skies, on a sea of sombre indigo, the s.s. *City of Random* ploughed through the liquid leagues on her homeward journey. Over in the far distance one caught fleeting visions of the rocky mainland, rendered hazy and indistinct by reason of the hot silvery mists which intervened. Perim Light was passed, and the vessel was making fine weather of it up the Red Sea.

On deck, lazing in the depths of a comfortable wicker chair, Lieut. Brigshaw sat studying the distant mainland through powerful field-glasses. 'Arabia!' he muttered to himself. 'Well, it looks a pretty dead sort of hole, 'pon my Sam! . . . How anybody can live there beats me. . . . Yet they do, sure as eggs! . . . Wonderful johnnies, those Arabs; but I like 'em best at a distance. Ah, well—wonder how Jenny's getting on. I'll go and give the little brute some grub.' So saying, he rose with a yawn, put his pipe in his pocket, and went below.

Descending to the hold, he came eventually to a large crate labelled in straggling capitals of black paint: 'MONKEY. DANGEROUS.' Bending down to peer through the woodwork, he talked encouragingly to the occupant, and studied her intently. We will take the opportunity and do the same.

She was in many ways a handsome little beast, roughly two feet long, grayish-brown in colour, but her face, ears, feet, and hands were black—coal-black. She was slender of build, long-limbed, with a prodigious tail. Her brows, the most notable feature of her ebony face, were of long stiff hair, projecting like a pent-house. In short, Jenny was a Hanuman or Langur monkey.

On coming into possession of her at Victoria Station, it had been Brigshaw's first intention

¹ This incident actually occurred as related here.

to turn her over to the authorities at the Victoria Gardens, on the outskirts of Bombay, where, he knew, some wild beasts were kept as a sort of zoological attraction. On second thoughts, however, he decided to take the creature home with him, and hand her over to a small zoo just outside his native town. In a way, he had grown rather fond of Jenny, for all her waywardness, or, perhaps, because of it; and if he put her in that zoo he could, he reflected, pay her occasional visits.

So Jenny had been put in a box, and labelled 'Dangerous,' not without reason, for her wild instincts were still very strong within her, and she could not by any stretch of the imagination be termed tame.

Brigshaw called her by name now, but Jenny refused to regard her captor with friendly eyes. She would not even suffer her head to be scratched, but crouched back, glaring defiantly from under her bushy moving brows, glowering with restrained ferocity, nervously clasping one skinny paw with the other, and snorting savagely.

It was not until the man brought forth some grain from his pockets and held it out to her that she condescended to unbend. Perhaps she might not have done so then had not her appetite been craving for food. But, if you cannot tame an animal by any other means, you can generally find the way to its heart through an appeal to the stomach. And so it was now. Jenny ceased to glower, and moved over to take a little nourishment, thereby laying the foundations of a friendship with the man which was to last for many months to come.

For the rest of that voyage the monkey regarded him with friendliness, looked forward to meal-times, and sometimes permitted her master to shake hands with her. The passage through the Bay of Biscay was distinctly a bad one, but though many human passengers were laid low and had perforce to go without their meals, Jenny was not affected thus. Slight sea-sickness she may have felt, but it was not sufficient to take away her appetite. So she came at length to England.

v.

Arrived at the zoo outside Lieut. Brigshaw's native town, Jenny was put into a large cage along with several other animals; and, with three exceptions, she bullied the lot. A queer assortment of beasts did that cage contain. The chief ruler there was a little white pomeranian dog; another was a female goat; and the third was a porcupine, newly arrived. It was only a small zoo, and a separate cage for monkeys had not yet been built.

To the dog, being frightened of its ceaseless yapping, Jenny entirely succumbed, never attempting to take the least liberty with it. As regards the goat, after it had once caught

Jenny on the hind quarters and butted her neatly into the air, she mostly ignored that too, though occasionally she would take advantage of an unguarded moment, jump or drop on to the creature's back, and make it carry her round the cage before she loosened her hold. But with the porcupine she was quite on equal terms.

For the first week after Jenny's arrival, the chief bone of contention was a particular corner of the cage, which each animal liked to consider as its own, and from which each of them tried persistently to eject the other. The guinea-pigs, which also inhabited these quarters, Jenny seemed to despise utterly, never meddling with them, but every inmate of that cage that wore a tail was dead certain to have that tail pulled just when the assault was least expected.

At first sight you might have thought that the formidable armature of the porcupine would be too much even for a monkey, but Jenny learnt to direct her attacks, not at the body of the porcupine, but at his quills. Creeping up until within reach, she would take hold of one of the creature's quills and pull it with a sharp jerk. Now, a quill is simply a very large hair, furnished, like our own hairs, with peculiarly sensitive nerves at the base. A pull at the porcupine's quill, therefore, is just as painful to the owner as is a pull at one of our own hairs. If the porcupine refused to move from the coveted corner, Jenny tried another and harder pull, until the beast was at last so exasperated that he came out into the open, and with quills extended for battle, made a dash at the monkey. That, of course, was precisely what Jenny wanted, and no sooner was the porcupine out of the corner than Jenny leapt over his back and settled herself in the disputed territory. Once there, she squeezed herself so tightly into the corner that the quills of the porcupine could not be brought to bear on her, and so she remained master of the situation for as long as she chose.

Occasionally, however, the porcupine was just a little too quick for Jenny, nimble though she was, and whisked round on her, and let the monkey feel what quills are made for. Whereupon there was a yell of mingled pain and surprise, and Jenny sprang up the side of the cage, chattered angrily for some time, letting forth the strongest monkey imprecations, and from her lofty position awaited her next chance for turning the tables on her antagonist.

With the keeper Jenny was from the first on the friendliest of terms, perhaps because he brought her food; but sometimes when Jenny felt she had not had enough to eat she would grow angry and jump up and down on all-fours, scratching her ribs with her little finger, and uttering maledictions in the form of a series of peevish 'errr-errrs.'

There was no doubt about her being a great

favourite—indeed the greatest—with those folk who from time to time passed along before her cage. Daily there would be several interested persons outside gazing at the zoo's new acquisition, and not without reason, for Jenny, with her bright dark eyes, seemed to have a personality almost human. Indeed, for some time she was worth more than a raging lion to the public. Small boys, in particular, found in her the

greatest source of attraction—how boys do love a noisy fighting animal!—and busily plied her with dainties, except just after her official feeding-time. They soon learnt that it was no use throwing peanuts then, for Jenny's loose-skinned cheeks were already bulging with them. So they passed on to find some more eager recipient of their favours.

(Continued on page 474.)

AT THE UIST FORDS.

By ALASDAIR ALPIN MACGREGOR, Author of *Behold the Hebrides!*

I.

THE efforts that are being made to preserve the ruined remains of the home of Flora Macdonald, who was born in the island of South Uist, have brought to mind certain fascinating associations of the Isle of Benbecula, on the north and south sides of which stretch the vast, sandy, islet-studded fords that from low to half-tide have served for untold generations as a means of communication between North and South Uist.

The origin of the name, Benbecula, has long confused both Gaelic and Scandinavian etymologists. At least one Gaelic authority suggests that, in accordance with a Cymric derivative, the word means the Herdman's Isle, an appellation very appropriate for an island devoted mainly to pasturage. Other translators have rendered it as the Mountain of the Fords (*beinn na faodhail*), a name which, from the peculiar geological formations impinging upon the island, seems equally suitable.

Benbecula, at all events, has been appositely described as a place 'where the sea is all islands and the land is all lakes'—a description not unlike that which MacCulloch gave of North Uist, when he wrote that so much of the island was equally occupied by water and by land that he found it impossible to discern with the naked eye which of the two predominated. That this topographical phenomenon impresses itself on most observant voyagers to the southern isles is adequately borne out in the accounts given by subsequent wanderers and explorers. One writer says that the manner in which North Uist is intersected by the most complicated reticulations of fresh and salt water is 'altogether unparalleled in the history of mother earth.'

In bygone days Benbecula and the Uists were numbered among the ancient properties of the chiefs of Clan Ranald, though the lichen and dilapidated remnants of the Castle of Borve (*Caisteal Bhuirbh*), where the lairds of Benbecula resided long ago, and of the Weaver's Castle testify in only a very meagre degree to the glory of pristine baronial days, when the

mighty descendants of Somerled, the *Rex Insularum*, and grandfather of Donald, who founded the great and noble clan of MacDonald, and of Roderic, who founded the Clan MacRuairi, so firmly established themselves in the more southern of the Outer Hebrides that latterly the chiefs of the MacDonalds were able to assume the dignified title of Lords of the Isles. Those were the days when to *Caisteal Eilean Bheag Rùm* (the Castle of the Island of small Dimensions), which stood on an islet in Loch an Eilean, a lake near Howmore, the captain of Clan Ranald and his family were obliged to flee for protection from the threatened attacks of neighbouring foes.

II.

Oh! these were grand old times in Uist; for at this period the islands were peopled by clansmen who feared neither God nor man, and who viewed the restraining attempts of central authorities as an opportunity of demonstrating to kings and to princes their prowess and their dauntlessness.

Be it said, parenthetically, that, though little is known of the Uists during the end of the thirteenth century and the beginning of the fourteenth, several members of the MacRuairi family, which at that time held possession of the north isles, were imbued (in a manner not unlike the MacNeils of Barra—those fearless sea-rovers who were included 'among the best seamen of the British Empire') with a good deal of the piratical spirit of the ancient Vikings, whose blood flowed freely in their veins. From the *Annals of Ulster* we learn that in 1212 Roderic, the grandson of Somerled, successfully harried the Irish coast with an armament of nearly eighty galleys. Then, again, we are told that about 1286 Alan MacRuairi, son of the aforementioned Roderic, accompanied by some of his clansmen, plundered the valuable cargo of a Spanish vessel which in a storm had been driven ashore in the Hebrides; and ten years later these same gentlemen had sufficient temerity to carry their marauding expeditions into the Long Island and Skye.

Loch Maddy was long the rendezvous of these wild pirates. It was not until about the year 1609 that the clan system in the Hebrides received its first real shock, when, through the signing of 'The Band and Statutes of Icolmkill,' the Western Isles were brought under the control of the Scottish parliament, and some measure of order was established. This change, however, was not effected without the exercise of a certain amount of compulsion, because, although the island chieftains assembled at Iona and affixed their signatures to the covenant, in spirit, at any rate, they were long recalcitrant.

Among its nine clauses the covenant required inns or 'oistlairs' to be set down in the maist convenient places within every Ile,' and demanded that the 'extraordinary drinking of strong wynis and acquavitie' be put a stop to, while the inhabitants were forbidden to 'beer pistolletis out of thair awne housis, or schuit thairwith at deiris, hairis, or foullis.' Furthermore, the expulsion of 'vagaboundis, bairdis, idill and sturdie beggaris' was to be rigorously resorted to, the belief prevailing that no order could be established while the islands harboured so many vagrants and ruffians.

III.

No account of the history of Uist, however short, would be complete without at least a passing reference to a refugee prince, who, among the wild rocks and creeks of the southern Hebrides, sought to conceal himself from the wrath of his enemies, and who, during his sojourn there, met, in the person of Flora Macdonald, a Uist woman whose loyalty, in face of adversity, was as the shibboleth of her race.

In the summer of 1745 Prince Charles Edward with his attendants landed at Eriskay from *La Doutelle*, a small French frigate of eighteen guns, which had been placed at his disposal by its owner, Antoine Walsh, a merchant of Nantes. Here, it is recorded, 'he set foot on the kingdom of his ancestors' for the first time.

The voyage was an adventurous one; and that night he put up at the house of Angus Macdonald, the tacksman, where he was visited by a number of sympathisers, including the brother of Lochiel, who at the outset tried to persuade him to abandon his undertaking.

'What a plague is the matter with this fellow that he can neither sit nor stand still, and neither keep within nor without doors?' exclaimed Angus, who did not realise that the prince, having been accustomed to large airy places, was, in consequence of the chimneyless and peat-reeked habitation, obliged to go outside every few minutes in order to get a breath of fresh air.

Later the prince sailed for Benbecula, having reached the island of Wiay one morning after

a stormy night-passage. Here he is said to have sheltered in a tumbledown shepherd's hut. Of this voyage we read that the prince 'was very well pleased, and slept soundly on an old sail.'

After Culloden he was compelled to seek refuge again in the outer isles, and landed at Rossinish in Benbecula. While in South Uist he found his way to a cave on the water's edge at Corodale, a bay between Loch Skipport and Loch Eynort, where he hid himself for some days.

It was at the shieling of a Macdonald near Ormacleit, in South Uist, that, when his capture seemed imminent, he found tenderness and mercy at the hands of Flora Macdonald, who planned his escape to Skye.

Oh, what romance is commingled with the history and tradition of this little Scotland of ours!

IV.

Now, I want to tell you something about those great fords, to which I alluded earlier as being the regular thoroughfare between North and South Uist. Here the isles folk are able to cross as on dry land when the tide is low, unless the weather is very stormy and the seas are exceptionally high.

Half-way across the North Ford—which, with its devious and precarious routes, stretches roughly between Gramisdale in Benbecula and Carinish Inn in North Uist, and is about three miles in length—lies Eilean na h-Airidh (the Isle of the Shieling), where one track branches off in the direction of the low-lying and boggy island of Grimsay. The South Ford, which is only about a mile long, is deeper, and lies between Creagorry in Benbecula and Carnan in South Uist. One has to travel a distance of over nine miles in all when going from one Uist to the other, five miles of this distance being traversed in crossing Benbecula.

I cannot think of the Uist fords without being reminded of the lost continent of Atlantis, concerning which a valuable book has been published recently by an Edinburgh man, who has devoted many years to the theories associated with this interesting subject.¹

A study of the extreme variations in climatic conditions, which resulted in successive denudations on a gigantic scale of areas that once supported a luxuriant vegetation, and an examination of the changes that have been produced by the submergence and emergence of land in what must be regarded as pre-historic times so far as our islands are concerned, yield convincing evidence that at one period in the earth's history St Kilda and the Flannan Isles were not separated from Lewis by the sea, and that the whole of the Western

¹ See 'The Lost Atlantis' by Lewis Spence in *Chambers's Journal*, March 1925.

Isles once formed part of what we now refer to as the mainland of Scotland.

Though these great geological changes are usually so slow as to be almost imperceptible in a generation, and, indeed, sometimes in a century, they are all the time taking place. The old order is continually changing; every moment the valleys are being exalted, and the hills laid low. We know that within historic times the Archæan formations of the Western Isles have witnessed a series of marine and epigene denudations of an important character. From the *Exchequer Rolls* we learn that in 1542 the valued rental of North Uist was reduced as a result of the encroachment of the sea. And nearly two hundred years later (1721) a further intrusion of the sea is recorded in a document addressed to the Forfeited Estates Commissioners, in which the wadsetters¹ and the tacksmen² attest and deliver that, besides the severe losses sustained through murrain among the cattle and sheep, 'about Candlemas last the Sea overflowed severall pairts of the countrie breaking down many houses to the hazard of some lives which hase impaired the lands to such a degree as its possible it may happen more and more that they cannot answer to the worst sett in former times.' The relative changes in the level of sea and land in these regions are further borne out by the *Sailing Directions for the West Coast of Scotland* (1885).

v.

The sands of the Uist fords are whitish in colour, since they are chiefly of calcareous origin. They have been formed by the crumbling and the powdering of sea-shells, which the irresistible force of the Atlantic waves has reduced to an infinitesimal fineness—a process that has been going on uninterruptedly for hundreds of centuries. When dry, these sand-grains are wafted landwards by the wind, where they fall among the bent and other grasses of the machair. In the heat of summer these æolian deposits cause the grasses to wither and to die; in an arid season the machair often becomes parched and sunburnt like a miniature desert, for every fail and blade of grass is shrivelled up, and is rendered lifeless and languid. One writer tells us that, whereas the grasses of the machair-lands on the west side of Uist are in summer dried up by the sun's heat, in winter the finer and more tender grasses are 'melted away by the rains and storms and frost.' The result is that the cattle in the coastal parts often starve, unless they have access to the sea-ware that grows on the rocks, or to a little winter fodder that may have been stored up to tide them over the lean months. Most of the

cattle in Uist are outliers; so you can imagine what a severe time they have in winter, especially on the west side.

The white sands of North and South Uist and Benbecula are visited by innumerable birds—eider-ducks and teals and gulls, and wild gray greedy geese and green plovers. In the month of May they are besieged by all manner of fowls, including the curlew, the snipe, and the rock-pigeon. These regions are visited annually by swans; and each August great flocks of geese invade the cultivated plains of North Uist, where they do so much damage to the crops that the inhabitants are obliged to light fires and to erect wind-clappers in order to scare them away. Seals often frequent the vicinity of the fords; and the shy red-deer come down from the hills to drink of the streams that flow through them.

But it is at eventide that you ought to visit the fords, if you are at all imaginative. Then, should the tide be far out, you will be able to watch the flounders that flop in the sandy channels and adjacent pools at the setting of the sun. And you will see the silent gatherers with their creels among the inexhaustible cockle-beds. And, if you should tarry until darkness has fallen around you, and the sands are aglow with the soft half-light of the Aurora Borealis and of many quivering stars, you will become conscious of the mysterious meaning of those boulders that by the hand of man have been placed at intervals to guide in safety across the fords the pilgrim who may be mist-enwrapped or night-encircled. And you will hear the lonely cry of the sea-birds, and the plaintive piping of the curlews and the oyster-catchers where, at the line of the ebbing tide, the cold green water meets the land. And your ears will be attuned to the sea-music that the breakers of the limitless Atlantic have been making on these Hebridean sands for a million years and more; and you will find yourself at one with the Infinite.

THE CLOUDED ALPS.

WE went to Grindelwald. The mists were low,
The Lütchine's wild wan stream was drenched
with rain;
The heights were hid where Alpen roses blow—
Then said my boy, whose eager hopes were slain,

'Where is the Wetterhorn? The Eiger's snow?
The Jungfrau's beauty? I look up in vain,'
The old Swiss guide smiled as he turned to go—
'Darauf hab' ich gestiegen. Da sie stehen!'³

Then smiled my son, in hope of a to-morrow.
Though heights are sometimes veiled in mists
of sorrow,
We need not present days of darkness count,
But trust to those whose feet have climbed the
mount.

³ 'I have climbed them. Yonder they stand!'

A TRAGEDY OF THE ARCTIC.

By GEORGE C. WELLS.

I.

IN July 1923, for the first time in history, a Canadian judge presided over a court held at the Royal Canadian Mounted Police station on Herschel Island, 200 miles north of the Arctic Circle, one of the most desolate and dreary spots imaginable as a place of human habitation. The occasion was the trial for murder of two Eskimo, as the climax of a long series of killings which had taken place during the two previous years, and, as a result, both men—Alikomiak, a youth belonging to the uncivilised Copper Eskimo of Prince Albert Sound, and Tetamagama, an older man—were sentenced to be hanged, a sentence which in due course was carried out.

The story of the tragedy as reported by the Mounted Police and as brought out at the trial is as follows. It is to be borne in mind at the outset that the original cause of the murders was the scarcity of women among the Eskimo. Owing to the difficulty of obtaining sufficient food to support life in the arctic regions, female babies are frequently allowed to die, as they are considered a burden, not being able to take their share in the business of hunting, and the adult women occasionally have two or three husbands, all living together. Jealousy sometimes leads these men to kill each other, or a man who has no wife will kill another man more fortunate than himself and take possession of the widow.

Thus it came about that in a band of Eskimo living in 1921 in what is known as the Kent Peninsula there was a man called Hanak, whose main object in life appears to have been to secure an extra wife or two for himself. As he could hope to attain that end only by killing some of the married men, he had threatened to do so, and he had also threatened to kill two men, named respectively Pugnana and Tetamagama, whom he considered too friendly with the wife he already had. She, by the way, was also named Pugnana. He had challenged these two men to fight with guns; they declined the invitation, but decided to watch Hanak, and kill him if he showed any signs of taking the aggressive.

Hanak had two backers amongst the men of the tribe, Ikpukuwak and his son Ikialgina, the latter spoken of as a useless trouble-maker, of whom it was said that he couldn't keep a wife if he had one, but for whom Hanak had promised to procure a helpmate. The rest of the band, fearing trouble and desiring only peace, had decided to move away; but the day before the emigration was to take place Hanak

made good his threat by firing on, apparently without provocation, and wounding a man named Angoiak, who was walking back to the camp after visiting his fish-traps.

Pugnana and Tetamagama had been watching, and as soon as the overt act was committed by Hanak, they rushed out of their tents, armed with rifles and knives. Tetamagama shot Hanak through the chest, while Pugnana fired at and killed Ikialgina. Then Pugnana killed Hanak's wife (who, as we have seen, bore the same name as the murderer himself) with his knife, and finding that Hanak was still alive, despatched him with the same weapon. In the meantime Ikpukuwak engaged Tetamagama in a rifle duel, the two men exchanging shots from behind shelter, until Pugnana came up, after he had despatched Hanak, and shot Ikpukuwak. Then he went to Hanak's tent and strangled his little four-year-old daughter, which deed, however, was looked upon by the Eskimo as an act of kindness, as she, being alone in the world with no one to take care of her, would have starved to death! The battle being over, Pugnana and Tetamagama carried the bodies of the slain to a near-by lake and threw them in.

According to Tetamagama's story, he and Pugnana shortly after this went caribou shooting, and as they walked along Pugnana told him he had made up his mind to kill some more people, as they were all against him, and he wanted Tetamagama's help. Being unable to dissuade him from his purpose, Tetamagama decided that the best thing to do, in order to avoid further trouble, was to kill Pugnana, but being afraid to attempt it alone, he called in the boy Alikomiak, and the latter agreed to do the deed. The two asked Pugnana to go hunting with them next day, and soon after leaving camp, Pugnana being ahead, Alikomiak shot him from behind, and he fell dead immediately.

II.

News of these tragic occurrences having reached the Mounted Police post at Herschel Island in the late summer of 1921, Corporal Doak was sent to the Kent Peninsula in December. He arrested Tetamagama and Alikomiak, and brought them to a place called Tree River, where a small detachment of the police (consisting of Corporals Doak and Bonshor and Constables Woolams and Stevenson) was stationed, and where there was also a Hudson's Bay Company trading station, in charge of two white men, Otto Binder and C. H. Clark. Besides the two prisoners, Corporal Doak brought with him also, as witnesses, the man Angoiak, whose wounding by Hanak had begun the series of events, his

wife, and Pugnana's widow, a crippled woman named Aguahiak.

As there was only very limited accommodation at the police post, the witnesses and Tetamagama were sent to an Eskimo camp some seven miles away, in charge of Constable Woolams, Mr Clark, the trader, being there also on business. Corporal Bonshor, some time towards spring, set out to carry the winter's mail to Great Bear Lake, and was accompanied part-way by Constable Stevenson. This left only Corporal Doak and the prisoner Alikomiak at the police post, and Mr Binder, his native wife, and their two small children at the Hudson's Bay Company post. Alikomiak was not under close confinement, but assisted in the work of the post, in accordance with the general custom of the police in those regions, which is to trust the Eskimo, owing to their general docility. Doak had treated Alikomiak kindly, and had attended to his feet, which had been frozen after his arrest.

Quite unexpectedly and without warning, on the morning of 1st April 1922, Alikomiak arose while Doak was still asleep, took a rifle, and shot him in the lower part of the back as he lay in bed. The corporal was not killed instantly, but lingered for about two hours, presumably in great pain, the murderer remaining in the room with him but not molesting him further.

During the morning Mr Binder came over, as was usual with him, to visit Corporal Doak, and when he was about fifty yards away Alikomiak, who had been watching for him, fired from a window and shot him through the heart. He then went to Binder's house, where his wife Toktogan, who had seen the murder from the porch, was weeping, and said to her, 'Don't cry any more. I can't help it. I scared. I killed both of them.' They then carried Binder's body into the police post and laid it on the floor.

Shortly afterwards some Eskimo arrived from the camp for trading purposes and found the two white men dead. These Eskimo took the murderer, the native woman, and her children with them back to camp. Alikomiak, according to his own confession, had some idea of shooting Constable Woolams and Mr Clark, but the other natives disarmed him *en route*, and on arrival at the camp he was at once taken in charge by the constable, who, with Mr Clark, then proceeded to the scene of the murder, at the same time despatching a messenger to bring back Bonshor and Stevenson.

Corporal Doak had been a long time in the district, and was well known and respected by both natives and white men; and Binder enjoyed a good reputation as a trader, and was well liked by the Eskimo. Alikomiak's reasons for killing Doak seem to have been rather vague. He said at his trial that he was offended at some things Doak had said to him about his work, and he was afraid perhaps

Doak would beat him, although he had never done so, nor even threatened to; also that he did not want to go west to a strange country, and thought that when he shot Doak the latter would take his revolver and shoot him, and he was not afraid to die. He said that he shot Binder because he thought that when Binder found Doak had been murdered he would want to kill him.

III.

The story of all that had taken place reached civilisation as soon as possible; but as those far northern regions are inaccessible save during a very short season in the summer, except to the most hardy and expert 'mushers,' no action could be taken for some months. It is hard for people resident in the British Isles to conceive the vast extent of Canada and the immense distances to be traversed. Edmonton, Alberta, which may be reckoned the 'jumping-off place' for the Far North, is over 2000 miles from Montreal, and from three to three and a half full days of twenty-four hours each are required of fast and comfortable—yes, luxurious—railway travel to go from one city to the other. Then from Edmonton there extends a railway line, called the Alberta and Great Waterways Railway, which is operated by the Alberta Government, running for nearly 300 miles almost due north to a point called Waterways, on the Athabasca River. During the season of navigation a passenger train runs once a week over the Alberta and Great Waterways Railway, and from about 10th May this train connects with steamers plying to Fort Fitzgerald, a distance of 292 miles. From Fort Fitzgerald to Fort Smith there is a 16-mile portage by motor trucks, in order to avoid a series of rapids, probably as turbulent and terrifying as any in the world; and at Fort Smith passengers can embark on fairly large and comfortably equipped steamers for a voyage of 1400 miles down the Slave River, into and across Great Slave Lake, and thence down the great Mackenzie River to Aklavik, which is within 50 miles of the Arctic Ocean, into which vast body of water the Mackenzie empties by a number of mouths.

The first trip of these steamers from Fort Smith to Aklavik was made about the middle of June that year, and under the most favourable conditions only a few round trips can be made before the season ends. Incidentally, it may be of interest to note that the fare quoted during the summer of 1923—Waterways to Aklavik and return—was \$240 (say about £50), exclusive of meals and sleeping accommodation. From Aklavik to Herschel Island the means of communication are motor-boats and small sailing-vessels.

IV.

With the opening up of the Great Waterways route above described for the brief summer

season, the Canadian Government despatched Judge Dubuc of Edmonton to hold court on Herschel Island, and try Alikomiak and Tetamagama for their crimes, as well as deal with other but less serious cases which had occurred. He was accompanied by a lawyer named Howatt, from Edmonton, delegated to act as crown prosecutor, while Mr Cory, a Winnipeg lawyer, undertook to defend the accused. The jury was composed of trappers and traders, an old steamboat captain living at Herschel Island, and a law-student who travelled with the judge and, when required, acted as his secretary. Cyril Uignik, a Christian Eskimo boy, who had been educated at the Hay River Mission of the Church of England, served as interpreter. Most of the Eskimo were away fishing for white whales during the progress of the trial, and only half-a-dozen or so were present, and they seemed but little interested in the fate of the accused.

Both prisoners gave evidence in a very straightforward manner, and, in fact, it was largely on their own testimony that they were convicted. Mr Cory, as their counsel, did not attempt any denial of the facts, but argued that Eskimo should not be tried or dealt with in the same manner as white men, as they are to-day practically in the same state of development as were the ancient Britons when Julius

Cæsar landed. Both men were found guilty, and were sentenced to be hanged, but did not appear much impressed by the announcement, Alikomiak, especially, smoking cigarettes immediately after sentence had been pronounced, and laughing and joking with the utmost unconcern.

Efforts were made to have the sentence commuted; but the Canadian Government, after full consideration of all the circumstances, decided to let the law take its course, pointing out that in the case of two Eskimo¹ who, in 1917, were sentenced to death for the murder of two priests, but afterwards had their sentence reduced, the exercise of clemency did not appear to have had any beneficial effect, as murders among the Eskimo are becoming very frequent, and that 'in the opinion of those conversant with the conditions in the North, it is in the best interest of law and order that the sentence be carried out.'

Corporal Doak's untimely and tragic end exemplifies the dangers run by the Royal Canadian Mounted Police, whose history, since the corps was first formed in 1873 as the 'Royal North-West Mounted Police' to keep order in the North-West Territories, is one long record of heroism, devotion to duty, and good work well done.

THE LIVING BRANCH

CHAPTER II.—*continued.*

III.

IT was rather difficult at first, and for a few moments they did not quite find themselves, but nothing prevented the quick mutual scrutiny that became, perhaps, the more keen as talk grew easier. It happened that the circumstance of each was in this case proclaimed by her appearance, so that without words many intuitive questions were answered. Connie, searching Sybil's face, read its record of boredom and somewhat cynical acceptance of life, if not actual disillusionment. She was still lovely, still held her former allure with all its smooth perfection. As to Connie, Sybil was frankly puzzled. The girl displayed no evidence of wear and tear. Her colour was not so high, but her cheeks had the milky whiteness of superb health. There was a sort of quiet content in her eyes. Sybil stole a look at the long capable hands. They had not suffered. Perhaps, she reflected, Mary Mostyn wasn't a fair average.

'And now,' Connie was saying, 'tell me everything—just how you got here, and where's George. You won't see Jack till to-night; he's up on the hill-side, where we're getting out timber for a new barn.'

Sybil told her, cutting it as short as possible. To Connie it was rather a remarkable recital, being notes from the diary of one who has had the world for a football. The contrast with life on Silver Bay was sufficiently sharp. But when Sybil concluded, the other girl was aware that this was only part of the story, and wondered if the rest of it would ever be told. Her gaze wandered from the Hanover Square tweeds to the American sailor, who was fishing a hundred yards away. The tweeds, the dinghy, the yacht on the other side of the narrows, the Thurstons, who had been sketched in with a slightly cynical touch, George, who had been perfectly described, since Sybil had said nothing of him; yes, she could imagine and supply the rest herself. Her thoughts ranged back to Marchmont and that half-hour by the fire. What a child she was then, and how much more anxious than Sybil guessed. But Mrs Jennison knew. Then Sybil made a little familiar gesture.

'It's your turn now.'

Connie's manner of telling was unconsciously effective. She said hardly anything of what they found at Silver Bay, because already those

¹ See *Chambers's Journal* for May 1919.

first two years of stress had become gently merged into the more equable present. There was much of Jack, their two children, the farm, the building of the bungalow that superseded the original log cabin, the growing trade with the mills, whence a launch brought mail twice a week, returning with produce; but there was no hint of isolation or loneliness. It struck Sybil that the girl had lost none of her charm, and she wondered if Jack Merivale had revealed unexpected resources. It could be nothing else, Connie having evidently discovered some fount of interest where she could drink and be satisfied. The story was so simple as to be rather baffling.

'It sounds a bit heroic,' Sybil said doubtfully. 'And do you mean that you don't really miss all the rest of it?'

'Of course not. We both miss it, but I think we're learning what one might call the art of replacement, and it's getting more natural every year. You were married about four months after us, weren't you?'

Sybil nodded; then, quickly, because she knew what was coming, 'We haven't any children, and I don't think I'm sorry now, so I suppose you'll see that it has all turned out very much as I expected. But our tastes are the same.' She said this with a little burst, as though breaking through some kind of crust behind which she habitually moved; and in saying it admitted that while she had counted on certain definite results from marriage, she was in truth disappointed at the accuracy of her forecast.

'I rather think,' she went on, 'the difference between us is that you've got out of it what you hoped, and I've got what I expected. Jack wanted you, because he was thinking about you, and I wanted George, because, frankly, I was thinking about myself. I believe I admitted that at the time, didn't I?'

Connie smiled. 'I fancy you did.'

'Well, I don't want you to imagine I'm on the penitent bench now, and I'm certainly not going to sit beside a river in British Columbia and confess that I've made the mistake of my life—even to you. But I did hope to find you, and not looking like poor Mary Mostyn, which you don't. If I don't say anything about George, it's because he's only about two miles away at this minute with Mollie Thurston. He isn't fishing, but making all kinds of passionate declarations, which is why they went.'

Connie was amused to realise that she felt slightly shocked, and in that instant perceived what the past five years had really done for her. Her mind slid back to Marchmont and George's proposal. It would have been so easy to stand where Sybil stood now, and she wondered if the result would have been the same. If it had, she could not have taken it so impassively. Then, far up on the hillside sounded

a faint ragged crash, and she knew that another stick of big timber was available for the new barn. At this her thoughts turned to Jack. He had found himself on Silver Bay.

IV.

'Won't you send the man back for the others, and I'll get Jack down for lunch? Meantime, come and see the children.'

Sybil shook her head. She wanted to keep this meeting to herself, and it would lose something of its tang if the Merivales were discussed back and forth across the saloon table. Mollie would be very polite and a shade compassionate, Thurston too ultra-Mayfair for a coast bungalow, and she could anticipate the effect of Connie's Diana-like beauty on George. It was strange, she thought secretly, that he had not capitulated years before. No, the thing wouldn't fit. She was curious to see the children, but, privately, a little afraid; and this amused her. 'I'd like to come up myself, but would rather leave the others out, if you won't think it frightfully rude. And we have to be off in an hour or so on our way north. I'm awfully interested, so do you mind if I regard you as my personal discovery?'

On Jack's account Connie was a little relieved. He was so contented, so keen on his work, that she was glad to avoid reviving in him any of his one-time abashment at being able to offer her so bare an alternative to social isolation. His former keen sense of contrast had now dimmed, or, if he did miss the fleshpots for her sake, he seldom showed it. At intervals which were becoming more rare she caught this in an occasional wistful glance, and always in his devotion was the implication that she had dowered him with utter prodigality. Behind this devotion was a complete love, and his mind, still boyish, had surprised her with its fertility. His was the cheerful habit of minimising his own efforts while he magnified hers, and always with a protective tenderness that touched her enormously. But he never knew how much she leaned on this. She wanted him to feel unburdened.

'Just as you like,' Connie said understandingly; then, with a laugh, 'is it really five years since our last talk?'

Sybil nodded. 'I was thinking of that too, and remember being extremely candid. I suppose you're saying to yourself that I've got just what I asked for?'

'Yes,' admitted Connie, 'I was.'

'Well, it astonished me to realise what an accurate forecast it was. George is exactly what I expected, only more so. We've done everything I anticipated, and perhaps because I had it all arranged in my mind it has been a bit flat. Probably I'll go on doing these things, not having enough stuff in me to change; which really means I'm a sort of servant to my tastes,

and they don't serve me. I'm saying all this, less because it's true than because I've never found anyone else to say it to. I know you're miraculously contented—one can see that in your face—while I'm not; but I wouldn't change places even now. Didn't we say something about our respective ideas of happiness that last time?'

'You suggested that we should compare them after five years. I thought a good deal about that for a while, but I don't now.'

Sybil smiled. 'You know, my dear, there's something about perfectly happy people which some others find almost irritating. That nice sailorman in the dinghy is absolutely serene, but if you asked him what he was thinking about he couldn't tell you. In a general way it's only the ones who are not happy who can tell you their thoughts, so I'd rather forget that comparison. But in a place like this, and especially in winter, which must be rather awful, I should imagine you'd do a lot of thinking which might be a bit disturbing. I'd like to stop thinking myself, and, of course,' she concluded coldly, 'I stopped feeling ages ago. Now, Connie, tell me how this miracle has happened, and how you do it, you—you Trojan.'

v.

'I don't feel a bit like a Trojan,' began Connie, 'but when I got here first I was rather appalled at the bigness and solitude. It made me seem small and impudent, but, of course, I didn't mention this to Jack. Then the mountains became in a way friendly. One has to get over that habit of being surprised and shocked that things happen to one's own self, when it might just as well be some one else. I didn't think much about what I'd left, though I expected to, because it seemed too remote and unreal, while here everything shouted its reality at you. And all the time I was watching Jack unfold one new resource after another in a way he'd never have done in England. What seemed awkwardness there was strength here, and that was a bit of an object lesson to start with. As to myself, while at home I was one of our crowd; here I'm one out of the crowd, and get perhaps a better perspective. You'll ask what's the use of a perspective on Silver Bay, but it's going to help me to have a tremendous time when we go back for a few months next year.'

'I think perhaps it will,' murmured Sybil. 'Please go on.'

'There isn't any more. The thing's all right, and if there was a hole in it I shouldn't mind telling you. But I haven't found one yet. The other side of this life wouldn't interest you—the building up of the place and all that; but the result is, we're doing rather well in a small way, and are going ahead quite steadily.'

'No, it wasn't that end of it, which I can see for myself; it's your particular angle. We are both doing what we proposed to do, and I was frightfully keen to know what your part of it had cost you personally. But it agrees with you, my dear—you never looked so utterly stunning in your life, and you'll create a sensation when you get back. I won't ask you to come to us on account of George. As for me, while I'll look all right for a while yet, it takes more and more time, and naturally I can't stop. Are you still in love with Jack?'

Connie laughed. 'Remarkable though it may sound, I am. Come and see our children.'

vi.

Half-an-hour later, Sybil, gliding through the narrows, waved good-bye to a tall straight figure that stood knee-deep in meadow grass. She was very thoughtful, but not in any way chastened, and though she felt suddenly lonely she would not have admitted it. What she must do now was to freshen up her capacity for enjoyment, not bother about Mollie Thurston, and not be too analytical. It seemed rather a waste of sheer beauty that Connie should be marooned in this cranny of a foreign coast, something she herself would never put up with. But what she had to admit was that the picture of Connie with tiny fingers making lovely disorder of her bronze hair, and Connie's eyes as she regarded her four-year-old son, would obtrude itself in days to come with disturbing frequency. What had really happened was that she and Connie had each grafted on to the tree of existence a branch of their own choosing. One was artificial and nurtured in a hothouse; the other had in it the fibre of health and endurance. One shrivelled in the variable winds of life, and the other thrived. This was still pricking in her mind when the sailorman backed water with one oar, and the dinghy lay three inches from the yacht's white hull.

Thurston emerged from his cabin soon after she reached the deck. Mollie and George were rowed back half-an-hour later; she with a high colour and very talkative, he notably affable—as he always was when he thought it worth while to try to disarm Sybil's suspicions. But this time she didn't care. They all stood in a little group in the bows while anchor was weighed. Then the engines throbbed, and, slowly gathering speed, the yacht headed for the mouth of Silver Bay. In a few minutes they came abreast of the narrows. There was a glimpse of lush meadow and a quaintly-built bungalow, in front of which stood some one quite motionless. George picked up his binoculars.

'It's a woman. Gad, what a devil of a life in a hole like this!'

Sybil was a hundred miles nearer Alaska when Merivale sat that evening on his wide

verandah and watched the pink flush dying on the high peaks. He smoked with great contentment.

'We're going to make that barn eighty feet instead of seventy; and, I say,' he added with a touch of wistfulness, 'I saw a corking yacht

pass the bay just before noon. She evidently put her nose in on the way north. Sort of thing I'd like for you.'

'I'm safer ashore than I'd feel in a yacht on a coast like this,' said Connie innocently.

THE END.

STARS AND THEIR WIRELESS MESSAGES.

III.—THE SPECTRA OF THE STARS.

By Professor GEORGE FORBES.

I.

HAVING prepared the ground in our two previous articles, we are able to understand the first discoveries that were made about the constitution of the stars.

Already the spectroscope had proved that the sun and the earth, situated in the same region of space, are made of the same materials. It was natural to suppose that the sun is not unique among stars in this respect. It was natural to extend the experiment to the other stars, and to expect them all to show spectra, like the sun, with dark lines for the materials found upon the earth. The very first application of a spectroscope to the brightest stars dispelled this expectation. It was soon found that some of the brightest stars have spectra differing totally from that of the sun. This was a discovery of first importance. And yet, on consideration, this result might have been foreseen, for we have another means, more rare but more certain, for finding out the materials that may be in different parts of space. Meteorites are masses of matter that come like comets from interstellar regions, and fall upon the surface of our earth. Some may come from the regions where Vega lies; others from near Capella. Are these made always from the same materials?

The answer is that they differ very much. There are, in fact, two great distinctive fundamental types, called the metallic and the stony meteorites. In the former, nickel and iron preponderate. The late Professor Graham, Master of the Mint, examined some of these, and found large quantities of hydrogen confined in the pores or cavities of the meteoric mass. He told how astronomers had found many stars made of hydrogen. He went on to say, 'This meteorite may be looked upon as holding imprisoned within it, and bearing to us, hydrogen of the stars.'

As yet we have no evidence as to the regions of space from which these two distinct types of meteors emanate. It would, at present, be impossible to say that the ring of the Milky Way and the bun-shaped space are the two sources whence the two kinds of meteorites come. What the meteorites tell us certainly

is that we ought not to expect to find that all stars are made of the same materials.

The new discoveries made by astronomers when they pointed a spectroscope at the stars last century were as numerous and surprising as those made in 1610, when a telescope was first pointed at the stars. The two great pioneers were Huggins in this country and Secchi in Rome. It is to the discoveries which began with Father Secchi at the observatory of the Vatican that attention will now be drawn—discoveries dealing with the materials found in the different stars.

II.

Secchi invented a spectroscope which he could use with his existing telescope, so very simple in application that he was able to make a rapid general survey of all the brighter stars. The results he arrived at were unexpected and surprising. Finding that they did not seem to be of uniform constitution, he set to work to find whether the spectra could be classified in a limited number of types. At the end of his laborious survey he was able to assert that there is 'a fundamental distinction between the spectra of stars, according to a *small number of types*.' This is the wonderful generalisation which to-day lies at the basis of all our knowledge about the constitution of the stars.

He found that nearly all stars belong to one or other of two distinct types, I. and II. The remaining stars he examined were red in colour, and had spectra of two other quite distinct types, III. and IV.

He also discovered, from his first great general survey, that *some of the different types are localised in particular parts of the heavens*. Far too little attention has been given by theorists to this second discovery, the truth of which is now completely established. In the British Association report for 1868 we can read about all the fundamental facts that Secchi had discovered at that date.

Nothing could ever obliterate from my mind the memory of Secchi when I was in Rome in 1871. I was a youngster, fresh from Cambridge. Secchi was, to my mind, one of the greatest of men, from his discoveries. I had a letter of

introduction to him, I think from Airy. He invited me to spend a night with him, at the Vatican observatory, with his spectroscope.

Secchi began by pointing his telescope on Sirius. During a period of about five minutes he was carefully adjusting the apparatus to give the very best effect. At last he stood back and invited me to look. I expected to have difficulty in seeing the spectrum of so feeble a light as a star. I shall never forget the wonder I felt at the splendid brilliance of that spectrum, with four dark lines across it, all due to hydrogen. I knew the solar spectrum well enough to see at the first glance that the spectrum of Sirius was totally different. It seemed to establish the fact that Sirius must consist almost entirely of hydrogen gas; whereas the sun shows lines due to most of the substances found on our earth.

He next showed me the spectrum of Capella, a star of his Type II. This was totally different. Of course I could not identify the numerous dark lines crossing the spectrum. But I was quite ready to accept what Secchi told me, that 'this spectrum is exactly like that of our sun.' In both Capella and the sun the hydrogen lines are far less notable than in Type I., the characteristic lines being calcium and various other metals.

Then he pointed his spectroscope and telescope to Betelgeuse, the red star in Orion's shoulder, whose spectrum is of the Type III. While its spectrum had some resemblance to that of Capella, its characteristic feature was the addition of a number of dark bands or flutings of unknown origin. We now know that these are due to absorption of light by *titanium oxide* in the atmosphere of the star.

I cannot now recall whether Secchi then showed me a spectrum of Type IV., found only in certain faint, blood-red telescopic stars. This resembles Type III., except that the added bands or flutings have a totally different character. They were correctly ascribed by Secchi to absorption of light by *carbon compounds* in the atmospheres of these stars.

Secchi also found that the spectrum of Rigel, and most of the Orion stars, though resembling

that of Sirius, and obviously belonging to Type I., had in addition a number of very fine lines. We now know that these lines belong to helium, an element that was discovered by Ramsay as a terrestrial element in 1895.

III.

Now, we are able to set out Secchi's four types of stellar spectra, and the chemical constitution indicated by each:

TYPE I., like Sirius, essentially a hydrogen spectrum; with a sub-section, like Rigel, showing also helium.

TYPE II., like Capella, solar stars, marked by calcium, metals, and most of our terrestrial elements.

TYPE III., like Betelgeuse, red stars, like the solar type, with titanium oxide added.

TYPE IV.—Telescopic, crimson stars, like the solar type, with carbon compounds added.

Nearly all the stars belong to Type I. or II. Some few stars have a spectrum intermediate between Types I. and II., or between Types II. and III.; but no stars have spectra intermediate between Types I. and III.

The discoveries of the early pioneers, such as Huggins and Secchi, have been enormously extended by later researches. But Secchi's great general classification remains fundamental. Really, he named five types, due to (1) hydrogen; (2) helium and hydrogen; (3) calcium and metals; (4) titanium; (5) carbon.

A very great additional interest, for people who do not own spectroscopes, arises from the fact that all of these five types can be generally foretold by anyone. For it is found that stars which differ in spectroscopic type can generally be seen to shine with different colours.

Sirius, Vega, and all stars of Type I. are white. Some of them may seem to have a bluish tinge, and all the Orion stars, like Rigel, have a greenish tinge. Still, they are all white stars. Capella, and all stars of Type II., the solar type, are, on the other hand, distinctly yellow. Betelgeuse, Antares, and other stars of Type III. are red; those of the Type IV. are crimson or blood-red. People vary in their readiness to detect these differences.

JOHN MACNAB: A COMEDY FOR POACHERS.

CHAPTER XIV.—HARIPOL—WOUNDED AND MISSING.

LAMANCHA watched Palliser-Yeates disappear along the hillside, and then returned to the hollow top of the Beallach, which was completely cut off from view on both sides. All that was now left of the mist was a fleeting vapour twining in scarfs on the highest peaks. The cliffs of Sgurr Dearg and Sgurr Mor towered above him in gleaming stairways, the drenched cloudberry sparkled in the sunlight, and the

thousand little rivulets, which in the gloom had been hoarse with menace, made now a pleasant music. Lamancha's spirits rose as the world brightened. He proposed to wait for a quarter of an hour, till Wattie with the stag was well down the ravine and Palliser-Yeates had secured the earnest attention of the navvies. Then he would join Wattie and help him with the beast, and within a couple of hours he might be

wallowing in a bath at Crask, having bidden John Macnab a long farewell.

Meantime he was thirsty, and laid himself on the ground for a deep drink at an icy spring, leaving his rifle on a bank of heather. When he rose, with his eyes dim with water, he had an unpleasing surprise. A man stood before him, having in his hands his rifle, which he pointed threateningly at the rifle's owner. 'Ands up,' the man shouted. He was a tall fellow in navy's clothes, with a shock head of black hair, and a week's beard—an uncouth figure with a truculent eye.

'Put that down,' said Lamancha. 'You fool, it's not loaded; hand it over. Quick!'

For answer the man swung it like a cudgel. 'Ands up,' he repeated. 'Ands up, you —, or I'll do you in.'

By this time Lamancha had realised that his opponent was the peripatetic navvy, of whom Palliser-Yeates had reported. An ugly customer he looked, and resolute to earn Claybody's promised reward.

'What do you want?' Lamancha asked. 'You're behaving like a lunatic.'

'I want you to 'ands up and come along o' me.'

'Whom on earth do you take me for?'

'You're the poacher—Macnab. I seen you, and I seen the old fellow and the stag. You're Macnab, I reckon, and you're the — I'm after. Up with your 'ands and look sharp.'

Mendacity was obviously out of the question, so Lamancha tried conciliation. 'Supposing I am Macnab—let's talk a little sense. You're being paid for this job, and the man who catches me is to have something substantial. Well, whatever Lord Claybody has promised you, I'll double it if you let me go.'

The man stared for a second without answering, and then his face crimsoned. It was not with avarice, but with wrath. 'No, you don't,' he cried. Consideration of public morals compels me to expurgate the speech till the many gaps make the sentences look like pieces of old lace. 'By—you don't come over me that way. I'm not the kind as sells his boss. I'm a white man, I am, and I'll — well let you see it. 'Ands up, you —, and march. I've a — good mind to smash your 'ead for trying to buy me.'

Lamancha looked at the fellow, his shambling figure contorted by hard toil out of its natural balance, his thin face, his hot, honest eyes, and suddenly felt ashamed. 'I beg your pardon,' he grunted. 'I oughtn't to have said that. I had no right to insult you. But of course I refuse to surrender. You've got to catch me.'

He followed his words by a dive to his right, hoping to get between the man and the Sgurr Mor cliffs; but the navvy was too quick for him, and he had to retreat baffled. Lamancha

was beginning to realise that the situation was really awkward. This fellow was both active and resolved; even if he gave him the slip he would be pursued down to the Doran, and the destination of the stag would be revealed. . . . But he was by no means sure that he could give him the slip. He was already tired and cramped, and he had never been noted for his speed like Leithen and Palliser-Yeates. . . . He thought of another way, for in his time he had been a fair amateur middle-weight. 'You're an Englishman. What about settling the business with our fists? Put the rifle down and we'll stand up together.'

The man spat sarcastically. 'Ain't it likely?' he sneered. 'Thank you kindly, but I'm takin' no risks this trip. You've got to 'ands up and let me tie 'em so as you're safe, and then come along peaceable. If you don't, I'll 'it you as 'ard as Gawd'll let me.'

There seemed to be nothing for it but a scrap, and Lamancha, with a wary eye on the clubbed rifle, waited for his chance. He must settle this fellow so that he should be incapable of pursuit—a nice task for a respectable Cabinet Minister in the prime of life. There was a pool beside his left foot, which was the source of one of the burns that ran down into the Sanctuary. Getting this between him and his adversary, he darted towards one end, checked, turned, and made to go round the other. The navvy struck at him with his rifle and narrowly missed his head. Then he dropped the weapon, made a wild clutch, gripped Lamancha by the coat, and with a sound of rending tweed dragged him to his arms. The next moment the two men were locked in a very desperate and unscientific wrestling bout.

It was a game Lamancha had never played in his life before. He was a useful boxer in his way, but of wrestling he was utterly ignorant, and so, happily, was the navvy. So it became a mere contest of brute strength, waged on difficult ground with boulders, wells, and bog-holes adjacent. Lamancha had an athletic, well-trained body, the navvy was powerful, but ill-trained; Lamancha was tired with eight or nine hours' scrambling, his opponent had also had a wearing morning; but Lamancha had led a regular and comfortable life, while the navvy had often gone supperless, and had drunk many gallons of bad whisky. Consequently the latter, though the heavier and more powerful man, was likely to fail first in a match of endurance.

At the start, indeed, he nearly won straight away by the vigour of his attack. Lamancha cried out with pain as he felt his arm bent almost to breaking-point and a savage knee in his groin. The first three minutes it was anyone's fight; the second three Lamancha began to feel a dawning assurance. The other's breath laboured, and his sudden spasms of

furious effort grew shorter and easier to baffle. He strove to get his opponent on to the rougher ground, while that opponent manœuvred to keep the fight on the patch of grass, for it was obvious to Lamancha that his right course was to wear the navy down. There were no rules in this game, and it would be of little use to throw him; only by reducing him to the last physical fatigue could he have him at his mercy, and be able to make his own terms.

Presently the early fury of the man was exchanged for a sullen defence. Lamancha was getting very distressed himself, for the navy's great boots had damaged his shins and torn away strips of stocking and skin, and his breath was growing deplorably short. The two staggered around the patch of grass, never changing grips, but locked in a dull clinch into which they seemed to have been frozen. Lamancha would fain have broken free and tried other methods, but the navy's great hands held him like a vice, and it seemed as if their power, in spite of the man's gasping, would not weaken.

In this preposterous stalemate they continued for the better part of ten minutes. Then the navy, as soldiers say, resumed the initiative. He must have felt his strength ebbing, and in a moment of mental disquiet have decided to hazard everything. Suddenly Lamancha found himself forced away from the chosen ground and dragged into the neighbouring moraine. They shaved the pool, and in a second were stumbling among slabs and screes and concealed boulders. The man's object was plain; if he could make his lighter antagonist slip, he might force him down in a place from which it would not be easy to rise.

But it was the navy who slipped. He lurched backward, tripping over a stone, and the two rolled into a cavity formed by a boulder which had been split by its fall from Sgurr Mor in some bygone storm. It was three or four feet of a fall, and Lamancha fell with him. There was a cry from the navy, and the grip of his arms slackened.

Lamancha scrambled out and looked back into the hole, where the man lay bunched up as if in pain. 'Hurt?' he asked, and the answer came back, garnished with much profanity, that it was a broken leg.

'I'm dashed sorry. Look here, this fight is off. Let me get you out and see what I can do for you.'

The man, sullen but quiescent, allowed himself to be pulled out and laid on a couch of heather. Lamancha had feared for the thigh or the pelvis, and was relieved to find that it was a clean break below the knee, caused by the owner's descent, weighted by his antagonist, on an ugly sharp-edged stone. But as he looked at the limp figure, haggard with toil and poverty, and realised that he had damaged it

in the meagre capital which was all it possessed, its bodily strength, he suffered from a pang of sharp compunction. He loathed John Macnab and all his works for bringing disaster upon a poor devil who had to earn his bread. 'I'm most awfully sorry,' he stammered. 'I wouldn't have had this happen for a thousand pounds—'

Then he broke off, for in the face now solemnly staring at him he recognised something familiar. Where had he seen that long crooked nose before, and that cock of the eyebrows? 'Stokes,' he cried; 'you're Stokes, aren't you?' He recalled now the man who had once been his orderly, and whom he had last known as a smart troop sergeant.

The navy tried to rise, and failed. 'You've got my name right, guv'nor,' he said, but it was obvious that in his eyes there was no recognition.

'You remember me? Lord Lamancha?' He had it all now—the fellow who had been a son of one of Tommy Deloraine's keepers—a decent fellow and a humorous, and a good soldier. It was like the cussedness of things that he should go breaking the leg of a friend.

'Gawd!' gasped the navy, peering at the shameful figure of Lamancha, whose nether garments were now well advanced in raggedness, and whose peat-begrimed face had taken on an added dirtiness from the heat of the contest. 'I can't 'ardly believe it's you, sir.' Then with many tropes of speech he explained what, had he known, would have happened to Lord Claybody, before he interfered with the game of a gentleman as he had served under.

'What brought you to this?' Lamancha asked.

'I've 'ad a lot of bad luck, sir. Nothing seemed to go right with me after the War. I found the missus 'ad done a bunk, and I 'ad the two kids on my 'ands, and there weren't no cushy jobs goin' for the likes of me. Gentlemen everywhere was puttin' down their 'osses, and I 'ad to take what I could get. So it come to the navyin' wi' me, like lots of other chaps. The Gov'ment don't seem to care what 'appens to us poor Gawd-forgotten devils, sir.'

The navy stopped to cough, and Lamancha did not like the sound of it. 'How's your health?' he asked.

'Not so bad, barrin' a bit of 'oarseness.'

'That explains a lot. You'll have consumption if you don't look out. If you had been the man you were five years ago you'd have had me on my back in two seconds. . . . I needn't tell you, Stokes, that I'm dashed sorry about this, and I'll do all I can to make it up to you. First, we must get that leg right.'

Lamancha began by retrieving the rifle. It was a light double-barrelled express, which fortunately could be taken to pieces. He had

some slight surgical knowledge, and was able to set the limb, and then, with strips of his handkerchief and the rifle-barrel, to put it roughly into a splint. Stokes appeared to have gone without breakfast, so he was given the few sandwiches which remained in Lamancha's pocket and a stiff dram from his flask. Soon the patient was reclining in comparative comfort on the heather, smoking Lamancha's tobacco in an ancient stump of a pipe, while the latter, with wrinkled brows, considered the situation.

'You ought to get to bed at once, for you've a devil of a bad cough, you know. And you ought to have a doctor to look after that leg properly, for this contraption of mine is a bit rough. The question is, how am I going to get you down? You can't walk, and you're too much of a heavy-weight for me to carry very far. Also, I needn't tell you that the hillside is not too healthy for me at present. I meant to go down it by crawling in the open and keeping to the gullies, but I can't very well do that with you. . . . It looks as if there was nothing for it but to wait here till dark. Then I'll nip over to Crask and send some men here with a stretcher.'

Mr Stokes declared that he was perfectly happy where he was, and deprecated the trouble he was giving.

'Trouble!' cried Lamancha. 'I caused the trouble, and I'm going to see you through it.'

'But you'll get nabbed, sir, and there ain't no bloomin' good in me 'aving my leg broke if Claybody's going to nab you all along of it. You cut off, sir, and never 'eed me.'

'I don't want to be nabbed, but I can't leave you. . . . Wait a minute! If I followed Wattie—that is my stalker—down to the Doran I could send a message to Crask about a stretcher and men to carry it. I might get some food too. And then I'd come back here and we'd "bukk" about Palestine till it's time to go. . . . It might be the best way. . . .'

But even as he spoke, further plans were put out of the question by the advent of six men who had come quietly through the Beallach from the Sanctuary, and had unostentatiously taken up positions in a circle around the two ex-antagonists. Lamancha had been so engaged in Stokes's affairs that he had ceased to remember that he was in enemy territory.

(Continued on page 469.)

RUBBER THIEVES.

THE rat is often quoted as the most expensive thief levying tribute in either the Old or the New World. Generally considered, this is the case. But insects also cause an immense loss, especially among tropical and semi-tropical crops. The damage rats do among sugar-cane plantations, particularly in the Mauritius and also in several of the islands of the East Indies, is almost rivalled by the rubber thieves. These insect pests bring about great financial loss in the rubber plantations of Brazil; and the worst of them is the rubber-stealing ant, though its fellow-thief, the rubber-stealing bee, is almost as troublesome.

These two thieves in one year cause, it has been reckoned, the loss of from two hundred and fifty to three hundred pounds in weight of rubber, in addition to damage done to the trees by the work of the bees. And, as rubber plantations are numerous in certain States of Brazil, the financial loss is to be estimated in no low figures.

The bees make use of the sweet rubber sap in forming the cones of their honeycombs, and do not wait until the plantation workers come along. They have an uncanny knowledge as to when the sap is ripe, and if the season is late they do not wait for the rubber gum as it oozes forth and drops into the buckets. They start the flow of sap by boring into the tree, and not only cause more gum to be wasted than they take away, but spoil valuable trees.

Up to the present, the only method of defending the trees against the bees' operations is by means of a poisonous wash, killing the insects. But as their honey brings a good price, and a few 'washed' trees means poisonous honey throughout a large district, causing many deaths, the Brazilian rubber-planter prefers to leave the bees alone.

The rubber ants seem to know instinctively when the sap in the buckets and other receptacles is neither too hard nor too soft, and then, coming in myriad numbers, they bite out tiny scraps and carry them off to their nests. On many of the rubber plantations where their nests are numerous—and to effect the destruction of them is almost impossible—the amount of gum thus thieved is so large that efforts are made to ward off the countless pilferers.

The method most in favour is to coat the stumps of the indiarubber trees with a very sticky solution that, on evaporation, leaves a thickish film; in it the ants become entangled and stuck fast. The insects, however, keep marching up in hundreds of thousands, and over the bodies of their comrades, until the sticky film is covered with them, and the tree trunk is black with ants going to and coming from the sap-buckets.

If anyone can present the Brazilian Government with an effective remedy against these two pests, his or her fortune is made.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

WESTMINSTER is passing through changes which are reflected from the altered world on the proudest, worthiest, and most conservative patch of land in the empire, of which this is the true centre. Can they spare them, ladies and gentlemen who come to London during this summer season should spend a few days in some aimless wandering through this city of Westminster, for I have always found, home and away, that an easy meandering, without guide, without notion of locality or route, or of time or circumstance, care-free and impulsive, catching delights of stones and history and legends, lingering for half-an-hour where others hurry by, is much the most pleasant and profitable way of coming to understand a famous place. I invite the country and foreign friends of London who now accept its hospitality not to content themselves with the conventional trippery call upon the Abbey and the Houses of Parliament, but to wander in and out among Westminster's labyrinths, quaint streets, obscure passages, and its grand and noble spaces. Let them steal through a narrow opening at the side of a splendid avenue called Birdcage Walk, a little east of Storey's Gate. Old Edward Storey was Keeper of the Birds to Charles II., and I think of tradition when sometimes even now I see in the small gardens which back on from Queen Anne's Gate a parrot or something of the kind. From this opening they may creep up the passage called Cockpit Steps—such seducing names!—and at once they will enter Queen Anne's Gate, one of the rarest and most retired quarters in old London, distinguished by the true sheltered doorways of the period of the illustrious queen. Here great men still live. In this smooth and gentle backwater, secluded from the rush of life and action in the surrounding parts, many curious things, with attendant stories, may be discovered. At a corner, against a wall, stands a statue of Queen Anne herself, brought one time from the Strand. We should remember in the record of Anne that it was in her time that the parliaments of England and Scotland joined together, and it seems fit that an emblem of this lady, who, like a true royal Londoner, was born at St James's Palace, should stand here in the shadow of the great

towers of Westminster. And it was in the time of Anne that a beginning was made upon the system of party government; but, considering the condition of things to which we have now attained, whether we are to reckon the queen as blessed for that coincidence makes a point of doubt. Parties and the intrigues of parties are responsible in no small measure for the present ills of the world. Anne was a sound Tory queen. It pleased her to have the big work done for her by a thoroughly Tory general, his wife wheedling the queen to the Marlborough advantage, and of all parts of England there is none that is so truly Tory as Westminster. It is claimed that in system and sentiment, in its traditions and customs, it is stronger, better set, and more abiding than any other part of our country. That a Conservative is always returned to Parliament for Westminster is a detail. Even when Mr Winston Churchill himself, turned back more than half-way towards Conservatism, not long since contested the division, the Marlborough blood and perhaps some of the dare-devil tendencies being in him, he lost to a plain Conservative.

* * *

So we feel that if a place must take a king or a queen from history as its own patron royalty, Anne is the queen for us in Westminster. Something of the flavour of the atmosphere of her time still lingers here. But Queen Anne is dead. Why should so much scornful stress be laid upon a frequent modern statement that Queen Anne is dead, made commonly to those who convey news that is already known? When she died no mystery hung upon the sad event; the whole world knew. A disappointed woman was Queen Anne at the end of her life, and perhaps she was nearly ready to die, even though barely fifty years old. By stressing the death of the queen as a form of satirical humour a tendency may be exerted in careless minds to overlook her living, and all the strong influences that were working on our country at the time. She was a remarkable woman. Though none of them grew up, let us recall to her womanly credit that she had seventeen children, which may be a record for a white queen in her own right. In the public fancy

she is overshadowed among queens of the past by Elizabeth of the glowing romantic period of expansion, the queen of high spirits and intensity of nationalism, of great power of will with feminine caprice, the great but yet the lonely queen. Elizabeth, like Anne, is dead; but one likes to imagine that in some fervent way her soul goes marching on, or to reflect that in these doubtful times, when love of country and loyalty to the common interest are less obviously dominant than once they were, it would be well if it did. Anne, our queen of Westminster, had also sound merits, faults no worse than those of many good women. She was of a type that liked some feminine creature to be purring around her always and taking advantage of her under her very nose and with her tacit consent. I should like to see the ghost of glorious Bess come upon a party of our Bolsheviks in these times. Goodness, what that sharp tongue would say to them! How she would make them run! Anne's ghost walks, but has nothing to say to anyone. On the anniversary of her demise, so 'tis said, her late Majesty, as cut in stone, described on the pedestal as Anna Regina, seeming a pleasant little body with a homely face, holding the constitutional ball in her left hand and the sceptre in the right, and attired in a long lace frock, gets herself down and walks three times round the place. I distrust this story because I know of no reason why thus she should incommode her dead self, since Westminster is unswerving in its old conservatism, and her pedestal is seven feet high, fronted by spiked railings which might be things of indifference to an almost bare-legged modern maid, but would be considerations for a spectral queen in lace to the feet. Of ghosts, however, Westminster, so much steeped in history, has always been an agreeable habitation. I should have seen some of them, but curiously have not, for none except the policemen has sauntered more than I by night in Westminster, which is then enchanting. In the stillness of two and three o'clock in the morning, shortly before the summer dawn, its serenity and strength are presented with a witching power. I have risen at three to creep out for the enjoyment of this spell. No emotional experience of the kind can be superior to that gathered in a slow saunter from the Parliament buildings and the Abbey, along Millbank to Lambeth Bridge, from which the nocturnal prospect down the river, through the bunches of dim yellow lights from Parliament to the city, is superb. We think of Whistler's sublime nocturne of old Battersea Bridge, and under the stars history repeats such famous stories as that of the manner in which James II. crossed the river at this very spot in a little rowing-boat and dropped the Great Seal of England into the water as he went. His queen had made the passage of the river two

days before, and we are told that in her case it was made very difficult and dangerous by the violence of the wind and the heavy and incessant rain. Yet, as ages go, that was only yesterday, and think of it, that the passage of the Thames here was difficult, even for a king and queen, and that there were no bridges. Such a nightly perambulation as I have indicated is well ended, if the moon is up and moving through the clouds, before the Houses of Parliament at the end of Parliament Street, for on such a blue and silver night, as you look across the square, Peel and Palmerston, Derby and Disraeli, and other patchers of our State seem to stand stronger and to tell their lesson with deeper emphasis than in the light of day, with the noise and the crowds about. The moon, inspirer of good sentiment and heavenly crier of eternal lessons, rides above the towers; the morals of age and empire, of power and endurance, penetrate us. The scene is blessed and benign and strong. A spell is here for patriots.

* * *

A somewhat thin idea tediously expressed by travellers is that places and scenes presented to them in their distant excursions exhibited wide and glaring contrasts. How singular would be the scene without such contrasts, in men and things and acts, for it is the law of the world and life. Where there is sunlight shadows must fall. Contrasts are remarkable only when harmony is strained and gross incongruity begins. The crudest I ever saw was once in Rome when on some waste ground adjoining the Colosseum a party of young American male travellers, to occupy a little time which was empty when it should not have been, proceeded to disport themselves in a foolish manner and to sing some jazzy stuff called 'Alexander's Rag Time Band.' Nonsense and incongruity could go no further. Of another kind, less offensive but still disturbing and saddening, is the incongruous contrasted scene from our housetops at Westminster, for to grand monuments we look across the vilest slums. On my roof I stand midway between the Parliament Houses and the Abbey, nobly shaped against the sky, and the Westminster Cathedral, east and west. Far out on the uplands of the southern distance the Crystal Palace is discerned; to the immediate left are blocks of offices, and, by a little manœuvring among the chimney stacks, glimpses of the City may be gained. But all along this low depression between me, standing thus, and the Abbey dirty smoke ascends from thousands of chimneys, making a filthy cloud that rests upon rows of the meanest dwellings to be found in any city. As we look down on this scene, it is suggestive of that drab and pigmy uniformity of the workers' quarters in what is called the Black Country. Some who have moralised with me upon this matter declared it was like Wigan

at its worst; but I know it is worse than Wigan. These are bad contrasts. In these slums poor people live mean and wretched lives, and the circumstances, as I have found them, are depressing. Residence in Westminster, which seems always so serene and tranquil, is being coveted by a new class of rich and tasteful persons, and in some cases they have taken mean streets for themselves and renovated them. Lately, with an idea, I perceived in another mean street a very small house advertised for sale. It was occupied by poor labouring folk, who paid but a few shillings a week in rent for it; but when I inquired by letter of the owners what price they asked, the answer was in the region of four thousand pounds, and so the tale was told. Some of the most valuable sites in Westminster are reckoned at £30,000 an acre, and every inch of this land is of great value, yet much of it is thus wasted in slums. I am informed that sixty-four out of every hundred of the population of Westminster (which officially and municipally is a very wide area, and stretches off towards the Strand) live in houses of three rooms or less. Worse, last March there were 6258 families, varying in number from one to eight, living in one room, 8711 families, varying from one to eleven persons, in two rooms, and 7142, of from one to twelve persons, in three rooms, while 6914 basements were used for dwelling purposes. We hear much of the housing problem now; how terrible is it here at the very heart of empire, the most glorious and venerated spot of our land! However, the slums are slowly being reduced; the four-thousand-pound properties, which in my young days in the country would have been considered barely big enough for fowl-houses, are coming into their own. From my roof I see huge gaps being rent through the chaotic mass. Some day Westminster, if it lives, will be all clean and nice, with more big offices, and pleasant dwellings for serious folk. Even now this is particularly the land of flats, expensive flats, in which nice people, not entirely devoted to the conventionalities of the social season, live agreeable lives. One day last year, when the Labour government was starting work, in a walk through Westminster I passed some waste ground right beneath the great Victoria Tower of the House of Lords, and here found a mean and dirty sample of a travelling country fair, in process of being dismantled for moving on to Kingston, the short season of a week being ended. Here were the roundabouts, with their tawdry fittings, the uglier for the unscrewing being done, exposing their inner mechanism. These contrivances had been circulating for a week, carrying the pale-faced children from the slums upon the backs of dragons, to the accompaniment of the harshest of all musical sounds, something worse than jazz, and manufactured by steam and pulleys. Booths for shies at coco-

nuts had flourished there, and over one was emblazoned the strange announcement that it was patronised by the Royal Family! By many specious means pennies were coaxed from the slum-dwellers who came here for their delights, and thought that by dexterity they might win one of the clocks or garish vases exhibited as prizes. The steam music was belched out with such intensity, and the sound of the slummers' gaiety was so noisy that it was heard in the precincts of Parliament, where the parties were contending for their great and various ideals, and contemplating measures they should take against their enemies afar. Then, the day after, the dismantling being done, dogs sniffed among the debris, and wan-faced children, looking enviously upon the dwellers in the showmen's caravans, took each other's hands, and gazed at their disappearing delights. A cold clammy day was this. I looked up to the grand tower of the House of Lords, and walked by it and past the statue of Oliver Cromwell.

* * *

Those casual wanderers, peeping in and out, are not invited to such parts as these; more wholesome entertainment awaits them in other quarters. In this city, which has been the real capital of England since the twelfth century, and where were the Law Courts until not so long ago, æsthetic and other pleasures may be gathered as you go. From the delightful collection of the Tate Gallery, return from the river bank into real Westminster, and you enter old and tranquil squares where parliamentarians and others live, and where you find curious churches, like St John's, being the second of Queen Anne's fifty churches, with a solid tower at each corner—which caused a famous lord to liken it to an elephant on its back with legs in air. It is not a beautiful building, but it is set with a strange and solid impassivity amid odd surroundings. Not far away, in another square, is a house where a Prime Minister of the present time resided for a space when he lost office, and still in Westminster, in one of those odd streets where exists a close compact line of little shops at which the humbler classes may buy fully all they need, is a fishmonger who, I am told, owned the house. Let Hamlet speak according to his mood, but the chief of government here was in no position to gibe at his landlord for being a fishmonger. And such careless mention of the Dane makes reminder of the exceptional entertainments of Westminster, with all of which conservatism holds. Shortly before Christmas the famous Westminster Play is given in Latin or Greek in the School, according to a custom and tradition that wind back to Elizabethan time. This, however, is special, and not for the people. The conservatism of Westminster is manifested by the performances,

more frequent here than in other parts of London, of the old-fashioned tragedy of Punch and Judy, presented with the traditional style and the old effects. The show is commonly encountered in the byways; but lately there were grand upheavals in the main thoroughfare running through real Westminster, and gigantic cementing and other engines have occupied it, while traffic has been diverted. At the time that ratepayers, including Members of Parliament—of whom many dwell round here—and various eminent and titled folk, viewed these operations with a certain morbid interest, knowing they paid twenty thousand pounds for them; and while the youth and strangers found them a constant delight, as somebody making a public show always is to the lazier passers-by in London, the proprietors of the Punch and Judy exhibition, with a quick instinct, erected among the works their old-time miniature theatre, the conventional construction some eight or nine feet high, with a proscenium measuring three by two, and a stage-manager hidden inside. The show was placed in the middle of the street with the royal name, along which the most magnificent imperial processions have passed. In many ways it is a grand street, but by its curious moods it has missed greatness. Thronged and busy in the daytime, a great quarter for architects, engineers, colonial offices, and the agencies of vast concerns for construction, it lapses to funereal solemnity and emptiness at night. In this, after all, it does but match the surrounding Westminster, which, saving the Commons, is no night-bird of a place at all. But here, day after day, in the middle of the street the tragedy of Punch and Judy was enacted, and the people who stayed to see the cement-grinder's machinery passed on to the more æsthetic delights of this ancient show. Large audiences of good and serious people gathered round and stood for a long time watching. A Member of Parliament and a countess were once among them. And really, conjuring up the sensations of our early years, this entertainment, quite the old thing, seemed magnificent. In order the three dramatic representations to which I had just previously applied myself were the *Hamlet* of Mr John Barrymore, the American, at the Haymarket Theatre (and as one who has seen all the *Hamlets* for thirty years, including that of Sarah Bernhardt, and has classified them, Forbes Robertson first, I would place this of the American in the leading four); next the uncut *Hamlet* given once a year at the Old Vic., and done with great endurance this time by Mr Ernest Milton (but *Hamlet*, after all, is better cut, I think); and then Mr Bernard Shaw's *St Joan*, with Miss Thorndike as the heroine (disappointing to me; Mr Shaw's concealed satire

seems not to be exerted with sufficient dexterity); and now I came to Punch and Judy of precisely the old pattern in the middle of Victoria Street. The performance, which was strictly on traditional lines, as suited the conservatism of Westminster, was neither better nor worse than of yore. Punch was as irresponsible and exuberant as ever. There is nothing in Shakespeare like the strange folly of this madcap, who, despite all warnings, turns his face from the fate that surely envelops him. With the traditional high falsetto voice the part was played effectively, and the strange inconsequence of the character clearly portrayed. Judy, as before, stood for patience with a limit; and some of the minor characters, such as the representatives of the law, were capably performed; but the honours went to a masterly handling of the part of Toby by a small, brown, smooth-haired dog with a white nose, a dog of a kind that seems to be bred for this purpose. Through the violent crises of the play and the wild harangues of Punch a perfect passivity was maintained by Toby, whose restraint and concealment of true art were superb. Only at rare intervals, and at the proper moments, did he yap and snarl. For the most part, with a collar of red, blue, and green, he gazed from his corner of the little stage serenely out towards the Abbey and Parliament, as who should say that monuments endure while the petty quarrels of mankind, petty even though death itself may hang upon them, pass away. I must give a word of praise to the short scene of the revels when Judy appeared with the baby, which was incontinently killed by the irascible Punch. Some of the soliloquies of the latter seemed too much drawn out, so that the performance lasted beyond four o'clock, with the result that the elders were caught by the children going home from school. At this appearance many, including the countess and myself, departed; the Member of Parliament had already left, for the Budget was being discussed in the House of Commons.

* * *

Something like poor Jack Point does the writer feel among this fooling. He is leaving Westminster. It is now good-bye, and he is somewhat sad, for he likes and reverences the place. One thing at least he has humbly in common with the Prince of Wales, who, in parting for his latest long voyage, said in a speech that Westminster was his home town. A wanderer as he is, the writer returns from afar to his home town, Westminster, but does it stealthily, for it has been for many years his place of secret delight and solitude. Few have known of it. Here he has been himself. When he has come homing from distant parts the heart of things most truly and appropriately

has been where he is now. With his head upon his pillow he can hear the chiming of Big Ben. Up two flights of steps he mounts to his flat roof, high in the air, from which he can survey Westminster and much of other London, the Parliament, the Abbey, the Cathedral, and the slums. There is much space for walking up here aloft, and for thinking it is superb. Being fond of the sea, he has often pretended this space to be a quarter-deck, along which he has affectedly walked with the jaunty manner of the sailor man, the side rails and an occasional telescope—and even the newly-erected wires of the radio enthusiasts—assisting the illusion. It was easy to consider it in the war-time as a battleship, for from this quarter-deck he beheld straight up above him the first

Zeppelin that came to London, like a gigantic silvery cigar shining in the blue night sky. Some months later bits of shells fell fast upon the quarter-deck, and once a missile all complete and deadly missed it by inches, crashing into the courtyard below. With sweet solitude and no conventions most things may be done and the rest assumed, and man is then what he may choose to be. So, being fond of southern Spain, this writer easily imagined in non-seafaring moods that this space above him to which he ascended in pleasant summer evenings was his azotea, like the flat roofs on which the Sevillians sit happily in summer, listening to the guitar and castañuelas, and watching the children dance. . . . Some time, after distant journeys, he may return.

JOHN MACNAB: A COMEDY FOR POACHERS.

CHAPTER XIV.—*continued.*

LAMANCHA'S military service had taught him the value of the offensive. The newcomers were, he observed, three navvies, two men who were clearly gillies, and a warm and breathless young man in a suit of a dapperness startling on a wild mountain. This young man was advancing towards him with a determined eye, when Lamancha arose from his couch and confronted him. 'Hullo!' he cried cheerfully; 'you've just come in time. This poor chap here's had a smash—broken his leg—and I was wondering how the devil I was to get him down the hill.'

Johnson Claybody stopped short. He had rarely seen a more disreputable figure than that which had risen from the heather—dissolute in garments, wild of hair, muddy beyond belief in countenance. Yet those dilapidated clothes had once, very long ago, been made by a good tailor, and the fellow was apparently some kind of a gentleman. He was John Macnab beyond doubt, for in his hand was the butt-end of a rifle. Now Johnson was the type of man who is miserable if he feels himself ill-clad or dirty, and who discovers in a sense of tidiness a moral superiority. He rejoiced to have found his enemy, and an enemy over whom he felt at a notable advantage. But, unfortunately for him, no Merkland had ever been conscious of the appearance he presented, or cared a straw for it. Lamancha in rags would have cheerfully disputed with an emperor in scarlet and suffered no loss of confidence because of his garb, since he would not have given it a thought. What he was considering at the moment was the future of the damaged Stokes.

'Who's that?' Johnson asked magisterially, pointing to the navy.

The man's colleagues hastened to inform him.

'It's Jim Stokes,' one of the navvies volunteered. 'What 'ave you been doing to yourself, Jim?' And Macnicol added, 'That's the man that was to keep movin' along this side o' the hill, sir. I picked him, for he looked the sooplest.'

Then the faithful Stokes uplifted his voice. 'I done as I was told, sir, and kept movin' all right, but I ain't seen nothing, and then I 'ad a nawsty fall among them blasted rocks and 'urt my leg. This gentleman comes along and finds me, and 'as a try at patchin' me up. But for 'im, sir, I'd be lyin' jammed between two stones till the crows 'ad a pick at me.'

'You're a good chap, Stokes,' said Lamancha, 'but you're a liar.—This man,' he addressed Johnson, 'was carrying out your orders, and challenged me. I wanted to pass and he wouldn't let me, so we had a rough-and-tumble, and through no fault of his he took a toss into a hole and, as you see, broke his leg. I've set it and bound it up, but the sooner we get the job properly done the better. Hang it, it's the poor devil's livelihood, so we'd better push along.'

His tone irritated Johnson. This scoundrelly poacher, caught red-handed with a rifle, presumed to give orders to his men. He turned fiercely on Stokes. 'You know this fellow? What's his name?'

'I can't say as I rightly knows 'im,' was the answer; 'but 'im and me was in the War, and he once gave me a drink outside Jeroosalem.'

'Are you John Macnab?' Johnson demanded.

'I'm anything you please,' said Lamancha, 'if you'll only hurry and get this man to bed.'

'Damn your impudence! What business is

that of yours? You've been caught poaching, and we'll march you down to Haripol and get the truth out of you. If you won't tell me who you are, I'll find means to make you.—Macnicol, you and Macqueen get on each side of him, and you three fellows follow behind. If he tries to bolt, club him. . . . You can leave this man here; he'll take no harm, and we can send back for him later.'

'I'm sorry to interfere,' said Lamancha quietly, 'but Stokes is going down now. You needn't worry about me. I'll come with you, for I've got to see him comfortably settled.'

'You'll come with us!' Johnson shouted. 'Many thanks for your kindness. You'll damn well be made to come.—Macnicol, take hold of him.'

'Don't,' said Lamancha. 'Please don't. It will only mean trouble.'

Macnicol was acutely unhappy. He recognised something in Lamancha's tone which was perhaps unfamiliar to his master—that accent which means authority, and which, if disregarded, leads to mischief. He had served in Lovat's Scouts, and the voice of this tatterdemalion was unpleasantly like that of certain high-handed officers of his acquaintance; so he hesitated and shuffled his feet.

'Look at the thing reasonably,' Lamancha said. 'You say I'm a poacher called John Something-or-other. I admit that you have found me walking with a rifle on your ground, and naturally you want an explanation. But all that can wait till we get this man down to a doctor. I won't run away, for I want to satisfy myself that he's going to be all right. Won't that content you?'

Johnson, to his disgust, felt that he was being manoeuvred into a false position. He was by no means unkind, and this infernal Macnab was making him appear a brute. Public opinion was clearly against him; Macnicol was obviously unwilling to act, Macqueen he knew detested him, and the three navvies might be supposed to take the side of their colleague. Johnson set a high value on public opinion, and scrupled to outrage it; so he curbed his wrath and gave orders that Stokes should be taken up. Two men formed a cradle with their arms, and the cortège proceeded down the hillside.

Lamancha took care to give his captors no uneasiness. He walked beside Macqueen, with whom he exchanged a few comments on the weather, and he thought his own by no means pleasant thoughts. That confounded encounter with Stokes had wrecked everything, and yet he could not be altogether sorry that it had happened. He had a chance now of doing something for an honest fellow—Stokes's gallant lie to Johnson had convinced Lamancha of his superlative honesty. But it looked as if he were in for an ugly time with this young

bounder, and he was beginning to dislike Johnson extremely. There were one or two points in his favour. The stag seemed to have departed with Wattie into the *Ewigkeit*, and, happily, no eye at the Boallach had seen the signs of the gralloch. All that Johnson could do was to accuse him of poaching, *teste* the rifle; he could not prove the deed. Lamancha was rather vague about the law, but he was doubtful whether mere trespass was a grave offence. Then the Claybods would not want to make too much fuss about it, with the journalists booming the doings of John Macnab. . . . But wouldn't they? They were the kind of people that liked advertisement, and, after all, they had scored. What a tale for the cheap papers there would be in the capture of John Macnab! And if it got out who he was! . . . It was very clear that that at all costs must be prevented. . . . Had Johnson Claybody any decent feelings to which he could appeal? A sportsman? Well, he didn't seem to be of much account in that line, for he had wanted to leave the poor devil on the hill.

(Continued on page 483.)

A BOATING SONG.

THE little streams of England,
They wander where they will,
Thro' the lush Fenland pastures,
By poplar, wharf, and mill;
Or else thro' wooded valleys
They hide, so sweetly shy.
We love to go a-wooing them,
My little boat and I.

The little streams of England,
They are so old and wise;
They knew the men that made us;
They saw our cities rise.
Of ancient wrongs and splendours
They dream as they drift by;
And we go dreaming with them,
My little boat and I.

The little streams of England,
They are for ever young,
And they will still be singing
When all our songs are sung;
And they shall watch new glories
Blossom against the sky,
As we in fancy see them,
My little boat and I.

Give me an English river,
Give me my little boat,
And in the soft blue English air
An English songster's note.
Not for your far Rivas,
Your costly heav'ns, we'll sigh—
We know a nearer paradise,
My little boat and I.

GILBERT THOMAS.

A CUSTOM OF THE SERVICE.

By Commander CHARLES GLEIG, R.N.

I.

MORE than normally sleepy, the sub arrived on deck to relieve the lieutenant who had kept the middle-watch. He had been to a dance overnight, and although he had left the festive scene early, there had been little time for sleep when he was called at 3.50 A.M. The sub rather resented having to keep the morning watch every morning when the fleet was in port, but he had not confided his dissatisfaction about it to anybody. He was privately of opinion that the watch-keeping lieutenants enjoyed a much easier life of it in harbour than he did himself. For when you begin the day—every day—at four o'clock, it is surprising what an amount of duty can be got through before turning-in time.

As he mounted the bridge ladder, the sub noticed that the south-westerly wind had much freshened since he returned on board at 1 A.M. He noticed this because his old cap narrowly escaped being blown overboard. It was a nasty, wintry morning, and still pitch-dark. The fleet was lying at single anchor in the roads, but was not much sheltered by the breakwater, with the wind in the south-west. The *Brutus*, in which the sub had the honour of serving, was the last ship in one of the lines. In the pitchy darkness one could hardly distinguish the hulls of the other ships, but their anchor lights twinkled faintly to port and starboard of the *Brutus*. The sub had a momentary impression that these anchor lights looked farther off than usual, but he was too sleepy to concentrate on that or any other subject. Walteson, who had kept the middle-watch, was awaiting his relief under the lee of the chart-house. The sub liked Walteson better than any of the other watch-keepers, because he found him free of the offence of patronising youth and inexperience. More than once, too, Walteson had asked him to dine in the ward-room on guest nights, and the sub appreciated the courtesy.

'Ah, there you are at last, Reggie,' remarked the lieutenant.

'Am I behind time, sir?'

'Oh no, only five minutes, but it's surprising how long a minute seems when one's watch is over.'

The sub explained about the dance, and Walteson did not dwell upon the virtue of prompt reliefs. 'The wind has freshened,' he said, 'and the glass is still falling. You'll see in the night order-book that the captain is to be called should it seem at all necessary to drop a second anchor. Really, I think there's nothing else to tell you—so good-night.'

II.

Enviously the sleepy sub watched the lieutenant making for his bed. He was painfully sleepy, and half resolved to attend no more dances, unless the commander switched him on to some other duties. Dances were all right, but one required five or six hours of sleep in order to face a seventeen-hour day. He wondered whether a certain young lady in the port at all appreciated his attendance at those dances. It was pretty certain, he thought, that she did not, for what could she know of the arduous life of a naval sub-lieutenant?

The sub opened the sliding door of the chart-room and went in out of the stinging wind. Here was comparative warmth and a cheerful light. Along one side of the chart-room ran a well-padded settee. There the navigator sometimes slept when the fleet was at sea and close to land. The couch was also utilised by nearly all watch-keeping lieutenants when the fleet was at anchor. It was one of the customs of the service (although contrary to the King's Regulations) for night watch-keepers to enjoy illicit sleep upon the chart-house settee. Following this ancient custom, it was the sub's almost invariable habit to sleep in the chart-house until the hands were turned out at 5.30 A.M. A portion of the morning watch was thus passed quite agreeably, and without any serious risk. The sole danger was that the flagship might make a flashing signal while the signalman of the watch also slept. The quartermaster, however, could be relied upon to keep awake—this being another long-established custom of the service. It was easier for quartermasters to keep awake, because they only rarely attended dances, and went early to their hammocks.

The sub, before settling down to doze, went out onto the bridge to remind the quartermaster to call him when the hands were turned out—or if the flagship happened to signal. The quartermaster kept his harbour watch near the after-turret and the gangway, so that the sub had to call out to him from the bridge. Forward, the marine sentry was pacing his short beat, carrying an unloaded rifle at the slope. Custom of the service did not permit him to sit, much less to sleep. And always, when the ship's bell tolled the hour and half-hour, the faithful sentry cried out to the heedless night, 'All's well.'

Looking to windward, while waiting for the quartermaster to reach the bridge, the sub remembered his fleeting impression. Yes, there could be no doubt about it—the *Brutus*

had dragged her anchor and had drifted considerably out of her assigned position as the rear ship in one of the lines. How far she had dragged the sub could not determine, but she was very distinctly out of position—a couple of cables, at least, he thought. At daylight this would be noticed by the flagship. And it occurred to the sub that the ship might still be dragging her anchor, so getting more and more out of position.

'Quartermaster,' he said, 'how much has she dragged, do you think?'

The petty officer, after looking hard at the anchor lights of the fleet, thought it might be a matter of three cables. The sub went into the chart-house, found a sextant, and returned to the bridge rail. After a few minutes he decided that the ship was no longer dragging.

'I expect it was some time in the middle-watch, sir,' said the quartermaster.

The sub paced the bridge twice before replying. This gave him time to reflect that Walterson would be 'in the soup' unless it could be made to appear that the dragging had not occurred during the middle watch.

The quartermaster was a trustworthy man, so the sub took him into his confidence. 'All right, sir,' he said, with a wink, 'I've seen nothing up to now.'

III.

The sub no longer felt any desire to sleep in the chart-house. The ship might continue to drag her anchor, but, besides this possibility, he had to think out how to clear Walterson. For it was pretty clear that the lieutenant had slept during his middle-watch, and had failed to notice the dragging. Walterson was a good chap, and the sub was appreciative of those dinners in the ward-room. Other lieutenants of the ship had not condescended to recognise that his constant keeping of the morning watch, in port, relieved them of a solid slice of their duty.

During a full hour the sub paced the bridge, using from time to time his sextant to make sure that the dragging had ceased. Shortly after two bells (5 A.M.) he summoned the quartermaster again. 'Report to the captain,' he said, 'that the ship has been dragging her anchor during the past half-hour. Tell him that we have now left off dragging, and ask if I shall let go the other anchor, or wait till the commander comes on deck.'

'Very good, sir,' responded the petty officer with an appreciative chuckle.

Presently he returned to the bridge. 'The captain says, sir, that you ought to have reported the dragging at once. He says you are not to let go the second anchor until the commander comes on deck, and not to let it go then, unless the commander considers it necessary.'

'Anything else?'

'He says you're to report to him what the commander decides on it.'

At 5.30 A.M.—a ghastly hour for turning out on a wintry morning—the shrill piping of the boatswains' mates broke out on the sleeping decks. And between the piping the sub could faintly hear the familiar admonitions of the petty officers. 'Heave out—heave out—heave out. Show a leg and a pusser's stocking—heave out.'

A few minutes later the commander came on deck, and the sub descended from the bridge to report to him the captain's order.

'When did she begin to drag?' demanded the commander.

'Only since I came on watch, sir.'

The commander went up on the bridge, and decided that the second anchor should be dropped. This was accordingly done, and sufficient cable was veered out to ensure against further dragging. The captain, like a wise man, received the report in his bunk, and remained snugly between the sheets until his usual time for rising. The morning watch ran its course, and at 7.30 the sub was relieved by one of the lieutenants.

IV.

Some two hours later, Lieutenant Walterson and the sub were sent for to the captain's cabin, but the sub got there first. The deck log lay open upon the cabin table. 'I see,' said the captain, 'that the ship began to drag at 4.30 A.M., and continued to drag until you called me soon after 5 A.M.'

'Yes, sir, as nearly as I could judge.'

'I don't quite understand,' said the captain, 'why you delayed calling me.'

At this moment Walterson entered the cabin, and may have overheard the captain's remark.

'Because she had left off dragging, sir,' explained the sub.

'Another time,' said the captain, 'you should call me immediately.'

'Yes, sir. I thought——'

'Theirs not to reason why,' remarked the captain mildly. 'There's no harm done, but you should have had me called sooner.'

'Yes, sir.'

'Because,' continued the chief, deigning to give a reason, 'if we had been stationed in the middle of one of the lines a second anchor would have had to be dropped immediately.'

'I think I should have dropped it, sir, in such a case.'

'Without waiting to have me called?' asked the captain.

'Yes, sir—I think so.'

'You would have done quite right,' said the captain approvingly.

He indicated by a nod and a gesture that the sub might leave the cabin. Left alone with the lieutenant, the captain remarked that the

sub was a smart lad, not devoid of reasoning powers.

'Quite our best sub, sir,' said Walterson.

'There are certain old customs of the service,' observed the chief—'I need not specify them precisely—which have been handed down by captains and lieutenants for, perhaps, centuries. Some of them conflict with the King's Regulations, but we do not look too closely into these old customs, Mr Walterson, unless they happen to lead to undesirable results.' He broke off abruptly to ask: 'You didn't notice any dragging during your middle-watch?'

'No, sir, I did not,' replied Walterson truthfully.

'Quite so,' agreed the captain; 'and so, I suppose, you didn't warn your relief that she might drag if the wind increased?'

'I referred him to your night order-book, sir.'

'I think that is all I wanted to ask you,'

remarked the chief; 'but it's lucky we are the rear ship in the line.'

Walterson saluted and made toward the door. He had understood the captain's allusion to old customs conflicting with the regulations. But as he opened the door the captain spoke again. 'Isn't this your guest night in the ward-room?'

'Yes, sir.'

'Ah, then I shall be dining in the mess, I remember.'

'So I heard, sir.'

'I wonder if you'd care to invite the sub?' said the chief.

'That's just what I was thinking of doing, sir.'

'And a very appropriate thought, too,' said the captain cryptically.

'He means,' reflected Walterson, as he walked away, 'that I owe the sub a good dinner.'

STARS AND THEIR WIRELESS MESSAGES.

IV.—HYPOTHESES.

By Professor GEORGE FORBES.

I.

MANY hypotheses have been propounded to account for the different types of spectra. All of these are regarded by the true astronomer as being merely tentative. When so regarded, they are useful for indicating directions of research that will tend to support or refute one or other of these hypotheses. So in time we may hope to reach truth. The particular hypothesis most generally preferred by astronomers fluctuates from decade to decade. Here it will be well to concentrate upon a single one of these hypotheses, which may be only partially true, but which seems to the present writer to be the most obvious one, and not based upon any improbable assumption. It is the only one that is not in conflict with one of the main facts of observation, the localisation of spectral types in space.

The obvious interpretation of the different types of spectrum is that about one-half of the stars, like Sirius, are chiefly composed of hydrogen; that some of these, like Rigel, are unique in containing much helium in addition; that nearly all the remaining half of the stars, like Capella and our sun, are composed of the same materials as the earth is made of; that the red stars, like Betelgeuse, are largely composed of titanium oxide; and the crimson stars of Type IV. are largely composed of carbon compounds.

If we accept these obvious conclusions about the materials that stars are made of, Secchi's hint that stars with the different contents are to be found in different constellations opens out

a totally new aspect of the universe. The suggestion is that stars have been made out of the materials prevalent in each region of space by a condensation of these materials under gravitation. And our task is reduced to finding what regions of space contain the various materials found in the spectra of different stars.

We already know that our stellar universe seems to be a limited region resembling, in shape, one of the spiral nebulae. For it consists essentially of two parts: (1) the wide flat ring filled with the clouds of stars that constitute the Milky Way; and (2) the great bun-shaped space inside the ring with the solar system not very far away from its centre.

The researches carried out since the time of Secchi prove that the first of these parts is the home of the hydrogen stars: and the second is the home of the stars of the solar type. This stands as a general truth, in spite of the fact that in the course of ages many stars may, by their proper motions, have passed from the region of their birth to the other region, and make exception to the general rule. Moreover, it is quite obvious that at the boundary between the two regions stars would have built themselves up out of the constituents of both regions, and it is a remarkable fact, giving strong support to this hypothesis, that we find composite stars whose spectra contain every proportion of the two types. We have a continuous series of star-spectra passing by slow gradation from the Sirius type to the Capella type of spectrum. Yet again, Kapteyn found that the general average distance from us of the hydrogen stars

is two and a half times that of the solar type, just as we should expect if the former were in the Milky Way and the latter in the bun-shaped space.

II.

This localisation of stellar spectra in space is by far the most wonderful and the most illuminating positive fact, in relation to the structure of the universe, that has as yet been revealed to us by spectroscopic research.

Some of the other spectral types are still more precisely localised, most especially those of a fifth type which Pickering added to the four types of Secchi. A few words should be said about the intense localisation of the helium stars. These are nearly all found in the constellations Orion and Carina, and the short arc of 40° that connects them, along the border of the Milky Way. The distance from us of the stars on this short bit of the Milky Way is suspected to be even greater than that of the hydrogen stars in the Milky Way itself. They seem to lie in a limited region, or cloud, of concentrated helium, at the outer boundary of the Milky Way. This reminds us of the concentrated secondary nucleus of light in the whirlpool nebula at the outer end of one of its spiral arms.

Here again, as with Types I. and II., we find every stage of intermediate spectrum between the helium and hydrogen types. But there is no part of space where the helium and bun-shaped spaces can commingle. So there are no intermediate spectra between helium and Type II.

Types III. and IV., on the other hand, would be, on this hypothesis, in spaces adjacent to, or enclosed by, the bun-shaped region. For intermediate spectra between each of them and Capella are found in a continuous series; and none between their spectra and those of the hydrogen, Milky Way type.

The localisations of Types III. and IV. have been shown clearly by Pickering, Plummer, Espin, and others. All their results seem to be explained if there be two non-intersecting rings of space within the bun-shaped region, one containing titanium oxide, the other carbon

compounds, one in the plane of the Milky Way, the other slightly inclined to it.

III.

It is very satisfying to note that we have found a scheme of construction of the stellar universe that fits the main facts revealed by the spectroscope, and is in agreement with what we already knew about the shape of our universe. It is particularly pleasing to see how the variegated spectra all fit into one continuous succession from helium to calcium, and thence into two branches, titanium and carbon.

But there are many facts that are not so easily explained. One is that the temperatures of stars are found to vary with spectral type. Broadly, we have to account, on this hypothesis, for the outer regions of the Milky Way being hottest, and the central regions of the universe much cooler. There is also much difficulty in understanding why the size of stars should vary with spectral type, or with the regions we have assigned to them, as seems to be the case. Such difficulties must inevitably arise from our still imperfect knowledge of natural philosophy. For we are now only in the twentieth century.

The theory which has now been examined must not be taken as being necessarily true. It is certainly the obvious reading of the facts, but is repudiated by the vast majority of astronomers of to-day, who at present have a fancy for looking upon all stars as being made of the same materials as our earth. They ascribe the different spectra to different temperatures; and they consider that every star, during its life of visibility, shows in succession the whole series of spectra from low temperature to a maximum, and back again to coldness. It is a very ingenious and attractive hypothesis.

All such hypotheses must, in the present state of knowledge, be speculative. The locality-hypothesis and the age-hypothesis are both intensely interesting; but we are still very far from knowing why the stars are shining in the way they do. The fact remains that the stars are making great efforts, by wireless telegraphy, to give us the information we are trying to lay hold of, and every year adds to the knowledge that will some day tell us the whole truth.

BRIGSHAW'S MONKEY.

PART II.

VI.

AND so life went on, a dull life for Jenny indeed, which she sometimes resented, as you could see if you watched her closely, sitting up aloft with that unfathomable expression in her intelligent dark eyes, which seemed to be looking into the past, picturing old times, old

sights, old friends among the leafy peepul trees of the Central Provinces. But one evening, after the keeper had been along and given her some fodder, there came to her cage a youth whom Jenny had often seen watching her before, and whom she had come instinctively to dislike. It was as if the sight of him roused her to the uttermost depths of rage, brought

to the surface all the savage ferocity that had recently been sleeping within her. He was peering in at Jenny now with an ugly gleam in his eyes, when suddenly a long, thin arm shot out between the bars and snatched off the glasses he was wearing—his beautiful pince-nez—scratching his pale face at the same time, and disarranging his sleek, elegant hair. With a curse the young man lifted his stick, pushed it through the bars, and delivered a vicious stab at the softest portion of Jenny's anatomy. His glasses were broken; he could never have those back; but he was determined to have revenge of some sort, and the stick was the handiest method. With a little scream of rage Jenny seemed to lose every bit of docility she had acquired during the past months, and angrily she walked up and down, puffing out indignant little snorts, raising and dropping her bushy eyebrows, displaying her teeth, and glaring defiantly at the young fool outside. After a while she climbed up to her perch and continued to glare down at him, scratching her ribs, puffing, and working those expressive eyebrows—always a certain sign that she was angry. The sight encouraged the sickly youth outside to further efforts, and pushing his stick through again—not without first looking furtively round to see if there was a keeper within sight—he continued to agitate the monkey, till finally he caught her a severe blow across the back. Then he laughed; he was the sort who would. Jenny sprang towards him, mad with rage, and ran all round the cage, uttering cries which very soon brought the keeper along at the run. When he got there, however, he was somewhat puzzled. It was closing time, and though he looked up and down the path outside, there was no one to be seen, for, of course, the youth had vanished.

Opening the door of the cage, and calling to her gently, the keeper made to go inside, intent on finding out what the matter was. But even as he approached the monkey Jenny fairly leapt past him, shot out of the door, and next instant was lost in the gloom. Dashing out after her, the keeper made a thorough search of the trees and bushes in the immediate vicinity, but, closely as he looked, not a sign of Jenny could he see. For some time he called her by name, but the monkey would not show up, so finally he had perforce to relinquish the search, hoping that Jenny would return during the night. It was a serious matter for him, and he strode over to the head-keeper's lodge to make his report, heavy of heart, filled with the gravest misgivings.

VII.

Once out of the cage Jenny ran like mad—literally like mad. She was once again the wild young savage she had been when the engine-driver of the Bombay Mail had thrown

his coat over her and pinned her down to the coal on the tender months ago. Away down the pathway she flew, fairly leaping in her anxiety to get free from the horrible tortures of her tormentor, until suddenly the tall hedge which surrounded the zoo loomed up before her. Into the thick of it, without a moment's hesitation, she plunged, a flying vision of legs and whirling tail, and so out into the roadway on the other side.

There, the place being deserted, she sat down abruptly for a moment, as if uncertain which way to turn, till all at once Fate took a hand and sent down the road a lumbering carter's van with the back door open. No sooner did Jenny see that van than she was in it. Dashing after it, she leapt, with one colossal bound, through the open door and vanished.

Inside was a miscellaneous collection of furniture and odds and ends, among which Jenny settled herself down in comparative calm. Her temper, until now thoroughly ruffled, suddenly subsided, and she was once more calm and peaceful. Settling alongside a massive chest of drawers, she closed her eyes and—went to sleep. And the carter's van lumbered on and on.

At length the vehicle pulled up and came to a standstill. The men in front, arrived at their destination outside a long line of murky stone buildings fronting a wharf, slowly descended, and walked round to the back of the van. It was full dusk now, and the veil of night lay over everything; but the wharf was well lighted by a number of lamp-standards placed at regular intervals along the quayside, and beyond them lay an assembly of mixed shipping in the oily waters of the river.

'Well,' said the driver to his assistant as they got down, 'that's that, Bill. We'll get the stuff inside, and then hop over to the 'Sailor's Arms' for a pint. Gosh, reckon I could do with it right enough; it's mortal cold.'

It was just at that moment that Jenny awoke from her doze, and, hearing men's voices approaching, quickly leapt to her feet and glanced out of the door. Next moment she went through it like an arrow and made off down the wharf-side, full speed ahead. She was not minded to endure the proximity of man for a while, and sought only to get away from the hated voices. As she went the carter just happened to catch a glimpse of the dusky form dashing from the van. 'Gosh!' he exclaimed in a frenzy. 'What's that? Did you see it, Bill? Came from inside the van, I reckon, and looked more like a bloomin' monk. than anything I ever see. Why, look, there 'e goes 'longside the wharf-edge. Bide 'ere a mo' while I catches 'im.'

Whereat the rotund and ungainly figure of the man puffed its way across the road and down the wharf. But the carter had about as much chance of catching the nimble Jenny as a

snail has of hopping over the moon. And long before he had traversed twenty yards the agile monkey was well out of sight.

Hearing the man's footsteps behind her, Jenny paused a moment to consider her next move. Just on her right a mooring rope fixed to a bollard fell away over the water to a cargo-boat which lay against the quay, and the sight at once suggested a suitable means of escape. She jumped to it, launched herself on to the thick rope, and ran along it with all the aplomb of an accustomed tight-rope walker. Next moment she had gained the ship, and sat upon the bulwarks, gazing intently into the night. Over on the quay one or two loafers were lounging about, pipe in mouth, hands deep in pockets, but beyond them Jenny could see no one. She turned her attention to her immediate surroundings.

It was an ancient and rather weather-beaten cargo-boat, but for the moment there seemed to be nobody about, so Jenny crossed gingerly over to the edge of the hold and sat awhile peering down into the black depths. Down there was a medley of huge packing-cases, and from a ship's-crane above a long stout rope dangled invitingly into the darkness. Jenny sprang towards it, secured a firm grip upon it, and lowered herself into the hold, where she presently arrived among the cases. There, finding at length a snug corner up in the bows, she settled herself down for the night. It was close and stuffy where she was, but it was warm, and under its soothing influence she lay down and slept.

VIII.

Early next morning the *Golden Foam* slipped her moorings and sailed, outward bound for Karachi and other Indian ports, with a miscellaneous cargo of cotton and engineering goods. When Jenny awoke from her slumber it was to hear those voices which she had come to hate, and for a while she lay hid among the bales. It was only sheer hunger that at last forced her out. She came up on deck then, famished and thirsty almost beyond bearing. But the captain, a humane man and an animal lover to the very heart of him, ordered a man to look after Miss Jenny and her needs, and strictly forbade any undue teasing of the monkey. Perhaps he guessed something of Jenny's past history—I don't know. At all events he gave orders that the monkey was to be taken care of and fed until India should be reached, when they would be able to set her free.

So Jenny was given some soup—a commodity which she had never taken before, but which she now took to kindly enough. And after that she was allowed to roam freely about, and soon became on good terms with the men, whom she easily surpassed in the agility with which she ascended the rigging. She was, indeed, often pursued by members of the crew from one part of the rigging to another, when,

finding herself unable to escape from them by direct speed, she would swing herself out of their reach by grasping a loose end of rope, and thus bring the chase to an end.

Sometimes, too, she would ascend the rigging and wait there, at the mast-head, making faces till the men were almost within touching distance. Then she would suddenly lower herself to the deck by the nearest rope, or pass from one mast to the other by means of the mainstay.

At night, although her protector did his best to show Jenny the sleeping-place that was intended for her, she would as often as not run up to the mast-head and stay there till dawn, when she would allow herself to be coaxed down again by means of a peace-offering of coffee or tea. Once she was offered and accepted some wine, and shortly after that evidenced her affection for strong drink by stealing the captain's whisky-flask when he was out of the way, and 'scoffing' the contents, with dire results.

Came a day at length when land hove in sight, and an air of general excitement and unrest came over the vessel. It was Fort Manora, the entrance to the harbour at Karachi. Towards noon the *Golden Foam* sailed into the harbour and berthed without delay. It was one of those blazing hot days that occasionally visit that north Indian port. The very air seemed saturated with clammy heat, and so the process of unloading was left over until the cool of the evening.

On the floor in the captain's cabin, however, Jenny sat, a metal ring around her neck, and attached to the ring a chain. At the table sat the captain himself, talking earnestly to a friend, who had that afternoon come aboard the ship. 'And I want you,' the skipper was saying, 'to take her with you when you go down to Bombay to-morrow and turn her loose at one of those wayside stations around which the Langurs congregate. She'll be happier there than here, I'll warrant. Jones—that's the mate y' know—says the men want her to stop on this here ship as a mascot, but I'll not have it. Take her back where she belongs, there's a good chap. She must have come from somewhere down that way originally, for you don't get that sort of monkey anywhere else in the world.'

So Jenny was taken by train next day, and turned loose among her own kind. True, they were not the troop of Langurs to which she had once belonged, but they were Langurs, and welcomed Jenny, figuratively speaking, with open arms. And when, sitting beside the railway track, she gazed steadfastly at the vanishing train, her little beady eyes sparkled with intelligence, as if she understood, and her bushy penthouse brows went up to the limits of their expansion. Then, with an excited, joyous 'errr-errr,' she turned and ran off into the trees. Jenny had got back to her own.

THE END.

THE MONTH: SCIENCE AND ARTS.

NEW UPHOLSTERY SPRINGS.

IT seems not unlikely that spiral springs for upholstered seats have had their day, and will be superseded by the type described below. The new springs consist in essence of closely-spaced single wires of special manufacture passing from front to back of the seat, and following the contour of the surface, so that, except for a sheet of felt, very little stuffing is required. A strong wood frame forms the foundation of the seat. This carries stout steel bars along the front and the back, and along each side. The ends of the transverse wire springs are given several turns round the front and back bars, leaving short projecting ends which catch on the frame, and therefore cannot unwind. The result is a strong tendency on the part of the spring wires to push the seat upwards. To keep the springs equally spaced they are threaded through longitudinal wire coils, there being three chains of these in a seat of the ordinary size. These chains are attached at the ends to coil springs on the side bars, which keep them strongly extended. The complete arrangement forms a resilient wire cage closely following the contour of the finished seat. Many of these spring seats have been fitted into omnibuses and other vehicles with satisfactory results.

AN UNDER-THE-BED WARDROBE.

Under every bed there is a considerable space that is generally wasted. If a trunk is kept in this position it is hard work to pull it out and push it back again; moreover, these operations damage the carpet. These disadvantages have been obviated by what is in effect a horizontal wardrobe supported on rubber-tired wheels. The device takes the form of a box measuring 48 inches in length, with a width of 24 inches and a depth of 11 inches, so that two readily fit under a full-sized bed. Strongly made and lined with cretonne, the box is fitted with two wheels at each end, and has two handles for lifting purposes, and another for pulling it out from under the bed. A lid extends over two-thirds of the width from the front, and is hinged at its back edge, while strips of wood along the front and sides close down over the joint and prevent the entry of dust. These under-the-bed wardrobes are made with mahogany finish, of light or dark oak, or of polished solid mahogany.

A GIGANTIC AMERICAN LOCOMOTIVE.

If the huge locomotive described in this paragraph is not the largest in the world, it at least has special features which are without parallel in previous examples that have been

referred to in these pages. Built for the Chesapeake and Ohio Railway by the American Locomotive Company, this remarkable engine has a weight of over 252 tons, which is increased to 346 tons if the tender is included. The boiler may be safely taken as the longest yet made, being less than an inch short of 57 feet, while the maximum diameter of the barrel is 8 feet 8 inches. The fire grate is enormous, with its area of almost 113 square feet, which means 14 feet long by 8 feet wide. It burns over 5½ tons of coal an hour. Even two firemen would be hard worked to shovel so large a quantity into the furnace; this, however, is done by mechanical stokers. Funnels become shorter as locomotives increase in size. In this case there are two, one in front of the other, and they project only 11½ inches above the smoke-box. There are 20 wheels:—two sets of eight, coupled together in fours at each side, and a pair at each end of the engine. The coupled wheels have a diameter of 57 inches. Two separate engines drive the two sets of coupled wheels. Each has two cylinders, with a bore of 23 inches and a stroke of 32 inches. The two engines together develop 3902 horsepower, with a steam pressure of 205 pounds per square inch. This power means that the locomotive can pull with a force of over 46 tons. To ensure a supply of fresh air to the engine-men in tunnels two blowers are provided, which draw air from the space between the engine and the tender and discharge it into the cab. But gas masks are also provided, and these are supplied with fresh air from a reservoir.

TUBULAR EARTHS FOR LISTENING-IN SETS.

Everyone possessing a listening-in set knows how important is a good 'earth.' A water main is often used, but this form of earth means soldering a copper wire to an iron pipe, a job that is beyond the skill of most amateurs, while there may not be a water-pipe in a convenient position. Buried copper or galvanised steel plates are satisfactory, but these involve digging as well as soldering. In this connection much may be said in favour of a pointed steel tube, filled with powdered carbon, which is supplied complete with 15 feet of bare copper wire. This is specially made for the earthing of wireless sets, and can be driven into the ground in any convenient position, a metallic joint with the earth-wire being made without soldering. Measuring 2 ft. 6 ins. in length, the earthing tube is fitted at the top with a malleable iron cap which is soldered on, thus making a good electrical connection. Before the tube is driven into the ground, the wire is bent to one side into a slot provided for this

purpose, so that it will not be damaged. The tube is driven down until holes in the cap are level with or below the surface of the ground, their function being to admit water, which improves any earth connection. The powdered carbon in the tube forms a solid mass with the wire. Being a good conductor of electricity, the carbon, especially when damp, maintains a good earth even after the steel tube has been eaten away by corrosion.

A FLY-PROOF MILK JUG.

Objections to keeping milk in open jugs scarcely need enumeration. Flies are found struggling on the surface, and cats and dogs can help themselves to the milk. On the other hand, air must be allowed access if the milk is to keep fresh for the maximum period. A jug with a special lid, which is now obtainable, does away with the objections specified, while giving the necessary ventilation. Made of polished aluminium, the lid has a short cylindrical part which goes into the mouth of the jug until further progress is arrested by a projecting ridge that rests upon the rim of the jug. This ridge also serves as a hold for the fingers when removing or replacing the lid. The jug is made of white semi-porcelain with the usual spout at one side and a handle at the other. Just above the handle, but inside the jug, is a slight excrescence which engages with an L-slot in the side of the lid to form a bayonet joint. Horizontal slots in the side of the lid next to the spout prevent the entry of flies, while giving free access for air, and allowing of the milk being poured out even when the lid is on. These jugs are made in four sizes, having capacities of $\frac{1}{2}$, 1, $1\frac{1}{2}$, and 2 pints respectively.

A HAND TRANSMITTER FOR WIRELESS TELEPHONY.

In our issue for May there was described a wireless transmitter for lifeboats which sends out distress signals in the Morse code when a handle is turned. Invaluable as this instrument is likely to prove for the Morse code, it is useless for transmitting the human voice. A wireless telephone transmitter on similar lines has been brought out recently. It might be thought that a generator could not supply a truly continuous current, and that the resulting 'ripple' would be disastrous to speech transmission. The design of the generator under review successfully overcomes this difficulty, and the 'ripple' is so small that the effect is quite negligible. Like the lifeboat set, it can be operated by turning a handle, but as electric power is available for transmission work more often than not it is also made in a form suitable for being driven by an electric motor. Currents up to 30 milliamperes (i.e. approximately to $\frac{1}{33}$ of an ampere) at 1000 volts are generated

by this machine, involving a speed for the armature of 2800 revolutions per minute for the maximum output. At lower speeds lower pressures are produced, and the current may be increased to 40 milliamperes. Similar multiplying gear to that used in the lifeboat transmitter is provided between the armature and the handle, the latter being turned at 140 revolutions per minute for the maximum speed. When the appliance is driven by an electric motor no gear is required, the two spindles being coupled together, or the drive is effected by a belt. Only one-eighth of a horse-power is needed, for which the cost of current is very small. This little machine is intended for supplying the plate current in valve transmitters, the positive terminal being connected to the plate of the valve. At a low speed it can also be used for supplying the high-tension current of amplifier valves in connection with listening-in sets. The hand machine is particularly suited to the requirements of radio societies for field work, the weight being only $10\frac{1}{4}$ lb. With a set mounted on a car unit speech has been transmitted satisfactorily when the car was moving at high speeds. The machine has also been applied to motor-boats, aeroplanes, and yachts. Remarkable results have been achieved by British amateurs using this generator for transmitting both speech and Morse signals. In the spring of 1924 a well-known London amateur was successful in transmitting telegraphic messages to Philadelphia. Among numerous recent speech-transmissions probably the most remarkable is the achievement of the secretary of the Bradford Radio Society, who has on several occasions transmitted speech in daylight to the east of Switzerland, a distance of 800 miles.

HEAT FOR ALL THE HOUSE FROM THE KITCHEN RANGE.

The present high price of coal has given rise to several developments in the direction of utilising the maximum amount of heat from its consumption. In this connection it is increasingly becoming the practice in medium-sized houses to instal in all the rooms radiators for which hot water is supplied by a boiler incorporated with the kitchen range. A recently-devised system of this character contains several advantageous features. Of these the form of boiler is the most unusual. Rectangular in all directions, it measures 3 feet wide by 2 feet high by 1 foot from front to back. A vertical recess 14 inches wide and 9 inches deep passes from top to bottom and forms the fireplace. A special feature consists of two oval vertical tubes in each side of the boiler. A hot-plate and an oven are arranged above the fire recess, the flames impinging against the former, and part of the oven bottom being also exposed to the hot gases before they descend by way of the

tubes. The whole contrivance is set in brick-work, in which the necessary flues, dampers, and soot-doors are arranged. A damper can be opened on one side to pass some of the hot gases directly round the oven instead of first through the tubes. The usual plate-rack is arranged in the recess above the hot-plate. Being in a closed circuit, the water passing through the boiler and round the radiators is used over and over again. It does not, therefore, deposit scale, and the boiler and pipes never become 'furred.' Should hot water be required for baths or any other purpose, it is obtained from a device known as a 'calorifier.' This consists of a hot-water tank in which is a radiator, the latter having hot water from the boiler circulated through it by a separate closed circuit. The fire-grate can be placed in three positions according to the depth of fire required. In winter the lowest position gives the fire-box a depth of 21 inches. Spring and autumn are provided for by a depth of 15 inches, while in summer, when no radiators are needed, the grate is raised within $5\frac{1}{2}$ inches of the top of the boiler. Should the boiler and oven be fixed in the wall between the kitchen and the living room, the fire can be made to pass through, showing in the living room as an open fire with bars in front, although the stoking is done in the kitchen. In the summer the fire is above the sitting-room firebars, and, therefore, gives no objectionable heat. The fuel used is anthracite cobbles, either alone or mixed with coke; a mixture of coke and slack coal in the proportion of about 6 to 1 has also been found efficient. With a system comprising cooking, a domestic hot-water supply, and five radiators, the consumption is about 5 tons in twelve months.

'SUN VALVES' FOR LIGHTED BUOYS.

A great many of the buoys that mark the dangers to navigators around our own and other coasts are lighted by acetylene gas, which is stored in cylinders contained in their steel bodies. Apart from comparatively costly and complicated clockwork devices, no satisfactory means exist for turning off the gas at sunrise and turning it on at sunset; hence many of these buoys exhibit their lights by day as well as by night, thereby wasting gas and involving re-charging twice as often as would be the case if they were alight only during the hours of darkness. Many attempts have been made to invent a device, apart from clockwork, that will put out the light during the hours of daylight; but, until comparatively lately, none of these 'sun valves,' as they are called, has proved entirely successful. One made by the noted French makers of lighthouse apparatus, Messrs Barbier, Bénard, & Turenne, however, has amply demonstrated its ability to do what is required. It will be common knowledge among readers of

these pages that a bar composed of two strips of different metals lying side by side, of which the one expands more than the other when both are heated to the same degree, will assume a curved form when its temperature is raised. If such a bar be bent into a ring, with a gap between the ends, a rise in temperature will cause the two ends to come closer together, assuming that the metal with the greater expansion is on the outside. It follows that if one end is rigidly held, the other will move closer or further away according to the temperature. It is easy to understand that if the sun were always unclouded the heat-rays from it, playing upon such a ring, would move the end enough to close the tiny valve which admits gas to the light; but it will be news to many that the slight increase in temperature caused by mere daylight in cloudy weather is enough to do this. It will be obvious to every reader that the working of a device that is affected by so slight a difference of temperature would be completely upset by the changing seasons, and even by shifts of wind from a warm to a cold quarter, or vice versa. This difficulty has been entirely overcome by using two rings, one of which is exposed to daylight, and blackened so as the more readily to absorb heat; while the other, although open to the air (or rather the gas, as we shall see later), is screened from the light, and absorption of heat is reduced to a minimum by polishing the surface. Otherwise these rings are alike, and the one is fixed above the other. Both the free ends move in unison with general changes of temperature, and at night both are level. But when daylight strikes the upper ring it expands, and its free end moves in, whereas that of the lower ring, which is screened, remains stationary. By hinging the gas-valve lever on the free end of the lower ring, that of the upper ring can be made to move the valve with any difference of expansion between the two, although when they expand together no movement takes place. Normally, the valve is open and admits gas to the lamp when the two free ends of the rings are level. The movement of the upper one when affected by daylight shuts off the gas. It will be understood that the amount of movement of the upper ring is almost infinitesimal, but the multiplication of a comparatively long lever gives enough range to operate the valve. The device is protected by a gas-tight glass cover, to which gas is admitted from the reservoir in the buoy. An interesting feature is the conical form of this cover, which makes it impossible for birds to perch thereon. A cover that afforded 'claw'-hold would soon be obscured by droppings.

THE POSSIBLE PASSING OF THE 'CATWHISKER.'

Everyone with a crystal listening-in set will agree that a great advance would be made by an equally sensitive detector which did not

require the searching with the catwhisker for a sensitive spot. This has now been provided. The new instrument consists of a selected piece of the rare mineral bornite, against which an artificial mineral of the zinc-oxide order is pressed by a spring. No catwhisker is needed, and no adjustment except in the first instance. The bornite is embedded in Wood's metal in a wooden cap. The other crystal is mounted on a spring plunger which maintains a good pressure. The device is housed in an ebonite tube, with a brass terminal at each end. The spindle of the spring plunger passes through one of these terminals, and is fitted with an ebonite knob. Experience and tests have established the fact that these detectors are at least as sensitive as the best crystals and catwhiskers, while they require no searching and are unaffected by vibration.

A SUBSTITUTE FOR STAIR-RODS.

Everyone who has slipped on a loose stair-rod will admit that this ancient device leaves something to be desired. A substitute now coming into vogue takes the form of a metal arm at each side of the carpet, which turns on a single screw. When the arms are in a vertical position, the carpet is free. To hold it firmly in place they are folded down over the carpet until they lie along the angle generally occupied by the stair-rod of which they take the place. A knob, or 'boss,' at the outer end of each arm presses the carpet into the corner. So long as the screws are properly put in there is no possibility of these arms allowing the carpet to become loose, yet it can be freed in a few seconds when the carpet is to be taken up. They are made in various lengths to suit different widths of carpets and the rise of step. They do not require cleaning, and they can be obtained with an oxidised copper, brass, nickel, or oxidised silver finish.

COOLING BY EVAPORATION.

Many readers of these notes will have seen the porous earthenware jars that keep water cool by evaporation. This principle has recently been applied to cold-storage boxes for the home. These consist of a zinc box with a zinc framework outside having porous tile panels, the lid being of similar construction. If possible, the box is immersed in water for two minutes once a day, and so hygroscopic are the tiles that each takes up something like a pound of water. During the following twenty-four hours the water slowly evaporates, with the result that the inside of the box is kept remarkably cool even in the hottest weather. These boxes can be taken apart, which allows of packing the sides, bottom, and lid so that they lie flat. The framework is also readily detachable, and thus a new tile can be easily substituted for a broken one. Several sizes of this variety of

cold-storage box are made, some of the upright type for food-containing jugs and basins, others of a flatter shape for dishes.

'BEHOLD THE HEBRIDES!'

There are many Roads to the Isles, and each has its own appeal. Boswell, a century and a half ago, took Johnson there by one and brought him back by another, and his *tour de force* in transporting that unwieldy Scotophobe into the western wilds, so far from his books and his beloved London, was almost as great an achievement as the Life itself. Bozzy and the Doctor reached the Hebrides via Inverness (where Johnson purchased a copy of *Cocker's Arithmetic* to wile away the hours!) and Fort Augustus, and returned by Oban and Loch Lomond. Another line of approach was favoured in a book which we had occasion to mention in these columns last year, *The Road to Rannoch and the Summer Isles*, by T. Ratcliffe Barnett, who has recently collected an equally delightful set of essays on *Border By-ways and Lothian Lore* (Grant & Son). Mr Alasdair Alpin MacGregor, whose article 'At the Uist Fords' appears elsewhere in this issue of the *Journal*, comes from the Isles himself—and you may be sure he knows every way back to his native heath. Your Celt sees and feels and knows things of which the Sassenach is unaware; hence the exceptional value of a book on the Western Isles from a Highland pen. In *Behold the Hebrides!* (W. & B. Chambers, Ltd.; 7s. 6d. net) Mr MacGregor has brought together (with excellent illustrations) over a score of vivid sketches dealing with those fascinating fragments of Scottish territory in every aspect—their history and traditions, their folklore and superstitions, their industries and customs, their scenic charm and mystic glamour. And those who would behold the Hebrides, whether in wistful dreams or in joyous reality, could wish for no better guide than this fervid and persuasive Gael.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (a) a reply post-card, or (b) a stamped and addressed envelope or post-card, be sent to the Editor, Chambers's Journal, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

* * TO CONTRIBUTORS.

All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

For its return in case of ineligibility, a stamped and directed envelope (or postage-stamps) should accompany every manuscript.

To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the *writer's Name and Address written upon them in full.*

SEVENTH SERIES

IN THE VALLEY OF DECISION.

(1) THE STEEL HAND.

By ASHLEY L. BARNES-LAWRENCE, Author of *Jacob Bateman's Ladder*.

CHAPTER I.

I.

THERE are few persons who do not know what is meant by an iron hand, and of late years the 'mailed fist' has become almost as proverbial as the 'butter fingers' of boys at school. But nobody believes that those fingers are really made of butter; or that a strong hand, though sometimes called an iron hand, is actually made of that metal.

The inference to be drawn from these premises is that the steel hand with which this story is concerned was not really made of steel. But whoever jumps to such a conclusion will find by a perusal of these pages that he is wrong; for this particular hand *was* made of steel.

It was made by a hardware firm in Birmingham to the order of a well-known London surgeon, and as a mechanical contrivance was very skilfully designed not only to be like a human hand in appearance, but to serve some of the uses in which the hand is ordinarily employed.

Hubert Carrington, for whom this mechanical contrivance was intended, had lost his right hand in somewhat curious circumstances.

An all-round athlete, and a first-rate cricketer, as well as a capital good fellow, he so greatly distinguished himself in the Eton and Harrow match of the year in which he left Harrow, that he is referred to in his old school with respectful admiration even to this day.

But it was during the progress of this great cricket-match that he met with the accident which eventually entailed the amputation of his right hand.

He was fielding at point, pretty near in, when the batsman, taking advantage of a ball coming rather wide on the off-side, cut at it with tremendous force. Ordinarily speaking, a fielder standing where young Carrington did would have left the ball alone, and considered himself lucky in not being hit, and perhaps killed; but Carrington, as the ball whistled past his head, put up his right hand, and although he failed to hold the ball, his attempt caused the ball to

spin upwards high above his head, and he then caught it with both hands before it touched the ground.

It was a magnificent bit of fielding, requiring considerable courage and address, but it cost him his right hand. The top of the third finger of that hand had the skin torn off it in the form of a cap. This was immediately replaced and the finger was bound up; and perhaps all would have been well with him, but Carrington, with the pluck inherent in a well-bred Englishman, continued the game, and actually played to the finish—materially helping to win the match for Harrow.

Better a thousand times if he had retired from the game when he was first hurt! The wound refused to heal; blood-poisoning set in; and eventually the doctors said that, if he did not consent to the loss of his hand, he would lose his life.

He said he would as soon lose his life as lose his trusty right hand. But his mother with tears persuaded him that his right hand could no longer be regarded as good and strong. The opinion of the famous surgeon who had been called in was that it never could be good and strong again, and that the necessity for the operation was urgent.

And so he consented; but the career of a soldier to which he had looked forward from his childhood was henceforth closed to him. The operation was successful, but the recovery of bodily health and strength was slow, and it was many months before his natural cheerfulness of disposition came back to him. His friends, indeed, lamented that never again was he the merry fellow he had been before his accident.

II.

That, then, is how the steel hand came to be thought of. It was his own idea; but it was Mr Mackenzie, the eminent surgeon, who contrived, by his knowledge of anatomy and of mechanics, to give practical effect to the idea.

The result was that, after many experiments and several failures, the Birmingham cutlers

succeeded in manufacturing an artificial hand exactly the shape of the human hand, and adapted, as far as they could adapt it, to the purpose in view.

It is not necessary at this point to describe more minutely the cleverness of the mechanism by means of which Carrington, in process of time, was able to take up any object he wished to handle, and to retain it, if he so pleased, in what was literally a grip of steel.

A time came, however, when it fell to my lot to be compelled to make a most careful examination of this very contrivance, in view of one of the most tragic events that I was ever called upon to investigate.

The Carringtons lived at Olderton Manor, a comfortable and picturesque old country-house situate on the borders of the parish of Wingate; and it happened that I was appointed to the Rectory of Wingate, and came into residence there, just at the very time when Hubert had to undergo his operation. Needless to say, I lost no time in making kindly inquiry after him, and I continued to call day after day.

The Carrington family consisted of the widowed mother and her three children, Hubert, Cecilia, and Alice. Of these Hubert was the eldest.

'I wonder if Hubert would care to see me?' I asked at my third visit. 'Tell him I took my degree at Oxford, and have known a good many Harrovians there in my time.'

Mrs Carrington was doubtful whether her son ought to see a visitor at all; he was so ill and dispirited about himself.

Hubert, however, expressed a desire to see the new rector who had shown so much interest in him, and so upstairs I went.

Apparently my visit did him no harm, for it was reported to me afterwards (and it is wonderful how these things do get reported) that I had cheered him up tremendously, and that he wanted very much to see me again.

Such was the beginning of our friendship. I certainly managed to cheer him up, by leading him to take new and hopeful views of the opportunities for usefulness which remained to him, and I was able to convince him, from my own personal knowledge of human life, that physical and worldly losses are sometimes more than counter-balanced by the spiritual gains that result from them.

It is one of the consolations in the trying work of a clergyman that, although he has to make his way, often enough, into places of darkness, and to walk through ways in life that are overshadowed by the disappointments and tribulations of his fellow-beings, he is allowed sometimes to see the dispersal of the darkness, and to realise that he has been a man sent from God to bear witness of the light. It may be but a single ray of light that has penetrated the prevailing gloom, but that ray is not seldom

the harbinger of the dawning of a brighter day; and a man's hopefulness is renewed within him when he begins to see that the Sun of Righteousness has arisen with healing in His wings.

Hubert learned to bear his own particular burden not only with resignation, but with that kind of courage which causes the soldier to feel a sort of satisfaction in the long march and in the grim fight.

Thus in my early intercourse with him were laid the foundations of a friendship which was destined, four or five years later, to be of some service to him when he needed, as young men sometimes need, a friend.

III.

Meantime it was a delight to me to witness his growing interest in country pursuits. Fishing and shooting were beyond his powers; but he continued to ride, and after a while was to be seen in the hunting-field, not, perhaps, in the first flight, but taking his fences and enjoying the getting away after hounds.

What, however, began to claim his more serious attention was agriculture; and all sorts of schemes occupied him for the improvement of land, the cultivation of crops, and the planting of timber. And then, not content with his efforts in this direction at home, he must needs persuade his mother to agree to the purchase of some six hundred acres of land in British Columbia.

He did not buy this property without first going to see it; and then, in due course, there followed occasional visits to the locality to see what he could do with it.

I pass over the next three or four years, or perhaps I should say they passed over me, and I don't know that they added anything to the grayness of my gray hairs, for my hair turned gray some years ago—but that is another story. A man, it is said, is only as old as he feels, and nothing, I think, does more to make a parson feel old than to see those whom he has known as children, even the babes he has christened, growing up to be men and women, and in their turn presenting their babies to him to receive his blessing.

At Olderton Manor my juvenile playmates, Cecilia and Alice, had ceased to play with me, except at tennis and at arm's length. They were more charming than ever, but alas! they were no longer children: they were actually 'out'; and to be 'out' meant that, however much you might call upon these young ladies at home, you could hardly ever find them in. Quite recently they had been presented at court, and I sympathised with the anxious feeling of their mother, who, while wishful for the marriage of her daughters, dreaded the prospect of separation from them. But a matter more immediate than the marriage of the daughters was the engagement of the son.

Hubert had become engaged to an exceptionally nice girl, the only daughter of a retired cavalry officer living at Bath.

General Sir Thomas Weston, K.C.B.—to give him his full title—occupied a fine house there, and probably lived up to every penny of his means. There was a son, Arthur, half-way through his terms at Oxford, and doubtless he also helped to make a hole in his father's income. At any rate there seemed to be no present provision for the daughter, and the engagement, therefore, was likely to be a long one.

Hubert, however, was only in his twenty-fourth year at this time, and Vera Weston was three years younger. 'No sort of need for hurry,' said the old general. 'I never married till I was well over forty, so these young people have plenty of time before them.'

Vera came in due course to Olderton on a visit to Hubert's family, and there it was that I first made her acquaintance. My intimate friendship with Hubert might have hindered, rather than helped forward, any approach to friendship on her part towards me, for a man's fiancée has been known before now to show jealousy of her future husband's friends, and to exert herself to keep them at a distance; and a very good thing, too, if the aforesaid friends are not fit for a lady's society—which is as much as to say that I do not place myself in that category.

Let it suffice that this young lady evidently regarded my friendship with Hubert as a passport to her own affection, and we became at once very good friends; and in the result it turned out very well that this was so, for a day came when it was difficult to say which was the more wretched of the two, Hubert or his bride-elect. And I rejoice to think that in that dreadful time I did not despair of either of them, nor fail them.

CHAPTER II.

I.

A PARSON who lives nearly all the year round in the country—and can't leave his parish for many days together—is apt to value the quasi-independence afforded by membership of a London Club.

To be in town for ever so short a time and yet not to have a house, or even a hat-peg, that you can call your own—what is this but to feel homeless, and to be in the position of those unhappy persons who don't know where their next meal is to come from? A man can't always be sponging on his friends, or hunting about for a suitable place in which to take luncheon or dinner; it is demoralising, and means expense, or anxiety to avoid expense.

I had long been a member of the New University Club. And here it was that I

found a note from Carrington one morning, telling me that he hoped to be in town that very day, and that he would turn up at the club on the chance of having luncheon with me.

'Weren't you a bit surprised to get my note?' he asked, as we devoured a particularly good lobster salad between us.

'No!' I said. 'I am past the age to be surprised at anything.'

'I am so pleased to hear that,' said he, as he smiled away at me, 'for I was rather afraid I should surprise you by what I have arranged for you. Yes!' he went on, 'it is all arranged, so you must come.' And he went on to tell me that Vera at that very moment was staying with friends at Richmond; and that the daughter of the house, an old school-friend of Vera's, had got her to come up for a big dance, a quite swell affair to be given in two days' time.

'Of course I am among the invited,' he said; 'Vera saw to that; and as I was to bring a friend, she particularly said I was to bring you.'

It was in vain that I demurred. I told him I did not know Sussex Lodge; and as for Vera's friends, the Chapmans, I could not say that I had ever heard of Admiral Chapman's existence.

'Oh, but they've heard of you,' he rejoined, 'and are awfully keen to make your acquaintance; and according to Vera they really are exceptionally nice people. Now, do come; I don't half like going there without you, and Vera, I know, will be mortally disappointed if you don't turn up.'

Well! I had come up to town chiefly for the sake of a little change from the solitude of my country rectory, and so I suffered myself to be persuaded; and in my heart of hearts thought it was all very kind of them.

II.

We got down to Richmond in good time on the appointed night, and Sussex Lodge looked brilliantly lighted up in its setting of fine old trees as our taxi-cab glided swiftly up to the main entrance.

Here we were promptly pounced upon by well-trained men, who stripped us of our outer garments, offered us refreshments, and handed us over to a major-domo, and in a few moments we were being welcomed by our host and hostess.

They received us with the utmost kindness, and at once introduced me to two or three nice people. That word 'nice' means a great deal; too often the alternative is 'not nice,' and while the one sort seems to shrivel a man up, the other draws him out, and makes him feel on good terms with himself and with the world around him.

It was a large gathering, and if titles nowadays mean anything, there were several notables present.

One great pleasure that awaited me was finding, among the later arrivals, a cousin of my own, until quite recently Governor of Bombay, whom I hadn't met for a term of years.

Also I was honoured by a dance with the young lady for whom the ball had been arranged; a daughter of the gods, divinely fair, the adored of her father and mother, and of sundry young men who, while they worshipped her at a distance, seemed to regard me rather as a busy-body in other men's matters. However, they couldn't all have her; so why not I?

Vera also, perhaps out of compassion for my gray hairs, but more likely because she knew how safe a corner she occupied in my heart, gave me two dances; and it was at the end of my second dance with her that the first disagreeable incident of this memorable evening took place.

Vera was a little tired, and though her card was full, and the partner elect turned up to claim his dance, she begged off on the plea of fatigue, and continued to sit with me. A few moments later she touched my arm, and hurriedly whispered, 'Do not leave me. There is that horrid man coming this way.'

I had barely time to glance in the direction indicated, when a dapper-looking man with a rather aggressive moustache, and an insolent look about him, came to a halt in front of us,

and, ignoring me, addressed my protégée with an easy familiarity which in itself was offensive.

'Oh! here you are!' he exclaimed; 'I've been looking everywhere for you. I've come to claim my dance—the next one after this, isn't it?'

My companion's attitude stiffened. 'I remember telling you that I couldn't give you one,' she replied; 'I am engaged for all my dances.'

'Oh! I know,' he drawled; 'but you said you would see later on in the evening.' And with this he fiercely pulled his moustache, and leaned forward as though to try to see her card.

By this time I had taken the measure of the intruder, and had come to the conclusion that he had had the proverbial 'glass too much.' 'The lady is tired,' I said.

'She hasn't said so,' he snapped out, with a gleam of quarrel in his eye.

'Allow me to tell you,' I replied, 'that she has said so to me; and as for any promise of a dance, my partner has already told you that she gave you no such promise.'

I remained seated, and he favoured me with a long and threatening stare. 'Damned interfering,' he muttered under his breath; and then with a forced smile he bowed low to Vera. 'Perhaps later on,' he said, and sauntered off.

(Continued on page 498.)

SWIMMING FOR THE MIDDLE-AGED.

By SID G. HEDGES,

Hon. Instructor, Silver Medallist of the Royal Life Saving Society.

ONE has only to visit the Serpentine in Hyde Park, any morning of the year between six and eight o'clock, to realise that some of the keenest swimmers in England are middle-aged men. A wild enthusiasm for bathing characterises youth, but theirs is not that deep enjoyment of the artist which belongs to the finest swimmers. Of course, fine swimming is by no means necessarily synonymous with fast swimming.

Swimming is the perfect exercise for the middle-aged. An old writer has praised swimming as—

Of exercises most complete,
Because 'tis violent without heat.

And even the violence he implies is not at all essential. Swimming is strenuous, or not, as one likes to make it.

But, as many people arrive at middle-age without having learned to swim, I propose to give here such advice as will enable them to make a beginning. It is much easier to learn in salt water than in fresh, but salt water is more disagreeable if a chance mouthful is gulped down.

The greatest asset the learner can have is confidence, and one's share of this can easily be increased. What one needs to feel is that the body is really buoyant; that it is not inevitable that one will sink immediately the first swimming attempt is made.

Wade out until the water is breast-deep. Now take a good breath; bend forward, and snatch up a handful of sand or a pebble from between the feet. It will not be so easy as it would seem; in fact, the water will strongly resist the attempt to get down—it will actually push the body upwards. This sure knowledge of one's buoyancy will give much confidence for further trials.

The next step should be an attempt at floating, for this will help tremendously in back-swimming. Customarily, people begin to swim with the breast-stroke, but for the middle-aged bather I recommend back-swimming. In this quick results can be obtained, and thus the discouragement resulting from the reflection that 'I ought to have learned when I was young' will be the sooner dispelled.

To begin floating, sit on the sand, with the

water just around the shoulders; stretch the arms above the head; then gradually lean backwards until the ears are immersed, and the arms are lying along the surface of the water. Continue to straighten the body with exceeding slowness, and soon, providing that the arms and the ears are kept in the water, the whole body will be suspended, with the heels alone touching the bottom. It is essential that the body be quite straight, the chest and the stomach right on the surface, and the head thrown well back into the water. On no account must the body be in a 'sitting position.' These points apply equally to all back-swimming. Probably, if you are well built, the legs will rise from the bottom, but it does not matter if they do not.

During first attempts at this floating practice, and for the back-swimming which I am about to describe, a friend's supporting hand may lend additional confidence; but it is not at all essential.

Before actually trying back-stroke the leg movements must be thoroughly understood. They can be practised whilst lying on a bed, or, one leg at a time, when standing. The kick consists of four parts:

One.—The legs are drawn up to the body, heels touching each other, and knees pressed as flatly apart as possible—this is to prevent them from protruding above the surface and so sinking the middle of the body into the incorrect 'sitting position.'

Two.—The feet are driven right out, widely apart, until the legs are straight. Thus the soles of the feet are thrust against the water and drive the body head foremost.

Three.—The straight legs are swept in together until the ankles meet. This movement resembles the closing of the blades of a pair of scissors. It is the most important part of the stroke, for the greatest propulsive power comes from the driving out of the wedge of water from between the legs.

Four.—Nothing further is done at all. The legs remain straight and together, feet pointed in line with them; and the body *glides* until the impetus of the kick is exhausted.

When first practising the kick in the water, the swimmer should keep his hands on the hips. This opens the chest and so helps the body to float. It is not good in learning any stroke to begin by trying both arms and legs together. Better results are assured by concentrating on each set of movements separately, and only when arms and legs can each work with mechanical precision should they be combined.

The simplest arm-stroke has but two parts. To begin, the arms lie straight at the sides. Then they are gently carried outwards until they are about eighteen inches from the hips. During this negative or recovery movement the

hands should be flat or *feathered*, so as to give the least resistance to the water. Next, the arms are swirled vigorously in to the sides, like a pair of oars made to sweep right up to the sides of a boat. Hands should be cupped during this movement, to catch the water strongly. The sweep-in of the arms should synchronise with leg movement *two*. The hands should then remain still at the sides until the gliding in *four* is finished. As much gliding as possible should be performed in this style of swimming. It is gliding that necessitates and develops a good, horizontal position.

During all first practice there will be a constant temptation to blur the three distinct movements of the leg-stroke into one ineffective circular motion of the legs. This must not be yielded to; the separate parts of the kick must always be clearly defined.

All swimming movements should be big and deliberate; restricted, jerky actions are bad.

This method of back-swimming can easily be learned in two or three days in the sea, though rather more time will be necessary before fifty or a hundred yards can be covered. But when a little distance like this can be swum a much-improved arm-stroke may be learned.

In this, the hands, to begin, are held down by the thighs as before. Next, they are slid up the sides of the body past the shoulders, and so on until the arms are fully extended beyond the head, in line with the body. The hands should now be about twelve inches apart, with palms facing outwards. During the whole of this movement the hands should have been just beneath the surface. The next movement is the positive, or propelling one. Both arms, remaining quite straight, are swept right round in big semi-circles until they reach the sides once more in the preliminary position. The hands glide up the body in the recovery, while the legs are making their kick, and the sweep round of the arms occurs while the legs are straight in the number *four*, gliding position. As the arms make their sweep the chest should come quite clear of the surface, and the head be thrown so far back that the water washes over the forehead.

This is not a commonly practised method of swimming, chiefly because there are faster ways; but no other stroke will more surely give good style and a sense of ease and confidence in the water, which is always the mark of the fine swimmer.

But by this time you will be anxious to know something of the breast-stroke, the commonest of all modes of swimming, though not the easiest to learn. Of course, in breast-stroke one is right way up, which gives a good many practical advantages.

It is best to begin with the arm movements, and these should be practised in water that is

shoulder-deep—so that the arms can just be immersed. But be careful to face towards more shallow water, else you may, by the arm-strokes, get drawn into inconvenient depths.

The movements can be divided into four parts.

One.—Draw up the hands under the chin, back to back, thumbs and first fingers touching. Elbows should be dropped to the sides, and fingers be pointing to the front, parallel with the surface of the water.

Two.—Shoot the hands forward until the arms are straight, parallel with the surface, and about four or six inches beneath it. At the end of this movement the hands should be about twelve inches from each other, palms cupped and facing outwards.

Three.—Arms do not move.

Four.—Sweep the straight arms through a quarter circle, and always parallel with the surface, until they are in line with the shoulders.

In actual swimming the body glides forward for an instant while the arms are steady in *three*.

The kick is precisely the same as in back-stroke, except, of course, that the body is the other way up. To practise the kick it is necessary to hold on to a rock or the steps of a bathing pavilion, or to rest the elbows on the bottom in shallow water, in order that the body may be supported and kept horizontal. The heels should be at a constant depth of nine to twelve inches.

In *one*, when the legs are drawn up, care must be taken that the knees are underneath the body; a common fault is merely to draw the feet backwards, so that the soles emerge from the water.

The arms and legs should be combined as follows:

One.—Arms and legs are drawn up.

Two.—Arms and legs are thrust out.

Three.—Arms remain still; legs sweep in.

Four.—Arms sweep round; legs remain still.

A friend's hand beneath one's chest is particularly helpful during first attempts at this combination. He may also assist by counting aloud *one, two, three, four*, allowing about two seconds for each.

When some proficiency is gained, correct breathing should be added. Inhalation should be performed during *four*; exhalation during *two*. A learner often gets into difficulties by breathing-in during *two*—a very inopportune time, for during this negative movement the head is lowest in the water.

It should be remembered that the more of the body there is immersed the more easily will one float. In breast-stroke, therefore, the chin should be constantly submerged, and, of course, the shoulders. When once two or three yards can be achieved, unsupported, one has actually

begun to swim, and progress becomes sure and rapid.

One's aim should constantly be to swim an increased distance; and one should certainly not be satisfied until a quarter or a half-mile can be covered with ease. This moderate ability in back and breast-swimming will almost inevitably stimulate ambition to do still more, and probably a real study of swimming in its many branches will ensue.

There is nothing more fascinating than swimming; there is nothing more healthful; and there is nothing more suited to give both benefit and enjoyment to the middle-aged. And, curiously, swimming is about the only exercise in which it is a decided disadvantage to be slimly built. A person more corpulent is happy as a swimmer, for he can the better resist the chill of the water, and, too, he is more buoyant.

Man or woman, any middle-aged person who undertakes to become a swimmer is certain of finding a new zest in life.

A CHÂTEAU IN DREAMS.

I.

WEBS of thought for reverie's weaving
Framed anew, in mystic space—
Miraged dream past all believing,
Looms the cradle of a race:
Sombre towers and turrets pointing
Skyward with an ancient pride,
Lichened shields for whose anointing
Brave Crusaders fared and died.

II.

Knightly halls, grim armour keeping
Watch on silken legend walls,
Glittering steels in noontide steeping,
Ice-gray shades when moonlight falls—
Buoyant youth and age care-laden
Share ancestral honours there;
Haughty dame and winsome maiden
Grace the sweep of tread-worn stair.

III.

Tapers ray fair antique faces
Crowning carcanets of gold;
Blithe lavolta's gallant paces
Wing romance charmed years enfold.
Pictured forms, of life forsaken,
Hailed to kindred's festal cheer,
Quaff, in vows of fealty taken,
Wine of joy with rue of tear.

IV.

Coo of dove and prattling childhood,
Falconers give their call of lure;
Lilies throned, and menial wildwood—
Hark! the nightbird's descendant pure.
Chapelled lances, dawned in glory,
Flush the moth on hatchments drear.
Priestly chant of sacred story
Sounds Resurgam, full and clear.

Mangled waste! strange lifeless token!
Creature breathes, nor earth-fruit teems.
Silence waits some lone word spoken—
Vanished Avalon of Dreams!

ALBERT H. WHITIN.

ON THE PLATFORM.

By ARCHIBALD MARSHALL.

I.

THE little train that wound and looped its way up the mountain valley had a platform at either end of each car, where those who preferred to be outside could stand, or sit on the perches provided for two of them. Arthur Manby elected to stay on the platform during an excursion up the Rubaithal, not so much because he wanted to smoke—though he always wanted to smoke—as because he was feeling annoyed with his wife, and still more annoyed with his wife's bosom friend, Ruby Pickthorp.

Why should he have to accompany these two elderly and unattractive women on their suddenly announced expedition, when, if they had stayed indoors to write letters, as they had said they would, he might have made one of the party that had chosen that day to go up the Fehrental? One Thal was as good as another, with the same firwoods, pastures, and chalets, and the same mountain scenery. But what a difference in the company! Arthur Manby was four years older than his wife, and seven years older than Ruby Pickthorp, but he did not feel himself elderly. He was at home with youth, especially feminine youth. He was *not* elderly. A man of fifty-two, who had preserved his figure and most of his hair, could not be called elderly nowadays. He was the equal of—well, anything over the age of eighteen. He didn't care for mere children, and he was not the sort to go dangling after young married women. Eighteen to twenty-four—that was how he liked them. Their society was refreshing, and where was the harm in it?

As the train moved off, a heavily-bearded gentleman, with little knickerbockers showing his bare knees and a short jacket of red and blue checks, who occupied the opposite perch, was surprised to see him hurl away a half-smoked cigarette with a muttered exclamation and pull out a pipe and tobacco-pouch. The exclamation was punched out of him by the bitter thought that the other party would now be in a like train to this, and that with luck he might have been sitting on a similar platform with that dear little Iris Feldham on the perch opposite, instead of the bearded gentleman with the bed-jacket and the hairy knees. It was almost more than he could bear. Why hadn't he rebelled—said calmly that he had made his arrangements and couldn't alter them now? But the unfortunate thing was that he had said nothing about making arrangements. He had been intending to creep off. And a still more unfortunate thing was that his wife had known it. No doubt that was why she had suddenly

decided on this expedition; and, of course, Ruby Pickthorp had backed her up. What a pair!

He was going to be talked to. However had he come to allow that, *par exemple*, that he should be talked to like a naughty boy in front of another woman? It comforted him a little to use a French phrase to himself, but only a very little, about as much as the first whiff of his pipe, and the effect soon wore off. It was humiliating, that was what it was. But she didn't mind humiliating him. More than once, when he had been making himself the life and soul of some party, while she and Ruby Pickthorp had sat dull and glum in a corner, she had come over and, ignoring everybody else, practically ordered him up to bed. And he had always gone, if not immediately, very soon, with a light word to save his face, but knowing that the words used when he got upstairs would not be light, and that very likely Ruby Pickthorp would be there to hear them.

An official came for the fares, and indicated that he was expected to pay three of them. That was another thing. She had plenty of money of her own, and Ruby Pickthorp had, if not plenty, enough to pay her own train fares. He was always being sponged on; and what did he get for it? Just look what he could have done with his money if he had been free, *par exemple*! The phrase seemed to come of itself this morning. A nice little flat in town, instead of that dull suburban house, with *her* always in it; meals at the club whenever he felt inclined for them, and billiards as late as he wanted to go on playing; trips abroad whenever he liked, and nobody to look after but himself. Why, it would be a pure delight to sit in a train without *her* opposite to him, and there were always people to make friends with, and go about with, wherever one went.

The bearded gentleman cleared his throat without reticence. Very disgusting! These foreigners! She didn't clear her throat like that, but she had an irritating way of doing it all the same, a series of what the novelists call 'ahems,' when she would be sitting bunched up in her chair with her knitting, and very likely with her toes in trodden-down bedroom slippers turned inwards, and would pick him out of his novel with: 'Well, you're not very lively!' She never cared what she looked like when she was alone with him. 'I think I'll put on my slippers; my corns are shooting to-night. You might go and fetch them for me.' And he would go. Not amiably, perhaps; but still he would go and fetch down the horrid pink things, and be thanked by: 'I shouldn't have thought you'd have minded doing a little

thing like that for your wife. I'll fetch them myself next time.' But she never did; and to do himself justice he wouldn't have let her. He did his duty by her all right.

II.

They came to a halt. The bearded gentleman got off, and his place was taken by a young man in the same sort of Tirolese costume, but without the bed-jacket. Very natty, that green cloth and the horn buttons. The whole costume was picturesque, and he had thought of getting one for himself. Men much older than he wore them, and his figure, at any rate, was as youthful as it had ever been, or very nearly. But she had thrown scorn on the proposal. 'Make a fool of yourself at *your* time of life!' And Ruby Pickthorp had laughed unpleasantly. Really, that woman! No, she was too much. He'd get rid of her, insist upon it. But he knew he wouldn't. He might insist, but she would remain.

The young man looked about thirty. Oh, if only he were thirty again! Or twenty-eight, for he had married her at twenty-nine. Was it possible that he had been in love with her? Yes, he had; one must be honest. But it was like having been in love with another woman; there was nothing whatever to connect the two. That being in love when you were first married didn't seem to have anything to do with what came after. Marriages ought to be for five years at the outside, and then start again. There were a good many who wouldn't start again. Once bit, twice shy.

The young man got up and craned over the side of the car. They were skirting a curve, but there was nothing exceptional in the way of a view here, just a long slope of velvet-green pasture, with the firs from above breaking into it here and there. But now he was waving ecstatically. A large chalet came into view, its widespread roof dotted with heavy stones, gay flowers in all its windows. On a balcony stood an elderly woman with a large shapeless figure, and a slim young girl. They were too far off for exchange of words, but the waving went on until the chalet was lost to view again, the young girl doing less of it than the other two. The young man took his seat again with the look of the beatified male on his face. It was clear enough which figure he retained in his eyes. It had given Arthur Manby pleasure too, but as they went on the other figure obliterated it. The young man might be looking forward to marrying the one, but when a few years had passed over his head he would find he had married the other. That was how it happened; and the years passed so quickly that one might almost as well marry the other at once, and have done with it. Much better not marry at all; but, of course, the young man wouldn't believe it.

Why couldn't he get rid of her? People did now. No fuss, no great upheaval. Just a sensible understanding. You go your way and I'll go mine. We haven't hit it off very well together. Not your fault, of course, nor mine either, but we shall be happier apart. Why shouldn't he make that suggestion and insist upon carrying it out? This would be a very good opportunity. One couldn't do it in cold blood, out of the blue, *par exemple*. But if she was going to start in on him when they got out of the train, with Ruby Pickthorp picking her way like a censorious hen on the other side of her, and not flinching from putting in her word when she saw occasion, then he would take his opportunity. Gone a bit too far this time. Now we'll have an end of it. They would both laugh at him, of course, and refuse to take it seriously. But he would only have to stick to it, and they'd have to take it seriously.

But somehow he knew that he wouldn't be able to stick to it.

III.

Here they were. Now for it! He joined his wife and her friend. Was there anybody of all the crowd that bunched its way through the gate and straggled along the road who felt as much distaste for the company he was in? Not a smile or a word. Just a grunt from her and a sniff from Ruby Pickthorp. A contemptuous proleptic sniff. Oh, he was in for it! They had been putting their heads together; he knew the signs. But they would find it different now. The worm was going to turn at last. They'd be singing another tune before long.

He put on his usual armour, an air of sulky indifference. It hadn't served him very well before, but it wasn't armour for defence he would want this time. He was fingering his weapon of attack, which he couldn't use until the attack was launched against him.

It began in the usual way. 'Oh, you needn't behave like a naughty child. A nice thing to bring out a husband who hasn't got so much as a word to throw at his wife! Don't walk so fast. These stones hurt my feet.'

He reduced his pace to the amble of obese maturity, while the happy talkative crowd forged ahead, walking lightly and easily, as he would have done himself in this crisp mountain air if he had been in the sort of company to which he rightly belonged. He took a firmer grasp of his determination.

'I've got something to say to you. Ruby and I have been talking it over. I've had enough of it. Any young ninny of a girl rather than your own wife! And sneaking off to make a fool of yourself without a word! Enjoying yourself all day and bringing back nothing but a fit of the sulks! There isn't a woman who'd stand it.—Is there, Ruby?'

'I wouldn't,' said Ruby, sniffing. She had a

large nose to sniff with, and a pair of gooseberry eyes, but he never looked at them if he could help it.

It was a well-known opening. His time would come when she said, 'We'll have an end of it once for all.' Yes, they would have an end of it, but not in the way they thought. But he had better get rid of the sulkiness. 'Well, what are you going to do about it?' he asked lightly.

'Listen to that, Ruby! Isn't it beyond everything? Well, what I say now is, it's time to have an end of it once for all. I'll tell you what I'm going to do about it, as you've asked so politely; and Ruby says I'm quite right. I've overlooked it time after time, and hoped it would be the last, but it never is the last. Now it's going to be. We'd better part and have done with it. You go your way and I'll go mine. No need to make a fuss about it, and no need to have any talk. If anybody asks questions, just say we haven't hit it off very well, and as we're both sensible people we've just come to an understanding. No need to part as enemies, either. You're you, and I'm me; and that's all we need say about it. Isn't it, Ruby?'

'Except that you're sick and tired of it,' said Ruby, 'and you've made up your mind.'

'Yes, I've made up my mind. Ruby's coming to live with me. I don't suppose you want the house, as you've always turned up your nose at Wandsworth. The things in it you paid for mostly, but I can buy them off you. Luckily I've got enough of my own, and sha'n't want to take anything from you. You won't be as well off without me, but you'll have enough, and you'll have to do on it.'

Could he believe his ears? But he mustn't jump at it. 'Well, that's a serious decision to come to,' he said. 'It wants thinking over.'

'Oh, it's been thought over,' said Ruby Pickthorp. 'You've brought it on yourself, Mr Manby. Doris wants to have an end of it now, and she's quite right.'

She was helping him, though that wasn't her intention. 'I think you're both making a lot out of what doesn't amount to anything,' he grumbled. 'I enjoy society. There's nothing wrong in that.'

'Then go and enjoy your society. That's what Doris wants. You don't seem to have anything left for her, and she's sick and tired of it.'

'Yes, I'm sick and tired of it. I sha'n't go back on it now, whatever you say. You've brought it on yourself, and you must make the best of it. Go off and do what you like, without having a wife to look after you and see that you have everything that you want.'

'Or ought to want,' Ruby Pickthorp amended it.

'Or that any decent man of your age *would* want. Go and see how you like that.'

Perhaps a little sulkiness wouldn't come amiss. 'I don't see why I should be kicked out in that way,' he said. 'But if it's going to be like that I might as well clear out now.' He stopped in the road.

'Oh, you can show your obstinacy if you like. But if we are going to part—as we are, for I'm sick and tired of it—I should have thought you'd have wanted to part friends.'

He walked on again. 'If it's got to be,' he said . . .

'Oh, it's got to be, all right,' said Ruby Pickthorp; 'and the sooner you make up your mind to it the better. You'll have plenty of time to be sorry for it when you're by yourself. I should have thought you'd have wanted to leave the best impression you could on Doris, considering that you won't have her much longer.'

'Well, that's just what I was going to say,' he said, still sulkily. 'If you've made up your mind, what's the good of quarrelling now? I should have thought we might have parted as friends.'

'That's just what I said, didn't I, Ruby? It will just show whether there's anything left of him at all, whether he takes it sensibly or just blusters it out.'

'Well, I'm ready to take it sensibly, if you'll let me.'

'Oh, of course it's always me who's in fault. Still, if you're ready to part as friends, so am I. This looks a nice place for lunch, and I don't want to walk any farther. Let's have our last meal together in peace anyhow, and have *something* to look back on out of it all.'

IV.

He sat out on the platform going back. On the seat opposite to him was a young pleasant girl, quite nice-looking, though heavy about the calves and ankles. If he had had any skill in the language he might have struck up a conversation with her, but perhaps it would be as well not to take advantage of his liberty quite so soon. Hardly decent, with those two just inside. Ruby Pickthorp had sniffed when they had passed her sitting there.

Well, she could sniff as much as she liked now. He wouldn't be there to hear her. Fancy having her in the house morning, noon, and night! Still, he was glad his wife would have somebody. He wasn't feeling hostile to her now. His feelings were quite different from what they had been when he had sat on this very platform two or three hours before. The landscape looked different too, more sunny and sparkling. He hadn't felt so sunny and sparkling himself for years. There was no doubt it was the right solution, and thank heaven she had come to see it herself. She would get on

perfectly well without him. She would have her Ruby Pickthorp, who had been more to her than he had been for a long time past. She'd hardly miss him. As for his missing her, it was a sad thing that marriages should end in that way, but really he couldn't feel anything but utter relief at the idea of his freedom. He had lots of life in him yet—years and years of it—and he would live it exactly as he liked. What a delightful thing life was! Just ordinary living was enough; just to sit out here on this platform, and look at the foreign scene, the folds of the valley, the villages with their tall spired churches, the parcelled fields, the shaggy mountain slopes, and the jagged summits of naked rock. You hardly wanted company to enjoy it with; you only wanted not always to be oppressed by the wrong company.

Poor Doris! She wasn't always so bad, though to be let off going on living with her was about the best thing that had ever happened to him. He didn't think that he had been so happy when he was looking forward to marrying her twenty odd years ago as he was now; he didn't think he had ever been so happy in his life. One had extraordinary capacity for happiness when one grew older. One wasn't depending on one thing to bring it; one could make oneself happy over all sorts of little things, if one had a free mind. He had really quite enjoyed the lunch they had had, sitting at a table under the chestnuts, with the view of the snow-capped mountain at the end of the valley. His coming freedom had had most to do with it, no doubt, and he had begun to taste it, though he had had to be careful not to show too much jubilation. But she meant it, and had shown herself sensible. They had discussed it all in a friendly way, just as if he had been going off by himself to fish, which she had let him do once a year, while she and Ruby Pickthorp went for a cure to Harrogate. It wasn't going to be quite their last meal together, but they were actually going off the next morning. She and Ruby wanted to get home, and adapt the house to their new requirements. He could stay here as long as he liked, and then go wherever he wanted to. There would be a few things to settle, but they could do that by letter. He didn't know where he would go to when he had had enough of this; not London, for he didn't feel quite safe yet so near her. Sudden freedom was a thing you had to get used to gradually. It had kept coming over him in wafts that freedom was his, and once or twice he had been so delighted with the prospect that he had been quite gay, and made them laugh. Fancy their laughing, after they had given him the boot like that! But it showed how much it was the right thing to do. They would be as comfortable without him as he would be without them.

What a miracle of luck it was that she had

at last come to see it, and to want it for herself! No doubt Ruby Pickthorp had had something to do with bringing her to it, probably because it would suit her to take his place in the house, to which she was quite welcome. There had been hints of it before, but he had put his foot down there. But that, *par exemple*, no! How French he was getting! The result of coming abroad. He had always wished he could talk French fluently. He might, perhaps, go and live for a few months in a French family and learn it—a family with some nice young people in it, and something to do. It would be like being young again himself, to do a thing like that, and it was only one of the things he might do. The whole of the world would be before him to-morrow, and the whole of his time. Oh, surely it was too good to be true! He knew now that he never could have done it himself, however he might have strung himself up to it. She'd have put a stop to it somehow. He didn't mind admitting it, now that it was she who had given him his freedom. How it was that she had so got him under her thumb he couldn't tell, but there it was; or rather had been, and was no longer.

He was glad that they were going to part friends. He would think kindly of her, when he thought of her at all, and she would think kindly of him. He had been generous about the furniture. She could have it all, and he wouldn't hear of her paying for any of it, although her income was actually larger than his. The lunch had really been a success. He had been able to keep his jubilation from showing too much, but it had helped him to display himself in an agreeable light. It was best to part company in that way, leaving no grudges behind.

v.

The tram which they took from the station also had little platforms before and behind, but she said: 'Come in here,' when they got to it, quite in the old way. It annoyed him slightly, because he had intended to go inside with them anyhow. By this time to-morrow he would have got rid of them both, and he might as well pay them attention until he did. But if she was going back to her old form, for the short time that remained, he would dispense himself from doing that; for he wasn't under her thumb any longer, and there were plenty of people in the hotel who would be glad enough to have him with them.

They sat down. 'We've been talking it over,' she said. 'You *can* behave decently, as you showed us at lunch, so I'm going to give you another chance. Ruby is coming to live with us, so you'd better be careful how you behave, for it's the last chance you'll get.'

Ruby sniffed.

A LOCUST INVASION IN PARAGUAY.

By T. MARTYN.

I.

PARAGUAY, as you may or may not know, is in the centre of South America, and is fenced in by Brazil, Argentina, and Bolivia. It is nice to have near neighbours, sometimes; at others it isn't. When we hear of 'Foot and Mouth' in Bolivia—well, it's just a matter of weeks and it is romping across Paraguay. If Brazil has a little revolution on, first thing we know the Federals are chasing the Rebels over our border, to the detriment of our peace of mind. The same with Argentina. As soon as the locusts get tired of her wheat and maize, they fly over the fence to sample our mandioca; and we don't like it. I'll tell you about the visitation we are suffering from at the present moment.

II.

For the past four days it has been snowing furiously, not snow as you denizens of more temperate climes know it, but a snow of locusts. For a week or more we had been expecting them. Travellers had come along with tales that made one feel thankful one had 'stopped home,' instead of going the journey contemplated last week—tales of having to dismount, blindfold and lead the horses over a carpet of locusts, so thick that the track was obliterated and all sense of direction lost.

Locusts under foot, in the air in clouds, hanging to the trees in masses, to rise in thousands, stunning the passer-by with the drone of their wings and the stench of their foul breath!

Young fellows with good horses have tried to force their way through, only to be thrown, and have to stumble blindly along, seeking shelter, with the gross insects beating in their faces, creeping down necks, up sleeves and pants, whilst the maddened horses galloped wildly for home.

As I say, we expected them; but there was a chance that they might give us a miss. If a south wind from Argentina sprang up they would drift from us, but if it was a northerly 'buster' from Brazil, well, good-bye crops and everything else green.

We spent our spare time going outside, wetting fingers to see which way the faint breeze was coming. Then, when we were beginning to hope they had passed in another direction, they came.

The cattle gave us the first intimation. Moving frantically, with tails erect, they stampeded to the 'montes' for shelter. The horses came to the slip-rails, whinnying to be let in. Whilst we were wondering what had struck them, the sun became overcast, without a cloud in the sky. Then we knew.

Flying low, a few stragglers went swiftly past, followed by the advance-guard of an enormous army. In a dense cloud they flew, horizontally, without any seeming sense of direction. The rattle of them, as they struck the tin roof, reminded us of the machine-guns in revolution time. They cannoned against the windward side of the house, piling themselves in heaps, to lie writhing over each other at the foot of the wall.

Standing at the door watching them hurtle past, brought to mind the blizzard we got tangled up in near Alberta many years ago. There it was perishing cold; any animal life caught in the blizzard stood a good chance of going into cold storage 'for keeps.' Here it was stifling hot. Before the locusts came along it was a fairly warm day; now it was oppressive, and fairly made one gasp.

There seemed no end to them, but as they were flying steadily we hoped they would keep on doing it and alight anywhere but on our patch—selfish, yes, but human nature.

We couldn't hear each other speak for the drumming on roof and walls. My wife shook my arm and pointed outside.

'What is it?' I shouted.

'The well's not covered,' she screamed back.

'Phew; damn it.' That wouldn't do. If they started to alight the water would be ruined. A neighbour of ours, at the last visitation—four years ago—forgot about his well. He had to empty it and scoop out about a foot of dead locusts. Then they couldn't use the water for months after. I started on the run for the well enclosure, but fetched up on the wood pile with barked shins. Pulling my hat down over my eyes, I 'took a think.'

The gate to the well was to the right of the pile. If I passed the chopping-block on the left and kept straight on I ought to strike the fence; then it was only a matter of sticking to the pickets till I found the gate. My cogitations had taken only a minute or so, but by the time I had decided what to do I was ankle-deep with the insects that had bumped against me. Blindly I stumbled on and fetched up at the fence and found the gate. Sure enough, the well was open. I peered down, but it was too dark to see if any had got in. Closing the trap, I stood at the gate and calculated where the house was, then pushed through the storm to it.

III.

Towards sundown they slacked off, and we were able to go out to see what was what. We had been consoling ourselves that all except the comparative few that had stunned themselves

had passed on; we found they hadn't. Millions had passed, but millions stayed with us. The orange and peach trees were swarming with them, busily chewing up the leaves. The ground below was strewn with tiny green oranges; that meant a big shortage next season, even if they did not kill the trees. I cut a long switch and started beating them from the trees. They flew up in clouds, but as they simply flew from one tree to another I got tired before they did.

We went over to the cultivation patch and surveyed the young plants. Not much harm done as yet; only a few stragglers that we promptly stopped from nibbling. The vegetable garden is the apple of my wife's eye. I went into that with misgiving. If the pests were chewing that down the señora would surely run amuck and 'kill, kill' in all directions. All serene, bar the tops of some celery plants, which we pulled and took in for our own consumption.

Over supper my better-half asked me to explain the why of locusts. A theory of mine is that Nature never makes a mistake, always acts for the best, although it may not seem so to those that are close up. Even flies and mosquitoes are sent to teach us to be clean. Hornets are doubtful, though they sometimes leave a good impression behind—when sat on suddenly. Anyway, one year we cleared all our hornets out of the house—they were getting too familiar. That year we never got a cabbage or a lettuce. The green caterpillars—that hornets thrive on—got the lot.

But as to locusts, their best friends—if they have any—cannot say much for them. Certainly they are harmless, inasmuch as they have no weapons of offence or defence. A brother colonist, who hadn't been ravaged, argued that a flight of locusts passing over the land was as good as a ton of fertiliser to the acre. That may be so, but it's poor consolation to the man who has lost his crops and has to go with a tight belt and a long score till next season. After much reflection the only conclusion we could come to was that they were sent to keep agriculturists from getting swelled-head through too much prosperity.

They were still drumming on the roof when we lit the lamp. The light attracted a few inside. I caught one, and ran the rule over him—about four inches long, a big bull head, all mouth and goggle eyes, long tapering body, with four legs towards the front, for clinging on to our orange-trees, and a pair of powerful grasshopper legs at the rear, to enable him to get over the ground when the land is being cleared for replanting.

My natural history studies were interrupted by one of the insects flying down the lamp-tube, putting the lamp out and smashing the glass. So we went to bed, hoping our unwelcome visitors would clear off in the night.

IV.

Next morning a woeful sight met our eyes. The 'blighters'—that's an abusive term, but it's correct, as they both blight the land and blast our hopes. Well, the 'blasters' were still flying over, but instead of the majority passing along or attacking the trees they were alighting on our cultivation.

In the maize and mandioca patch they were piled in a wriggling mass, three or four inches thick, gorging every green thing they could clap their goggle eyes on. The cotton plants had vanished; the beans were no more; and there wasn't a sign of the tobacco that was going to pay the store bill. The vegetable garden was nearly as bad. The cabbages had been gnawed off at the roots, and each one was a mass of the insects, busy eating up our vitaminic food. My wife ran for a couple of sheets and some sacks to cover up the celery and the beets, whilst I took charge of the bed that was to supply us with new potatoes for Christmas. The remainder of our garden truck we had to let slide down their capacious maws.

All day long we took turns to patrol our precious potatoes, walking round the beds, waving a branch to keep the locusts on the move, and stamping on those that tried to slip in on the sly. For the night watch we engaged our squatter's boy, Ricardo, with strict instructions to worry them. At 10 p.m. I went out to see how he was getting on, and to supply him with sustenance. He assured me it was quite o.k., and I could sleep tranquilly, now that he was on guard.

Next morning we found Ricardo asleep under the oranges, with locusts walking all over him, and our tubers gone south on the way to Brazil.

We gave them best then, and are reserving our energies for twenty-one days hence, when the eggs they have deposited in the earth will come to life and start hopping across country, devouring everything their forefathers have missed.

And the pests are still drifting over.

PATHWAYS.

WHEN I dwelt in the country
I loved the sounding sea,
The ships that sailed its waters
To lands of mystery.

And now upon the ocean
I yearn for the shore,
For lanes where sun and shadow
Play truant evermore.

In cage of gold the linnet
Will pine for woods and storm—
Peril has freedom in it,
Dark night and glorious morn.

And so when on the ocean
I dream of roads that wind
Through every hill and hollow
And pathway of my mind.

CAHIR HEALY.

JOHN MACNAB: A COMEDY FOR POACHERS.

By JOHN BUCHAN, Author of *John Burnet of Barns*, *Greenmantle*, &c.CHAPTER XIV.—*continued.*

IT took some time for the party to reach the Doran, which they forded at a point considerably below Archie's former lair. Lamancha gave thanks for one mercy, that Archie and Wattie seemed to have got clean away. There was a car on the road, which caused him a moment's uneasiness till he saw that it was not the Ford, but a large car with an all-weather body coming from Haripol. The driver seemed to have his instructions, for he turned round—no light task in that narrow road with its boggy fringes—and awaited their arrival.

Johnson gave rapid orders. 'You march this fellow down the road, and bring the navy; better take him to your cottage, Macqueen. I'll go home in the car, and prepare a reception for Macnab.'

It may be assumed that Johnson spoke in haste, for he had somehow to work off his irritation, and desired to assert his authority.

'Hadn't Stokes better go in the car?' Lamancha suggested in a voice which he strove to make urbane. 'That journey down the hill can't have done his leg any good.'

Johnson replied by telling him to mind his own business, and then was foolish enough to add that he was hanged if he would have any lousy navy in his car. He was preparing to enter, when something in Lamancha's voice stopped him.

'You can't,' said the latter. 'In common decency you can't.'

'Who'll prevent me? Now look here, I'm fed up with your insolence. You'll be well advised to hold your tongue till we make up our minds how to deal with you. You're in a devilish nasty position, Mr John Macnab, if you had the wits to see it.—Macnicol, and you fellows, I'll fire the lot of you if he escapes on the road. You've my authority to club him on the head if he gets nasty.'

Johnson's foot was on the step, when a hand on his shoulder swung him round.

'No, you don't.' Lamancha's voice had lost any trace of civility, because he was very angry. 'Stokes goes in the car, and one of the gillies with him. Here, you, lift the man in.'

Johnson had grown rather white, for he saw that the situation was working up to the ugliest kind of climax. He felt dimly that he was again defying public opinion, but his fury made him bold. He cursed Lamancha with vigour and freedom, but there was a slight catch in his voice, and a hint of anticlimax in his threats; for the truth is that he was a little afraid. Still, it was a flat defiance, though it concluded with a sneering demand as to what and who

would prevent him from doing as he pleased, which sounded a trifle weak.

'First,' said Lamancha, 'I should have a try at wringing your neck. Then I should blast any reputation you may have up and down this land. I promise you I should make you very sorry you didn't stay in bed this morning.' Lamancha had succeeded in controlling himself—in especial, he had checked the phrase, 'infernal little haberdasher,' which had risen to his lips—and his voice was civil and quiet again.

Johnson gave a mirthless laugh. 'I'm not afraid of a dirty poacher.'

'If I'm a poacher, that's no reason why you should behave like a cad.'

It is a melancholy fact which exponents of democracy must face, that, while all men may be on a level in the eyes of the state, they will continue, in fact, to be preposterously unequal. Lamancha had been captured in circumstances of deep suspicion which he did not attempt to explain; he had been caught on Johnson's land by Johnson's servants; the wounded man was in Johnson's pay, and might reasonably be held to be at Johnson's orders; the car was, without question, Johnson's own. Yet this outrageous trespasser was not only truculent and impenitent; he was taking it upon himself to give orders to gillies and navvies, and to dictate the use of an expensive automobile. The truth is that if you belong to a family which, for a good many centuries, has been accustomed to give orders, and to take risks, and if you yourself in the forty odd years of your life have rather courted trouble than otherwise, and have put discipline into Arab caravans, Central African natives, and Australian mounted brigades—well, when you talk about wringing necks your words may carry weight. If, too, you have never had occasion to think of your position, because no one has ever questioned it, and you promise to break down somebody else's, your threat may convince others, because you yourself are so wholly convinced of your power in that direction. It was the complete lack of bluster in Lamancha, his sober matter-of-factness, that made Johnson suddenly discover in this potato-bogle of a man something formidable. He hesitated, the gillies hesitated, and Lamancha saw his chance. Angry as he was, he contrived to be conciliatory.

'Don't let us lose our tempers. I've no right to dictate to you, but you must see that we're bound to look after this poor chap first. After that I'm at your disposal to give you any satisfaction you want.'

Johnson had not been practised in commercial

negotiations for nothing. He saw that obstinacy would mean trouble, and would gain him little, and he cast about for a way to save his face. He went through a show of talking in whispers to Macnicol, a show which did not deceive his head-stalker. Then he addressed Macqueen, 'We think we'd better get this fellow off our hands. You take him down in the car to your cottage, and put him in your spare bed; then come round to the house and wait for me.'

'This is my show, if you'll allow me, sir,' said Lamancha politely. He took some notes from a wad he carried in an inner pocket. 'Get hold of the nearest doctor—you can use the post-office telephone—and tell him to come at once, and get everything you need for Stokes. I'll see you again. Don't spare expense, for I'm responsible.'

The car departed, and the walking party continued its way down the Doranglen. Lamancha's anger was evaporating, philosophy had intervened, and he was prepared to make allowances for Johnson. But he recognised that the situation was delicate, and the future cloudy, and since he saw no way out, decided to wait patiently on events, always premising that on no account must he permit his identity to be discovered. That might yet involve violent action of a nature which he could not foresee. His consolation was the thought of the stag, now, without doubt, in the Crask larder. If only he could get clear of his captors, John Macnab would have won two out of the three events. Yes, and if Leithen and Pallister-Yeates had not blundered into captivity.

He was presently reassured as to the fate of the last. When the party entered the wooded lower glen of the Doran it was joined by four weary navvies, who had been refreshing themselves by holding their heads in the stream. Interrogated by Macnicol, they told a tale of hunting an elusive man for hours on the hill-side, of repeatedly being on the point of laying hold of him, of a demoniac agility and a diabolical cunning, and of his final disappearance into the depths of the wood. Questioned about Stokes, they knew nothing. He had last been seen by them in the early morning when the mist first cleared, but it was his business to keep moving high up the hill near the rocks, and he had certainly not joined in the chase when it started.

Johnson's temper was not improved by this news. Twice he had been put to public shame in front of his servants by this arrogant tramp, who was John Macnab. He had been insulted and defied; but he knew in his heart that the true bitterness lay in the fact that he had also been frightened. Anger, variegated by fear, is apt to cloud a man's common-sense, and Johnson's usual caution was deserting him. He was beginning to see red, and the news that there had been an accomplice was the last straw.

Somehow or other he must get even with this bandit, and bring him to the last extremity of disgrace. He must get him inside the splendours of Haripol, where, his foot on his native heath, he would recover the confidence which had been so lamentably to seek on the hill. . . . He would, of course, hand him over to the police, but his soul longed for some more spectacular dénouement. . . . Then he thought of the journalists, who had made such a nuisance of themselves in the morning. They were certain to be still about the place. If they could see his triumphant arrival at Haripol, they would write such a story as would blazon his credit to the world, and make the frustrated poacher a laughing-stock.

As it chanced, when they entered one of the woodland drives of Haripol, they met the gillie, Andrew, on his way home for a late tea. He was asked if he had seen any of the correspondents, and replied that after a hard chase he and Peter and Cameron had captured one, who at the moment was in Cameron's charge, and using strong language about the liberty of the Press. Andrew was privately despatched to bid Cameron bring his captive with all civility and many apologies up to the house, with a message that Mr Claybody would be glad to have a talk with him. Then, with three navvies as a vanguard and four as a rearguard, Lamancha was conducted down the glade between Johnson and Macnicol—the picture of a criminal in the grip of the law.

That picture was seen by a small boy who was lurking among the bracken. To the eyes of Benjie it spelt the uttermost disaster. The stag was safe at Crask, but the major part of John Macnab was in the hands of his enemies. Benjie thought hard for a minute, and then wriggled back into the covert and ran as fast as he could through the wood. To him, at this awful crisis, there seemed to be but a single hope. Force must be brought against force. The Bloody Mackenzie, now tied up under a distant tree, must be launched upon the foe. The boy was aware that the dog had accepted him as an ally, but that it had developed for Lamancha the passion of its morose and solitary life.

The prisoner's uneasiness grew with every step he took down the sweet-scented twilight glade. He was being taken to the house, and in that house there would be people—women, perhaps—journalists, maybe—a most embarrassing situation for a Cabinet Minister. The whole enterprise, which had been so packed with comedy and adventure, was about to end in disgrace, and it was he, the promoter, who had let the show down. For the first time since he arrived at Crask Lamancha wholeheartedly wished himself out of the thing with a clean sheet. There was something to be said after all for a man keeping to his groove. . . .

They emerged from the trees, and before them stretched lawns, with a large and important mansion at the other end. This was worse than his wildest dreams. He stopped short. 'Look here,' he said, 'isn't it time to end this farce? I admit I was trespassing, and was fairly caught out. Isn't that enough?'

'By Gad, it isn't,' said Johnson, into whose bosom a certainty of triumph and revenge had at last entered. 'Into the house you go, and there we'll get the truth out of you.'

'I'll pay any fine in reason, but I'm damned if I'm going near that house.'

For answer Johnson nodded to Macnicol, and the two closed in on the prisoner. Lamancha, now really desperate, shook off the stalker, and was about to break to his left, when Johnson tackled high and held him.

At the same moment the Bluidy Mackenzie took a hand in the game.

That faithful hound, conducted by Benjie, had just arrived on the scene of action. He saw his adored Lamancha, the first man who had really understood him, being assaulted by another whose appearance he did not favour. Like a stone from a sling he leaped from the covert, straight at Mr Johnson Claybody's throat.

It all happened in one crowded instant. Lamancha felt the impact of part of Mackenzie's body, saw Johnson sprawl and fall, and then observed his captor running wildly for the house with Mackenzie hot on his trail. Then—such is the instinct of man to side with man against beast—he started after him.

Never had a rising young commercial magnate shown a better turn of speed, for a mad dog was his private and particular fear, and this beast was raving mad. Macnicol and the navvies were some twenty yards behind, but Lamancha was a close second. Crying hoarsely, Johnson leaped the flower-beds and doubled like a hare in and out of a pergola. Ahead lay his mother's pet new lily pond, and, remembering dimly that

mad dogs did not love water, he plunged into it and embraced a lead Cupid in the centre.

Mackenzie loved water like a spaniel, and his great body shot after him. But the immersion caused a second's delay, and enabled Lamancha to take a flying leap which brought him almost atop of the dog. He clutched his collar and swung him back, making a commotion in the fountain like a tidal wave. Mackenzie recognised his friend and did not turn on him, but he still strained furiously after Johnson, who was now emerging like Proteus on the far side.

Suddenly the French windows of the house, which was not thirty yards off, opened, and the stage filled up with figures. First the amazed eyes of Lamancha saw Crossby entering from the right, evidently a prisoner, in the charge of two gillies; then at one set of windows appeared Sir Edward Leithen with a scared face, while from the other emerged the forms of Sir Archibald Roylance, Mr Palliser-Yeates, and a stout gentleman in a kilt, who might be Lord Claybody. To his mind, keyed by wrath and confusion to expectation of tragedy, there could only be one solution. Others beside himself had failed, and the secret of John Macnab was horridly patent to the world.

'Archie,' he panted, 'for God's sake call off your tripehound. I can't hold on any longer. . . . He'll eat that little man.'

Lord Claybody had unusual penetration. He observed his son and heir dripping and exhausted on the turf, and a figure, which looked like a caricature in the Opposition Press of an eminent Tory statesman, surrendering a savage hound to a small and dirty boy. Also he saw in the background a group of gillies and navvies. There was mystery here which had better be unriddled away from the gaze of the profane crowd. His eye caught Crossby's and Lamancha's. 'I think you'd better all come indoors,' he said.

CANADA'S SOUTHERNMOST CORNER—PELEE ISLAND.

A CANADIAN, if asked to name the southernmost part of his country, might very well be at a loss for an answer. It is, in truth, a small island in Lake Erie, once famous as the only place in Canada where the Catawba grape could mature, and not unconnected with the people of Scotland in its little-known history. This is Pelee Island, the first home of two famous pioneering families, the M'Kees and the M'Cormicks.

Few travellers visit its shores, for it is some way from any big town, Windsor in Ontario being the nearest on the Canadian, Sandusky on the American side. The shape of it is long and narrow, the island being about nine miles in

length, and from three to four from east to west. The interior is to a large extent below the level of the lake, and an interesting system of pumping and canals enables this low but fruitful land to be cultivated. The whole length of the shore is wooded, with a fringe of bush behind the outer trees; consequently, seen from the lake, the island presents an exquisite study in green, red and white houses standing out in picturesque relief.

Originally the name of the island was Point-au-Pelée, a name possibly given to it by an early French-Canadian trader. The only record of its history (apart from local legend, which is perhaps the most interesting, though least

accurate of all) is a memorial to Lord Monck, then Governor-General of the country, dated in the year 1863. This document was drawn up on behalf of Mary M'Cormick, 'widow or relict of William M'Cormick' and of her surviving sons and daughters.

The memorial is of great interest as a record of how the British acquired the island, besides having a really human story behind it. It opens lucidly enough. 'On the first day of May, 1788, the Chiefs and Sachems of the Bands of the Chippewa and Ottawa nations of Indians, then owning and inhabiting the island (of Point-au-Pelée), executed with all due solemnity, and delivered to Thomas M'Kee, who was a half-breed and a Chief, and then of the Parish of L'Assumption, Quebec, a lease of the said Island, for a term of nine hundred and ninety-nine years.'

A legend has it that the new settlers gave the Indians a bushel of corn an acre, but there is no authenticity for this one-sided story. At any rate the Indians decamped, and Thomas M'Kee reigned on the island until his death in 1815, when he was succeeded by his son. Meanwhile the Indians who had originally been owners of the island were fast becoming extinct, their chiefs apparently being all dead by the year 1823, so that the right of the M'Kees to the property became almost absolute.

But before he died, the original Thomas M'Kee suffered a misfortune. 'The lease was taken from him,' says the document, 'with all his baggage, by the enemy, on the occasion of the retreat of the British forces after the battle of the Thames (in which he had participated) during the last war with the United States.'

In 1815 we have mention for the first time of the M'Cormick family; they obtain a lease as tenants to one of M'Kee's sons. Eight years later, one William M'Cormick secured the conveyance in fee of the whole island. It is interesting that, though a part of the island is now held in small farms, the M'Cormicks are still the leading island family, their property being considerable.

Alexander M'Kee made a thorough survey of the island in 1847. It was found to contain nearly twelve thousand acres, of which over five thousand were marsh. 'This marsh,' the surveyor reports, 'in consequence of its low level, is utterly irreclaimable; and about two thousand acres of the residue are liable to be overflowed during anything like a high stage of water; and further, there are at least five hundred acres on bed-rock—slightly covered with soil—which is also unfit for purposes of tillage. So less than four thousand acres are available at all times as arable land.' Thanks to the development of quarries, and the canal and pumping system, Pelee is now—in proportion to its size—one of the most productive corners of Canada.

In 1859 the M'Cormicks wished to raise a mortgage loan. The capitalists refused the money, there being no proofs of ownership. The island families thereupon brought an amicable action against the Crown, but were unexpectedly defeated, owing, as it appeared later, to the loss of the Indian lease. In the same year the Crown replied by issuing an 'information for intrusion' against Mary M'Cormick and William M'Kee. The memorial to Lord Monck was in answer to this, and eventually the families were confirmed in their rights by the Crown.

The most interesting development of recent years on Pelee Island has been the installation (and subsequent withdrawal) of a large wine-cellar, whose products are now famous in Canada, the finding of oil in small quantities, and the remarkable growth of the island fishing industry. It was the wine industry that caused the shortening of the name Point-au-Pelée, brevity being preferred in business.

Some Indian legends still survive. On the north-west side of the island is a large flat rock standing a few feet from the shore, known as Huldah's rock. The story runs that a trader came to Point-au-Pelée in the days of the Indians, and stayed a while on the island. There a beautiful Indian girl named Huldah fell deeply in love with him, and he remained with her for some time, living among the tribe. One day a ship arrived with an imperative summons for the white man to return to England. He promised never to desert his Indian girl, and departed, hoping to come back to the tribe.

Months and years went by, and Huldah stood every morning on the rock waiting and longing for the white sail of her lover's ship. It never came, and after long suffering, Huldah, in despair, threw herself from the rock where she had waited day by day for so long.

A traveller leaves the pleasant island with regret, for the people are kindly, and it is a beautiful place. It is said that the climate is the mildest in Canada, and if this is an exaggeration, it is certain that as a place for settlers it has many advantages and not a little romance.

LOCH ARD—SUNSET.

No breath disturbs the fragrant evening air,
No ripple steals across the loch's fair breast;
Craggs, trees, and bens are all reflected there,
Rose-flushed the waters from the crimson west.

The boats lie idle by the wooden pier;
Beside the boat-house, water lilies dream;
Far off, a shepherd's whistle loud we hear,
Nearby, the murmur of a mountain stream.

The crimson turns to gold, the gold to gray.
Soft twilight draws his curtain o'er the scene,
While, one by one, to guide our homeward way,
The silver stars shine forth from skies serene.

SEVENTH SERIES

WILD DUCK.

By BEATRICE HERON-MAXWELL.

THE gray mists of evening are beginning to creep over the long valley, veiling the distant reaches of meadow-land in a soft indistinct haze, massing the scattered brakes and copses into one dark blur against the horizon, and bringing into relief the nearer, though still shadowy, outlines of tree and bracken. Even these look one dull uniform colour, bereft now of the glory that the sunset had shed on their autumn tints, which merge through tones of green and gold and russet to deepest crimson. Across the fields that lead to the river we go, treading quietly on the light carpet of fallen leaves that strew the ground, and hushing our voices to a murmur; for this is the hour of Nature's evensong, and we are nearing the haunts of the wild-fowl at the time that they take their last flight before rest.

A narrow path winds round the bend of the river, and slanting down to meet it from the uplands is the Lovers Walk, shut in by tall trees set closely in a long trim avenue. The shadows here lie thick and deep; and when we pass on to the desultory track that skirts the river border, our eyes—grown accustomed to the gloom—find clearer sight in the more open space, and we pick our way with ease through the gathering twilight to where a glint of pale silver shines between tall rushes and sheltering willows. This is the valley of the Teste, the river dear to hearts of fishermen who angle with the fly; and, ribbon-like, it winds with fitful haste through pleasant pastures, with here a lazy pool beside a bridge, and there a little torrent or a splashing weir; while swift, vague forms—elusive, hovering—speak of sport past and to come, of failures still to be redeemed.

Here on a stretch of sedgy grass we halt and draw breath and realise the stillness; a quiet of repose and not of loneliness, like that of a vast cathedral, where, though there is no sound of audible prayer, the silence holds echoes of many voices.

Four of the 'guns' move farther off, in couples, and are lost to view in the obscurity, and when the sound of their steps dies away we find that our ears—grown accustomed to the hush of night, as our eyes are to the dimness—are conscious of many sensations.

There are innumerable minute sounds, heart-

beats of the world's life—the fluttering of tiny wings, the stir of little feet, the rustling of small soft bodies in the tangle of the hedge; leaves shaken by a fleeting touch or breath fall in a shower to the ground; a field-cricket sings, and faint chirrupings betray the nesting-places of drowsy birds and little wayside creatures. At our feet a miniature offshoot of the river finds unobtrusive way, hidden in the deeper grass, and with its murmur one can detect the shy, startled movements of a belated moor-hen hurrying home.

Over by the river a heron calls and a night-jar answers harshly; and, far in the distance, where the dark line of woods meets the sky, an owl hoots with quaint semblance of distress.

Then comes the welcome, grating sound of duck voices, and our hearts beat high, for they are stirring and restless, and the sound is echoed higher up the stream. At any instant now they may come. The clouds have gathered over, and it would be too dark to shoot if it were not for a strip of lightness athwart the sky above our heads. We wait and watch. A wave of absolute quiet seems to settle over everything for a moment, and then, cleaving the air to our right with metallic rhythm, comes the sound we wait for—a sound that is indescribable, though we might liken it to a clear, sharp whistle with a soft dull thud in it, or to the beating of thin plates of silver together; but which in reality resembles nothing else under heaven, so that when you have once heard it you know that it is caused by the wings of many ducks in full flight, and that in another moment they will cross your vision and be past and gone.

We raise our guns—quickly, silently—and when the triangular cloud of dark silhouettes appears against the lighter sky, follow it with our aim for an appreciable fraction of time, and—fire! The other guns ring out simultaneously, and there is the hurtling sound of inert bodies falling through space, a splash or two in the river, and again dead silence. It is almost too dark to find those on land, but we grope about till success rewards us, and even, by the aid of a long bough, draw two floating victims carefully to the bank; and with this result, small as it is, we fain must be con-

tent, for the night is at hand, and the duck, cautioned and wary, will make no more flights this evening.

So with our string of 'flappers' we go home, and in the fullness of time digestion, waiting

upon appetite, approves our prowess; for there are few things better than a tender 'flapper' taken in one of his first autumn 'flightings,' before either he or we have reached 'the winter of our discontent.'

IN THE VALLEY OF DECISION.

CHAPTER II.—*continued.*

III.

VERA'S bright eyes sparkled with indignation as she turned to me. 'Isn't he horrid?' she queried.

'Who is he?' I said.

'Oh! I'm so glad you answered him as you did,' she replied. 'Hubert had to be rather rude to him just now; he seems as though he couldn't let me alone; he has quite persecuted me.'

'Surely not?' said I. 'However, he sha'n't persecute you while you have a bodyguard around you comprising Hubert and myself, to say nothing of all the others. I had been thinking they seemed a very nice set of people here.'

'Oh yes, they are!' she answered; 'and the admiral and Lady Emma are two such dears; they have been so kind to me during my visit here.'

'Well,' I said, 'between you and me I think the admiral's champagne has been a little too much for your admirer. However, don't look troubled; we sha'n't allow him to worry you.'

At this moment up came Hubert, and I resigned Vera to him—not without an inward sigh, for a solitary man must not be supposed to be insensible to the charm of such a girl as Vera; and when the accepted lover, worthy of his prized possession, proudly carries her off with an air of ownership as though he challenged the whole world to deny his right, the man who is left to himself feels distinctly left.

But I was glad for both of them; and as I watched them gliding through the intricacies of 'The Arcadians' to the strains of the Red Imperial Band, I too felt a sense of ownership—they were my very dear friends, and I felt proud of them.

It was now nearly two o'clock. The party was a large one; but there was no crush, for a portion of the extensive grounds surrounding the house had been lighted with fairy lamps, and on this summer's night there were as many guests out upon the lawns as in the house. In fact, a number of the guests, acting upon a hint from their hostess, arranged to have some of the dances upon the lawn, and a very pretty scene it was; and when

Music arose, with its voluptuous swell,
Soft eyes looked love to eyes which spake again,
And all went merry as a marriage bell.

But I began to think about getting away. Hubert had said that he would not be later than two, and for the past five minutes I had been on the look-out for him.

A little later I caught sight of Vera with our hostess, and at once went up to them. 'I'm afraid I must get hold of Hubert,' I said, 'and drag him away from all these enchantments. Have you seen him?'

'No, indeed!' cried Lady Emma; 'and here is Vera complaining that this is one of his dances and he has not come for her.'

I remained chatting with them, and still he did not come. I was just about to go in quest of him, when I saw him hastily making his way to us. He seemed rather breathless and excited. 'Oh, Vera! I'm so sorry about this dance,' he said; 'but the fact is I felt rather overdone with the heat.'

Lady Emma expressed her concern, and suggested some iced coffee; and Vera, laying her hand upon his arm, said, 'Yes, you do look pale. Come and see if a little coffee won't pick you up.'

'No, thank you,' he murmured; and then, in an aside to me, 'I've ordered our taxi to come round, so if you are ready——?'

We made our adieux. 'Vera leaves us to-morrow,' said Lady Emma.

'Yes,' said Vera; 'and Hubert has promised to be at Paddington to see me off.—Don't come, dear,' turning to him, 'if you are not feeling quite fit; but come if you can. I shall be on the look-out for you; one o'clock sharp, remember.'

A clasp of hands and a smile, and so we departed. And many a long day it was before those two poor sweethearts met again.

Very rapidly our motor devoured the twelve miles between Richmond and St James's. My young friend seemed averse to talking, and with the help of a couple of cigars we soon became absorbed in our own private thoughts. I had thoroughly enjoyed the evening, and my only regret was Hubert's indisposition; but I hoped that a few hours in bed would soon put him to rights again.

'Good-bye, old man,' I said as I got out at my club; 'I suppose we shall meet at Wingate before long? I go down to-morrow, but if you still feel seedy, send me word, and I will come round after breakfast to your hotel and have a look at you.'

However, there was no word from him next morning, and so after a late breakfast, and a look at the day's papers, I went into the City, transacted some business there, and in due course betook myself to Waterloo Station for Wingate and home.

CHAPTER III.

I.

THE train had but just started, and I was unfolding an evening paper, when a headline caught my eye.

'SHOCKING DISCOVERY AT RICHMOND.'

'At an early hour this morning the body of a gentleman attired in full evening dress was discovered at the foot of a large cedar tree in the pleasure grounds of Sussex Lodge in circumstances which point to a sudden and violent end.

'Admiral Chapman, who resides there, at once identified the body as that of Major Spicer, one of his guests at a ball given on the previous evening.

'It seems that Major Spicer had but lately returned from India, on retirement from active service. He came to the ball unaccompanied by any friend, and as the number of guests was large, exceeding two hundred, his departure with the others when they left had been taken for granted.

'The coroner's inquest will be held to-morrow, and although there are rumours that the appearance of the deceased points to death by strangulation, it may be found that death was due to apoplexy, or some other natural cause.'

I put down the paper, and rapidly passed in review the events of the previous night.

This must be the very man who had annoyed Vera, and whom I had frowned upon.

She had whispered his name so hurriedly to me that I could not be quite sure of it, but it certainly was something like Spicer, and I had little doubt—yes! this must be the very man. Poor fellow! What a dreadful and sudden tumble out of this life!

And then I remembered that Vera must still have been at Sussex Lodge when the discovery was made. How shocked she must have felt! And, indeed, how every one would feel it, especially the kind old admiral and his wife!

I hoped Hubert had been able to meet Vera at Paddington as had been arranged. He would be at Wingate before Sunday, and then I should be able to hear more about it. My Saturday's *Times* also would be sure to have some account of the inquest, and as the circumstances were so peculiar, a detailed report might well be expected.

II.

The full report need not here be given. Let it suffice that the personality of the deceased officer was referred to, and also the unexcep-

tionable character of the entertainment, and of the guests at Sussex Lodge.

Evidence was given as to the finding of the body, and as to its appearance. The medical evidence, however, was incomplete, and although there was a consensus of opinion that death was due to suffocation, it did not appear that there were sufficient *data* to determine the question whether the deceased had been subjected to violence at the hands of some other person, or had died through falling on his face in a fit.

There was considerable congestion and discoloration in the region of the throat and some abrasion of the outer skin, and these marks afforded reason for the suspicion that Major Spicer had come to his death by foul means. But if so, what were the means employed?

It was within the range of possibility that a noose might have been thrown over his head by some one approaching him from behind, or, if the attack had been a frontal one, very great strength and determination must have been shown by some person who apparently had seized him by the throat.

A further consideration of the case led to conjectures of a different kind. The attitude of the body when it was found showed that death had not taken place without a convulsive struggle, for both hands were violently clenched. But the left hand was clenched upon the throat, and it was argued that under a sudden sense of suffocation due to natural causes the deceased officer might have made a desperate effort to tear his collar off, and thus caused the abrasions and bruises.

Under these circumstances it clearly was of the utmost importance that the inquest should be adjourned to give time for a more searching investigation. The inquest, therefore, was adjourned. In the final result the medical experts were unable to come to absolute agreement as to primary causes, and an open verdict was given.

III.

Meantime my talk with Hubert Carrington at Wingate, to which I had looked forward, never came off.

He was not at church on the Sunday morning, but his mother and sisters waylaid me in the churchyard after service, and at once spoke of the tragedy at Sussex Lodge. 'Hubert has sent me a note,' said Mrs Carrington, 'just a few lines. He is greatly shocked, as indeed, my dear rector, you must be. He tells me he decided he wouldn't leave town till after the inquest was over.'

'Oh! I should hardly have thought that was necessary,' I observed.

'Probably,' exclaimed Cecilia, 'the fact of Vera being at the Lodge will have made him decide to stay.'

'No!' said I, 'for Vera was to leave at

midday on Friday, and Hubert was to see her off at Paddington.'

It was not until some days after this conversation that in the course of further talk with the Carringtons I was told a piece of news which much surprised me.

It appeared that Hubert had stayed in London until after the inquest; but as soon as this was over, instead of coming home to Olderton he had written for some of his clothes and other things to be sent to him without delay, to enable him to proceed to Montreal by the Royal Mail steamer which left Bristol three days later.

'I dare say,' said Mrs Carrington, 'he won't mind my showing you his letter. It seems to have been a very sudden decision; but he explains the reason for it.'

'You see,' he wrote, 'my agent out there advises me not to lose any time, as the value of the land is rushing up week by week in consequence of the decision of the Canadian Pacific Railway to bring their new branch right through the Pine Creek district.

'This will bring it within six miles of my holding; and the question isn't just a question of selling my land at the right moment, but whether we ought not to spend all available capital on buying up every acre at present prices. A huge advance is absolutely certain, and I agree with my agent that I ought to be on the spot.

'So probably, dear mother, I shall have to be there some considerable time, but I will keep you well posted as to my movements. I can almost hear you saying, "Now, my dear boy, don't speculate," so let me assure you that I've no intention of doing anything rash. But land is land, and can't run away; and the railway will make the land valuable without much help from me.'

IV.

Some six or seven months passed, and still there was no sign of any home-coming on the part of my friend Hubert.

During this time I saw as usual a good deal of his mother and sisters; but although they heard from him periodically, there seemed to be no special news for them to tell.

I myself in the same period received from him only a couple of letters, very brief and not altogether satisfactory to my way of thinking. The tone of them struck me as being rather stilted and reserved.

And then one day something happened which made me distinctly uneasy about him.

'I shall be in town to-morrow for three or four days,' I said to Mrs Carrington; 'so if you or the girls want me to do any commissions for you, pray command me.'

They seemed to have no commands to lay upon me, so I said good-bye, and Mrs Carrington accompanied me to the entrance-hall.

'I wonder,' she said, 'if you will be running up against Vera during your stay in London?'

'Oh! is she just now in London?' I asked.

'Yes, she and her father and mother are staying with old friends, the Chichesters, in Lennox Gardens.'

'Oh, I should very much like to see Vera again!' I exclaimed.

'Well now, do call,' she replied.

'But do you really think I might?' I questioned.

'Yes! I'm sure you might; Vera always looked upon you with so much affection as being my boy's great friend.'

'Then I certainly will; and perhaps you would drop her a line, so that her friends may understand that I don't come altogether unannounced.'

She paused, and looked somewhat wistfully at me. 'I think on the whole I would rather not write,' she then said; 'and if you only will call it would be so kind of you. I want you to report to me very particularly what you think about dear Vera.'

'Why! has she been ill?' I asked.

'No! not ill—but there is this long and unexpected absence in Canada, you see; and, dear friend—I really must make a confidant of you—I have begun to feel quite unhappy about my son. It is evident that something has come between him and Vera. They were so fond of each other, and now a sort of estrangement has come about. There is hardly a reference to her in any of his letters. And then his going off so hurriedly, and for so long a time! There must have been some misunderstanding, or some quarrel, and it dates back to the unfortunate dance at Richmond.'

'Well, I happened to be with him,' I said, 'when he parted from her that night. He then was suffering from indisposition caused by the heat of the evening; but he and Vera certainly seemed affectionate enough when they parted, and he was to see her off from Paddington in the morning.'

'But that's just what he didn't do,' said Hubert's mother.

We looked into each other's eyes. 'Did Vera tell you this? or Hubert? or both of them?' I asked.

'No! it was Vera. She was talking to me about Hubert's long absence when she was here some two months ago, and I discovered that he was not writing to her nearly so often as I had expected. She told me about his not turning up at Paddington, and then, poor child, she quite broke down.'

'Then the estrangement is not on her side,' I said. 'I will make a point of going to see her; and if,' I added, 'it should turn out that I have nothing to report to you, it doesn't follow, mind you, that I shan't have something to write about to Hubert himself.'

(Continued on page 527.)

THE BIRTH OF THE MODERN KINGDOM OF ITALY, 1859-1861.

By HENRY JOHNSTONE

I.

'IT is a strange error,' says the gallant and eloquent Napier, in his *History of the War in the Peninsula*—'it is a strange error to think the Italians have not a brave spirit.' Yet to this day many people persist in the error, perhaps for this reason—that, just as a man in old age forgets much of his middle life, but retains vivid memories of his childhood and early manhood, so that general memory which is called 'history' usually presents us with vivid pictures from the more distant past, while, for most of us, the events of fifty to a hundred years ago are dim and confused, so that, if we try to marshal them into definite order, we wonder at the vagueness of our knowledge, the extent and variety of our ignorance. Napier was writing of the Italians who served under the great Napoleon and suffered and died for a cause that was not their own. From the close of Napoleon's wars to the year 1859, whatever active courage, whatever passive courage the Italians showed—and they showed the former in a high, the latter in a quite extraordinary degree—they did not succeed; and nothing is easier than to sneer at the unsuccessful and deny the reality of those virtues upon which the stamp of success has not been set. But in 1859 they began to succeed at last, and—though the world hardly yet believes it—they owed their success in large measure to themselves. The impossible dreams of 1848 and 1849 became, within twelve years, to a great extent accomplished facts.

After the revolutions of 1848 and 1849 the King of Naples, the Pope, and the other dispossessed princes returned to their capitals. It was to be expected—and it was the fact—that, however little any of them had ever resembled Solomon, they all returned in the likeness of Rehoboam; the little finger of oppression, after 1849, was thicker than its loins had been before. In the Pope's dominions, and even in Tuscany, where the steel hand had hitherto worn a velvet glove, 'order,' as the phrase ran, 'was vigorously enforced'; that is to say, reaction and oppression prevailed. In the north-east the Austrians ruled by naked force: death, cruel flogging, imprisonment, or at least exile and poverty were the lot of all who offered, or were suspected of offering, resistance. But not even the Austrian rule was so cruel as that of the hated King 'Bomba' in the south. For seven months, in 1850 and 1851, a great state-trial dragged on at

Naples: forty prisoners, the ablest and noblest of those who had put their hands to the work of constitutional government in 1848 and 1849, were tried for treason. The means employed to secure conviction were false witness and forgery; the sentences passed were of imprisonment for life, or for long terms of years. And the horrors of this imprisonment were worse than those inflicted by the Austrians on the northern patriots confined in Spielberg. Every circumstance of physical squalor and misery was intensely aggravated for these high-minded men by enforced association with the vilest criminals. In some cases patriot and criminal were chained together; the imagination shrinks from picturing this hell. Yet when a rescue was proposed, one of the patriots, Spaventa, to his undying honour, declined the hope of deliverance, because an unavoidable part of the scheme would have been the release of the criminals also to prey upon society. Another, the Duke of Morciano, has told how his one fear was lest he should be pardoned—since to be pardoned by 'Bomba' meant indelible disgrace in the eyes of all who loved liberty. All this time Naples was nominally a constitutional kingdom; for it was not worth while to repeal a constitution which could be disregarded with impunity.

II.

William Ewart Gladstone played many parts in the public eye, and the most opposite views are still taken of his long and strenuous career. Perhaps no act of his has been more generally approved than the publication, in 1851, of his *Letters to Lord Aberdeen*. He had recently been in Italy, had witnessed a part of the proceedings against the Neapolitan patriots, and had visited the prisons where they were confined. Mr Gladstone was not then a Liberal, and the party with which he acted were disposed to regard Italian patriots as dangerous revolutionaries; but he had looked on tyranny at close quarters, and all that was best in him compelled him to denounce the loathsome thing. He quoted the words of an Italian regarding it: 'This is the negation of God erected into a system of government.' The sympathy which our countrymen showed towards the Italian cause from 1851 onwards is largely due to Mr Gladstone.

In the kingdom of Sardinia, and nowhere else in Italy, there was good government. More and more clearly all who loved Italy began to see that the one hope for her lay in union under the Sardinian Crown. Mazzini may still have

dreamt of a republic, but not Garibaldi, nor the wise Venetian exile, Manin. Victor Emmanuel had concluded a peace with Austria, not dishonourable nor wholly disastrous, and was maintaining the Sardinian constitution granted by his father. Cavour had emerged from the study of economics and the management of a patriotic newspaper, had been a member of the government from 1850, and became its head in 1852. He insisted that Sardinia should ally herself with France and Britain in the Crimean War, in which it might have been supposed that she had little enough concern. But Cavour knew what he was doing. Austria was too strong for Italy in the oppressed and divided condition in which Italy then lay; she had to find an ally against Austria. Cavour would have preferred British help; failing this, he meant to secure the aid of France, knowing well that Napoleon III. would exact a price for that aid. It was due to Cavour's policy, and to a strange turn of events that followed, that, while the revived French republic had been the enemy, the revived French empire was now to be the friend—up to a certain point—of Italian liberty and unity.

In 1858 an Italian refugee, Orsini, tried to blow up the Emperor of the French. Later in the same year a meeting took place at Plombières, in the Vosges, between the emperor and Cavour. Napoleon was the least calculable of monarchs or of men; and Orsini, though a murderer, was also an ardent lover of Italy, and displayed—like so many Italians of last century—a high devotion to his country, only intensified by the approach of death. During his trial he was allowed full opportunity of revealing this devotion, and his letter to the emperor asking, not mercy for himself but help for Italy, was printed and read all over France and the kingdom of Sardinia.

Not only had Napoleon the magnanimity to allow the appeal to be published in his dominions, but he meant to listen to it—from what mixture of motives who can say? Cavour, on first hearing of the attempt on the emperor's life, had exclaimed, 'If only this be not the work of Italians!' Within six months he was to find that this apparently worse than useless crime had after all helped to loosen the fetters of Italy.

III.

The agreement made between the emperor and the statesman at Plombières was this: France (with 200,000 men) and Sardinia (with 100,000) were to drive the Austrians from the Lombard and Venetian territories; in return France was to receive Savoy, the cradle of the Sardinian royal family, and possibly also Nizza, the birthplace of Garibaldi.

In December 1858 Cavour sent for Garibaldi, who had returned from America in 1854 and

was living quietly in the little island of Caprera. 'Write me a hymn for my volunteers,' said Garibaldi to his friend Mercantini, who wrote what became the anthem of Italian liberty. Garibaldi began to enroll the 'Alpine Rangers,' who became famous in the liberation of Lombardy. Mazzini hated the French alliance, and foretold from the first that Venice would not be set free.

On New Year's Day 1859 Napoleon said to the Austrian ambassador that he was sorry the relations between the two countries were not better, but that his sentiments towards the Austrian emperor were unchanged. All Europe was startled. Austria, France, and Sardinia pushed forward preparations for war. Victor Emmanuel declared that he could no longer remain deaf to 'the cry of suffering that rises to our ears from so many parts of Italy'; and Cavour undertook to make Austria declare war on Sardinia in the first week of May. The actual order to invade Sardinian territory was given on the 27th April, and the Austrians began to cross the Ticino, but did not move briskly enough to achieve anything decisive before the French could come into line. The Sardinians and French united, and won a first success at Montebello.

One of the steps by which Cavour had at once provoked the Austrians and made ready to meet them had been to encourage volunteers from all parts of Italy—including those under Austrian rule—to enlist in the Sardinian army; a large proportion of these came under Garibaldi's command. Poorly equipped as they were, his 'Alpine Rangers' did good work; serving a king whose active allies the French were, they could not, of course, wear the 'red shirt,' so famous before and afterwards.

Garibaldi moved independently with his little force of 3500 men, operating as an advanced left wing well to the north of the main armies. Crossing Lago Maggiore into Lombardy, he was everywhere welcomed by the Lombards, who hastened to put themselves under Victor Emmanuel's rule. He was now far ahead of the regular armies, and the Austrian general, Urban, tried to crush him at Varese, but, though his artillery at first gave him an advantage, his men could not face the bayonets of the Italian volunteers. Urban was reinforced, and resolved to hold Como against Garibaldi, whose numbers did not amount to half his own. But on the 27th May he failed to hold the pass of San Fermo against the volunteers, who that night were received with a wild welcome as they entered Como, already evacuated by the enemy. By the end of the campaign Garibaldi had pushed as far east as the Val Tellina, had taught his men the secrets of that partisan warfare of which he was so great a master, had impressed upon the Austrians the conviction that his volunteers were more than a match for

their best regulars, and had shown to the world that the 'brave spirit' of the Italians was not to be held cheap.

But the campaign was actually decided farther to the south. At Magenta, on 4th June, the French beat the Austrians, though not very decidedly. Next day the Austrians evacuated Milan, which was thus restored to liberty in the tenth year of renewed oppression, and on the 8th June the Milanese welcomed their king and his ally, Napoleon. 'How these people must have suffered!' said the emperor, on witnessing their delight at being set free. Already the rulers of Tuscany, Modena, and Parma had fled, or were fleeing, from their dominions, leaving these parts of Italy, as well as Lombardy, free to unite under Victor Emmanuel's sovereignty.

On the 24th June was fought the second important battle of the war, at Solferino. Both sides seem to have been taken by surprise, and among the Austrians confusion reigned. From eight in the morning the French were attacking the heights of Solferino, by two o'clock they had carried them, but it was near six when the Austrian retreat began. A separate action went on all day between the Sardinians and the Austrians at San Martino, of which the issue was still doubtful when orders from the field of Solferino compelled the Austrians to retreat.

IV.

And now Napoleon resolved to stop the fighting. It was said that the carnage at Solferino had shaken his nerve, or had shocked his humanity; that he feared to enter the 'Quadrilateral' of Austrian fortresses which now lay before him; that, bravely as his men had fought, perilous defects had appeared in their organisation. But apart from all these things, he had for once a simple and intelligible motive for his conduct. The Prussians were making warlike preparations, and he feared for his north-eastern frontier. Though he had been so far successful, he proposed an armistice. The Austrian emperor accepted the proposal and Victor Emmanuel assented to it. Cavour hurried from Turin, had a furious interview with his king—such as, perhaps, has never passed before or since between a sovereign and his minister—and resigned office.

Preliminaries were settled at Villafranca; the Austrians gave up Lombardy, but retained the Venetian territories, as Mazzini had foretold. It was understood that Napoleon would not claim Nizza or Savoy. His hope now was to see an Italian confederation under the Pope—a union which would not be a real or effective union at all. But the newly-freed peoples of Tuscany, Modena, Parma, and Romagna were resolved to become one with Lombardy and Sardinia, and neither France nor Austria could say them nay. Delay there was, but the union was accomplished; whereupon Napoleon claimed

and received Savoy and Nizza, not as the reward of his assistance in freeing Lombardy, but as the price of his assent to the union of Central Italy under Victor Emmanuel.

The king and Cavour were soon on friendly terms again. It is the measure of the passion with which both men loved Italy that it made inevitable a reconciliation which must otherwise have been impossible. After Villafranca Cavour had said, 'They have cut me off from making Italy from the north by diplomacy. Very well; I will make it from the south by revolution.' This was the great adventure which the year 1860 was to see tried.

A great difference between Mazzini and Garibaldi was this: that Mazzini thought even hopeless insurrections of value as protests against tyranny, while Garibaldi would never deliberately be a party to throwing away men's lives where success was impossible—though his standard of possibility was not that of other men. A new king, Francis II., had lately come to the Neapolitan throne; he had been invited, but had refused, to join in the war against Austria. Sicily, it was believed, was ready to rise once more if a leader could be found; now the only possible leader was Garibaldi. He was ready to head an insurrection on two conditions—that the Sicilians should start it themselves, and that they should rise in the name of 'Italy and Victor Emmanuel.' Even Mazzini recognised at length that it was 'no longer a question of republic or monarchy,' but of national unity.

In April 1860 the Sicilians rose under Rosolino Pilo, and Garibaldi, giving up a scheme of offering resistance to the handing over of Nizza, his own birthplace, to the French, prepared to go to Sicily, knowing that if he succeeded the king and Cavour would accept his success, and caring little what might happen to himself if he failed. He speedily re-enlisted many of his old 'Alpine Rangers' of the year before. Others, untried, were hardly less eager to serve under so famous a captain. His second in-command was Nino Bixio, an officer in whom zeal for the cause seemed at times almost to reach the pitch of madness. It was necessary to avoid depleting the regular army, and committing the king or Cavour too visibly to the new adventure; but Garibaldi was no longer acting along with the French, and the famous 'red shirts' reappeared.

The force embarked at Quarto, close to Genoa, on the night between the 5th and 6th of May, 1089 strong, and landed in Sicily on the 11th; almost all were Italians. Cavour gave orders to stop the expedition, but in such terms as made it clear that they were not to be obeyed. Two British war-vessels happened to be lying off Marsala, the Sicilian port where the landing was to take place, and their presence and the red shirts of the volunteers

—which suggested British uniforms—puzzled the officer of the Neapolitan navy who should have hindered the landing. When at last he opened fire it proved totally ineffectual, and not the least difficult part of Garibaldi's enterprise was safely accomplished.

v.

Next day, 12th May, the 'March of the Thousand' began. There were over 20,000 Neapolitan regulars in Sicily. Garibaldi was joined by 200 volunteers, who remained under his command, and by varying numbers of islanders, who were useful as guides, and did better under fire than was to be expected. On the 15th the Thousand carried the hill of Pianto dei Romani. It was a stiff fight. The Neapolitans did well. The advance of the volunteers from terrace to terrace was slow, and even Bixio at one point counselled retreat. The chief's answer was, 'Here we make Italy or die.' But the enemy began to run short of cartridge and to throw stones. One of these hit Garibaldi, and revealed the condition of things to him. His men carried the hill-top with a final rush. He pushed on for Palermo, by skilful strategy drawing off a considerable body of the enemy, who followed his apparent traces far inland and returned to find him in the city.

There was a fierce struggle when the volunteers broke into Palermo on the 27th, and street-fighting and bombardment from the castle and the fleet filled Palermo with sounds and sights of horror. On the 30th Garibaldi had hardly a cartridge left, and on the 30th the Neapolitan commander proposed an armistice of twenty-four hours. Garibaldi met two Neapolitan generals on board the British flag-ship, and returned to announce that he would renew hostilities next day. The people illuminated the city that night, and the Neapolitan commander, who seems to have doubted the spirit of his men, agreed to evacuate the place. Garibaldi, by unfaltering coolness, had made up for his want of ammunition, and so induced the enemy to quit a place from which he had no means of ousting him by force. The freeing of Palermo, the capital of Sicily, was the crowning achievement of the Thousand. Fresh bodies of better equipped volunteers, to the number of 5000, now joined them, yet it was with difficulty that the rest of the island was liberated, and the citadel of Messina did not surrender till March 1861.

Victor Emmanuel now wrote to Garibaldi that, if the King of Naples gave up Sicily, it would be reasonable to abandon all further attempts upon his kingdom. The general replied that, once he had made His Majesty King of Italy, he would be delighted to obey him for the rest of his life. He induced 8000 men who had gathered in the island of

Sardinia for an attack on the Pope's dominions to join him instead in the invasion of Calabria, and prepared to pass the Strait of Messina. Cavour said that this was the most difficult juncture in his public life—so much had been gained in the last year and a half, and the danger was so grave of losing it all again, especially if Garibaldi passed on from Naples to attack Rome, which was certain to arouse Napoleon's open hostility, for the French had had a garrison in Roman territory ever since 1849.

Cavour's first hope, that the Neapolitans would rise against Francis II., and adopt Victor Emmanuel as their king before Garibaldi crossed the strait, was disappointed. On 8th August the crossing began. Feints and false starts baffled the Neapolitan naval officers, and by the 21st Garibaldi had some 19,000 men on the mainland. Reggio fell on the 21st. Near Salerno there were 30,000 Neapolitans. Colonel Peard—known as 'Garibaldi's Englishman'—made use of the telegraph to despatch such alarming messages that these troops were withdrawn towards Capua, and the king left Naples for Gaeta.

Garibaldi, taking with him only thirteen officers, entered Naples, still garrisoned by the king's troops. 'Drive slower, slower yet,' he said, and stood up in the carriage as he passed in front of the guns which commanded the Toledo. The artillerymen saluted, and Naples was virtually free, the king's troops marching out on 11th September, and the ships in the bay being surrendered to Persano, the admiral who, earlier in the year, had received Cavour's nominal instructions to stop the Thousand on their way to Sicily.

vi.

And now Garibaldi was preparing to spring from Naples upon Rome. But Cavour had rightly decided that this must not be. France, Austria, and other Powers were threatening; there were French troops on Roman soil, and the danger was too great. When a forest-fire is raging, a better-controlled fire is sometimes started to burn a gap which the first fire cannot overleap. Our Highland sheep-farmers sometimes make use of a similar plan when burning the heather in spring. This was the method now adopted by Cavour. To keep Garibaldi from advancing on Rome from the south, he directed an advance into the Pope's territories from the north—dangerous, indeed, but not so dangerous, as direct conflict with Napoleon's troops might be avoided, and at least Rome itself could be let alone. The northern army entered the Pope's dominions, defeated a mixed force of Frenchmen and others in the papal service near Ancona, and pushed on towards the kingdom of Naples.

Garibaldi and the Neapolitans now faced

each other, with the river Volturno between them. On 1st October the Neapolitans crossed the river; up to midday they had the advantage, and actually pierced Garibaldi's centre; but finally they were thrust back across the river, or had to surrender where they stood. The following day the army from the north and Garibaldi's men touched hands. On the 26th the king and Garibaldi met. The general dismounted, walked up to his sovereign and said, 'Hail, King of Italy!' The king replied with the one word, 'Thanks!'

The kingdom of Naples, including Sicily, was now united to the kingdom of Italy, though Gaeta held out till January, the citadel of Messina till March, of the following year. The Italian kingdom thus included all that

was known as Italy up to the year 1919, except the territory of Venice, still held by the Austrians, and the Pope's remaining dominions, much shrunk since the beginning of 1859. Savoy and Nice had been given up to France. Early in 1859 Cavour had said, 'I am leaving the last sitting of the Piedmontese parliament; the next will be that of the kingdom of Italy'; and this kingdom of Italy, though not yet complete, had now come into being.

The king wished to make Garibaldi a duke, thus raising him to the rank of the king's cousin, and to shower wealth upon him. He declined these offers, and returned to Caprera, 'to dig up the potatoes which he had planted in the spring.'²

THE TRAGEDY OF THE SEVEN HUNTERS.

By J. G. LOCKHART.

I.

OUT in the North Atlantic, uninhabited, seldom visited and often storm-bound, lie the Seven Hunters, better known, perhaps, as the Flannan Islands. They are little more than rocks, for the largest of them measures only five hundred by two hundred yards; and they are among the loneliest spots in the world. Seventeen miles to the east of them is the island of Lewis in the Outer Hebrides; but to the west there is no land between them and the coast of North America.

The seven islands differ little in appearance. Gray cliffs of gneiss tower above the waters to a height that varies from one hundred and fifty to two hundred feet; and the tops are crowned with smooth stretches of turf, starred with sea-pink and buttercup and ragged-robin. They have always been a great haunt of sea-fowl, and especially of puffins, which, orange-beaked and orange-footed, sit in row on solemn row about the cliffs. Except for these the islands remained for long years untenanted, though in bygone times, when the grazing was poor in Lewis, sheep used to be taken across and left on them to fend for themselves for a month or two.

To talk of the history of such rocks as these is perhaps a misuse of language; yet the islands¹ possess both a ruin and a tradition. The ruin, which is on Eilean Mor, the largest of the group, is that of a little chapel; and the tradition has it that there, in the seventh century, St Flannan, the bishop of Killaloe, made his home and dwelt for many years in seclusion from the world.

In the nineteenth century, however, the

Flannan Islands began to have other associations, which were far from saintly; they became a minor problem. Situated, as they are, on or close to the route of vessels bound by the Butt of Lewis for the north coast of Scotland, or through the Pentland Firth for some Scandinavian port, they were a dangerous obstacle on a dark night or in thick weather. Many a ship crashed on to those unlighted rocks; and small was the chance of escape of those aboard when they found themselves caught between the fury of the waves and the gray cliffs of Flannan. Even if they were so fortunate as to reach the shore and to clamber up onto one of the little grassy plateaus, in certain seasons of the year they might remain there undiscovered for days and even weeks, until, perhaps, they exchanged death by drowning for death by exposure or starvation.

Towards the close of last century, therefore, as the result of a good deal of representation and of more than one disaster, it was decided to build a lighthouse on the Flannan Islands. The task of constructing it was both laborious and dangerous; the sea was seldom really calm, and it was necessary to blast landing-places out of the solid rock, to erect cranes, and to hoist all the materials required to the top of the cliff. Consequently the work, which was put in hand by the Northern Lighthouse Board in 1895, was not completed until the month of December 1899. The lighthouse was placed on Eilean Mor, close to the ruin of St Flannan's chapel, and two hundred feet above the sea; and in the tower, which was seventy-five feet high, was installed a light of 140,000 candle-power, visible for a distance of forty miles. Such was the station that had been established for exactly a year

¹ See *Behold the Hebrides!* by Alasdair Alpin MacGregor.

² Countess E. Martinengo-Cesaresco.

when the extraordinary tragedy took place which cost three men their lives, baffled every attempt at investigation, and still remains an unsolved mystery of the sea.

II.

The lighthouse was manned by a staff of four men, one of whom was always away on leave; so that the work was arranged in a continuous shift, each man doing six weeks on and then taking a fortnight off. In order to work the reliefs the Northern Lighthouse Board's steamer, the *Hesperus*, visited the station, weather permitting, once a fortnight.

On 26th December 1900, when the *Hesperus* appeared off the Flannan Islands, the fortnightly relief was some days overdue. Probably it had been delayed by the stormy weather; at all events the islands had last been visited on 6th December, nearly three weeks before. The men left on duty at that date were James Ducat, Thomas Marshall, and Donald M'Arthur; and the fourth man, Joseph Moore, was now returning to the islands in the *Hesperus* to relieve one of the others, whose turn it was to take a spell of leave. The programme was according to routine. After landing Moore with letters and provisions for the station, and embarking the other man, the steamer was to return to Loch Roag in the afternoon.

Some account has already been given of the general character of the islands: a few details about Eilean Mor, the rock on which the lighthouse was built, may be added. It is, as has been said, the largest of the group. It is egg-shaped in appearance, and has been described as like a larger edition of the Bass Rock. At its highest point is the lighthouse itself, from which a grassy slope stretches to the edge of the cliffs. When the construction of the station was begun, it was found necessary to cut two landing-places out of the rock; one of these was on the west and one on the east side of the island, so that on most days, if there was not actually a gale blowing, it would be possible to land materials, stores, or reliefs, at one of them. At each landing-place a zigzag stair had been cut up the cliff, and a crane and a trolley tramway had been installed.

On this particular day the *Hesperus* hove-to off the east landing and hoisted the usual signals. To the surprise of those aboard, however, no answering signals were shown from the lighthouse; and, what was more significant, it was evident from the appearance of the landing that none of the usual preparations had been made for the reception of the steamer. It was possible, of course, that the ship, being overdue, was not expected; yet she should have been sighted while still at some distance from the island, and it was surprising that not one of the three keepers should be visible.

At first, however, the deserted appearance of the island aroused no apprehension of any

disaster. A boat was manned, and put off for the east landing with Moore, the assistant keeper, who was returning to duty. Still no one appeared. In the absence of anyone at the landing-place to lend a hand, Moore had a difficult jump to make in order to reach the shore. He managed it, and, leaving his companions in the boat, set off at once up the zigzag path leading to the station. When he arrived there he found the entrance-gate and outside doors closed. Pushing them open, he entered. The place was empty. In the living-room the clock had stopped, and, although it was mid-winter, no fire was lit. He looked into the bedroom, thinking that perhaps the men had overslept themselves; but there was no one there.

Puzzled, and by this time more than a little alarmed, he hurried back to the landing-place to obtain assistance, and on hearing his account of his experiences two more men scrambled ashore and joined him. The three men then made a thorough and systematic search of the island and the lighthouse premises. But they found no one. There was not a trace of the missing keepers; there was scarcely a hint of their fate. The Seven Hunters had claimed and taken them, as though resenting the invasion of their long solitude; the men had simply and completely disappeared.

The search did not take very long, and though nothing was found to indicate an explanation of the tragedy, certain points of interest and significance were noted. In the first place there was the slate on which the records were kept by Ducat, the principal keeper. The last entry had been made at 9 A.M. on Saturday, 15th December. It was, therefore, fairly safe to assume that the calamity, whatever its precise nature might have been, took place some time in the course of that day. But a further investigation of the premises enabled the time to be fixed more closely. The morning's work had evidently been completed. The big lamps had been trimmed, the oil fountains and can-tees were full, and the lens and machinery had been cleaned since their last night of work. In the kitchen, too, everything was tidy, and the pots and pans had been washed. Thus it was pretty clear that the mysterious tragedy must have taken place during the late morning or the afternoon of the 15th. We may mention that this conclusion was subsequently supported by Captain Holman of the steamship *Archer*, who stated that he had passed the Flannan Islands at midnight on the 15th/16th of December; that he had been surprised not to pick up the light; and that the course he followed was such that, in the prevailing weather, he could not have failed to see the light if it had been burning.

That point, therefore, was established. But it did not bring a solution much nearer. One

further discovery was made in the lighthouse. On a careful examination of the missing men's possessions, it was found that Ducat's and Marshall's sea-boots and oilskins were missing; and Moore, who was, of course, acquainted with his comrades' habits, declared that the men only wore these articles when they were visiting one of the landings.

III.

Since the key to the mystery was not to be found in the lighthouse building, the searchers next turned their attention to the exterior, in the hope that the landing-places might supply the clue which they were seeking. They took the east landing first, the one at which they had come ashore. Everything there was in perfect order, and the ropes, which had been coiled and stored there after the relief on 6th December, were all in place.

At the west landing-place, however, traces of the recent gales were found. The crane, which had been installed on a concrete platform seventy feet above the sea, was, it is true, undamaged. The jib was lowered and secured to the rock, the canvas covering the wire-rope on the barrel was securely lashed, and there was no sign that the men had been attempting to do anything there. Nevertheless, during the late storms the waves must have piled themselves up against the cliff at this spot, for a wooden box, containing ropes, crane-handles, and odds and ends, which was kept in a crevice of the rocks forty feet above the crane platform and 110 feet above sea-level, had been washed away. In the process it had been torn open: several of the ropes had been flung down and scattered over the rocks near by, and some of them had been caught and entangled in the crane. There were other signs of the violence of the storm: the iron railings running round the platform and up the zigzag stair had been displaced and twisted, and a block of stone, weighing upwards of a ton, had been dislodged and swept some distance to the left, coming to rest on the concrete path just above the landing-place.

On examining the railings protecting the path the searchers thought for a moment that they had found a clue to the fate of the missing men. The lifebuoy, which was always kept fastened to the railings against an emergency, was gone. But on closer inspection it was observed that the ropes securing it had not been touched, and that pieces of canvas were still adhering to them; so that it seemed more likely that the sea, pouring through the railings, had torn the lifebuoy bodily from its fastenings and carried it away. We get some idea of the force and fury of the storm when we recall that this happened at a height of more than a hundred feet above the level of the sea.

If what was found at the west landing provided no clues, at least it gave certain indications, which, when combined with the results

of the search of the lighthouse premises, pointed to a possible explanation.

December had been a month of storms: during one of these the waves off Flannan had risen so high as to damage objects a hundred feet above the sea; when the disaster occurred the keepers—or two of them, at any rate—had been dressed to visit one of the landings. On this rather meagre foundation a theory was constructed: the men, it was assumed, fearing that all was not made fast on the west landing, had attempted to reach it during one of the storms; and they had been blown off the rock by the power of the gale, or swept away by an exceptionally high wave.

IV.

Such a theory, though it received some support when first the news of the disaster reached the mainland, was not seriously tenable. To anyone with any knowledge of lighthouse work it was inconceivable that three experienced keepers should have ventured onto one of the landings when a storm was raging. But there was a stronger objection than this. The important point, of course, is the weather, and of this we have a complete record in the log kept by Ducat and found by the search-party. From this it appears that on 12th and 13th December a gale blew from the west, but that on the 14th, the day before the disaster, the wind dropped appreciably, and was scarcely more than a stiff breeze. It blew a gale again on the 20th, as we know from other sources, but on the 15th the weather must have been by comparison calm. When, therefore, the men disappeared, the damage had probably already been done, and certainly the storm was over. There was no direct connection between the storm, the damage on the west landing, and the disappearance of the keepers.

But, having rejected this explanation, let us put forward another, and, in the light of such evidence as is available, try to reconstruct the tragedy as it may have happened. On the 12th and the 13th the men were storm-bound within the lighthouse building. They could hear the roar of the tempest outside; they could, perhaps, see something of the tremendous seas that were running; their little fortress, high though it was perched, must have been lashed by the spray of those mountainous seas; and possibly the keepers guessed that some damage would be done on the west landing, which was exposed to the full violence of the gale. But so long as the storm lasted they could do nothing. On the 14th the wind moderated, but probably the sea was still too rough for the landings to be visited in safety. On the morning of the 15th, however, the weather had become calmer, and all three men went down to the west landing to see what had happened there during the storm.

So far our task has been easy. But at this point we reach the crux of the problem. The men are at the landing-place. What disaster can overtake them there on a comparatively calm day? Conjecture, of course, is possible. One of the men may have slipped and fallen into the sea, and the others may have lost their lives in attempting to save him. Yet, if we recall that the crane platform and the path were littered with ropes from the wooden box which had been swept away by the waves, it is hard to believe that the men would have jumped into the sea, when they could more easily and safely have thrown a rope to their companion. But perhaps he was disabled? Even so, why did both men follow him? Surely one of them would have remained on shore with a rope.

Having brought the matter to a deadlock, let us now produce a possible solution, which, though it may not commend itself to everybody, does cover most of the facts. At the time the explanation did not suggest itself; the lighthouse had been completed only a year when the tragedy occurred, and consequently no one knew very much about the island and its ways. Later,

however, when the post had been established for some time, a curious phenomenon was discovered. It was found that off the west landing, in quite calm weather, the sea would suddenly and unexpectedly rise to a very high level. Whatever freak of the tides may be the cause, the effect is remarkable; it is almost as though a volcanic upheaval had taken place in the depths of the ocean, or as though some huge marine monster was convulsing the waters. At one moment the waves will be washing idly round the base of the rocks; at the next they will surge forward and upward; and, if there is anyone standing within their range at the moment, they will catch him and drag him back and drown him. On several occasions this strange upheaval has been observed, and more than once since 1900 the keepers of Flannan have narrowly escaped being caught in it and drowned.

This, then, we may conjecture to have been the fate of the three lost men. Unwarned, and deceived by the fairness of the weather, they went down the path towards the west landing-place; and the quiet ocean rose swiftly and engulfed them.

THE CENTURY PLANT.

By M. WILSON BEVERIDGE.

A CENTRAL AMERICAN plant, of remarkable beauty and appearance, the Maguey, or Agave, is one of the wonders of the plant world. Owing to a superficial resemblance to the aloe it is popularly known as the American Aloe, but is not related to the Old World plant.

The agave has either no proper stem, or a very short one, bearing at its summit a crowded head of large fleshy leaves, which have spiny margins. These leaves are inclined to be blue rather than green, and have a whitish bloom, which gives the plant the appearance of being made from painted tin. A single leaf, when fully grown, sometimes weighs about twelve pounds.

In Mexico the plant usually flowers in its seventh or eighth year, and sometimes in its fifth or sixth year. In poor soils or under exposed conditions it may not flower till it reaches its twelfth year, and in our hothouses not until it has reached a very advanced age, sometimes eighty, or even a hundred years. Whence arises the gardeners' fable of its flowering only once in a hundred years, and the name Century Plant.

During the development of inflorescence there is a rush of sap to the base of the young flower-stalk, which springs from the centre of the leaves, sometimes at the rate of one and a half feet per day, until it may reach the height of even forty feet. Horizontal branches spread out

from the upper portion, bearing thousands of golden blossoms, which become a feast for bees, butterflies, and other insects.

This tremendous effort exhausts the plant, and as soon as the flowers make their appearance the huge leaves, which have taken many years to grow, begin to droop and wither. The gigantic flower-stalk draws all the life-fluid from the roots and leaves, and ultimately causes the death of the plant. After the blossoms fade the dying stalks remain a long time, and when planted along a railway line, as they often are, agaves have the appearance of a line of telegraph poles.

The agave has served the inhabitants of Mexico for many widely different purposes from the earliest times. The leaves furnished a strong, impenetrable thatch for the roofs of their houses; the thorns from the extremity of the leaves made a fair substitute for pins and needles; the root, when properly cooked, became a palatable and nourishing food; a fibre was produced from the roots and leaves, which was made into a sort of coarse material and thread; the Aztecs made from the leaves a kind of paper—somewhat resembling the Egyptian papyrus—specimens of which still exist in their original freshness and brilliancy of colouring; and the national liquor, *pulque*, was made from the sap. In short, the plant provided food, drink, clothing, and writing material to the early inhabitants of Mexico.

Legend tells us that many centuries before Europeans visited the New World a woman of the Toltecs, a race which inhabited the land before the Aztecs, showed the king how to extract a wonderful nectar from the heart of the plant. He was delighted with the discovery, and later married the woman. When their son came to the throne he thought that the liquid might be much finer in a fermented condition. He tried the experiment, the result being *pulque*, and in consequence the Toltecs deteriorated rapidly.

To-day in Mexico the flower shoot is cut out, and the sap, which contains a considerable amount of sugar, is collected daily. Subsequently fermented, this becomes *pulque*, which is a milky, sour, and ill-smelling liquid resembling thin buttermilk; but in face of this even Europeans soon find it agreeable and refreshing.

The liquor has become a curse to the lower-class Mexican. Of it he sings:

Know ye not Pulque?
Liquor divine!
The angels in heaven
Prefer it to wine;

and he will neglect his family and steal from his employer to obtain it. *Pulque* does not contain

a large percentage of alcohol, but when taken in large quantities, as the Mexicans are accustomed to take it, it produces a dazed condition, which they are obliged to sleep off. The amount of the liquor consumed will be readily understood when it is said that there are over sixteen hundred *pulque* saloons in Mexico City alone, and that a complete trainload and various other quantities enter the capital every morning. By distillation a kind of brandy of highly intoxicating quality is prepared.

The plant is still used in Mexico, and also in the West Indies and southern Europe, for its valuable fibres, variously named Pita fibre, Pita flax, and Pita hemp, from which twine, matting, netting, and paper are made. But the uses to which the agave is put have not yet been exhausted. When dried and cut the flowering stem forms natural razor strops; the expressed juice will lather in water like soap; and in many different parts of the world the plant has been extensively used for hedges.

Recently, in Pasadena, California, three specimens of this extremely versatile plant, which grew beside each other, decided to burst into blossom at the same time. One of them succeeded in reaching a height of thirty-five feet.

JOHN MACNAB: A COMEDY FOR POACHERS.

CHAPTER XV.—HARIPOL—THE ARMISTICE.

THE great drawing-room had lost all its garishness with the approach of evening. Facing eastward, it looked out on lawns now dreaming in a green dusk, though beyond them the setting sun, over-topping the house, washed the woods and hills with gold and purple. Lady Claybody sat on a brocaded couch with something of the dignity of the late Queen Victoria, mystified, perturbed, awaiting the explanation which was due to her. Her husband stood before her, a man with such an air of being ready for any emergency that even his kilt looked workmanlike. The embarrassed party from Crask clustered in the background; the shameful figures of Lamancha and Johnson stood in front of the window, thereby deepening the shadow. So electric was the occasion that Lady Claybody, finically proud of her house, did not notice that these two were oozing water over the polished parquet and devastating more than one expensive rug.

Lamancha, now that the worst had happened, was resigned and almost cheerful. Since the Claybodies had bagged Leithen and Palliser-Yeates, and detected the complicity of Sir Archie, there was no reason why he should be left out. He hoped, rather vaguely, that his captor might not be inclined to make the thing public in view of certain episodes, but he had got to the

pitch of caring very little. John Macnab was dead, and only awaited sepulture and oblivion. He looked towards Johnson, expecting him to take up the tale.

But Johnson had no desire to speak. He had been very much shaken and scared by the Bluidy Mackenzie, and had not yet recovered his breath. Also a name spoken by his father as they entered the room had temporarily unsettled his wits. It was Lord Claybody who broke the uncomfortable silence. 'Who owns that dog?' he asked, looking not at Lamancha but at his son.

'The brute's mine,' said Archie penitently. 'He followed the car, and I left him tied up. Can't think how he got loose and started this racket.'

'But how did you come here, my lord? You look as if you had been having a rough journey.'

Lamancha laughed. Happily the waning light did not reveal the full extent of his dirt and raggedness. 'I have,' he said. 'I'm your son's prisoner. Fairly caught out. I dare say you think me an idiot, unless Leithen or Palliser-Yeates has explained.'

Lord Claybody looked more mystified than ever. 'I don't understand. A prisoner?'

'He's John Macnab,' put in Johnson, whose breath was returning, and with it sulkiness. He

was beginning to see that there was to be no triumph in this business, and a good deal of unpleasant explanation.

'Well, a third of him,' said Lamancha. 'And as you've already annexed the other two-thirds, you have the whole of the fellow under your roof.'

Lord Claybody's gasp suddenly revealed to Lamancha that he had been premature in his confession. How his two friends had got into the Haripol drawing-room he did not know, but apparently it was not as prisoners. The mischief was done, however, and there was no going back. 'You mean to say that you three gentlemen are John Macnab? You have been poaching at Glenraden and Strathlarrig? Does Colonel Raden—does Mr Bandicott know who you are?'

Lamancha nodded. 'They found out after we had had our shot at their preserves. They didn't mind—took it very well indeed. We hope you're going to follow suit?'

'But I am amazed. You had only to send me a wire and my forest was at your disposal for as long as you wished. Why—why this—this incivility?'

'I assure you on my honour that the last thing we dreamed of was incivility. Look here, Lord Claybody, I wonder if I can explain. We three—Leithen, Palliser-Yeates, and myself—found ourselves, three months ago, fairly fed up with life. We weren't sick, and we weren't tired—only bored. By accident we discovered each other's feelings, and we decided to have a try at curing ourselves by attempting something very difficult and rather dangerous. There was a fellow called Tarras used to play this game—he was before your time—and we resolved to take a leaf out of his book. So we quartered ourselves on Archie—he's not to blame, remember, for he's been protesting bitterly all along—and we sent out our challenge. Glenraden and Strathlarrig accepted it, so that was all right; you didn't in so many words, but you accepted it by your action, for you took elaborate precautions to safeguard your ground. . . . Well, that's all. Palliser-Yeates lost at Glenraden, owing to Miss Janet. Leithen won at Strathlarrig, and now I've made a regular hat of things at Haripol. But we're cured, all of us. We're simply longing to get back to the life which in July we thought humbug.'

Lord Claybody sat down in a chair and brooded. 'I still don't follow,' he said. 'You are people who matter a great deal to the world, and there's not a man in this country who wouldn't have been proud to give you the chance of the kind of holiday you needed. You're one of the leaders of my party. Personally, I have always considered you the best of them. I'm looking to Sir Edward Leithen to win a big case for me this autumn. Mr Palliser-Yeates has done a lot of business with

my firm, and after the talk I've had with him this afternoon I look to doing a good deal more with him in the future. You had only to give me a hint of what you wished and I should have jumped at the chance of obliging you. You wanted the thrill of feeling like poachers. Well, I would have seen that you got it. I would have turned on every man in the place, and used all my wits to make your escapade difficult. Wouldn't that have contented you?'

'No, no,' Lamancha cried. 'You are missing the point. Don't you see that your way would have taken all the gloss off the adventure and made it a game? We had to feel that we were taking real risks—that, being what we were, we should look utter fools if we were caught and exposed.'

'Pardon me, but it is you who are missing the point.' Lord Claybody was smiling. 'You could never have been exposed—except perhaps by those confounded journalists,' he added as he caught sight of Crossby.

'We had the best of them on our side,' Lamancha put in. 'Mr Crossby has backed us up nobly.'

'Well, that only made your position more secure. Colonel Raden and Mr Bandicott accepted your challenge, and in any case they were sportsmen, and you knew it. If they had caught one or the other of you they would never have betrayed you. You must see that. And here at Haripol you were on the safest ground of all. I'm not what they call a sportsman—not yet—but I couldn't give you away. Do you think it conceivable that I would do anything to weaken the public prestige of a statesman I believe in, a great lawyer I brief, and a great banker whose assistance is of the utmost value to me? I'm a man who has made a fortune by my own hard work, and I mean to keep it; therefore in these bad times I am out to support anything which buttresses the solid structure of society. You three are part of that structure. You might poach every stag in Haripol and I should still hold my tongue.'

Lamancha, regardless of the condition of his nether garments, sat down heavily on an embroidered stool, which Lady Claybody erroneously believed to have belonged to Marie Antoinette, and dropped his head in his hands. 'Lord! I believe you're right,' he groaned. 'We've all been potting at sitting birds.—John, do you hear? We've been making godless fools of ourselves. We thought we had got outside civilisation, and were really taking chances—but we weren't. We were all the time as safe as your blessed bank. It can't be done—not in this country anyway. We're in the groove and have got to stay there. We've been a pretty lot of idiots not to think of that.'

Then Johnson spoke. He had been immensely cheered by Lord Claybody's words, for they had seemed to raise Haripol again to that dignity

from which it had been in imminent risk of falling.

'I don't complain personally, Lord Lamancha, though you've given me a hard day of it. But I agree with my father—you really were gambling on a certainty, and it wasn't very fair to us. Besides, you three, who are the supporters of law and order, have offered a pretty good handle to the enemy, with these infernal journalists advertising John Macnab. There may be a large crop of Macnabs springing up, and you'll be responsible. It's a dangerous thing to weaken the sanctities of property.'

He found, to his surprise, a vigorous opponent in his mother. Lady Claybody had passed from mystification to enlightenment, and from enlightenment to appreciation. It delighted her romantic soul that Haripol should have been chosen for the escapade of three eminent men; she saw tradition and legend already glorifying her new dwelling. Moreover, she scented in Johnson's words a theory of life which was not her own, a mercantile creed which conflicted with her notion of Haripol and of the future of her family.

'You are talking nonsense, Johnson,' she said. 'You are making property a nightmare, for you are always thinking about it. You forget that wealth is made for man, and not man for wealth. It is personality that matters. It is so vulgar not to keep money and land and that sort of thing in its proper place. Look at those splendid old Jacobites and what they gave up. The one advantage of property is that you can disregard it.'

This astounding epigram passed unnoticed save by Janet, for the lady, smiling benignly on the poaching trinity, went on to a practical application. 'I think the whole John Macnab adventure has been quite delightful. It has brightened us all up, and I'm sure we have nothing to forgive. I think we must have a dinner of everybody concerned to celebrate the end of it. What Claybody says is perfectly true—you must have known you could count on us, just as much as on Colonel Raden and Mr Bandicott. But since you seem not to have realised that, you have had the fun of thinking you were in real danger, and after all it is what one thinks that matters. I am so glad you are all cured of being bored. But I'm not quite happy about those journalists. How can we be certain that they won't make a horrid story of it?'

'My wife is right,' said Lord Claybody emphatically. 'That is the danger.' He looked at Crossby. 'They are certain to want some kind of account.'

'They certainly will,' said the latter. 'And that account must leave out names and—and other details. I don't suppose you want the navy business made public?'

'Perhaps not. That was Johnson's idea, and

I don't consider it a particularly happy inspiration.'

'Well, there is nothing for it but that I should give them the story and expurgate it discreetly. John Macnab has been caught and dismissed with a warning—that's all there is to it. I suppose your gillies won't blab? They can't know very much, but they might give away some awkward details.'

'I'll jolly well see that they don't,' said Johnson. 'But who will you make John Macnab out to be?'

'A lunatic—unnamed. I'll hint at some family skeleton into which good breeding forbids us to inquire. The fact that he has failed at Haripol will take the edge off my colleagues' appetites. If he had got his stag they would have been ramping on the trail. The whole thing will go the way of other stunts and be forgotten in two days. I know the British Press.'

Within half-an-hour the atmosphere in that drawing-room had changed from suspicion to something not far from friendliness, but the change left two people unaffected. Johnson, doubtless with Lamancha's behaviour on the hill in his memory, was still sullen, and Janet was obviously ill at ease.

Lamancha, who was suffering a good deal from thirst and hunger and longed for a bath, arose from his stool. 'I think,' he said, 'that we three—especially myself—owe you the most abject apologies. I see now that we were taking no risks worth mentioning, and that what we thought was an adventure was only a *faux pas*. It was abominably foolish, and we are all very sorry about it. I think you've taken it uncommon well.'

Lord Claybody raised a protesting hand. 'Not another word. I vote we break up this conference and give you something to drink. Johnson's tongue is hanging out of his mouth.'

The voice of Janet was suddenly raised, and in it might have been detected a new timidity. 'I want to apologise also. Dear Lady Claybody, I stole your dog. . . . I hope you will forgive me. You see we wanted to do something to distract Macnicol, and that seemed the only way.'

A sudden silence fell. Lady Claybody, had there been sufficient light, might have been observed to flush. 'You—stole—Rogueie,' she said slowly, while Janet moved closer to Sir Archie. 'You—stole—wee Rogueie. I think you are the—'

'But we were very kind to him, and he was very happy.'

'I wasn't happy. I scarcely slept a wink. What right had you to touch my precious little dog? I think it is the most monstrous thing I ever heard in my life.'

'I'm so very sorry. Please, please forgive

me. But you said yourself that the only advantage of property was that you could disregard it.'

Lady Claybody, to her enormous credit, stared, gaped, and then laughed. Then something in the attitude of Janet and Archie stopped her, and she asked suddenly, 'Are you two engaged?'

'Yes,' said Janet, 'since ten minutes past twelve to-day.'

Lady Claybody rose from the couch and took her in her arms. 'You're the wickedest girl in the world. Oh, my dear, I am so pleased.—Sir Archibald, you will let an old woman kiss you. You are brigands both of you, so you should be very, very happy. You must all come and dine here to-morrow night—your father and sister, too, and we'll ask the Bandicotts. It will be a dinner to announce your engagement, and also to say good-bye to John Macnab. Poor John! I feel as if he were a real person who will always haunt this glen, and now he is disappearing into the mist.'

'No,' said Lamancha, 'he is being shrivelled up by coals of fire. By the way'—and he turned to Lord Claybody—'I'll send over the stag in the morning. I forgot to tell you I got a stag—an old beast with a famous head, who used to visit Crask. It will look rather well in your hall. It has been in Archie's larder since the early afternoon.'

Then Johnson Claybody was moved to a course which surprised his audience and may have surprised himself. His sullenness vanished in hearty laughter. 'I think,' he said, 'I have made rather a fool of myself.'

'I think we have all made fools of ourselves,' said Lamancha.

Johnson turned to his late prisoner and held out his hand. 'Lord Lamancha, I have only one thing to say. I don't in the least agree with my mother, and I'm dead against John Macnab. But I'm *your* man from this day on—whatever line you take. You're my political leader, for, by all that's holy, you've a most astonishing gift of getting the goods.'

EPILOGUE.

CROSSBY, from whom I had most of this narrative, was as good as his word, though it went sorely against the grain. He himself wrote a tale, and circulated his version to his brother journalists, a tale which made a good enough yarn, but was a sad anticlimax to the return of Harald Blacktooth. He told of a gallant but frustrated attempt on the Haripol Sanctuary, the taking of the culprit, and the magnanimous release by young Mr Claybody of a nameless monomaniac—a gentleman, it was hinted, who had not recovered from the effects of the War. The story did not occupy

the first page in the papers, and presently, as he had prophesied, the world had forgotten John Macnab, and turned its attention to the cinema star, just arrived in London, whom for several days, to the disgust of that lady's agents, it had strangely neglected.

The dinner at Haripol, Crossby told me, was a hilarious function, at which four men found reason to revise their opinion of the son of the house, and the host fell in love with Janet, and Archie with his hostess. There is talk, I understand, of making it an annual event to keep green the memory of the triune sportsman who once haunted the place. If you go to Haripol, as I did last week, you will see above the hall chimney a noble thirteen-pointer, and a legend beneath proclaiming that the stag was shot on the Sgurr Dearg beat of the forest by Lord Lamancha on a certain day of September in a certain year. Lady Claybody, who does not like stags' heads as ornaments, makes an exception of this; indeed, it is the one of her household treasures to which she most often calls her guests' attention.

Janet and Archie were married in November in the little kirk of Inverlarrig, and three busy men cancelled urgent engagements to be there. Among the presents there was one not shown to the public or mentioned in the papers, and a duplicate of it went to Junius and Agatha at their wedding in the following spring. It was a noble loving-cup in the form of a quich, inscribed as the gift of John Macnab. Below, four signatures were engraved—Lamancha, Edward Leithen, and John Palliser-Yeates, and last, in a hand of surprising boldness, the honoured name of Benjamin Bogle.

THE END.

TO MY AIN FOLK.

OH! London's streets are unco bricht, an' London
hooses graun';

But tho' sae mony folk I pass, there's ne'er a
ane I ken,

An' it's oh! ma he't is sair tae see the moorlan'
heath an' bracken,

An' tae hear the whaup's wild cryin' ower the
lochan an' the glen.

Thae London nichts fair deave a mon wi' clash, an'
sang, an' ongaun—

It's I wad hear the soughin' win's amang the
norlan' trees,

Whaur black an' awesome fa's the nicht on mony
a lanely cairn,

An' neibors meet wi' freen'ly clash around the
hamely bleeze.

There's nane o' them wad ken me noo, an' nane
tae bid me hame,

But I fain wad see the lochan, an' the woods
ahint the Ben;

An' I'm wae tae see the wimplin' burn I dooked
in as a bairn,

An' for the few mair years I hae, tae bide in
yon wee glen.

Chambers's Journal

SEVENTH SERIES

APPALUCY.

By ROY SNIDER.

PART I.

I.

A MAN of decidedly obtuse moral sense deliberately closed and locked the door of the vault of the Snowshoe Branch, Second State Bank of Helena, Montana, while manager Maxwell Brant was within the burglar-proof chamber, and while the only other employee of the institution was conveniently absent on an errand by Brant's direction.

After locking the heavy steel door the man of blunt morals walked out of the bank, mounted the best-known and most easily identified horse in Montana, and rode away at an easy lope.

When the only other employee of the branch bank returned to his place of employment he was naturally surprised to find the premises apparently unoccupied, and it took him several minutes to locate and subsequently release the imprisoned manager.

Manager Brant promptly established a long-distance telephone connection and notified a detective who represented the interests of the American Bankers' Association that the bank had been robbed of twelve thousand dollars. He also gave the detective much additional detailed information, and requested him to set out immediately in pursuit of the perpetrator of the outrage. Next, the county attorney's office was notified; then the manager of the parent Second State Bank at Helena. After that Mr Brant told the town marshal of Snowshoe what had happened, and discussed the affair in all its possible elaborations of detail with several of his business associates. Last of all he called up the sheriff's office, having purposely postponed this proceeding as long as possible for three well-defined reasons—first, because county sheriffs generally have a disconcerting way of insinuating themselves just when and where they are least wanted; second, because he didn't like Sheriff Harvey Fyffer of Lewis and Clark county; and third, because for other reasons politic he wished to keep the said Harvey out of the affair as much as possible.

When Maxwell Brant finally got into communication with the sheriff's office he was laconi-

cally informed by a deputy that 'Harvey knew all about it, and was gone to get the guy;' whereupon he slammed the telephone receiver viciously on the hook, and kicked his mahogany desk to demonstrate that he was peeved. 'Damn!' he said, and, finding it a satisfying expletive, he said it again more emphatically.

II.

Half-an-hour or so later, in an upper room of Durkee's Place at Marysville, Montana, certain devotees of the noble game of stud poker also found Harvey Fyffer's activities distinctly annoying.

The state of Montana, at the urge of its sovereign people, had successively legislated against gambling, red-lights, and whisky; but all three still flourished surreptitiously at Durkee's, and the resort was unequivocally a worse place in 1922 than it had been at the time of its establishment in the wide-open days of 1882.

Five sophisticated gamblers sat in the game which Harvey interrupted. One, whose faced-up cards were the respective eight spots of spades and clubs and the sixes of hearts and diamonds, had successfully afflicted his features with the vacuous expression known as 'poker face,' and was staring stupidly at the man who had been dealt the six spots of spades and clubs and the eights of hearts and diamonds. This gentleman registered utter absence of intellect, and said, 'I check.'

Harvey Fyffer stepped suddenly into the room and said, 'You're pinched,' which shows what an unfeeling sort of sheriff he was.

The man who had declared his position as being checked greeted the officer carelessly. 'Hello, Harvey,' he said, 'we're just——'

'Yes, I know,' Mr Fyffer interrupted him. 'I've heard it so often it hurts my ears. You're just having a little game of freeze-out among yourselves, and in a minute or two a waiter will bring in five glasses of soda pop that nobody wants to drink. Nothing to it, Johnson. I don't want you for gambling. Cash in your chips and come along. You other roosters can do as you like.'

While Harvey was speaking he glanced from one gambler to another, studying each man's features. His olfactory senses detected a faint odour suggestive of essential oils, and a speculative sniff or two apprised him of the fact that the odour emanated from the person of a tough-looking individual who sat at the left of the man he had called Johnson.

'It happens that I'm runnin' the game, Harvey,' Johnson stated shamelessly. 'I'll cash these boys' chips, if that ain't what you want me for. What was it outside of that?'

'A talk and considerable advice,' answered Fyffer. 'Mostly the last. I'm asking for it, not giving it, understand.'

Johnson cashed the chips of the other four gamblers, then arose and accompanied the sheriff from the room without a word to or a backward glance at his companions.

III.

Several loungers occupied the benches in front of Durkee's Place. At the hitching-rack stood that rarest kind of equine, an Opalouzas pony.

In an occasional freakish mood Nature sprinkles a few small dark spots over the coat of an otherwise white or light-coloured colt. Once in a century or so she is lavish with her spangles, and produces the true Opalouzas horse by dotting a light-coloured coat with hundreds of dark spots of the approximate size of a twenty-five cent piece.

The colour scheme of the hide of the pony which stood at Durkee's hitching-rack was distinctly, and impressively, jet black on a ground-work of milky white.

'Leave your cayuse there, and we'll walk around a while,' Harvey suggested to Johnson. 'We won't go very far, and the exercise may do us good. Now,' he said, when they were beyond earshot of the more or less curious loungers, 'tell me straight out where you got money enough to run that game.'

'Had my month's wages from Jackson Clark to-day,' Johnson answered without hesitation. 'Ed Shattuck was dealing black-jack when we hit town. I was lucky, and cleared him out of a hundred and fifty in less than an hour. I started the stud game with that. We'd been playin' about ten minutes when you busted us up.'

'I see,' said Harvey thoughtfully. 'You gambled the Triangle-J away to Jackson Clark's old man. Now it looks as though you were going to get it back from the son. I see he was in the game there, just now.'

'Not a chance,' declared Johnson. 'He plays 'em right against his breast bone one minute and wide open the next. He's as good as the old man, only hasn't quite as much nerve as he had.'

'Not in any tight fix for money, then, is he?'

'Flush as a bank,' announced Johnson. 'He'd get credit for twenty thousand if he needed it.'

IV.

Harvey shrugged his shoulders and abruptly changed the subject. 'I called in at the Triangle-J on the way up from Helena,' he said. 'Riley told me that you and young Clark had lit out for town for the afternoon. He said that your speckled cayuse strayed away this morning with his saddle and bridle on. I thought he would always stay put?'

'It's the first time I ever knew him not to,' said Johnson. 'Usually I don't even throw the reins on the ground. Don't know if I did this time or not. They were hanging on the saddle-horn when he came kitin' back at noon.'

'How did he happen to ramble?'

'I rode out with Jackson Clark this morning to fix up the woven fence at the back of that pasture where he keeps the poll Angus yearlings. We left our horses in a patch of quakin' asps, and was gone maybe an hour, mending the fence. When we came back my Spot horse was gone, and Jackson's horse was right where we left him. Spot came tearing back to the ranch at noon like he'd been chased by a flock of angels.'

'Which he'd naturally want to avoid, having such a hellish disposition himself,' Harvey commented dryly. 'Outside of that,' he added, 'the bank at Snowshoe was stood up for twelve thousand dollars this morning, and the man that did it rode your speckled horse. Now, what do you make out of that?'

'Rode my speckled horse?' Johnson repeated wonderingly. 'Harvey, are you sure about that?'

'Reasonably so,' said the sheriff. 'He's the only Appalucy that I know of, and I'm fairly well posted on such things. I don't suppose there's a dozen of them in North America.'

'No,' Johnson agreed; 'an Opalouzas isn't the commonest breed of pups in the world, even if people *do* call 'em "Appalucys" and show their ignorance. It's likely my old Spot was the victim all right. Some sport's been layin' for a chance to borrow him for the purpose, and lifted him this morning when I left him at the quakin' asps; then rode into Snowshoe. It's less'n seven miles across the hills if a man knows the bridle trails.'

'After he did the job at the bank, he rode back near to the Triangle-J and turned Spot loose. A smack with a stick would make him hike out for home like the mill-tail of hell. That's that, but I don't see the sense of it yet.'

'I think I do . . . partly,' Fyffer stated thoughtfully. 'Looks like somebody sort of borrowed the idea about the darkest place being under the lamp. Anybody that saw that cayuse at all would think of you right away.'

You've got a first-class alibi all right . . . four reliable men can swear that you were at the ranch when the game was pulled off at the bank . . . but the dodge of using your spotted horse drags a red-herring across the trail, and balls things up about as effectively as anything I could think of.

'Besides, there's one or other two hitches in the play that are hard to get around. Spot's the toughest and strongest horse for his inches that I ever heard of, and what little twenty-one jewel meanness he didn't have the day he was foaled, you've taught him since you've had him.'

'I don't think I've ever neglected his education any to get excited over,' Johnson admitted naively.

'You certainly haven't,' the sheriff agreed. 'He kicks, bites, and strikes on general principles, and you're the only man in the county who is sure that he can ride him for more than a minute at a time. Most others know better than to try. Now, how could some stranger just naturally walk up and fork that fightin' demon of a bronc and ride away on him?'

'He couldn't,' said Johnson shortly. 'He could have made friends with Spot for the last few days and had no trouble at all about forking him off. Some horses take to oil of rhodium like a cat does to catnip. It's an old trick that nearly everybody knows. Spot loves it like a hobo loves his beer.'

'Oil of rhodium,' the sheriff repeated slowly while he puckered his brows in an effort to interpret an evasive idea. 'Oil of rhodium? Now where . . . my heck, I know!' he cried suddenly. 'Who was that hard-boiled mug that sat at your left-hand side in the game back there?'

'Stranger,' Johnson answered. 'I never saw him before.'

'I want you for a deputy,' Harvey stated crisply. 'Hold up your hand till I swear you in.'

v.

Johnson was sworn in in the hurried, unintelligible, mumbling manner that seems to be orthodox with sheriffs, and, after he had stated indifferently that he desired the Almighty to help him, the two men hastily retraced their way in the direction of Durkee's Place.

When they reached the door of the resort a man stepped forth aggressively and seized Johnson's arm. 'You're under arrest,' he cried harshly. 'You'll come along—'

'No, he won't come at all,' Harvey interrupted. 'He's my deputy.'

'The county isn't handling this,' the aggressive man retorted, exhibiting an imposing looking badge.

'I am,' said Harvey grimly. 'Take your hand away or I'll arrest you. Understand?'

Evidently the aggressive one understood. At any rate, he released his hold on Johnson's arm.

Sheriff and special deputy mounted Durkee's stairs, and re-entered the room they had left but a short time before.

Three men sat at the table playing freeze-out. The hard-boiled mug was gone. 'He left here a couple of minutes after you and Johnson went out,' one of the gamblers told the sheriff. Inquiries amongst the occupants of benches in front of the dive elicited the information that the stranger had travelled eastward when he quitted the premises.

At Harvey's suggestion, Johnson took his spotted pony to the nearest feed-barn, and left him there with instructions to the proprietor of the place that he was to be fed hay but no grain if he were not called for in the evening. The sheriff's motor-car was parked not far from Durkee's Place, and, when Spot had been temporarily disposed of, Harvey and Johnson got into the car and started eastward in search of the man they wanted.

'The whole game looks off colour to me,' declared Johnson. 'I confess it's got me beat, but I'm dashed if I can say just why.'

'It certainly has some queer turns in it,' agreed Fyffer. 'I want to find that hard-boiled mug badly, but I must say he doesn't act a bit like a man that's robbed a bank. He wouldn't stick around playing poker within fifteen miles of where it happened; now would he?'

'The whole thing looks to me like a bunch of men startin' up a freeze-out game to fool the sheriff when he's caught them playin' for money,' said Johnson—'sort of unreal and done for show.'

Harvey pondered silently for several minutes. 'You've hit it,' he said at last. 'That's just the idea that I've been figuring out, but I couldn't quite frame it all up. A man robs a bank, and advertises it by using the most conspicuous horse he can find; then flies to the toughest joint in Montana—and gets into a poker game—where he knows he's sure to be seen. That isn't true to form. When I dropped in I guess I side-tracked his plans, whatever they were, and he lit out. That looks as though he's been acting under instructions from some one else, and, as the instructions didn't take me into consideration, he made a move on his own account. He's acting natural now, and on his own initiative. But where does that get us if it's right? And we've no way of knowing whether it is or not.'

'I suppose I *could* say what I said before and feel like I'd said something important, only I don't just see where a man shows more'n average brains by sayin' that he doesn't savvy, so I guess I'll just leave it unsaid.' Johnson's words were spoken to himself rather than for his companion's benefit. He had considerably less idea

of what was forward than he believed his chief to have.

VI.

'We'd better stop at some of these shacks and see if anybody's seen our rabbit goin' this way,' suggested Fyffer. 'He hasn't a great deal of a start.'

They stopped at several places to ask for intelligence of the man they sought. At a shack near a forking of the road they learned that he had asked to be directed to a small near-by town known as Butler, and had been seen following the road which led in the direction in which he had expressed a desire to go.

They drove for a couple of miles along the road to Butler; then decided that they had either passed the man in hiding somewhere along the way, or that he was not travelling in that direction. The car was turned around, and they drove back to the forks of the road.

'I really believe that I've got an idea, now,' Johnson declared. 'I usually do get 'em when they're no use or too late. This joker we're after probably figured somebody'd be looking for him, and made them inquiries about the way to Butler purposely to get the pursuing parties off on a dead trail. I'm bettin' that he's headed up the other road as fast as he can hike.'

'So will we,' Harvey Fyffer assured him.

'I might have thought of that dodge, only I didn't.'

Reaching the branching of the road, they turned off into the trail which they believed they ought to have followed in the first place. At the first shack at which they stopped they were informed that a man answering the description of him whom they sought had purchased a horse and a dilapidated saddle at the place about half-an-hour before, and had straightway ridden off, after making some inquiries about the trails which led into the mountains. He had given the impression of being in something of a hurry, and the price required for the horse and saddle had been made accordingly high.

'We can't catch up with him afoot,' averred Harvey, 'and the car wouldn't travel a hundred yards into the hills from here. It looks like we've lost him for the present.'

'It also looks like he was heading for the good hiding-places over on the head of the Snowshoe Creek between the Triangle-J and Snowshoe,' Johnson opined. 'The way not to lose him for the future is to get back to Marysville, cross the divide by the M'Donald Pass road, and work up the other side of the range and head him off. We'll need horses for that job. How does it look to you?'

'The clear M'Coy,' replied the sheriff. 'Just watch me raise some dust.'

ST BERNARD'S MONASTERY.

FROM HOSPICE TO HOTEL.

By HORACE WYNDHAM.

I.

WITH the passing years everything changes.

Like other institutions elsewhere the world-renowned Hospice of St Bernard, perched remote and solitary, high up among the mountains between Switzerland and Italy, has had to march with the times. The change there is one that breaks the tradition of nearly ten centuries. Instead of free food and shelter being given as a prescriptive right to all who demand it, a charge is to be levied. In short, the hospice is to become a hotel with a fixed tariff. Still, whatever the tariff, it is certain to be a moderate one, for 'profiteering' has no part in the economic system of the monks who spend their lonely lives in succouring travellers.

Of course, the monks would much prefer to continue in the long-established practice of their pious founder, St Bernard of Menthon, and make no charge. But it is a matter of stern necessity, not choice. The Hospice has scarcely any revenue, and the annual army of

tourists and others who visit it imposes a heavy drain on its slender resources. As to the size of this army, carefully registered figures show that it now approximates 20,000 a year. More than half of these are Italians and Swiss, who cross the Great St Bernard Pass in the spring to look for work, and the remainder are tourists from all over Europe. Sometimes as many as five hundred are lodged within the walls during a single night. The provision of food and beds for such a number is a big toll to meet. It is true that the guests have always had the opportunity of making some return for the hospitality thus accorded them by contributing to an alms-box. Of late, however, the voluntary offerings have fallen off to such an extent that it has become imperative to adopt a new system.

The accommodation furnished in the Hospice is necessarily rather primitive. According to their social standing visitors are divided into various categories. These are composed of tourists, workmen, and paupers. The second and third classes are required to sleep in dormitories, while the first have bedrooms.

Each bedroom, however, contains several beds, and, except under special circumstances, nobody is allotted a room to himself. The guests are of all degrees, and where food is concerned everyone—rich and poor, gentle and simple—is treated alike. A prince may find himself sitting next an artisan, and a millionaire next a pauper. It is a matter of indifference to the cook. He serves up the same menu for all. This consists of soup, meat, vegetable, bread, and wine. One of the monks is always present as host.

The signatures in the visitors' book (a volume which would probably fetch a big price among collectors) show that the Hospice has welcomed many distinguished guests. Royalty has several times entered its portals. The King and Queen of Italy have motored there from Aosta more than once; and, in long bygone days, Queen Victoria was a guest. King Edward VII., when touring the Continent as a young man of seventeen, had a meal there, and took away with him the wooden cup and spoon he had used on this occasion. On leaving, escorted by some of his hosts, he was presented with a St Bernard puppy. When he returned to London, the Prince of Wales (as he then was) had a cottage piano despatched to the Hospice. Years afterwards he was informed that this had perished from damp and decay. He therefore sent out a second one, 'to prove that he still retained a grateful remembrance of the hospitality he had received.' Other royal guests have included the Emperor and Empress Frederick, who, when Crown Prince and Princess of Germany, visited this part of the world in 1883.

II.

On account of its remote position the Hospice of St Bernard is not very accessible. This is chiefly due to the fact that, for ten months in the year, the whole district is wrapped in snow and fog and mist and crashing avalanches. The road across the Pass is one of memories, and history has been made along every yard of it. The winding track echoed in ancient days to the legions of Rome and Gaul, and in modern times to the rumble of guns and wagons, and the tramp of marching feet led by Napoleon. The whole region is bare and bleak and desolate. No trees can grow within two hours' walk of the summit, and there are no flowers or vegetation anywhere beyond occasional thin patches of grass and a few pale pansies sheltering under the rocks. Everywhere a chill and brooding silence.

As for the Hospice itself, this lies in a hollow. The buildings composing it, high and square and ungainly in appearance, rather suggest a barracks. They are of stone, solidly constructed to withstand the fierce winter storms. On this account the massive walls are

further strengthened by Romanesque arches. Upstairs are the dining-rooms and bedrooms for visitors, and at the end of a long passage is the kitchen. There is also a small salon on the first floor, where, as evidence that a touch of modernity has crept in, picture-postcards are on sale. Another connection with the outer world is a telephone, by means of which warning is given when travellers are coming. At the back of the Hospice is a picturesque little lake. Beyond this, only a short walk along the path, the valley reaches down to Italy and thus into a gentler climate.

Fifteen monks, all of whom are Canon Regular of the Order of St Augustine, are housed in the Hospice at a time. The average age of them is under thirty. There is, however, a reason for this. It is that they begin their work at eighteen or twenty, and seldom survive the climate beyond ten or twelve years, falling victims to rheumatism and heart trouble. The little band once numbered an Englishman in their ranks, James Thomas by name, who stopped with them for two years. 'But,' so it is recorded, 'as he was the only son of his parents, and his mother loved him so much that she could not live without him, he reluctantly left us for his own country, much to our regret.'

The monks do not appear to find the time hang heavily on their hands. The fact is, they are all well occupied, each having his appointed task. Thus, one acts as the Father Aumonier and receives the guests; a second keeps the accounts; a third attends to the kitchen department; and a fourth is librarian. The others, on the rare occasions when the weather permits, look after a small pasturage. The day begins and ends with a short service in the chapel. This, built in the sixteenth century, has some good carvings. For relaxation there is a library, well stocked with ancient and modern works in various languages.

III.

Where the average tourist is concerned, the chief interest of the Hospice is connected with the famous St Bernard dogs that are traditionally maintained there to rescue travellers lost in the snow. The pack, which was first established at the beginning of last century, usually consists of fifteen. They have been gradually evolved from short-haired Newfoundlands crossed with Danish and German mastiffs. It is imperative that they should be short-haired, as otherwise they would not be able to get through the snow. The kennels are installed in a separate building adjoining the Hospice. Originally, however, so the records declare, 'the dogs were kept in the entrance hall, to prevent quarrels and fights among the guests.' They could certainly do this, for they are strong enough to carry a man if necessary, and reach a considerable size.

Some of them, indeed, measure six feet from tip to tail, and weigh up to 150 lb.

The young puppies are taught their work by taking them some distance from the Hospice, and then turning them loose with an experienced dog to lead them back to the kennels. After a time they pick up the path for themselves, even when it is hidden by snow and fog. When sent out to search for travellers they are driven off in pairs. One of them stops at the point where the wayfarer is discovered, while his companion returns and brings up a rescue party. By the way, the popular idea that each dog carries a keg of brandy slung round his neck is a fiction. What he does carry is something much more useful, viz., a warm blanket. The brandy does not arrive until a monk appears on the scene.

Of late years the telephone that is now installed between the Hospice and the village of Bourg St Pierre has saved so many lives, by giving timely warning of bad weather, that actual rescues by the monks and dogs do not often occur. In the past, however, the case has been different. A memorable instance took place in 1875. At dawn one morning a band of Italian workmen set out for the Hospice from a hamlet in the district. Snow began to fall heavily soon after they started. Presently they were met by a couple of monks, who, with a dog, had come to help them. As they tramped along a fierce whirlwind suddenly sprang up and buried five of the workmen, both the monks, and the dog in a snow drift. The rest of the party attempted to dig them out, but had to abandon the effort and return to Bourg St Pierre for assistance. While they

were away one of the two monks managed to crawl, bruised and bleeding, up to the door of the Hospice. He lay there for twenty-seven hours, unable to reach the bell and let his comrades know what had happened. They discovered this only the next evening, when the dog made his way back there. It was then too late. Every soul had perished, and the bodies were not found until a week had passed.

There was another sad chapter in the annals of the previous year. This was caused by the occurrence of one of the avalanches, which are more to be dreaded than the snow. Eight Italians looking for work were given a night's shelter in the Hospice one wintry evening. The next morning, although pressed to stay, they left to continue their journey, being accompanied on the first stage by six monks and a dog. After walking for three hours, an avalanche swept three of the monks, five of the workmen, and the dog into a drift. By great efforts the others managed to dig out one of the monks and four of the workmen. The dog also contrived to extricate himself and get back to the Hospice. Perceiving from its appearance that a catastrophe had occurred, the other nine monks on duty there, together with the rest of the dogs, hurried to the rescue. It was five hours before they reached the scene of the accident. There they found one of the monks and a workman dead, and the remainder of the little party in the last stage of exhaustion. To bring them back to the Hospice through the snow and fog was perilous work. It was, however, cheerfully accomplished, for no peril has ever yet caused the monks of St Bernard to shirk the task entrusted them.

THE FIGHTING PLANES.

By H. MORTIMER BATTEN, F.Z.S., Author of *Habits and Characters of British Wild Animals, Tracks and Tracking*, &c.

IN the rugged face of Mount-o'-Cairn, a hundred feet from the brow of the cliff and three hundred feet from the surf below, the three little peregrines were hatched. Of nest there was none, only a hollow scraped out in the sandy shelf, and so overhung by the ledge above that they were shielded from sun and rain, and—most important of all—from human eyes, and the missiles of death certain humans might have showered upon them. To such cliffs as Mount-o'-Cairn the peregrine owes its scant survival, for here, about those towering shelves, the rocks were set in crumbling sand, so that even the alighting of a gull might set a landslide moving. For the human spoiler, then, the nest was inaccessible.

One had only to see that place to know that here, if anywhere, the peregrine might be found,

for with its scowling grandeur and its inexpressible solitude, it was a fitting place for the fittest of our birds of prey. Rugged in character, peregrines love such rugged haunts, and for centuries past they had bred in Mount-o'-Cairn. Year after year they returned to this stronghold, and at one time the peregrines of that cliff were reserved for the kings of Scotland. "Those days are long since gone, and from the lofty position the peregrine then held he has sunk to the status of vermin. Yet the peregrines of Mount-o'-Cairn still belong to the Crown, for the ancient law has never been rescinded.

They were not the only tenants of the place; indeed, they shared it with thousands of others—kittiwakes, lesser black-backed gulls, herring gulls, fulmars, rock doves, and rabbits, while in the lower sea-washed caves, dingy and dripping, where no man had ever trod, a colony of

shags had their nests, and could be seen coming and going like the business-like folk they are. No, the peregrines were not alone, but certainly they were aloft and aloof from the vulgar rabble on the shelves below.

The visitor to the place would at first see nothing of them, but presently he would hear a metallic chattering note, harsh and defiant, which he would know at once as the voice of a royal bird. Separate and apart it seemed to ring, while anon the gulls screamed and croaked, filling the air like silver confetti as they soared and glided about their nesting shelves, and below the surf thundered. Hollow booming sounds came up, stabbed now by the shrieks of a frightened woman, now by peal after peal of crazy laughter, and as a thousand gulls filled the air, dazzling the eyes as they flashed in the sunshine, there, behold, was milord, gliding in immeasurable space!

He was not difficult to locate—a black darting speck, now sweeping skywards, now darting in and out amidst the giddy throng, cutting rings round the rest and making the swiftest of them slow by his meteoric flight. Moreover, he was rendered conspicuous by the fact that everywhere he went he was pursued by the vulgar crowd, first one, then another, plunging headlong after the master flyer; and when one of them came too near, the falcon would scream warningly as he swerved in his flight, then rise up, up, in colossal, mile-eating bounds.

This had gone on since the peregrines arrived several weeks previously, and now to-day, the chicks were hatched. Within an hour of their hatching a man and a girl descended the green slope beyond the cliff to the ruins of the castle which jutted out on a headland. And there, with the face of Mount-o'-Cairn in view, they stayed awhile, watching the bird life. The tercel resented their presence, and was constantly a-wing. Now he would glide overhead, uttering his fierce harsh note, then seawards he would dive through the scintillating host, never failing to draw the angry mob in pursuit, but in a moment he was up and away. Then at intervals he would fly full tilt at the cliff, as though to dash himself lifeless; but, gaining his look-out shelf above the eyrie, he would stop dead and land—lightly as thistle-seed.

One big herring-gull, which evidently had its nest near to the falcon's shelf, was particularly persistent in its attacks upon him, and the man remarked to his companion—'That gull will go a little too far one of these days.'

Exactly what happened the two people did not see, because it occurred just beyond their line of vision. That morning, I say, the chicks had left the eggs, which perhaps accounted for it, for hitherto the fighting planes had avoided dispute with the greater gulls.

When the two visitors finally left the headland and sauntered up to the cliff they found,

lying in a wash-out, at the end of a train of its own feathers, a great herring-gull, which looked almost the size of an albatross. Very beautiful it was in its springtime plumage, and, as they raised the warm body in their hands, more feathers fell. They saw that the strong neck was almost severed, while the patch between the wide shoulders was denuded of feathers.

'How did it die?' The girl asked the question, for on account of its beauty she was sorry for the bird.

'Gulls,' the man answered, 'are the Bolsheviks of the bird world.'

'How was it killed?' the girl repeated, and presently her companion, turning to offer his hand on the steep ascent, answered indirectly—for he loved the peregrines—'If one were mobbed by a vulgar crowd every time on leaving one's ancestral home, it would surely be permissible if at length one knocked down the ring-leader?'

'It was the peregrine, then?' she demanded.

'I'm afraid so,' he answered. 'Yes, undoubtedly.'

'What a pity,' she said, 'that such beautiful things should be so cruel.'

II.

As the days continued, and the needs of the growing chicks increased, the peregrines still stuck to their principle of leaving the wild bird-life about them undisturbed. This was not perhaps because they were anxious to keep on good terms with their neighbours, for in their dashing glory they cared not a jot for any living thing. It was, I fear, mainly because the birds which shared their cliff did not appeal to their epicurean tastes, because, generally speaking, the peregrine eats only what man would eat. Truly there were rock doves in the lower caves, but the rock doves knew that the peregrines were there, and when they came and went they dropped almost to the surface of the sea, and skimmed out of sight along the water, for they knew well that the headlong plunge of the fighting planes necessitated open air below, and that, therefore, the peregrine will not stoop at a bird flying low.

At first, when the chicks were very small, the tercel hunted for them and for his mate, while she protected her fluffy brood from the cold east winds, and the chill sea damps, which for days on end smote the cliff face. One morning an artisan, going to his work at five in the morning (summer time) down the High Street of the nearest market town, was surprised to see the pigeons rise from the square and fan up hastily into the church tower. But his surprise was short-lived, for now he beheld milord in blue, progressing along the High Street about a yard from the ground—so low, indeed, that his tapered wings cast up a little scurry of dust. He passed within five yards of the human

observer, then suddenly he corkscrewed and pinwheeled skywards. Wheeling round the tower, he knocked the proudest, plumpest pigeon into giddy space. As it smote the cobbles and rebounded, the man ran forward to secure the prize for himself. His hands were within a yard of it, when the peregrine alighted on the dead bird. Seeing him, evidently for the first time, it uttered a shrill 'kree' of surprise and defiance, and 'sucked' up, under his very eyes. And there on the polished cobbles it left only a little heap of feathers.

The tercel's look-out tower on Mount-o'-Cairn was high above the eyrie, to which he rarely descended. Cutting the air above, his prey in his talons, he would utter a cackling call, then let fall his lifeless load. And as it fell through space, the hen bird would launch herself from the eyrie, turn keel upwards, and catch the prize in mid-air, to dart back instantly to her young.

Soon, however, the demands of the chicks were too great for the tercel to cope with, and since the weather had improved, the hen bird left them at intervals to feed herself and to bring back food for them. So ere long both parents were a-wing from dawn till dusk, and many a hundred leagues they traversed. Once or twice the hen bird, which was the larger—her wings designed for greater lifting power—returned to the eyrie with a hen ptarmigan, and the nearest ptarmigan height was thirty miles away. Plovers, pigeons, puffins, teal, and once a young brown hare, were brought and laid beside the chicks to devour at their leisure; and sometimes, after sunset, when the sky was still aglow and the sea was clear, and the thunder of the surf and the cries of the gulls seemed to enhance, rather than to break, the mighty quietude, both falcons would soar upwards into the blue—up, up, till the gossamer clouds were reached, and they were the merest specks in the unlimited glory of space. Then, as though for the joy of it, they would drop to earth in a sheer, unbroken plunge, swift as thunderbolts, to wheel and scream and sweep and glide, scattering wide the gulls, finally to alight, the tercel on his look-out shelf, the hen bird by her brood.

Once two wild ducks came wheeling round the headland, two hundred feet or more from the surface of the sea, and the human spectator watched, knowing now that the band would play. The ducks were flying down wind, swift even for their kind, and the man saw the hen peregrine shoot from her shelf. Down she came towards the ducks, straight down. They swerved and quacked and doubled in the air, but too late! There was a heavy thud, and one was spinning seawards in a cloud of its own feathers. The other dived headlong, straight down into the sea, and so escaped with its

life. But the peregrine did not descend for the duck that she had killed. She left it floating on the surface, and in a minute or so a hundred screaming gulls descended upon it. When at last they rose from the surface there was no trace left of the peregrine's kill.

I have said that sometimes the hen falcon visited the distant ptarmigan hill, and one evening on the lower slopes of that hill the keeper was busy digging peats when he heard a swish of wings above his head. He looked up to see a hen peregrine descending—not in a straight nose-dive, after the manner of her kind, but at an angle of forty-five degrees across the glen. He turned for his gun, but she was far out of range ere his fingers reached it. The keeper saw her alight in the heather about a hundred yards away. She seemed puzzled, for she sat there looking about her, and meantime the keeper, armed now, quickly stole up. He knew very well that the falcon had descended in pursuit of a covey of grouse in the heather she had seen from afar, and that the grouse had huddled down, hiding themselves as she approached. As the man came up, he saw the hen falcon walking about, looking for her prey. He saw her suddenly strike her armed feet deep into the ling roots, and next moment she would have been a-wing but that—the keeper fired.

He fired—yes, and killed. So there was yet another little freebooter less, no more to take her deadly toll, nor yet to delight the heart of man by her wonderful powers. When he got up she lay very still, her wonderful wings outspread, her claws still fast upon the grouse she had struck deep down in the ling. And from the man's very feet five more grouse rose, to skim the ling-tips scarcely a foot from the ground, then to pitch again and bury themselves not twenty yards away.

The keeper laughed. This had been a lucky day for him, for it was not often a peregrine came his way; and from that day on it has been the man's boast that he is the only keeper who has ever shot a peregrine hunting its prey on foot.

III.

That evening the tercel lingered long in the sunset glory, rising and wheeling, calling, calling—those sharp metallic notes, to which no answer came. Till after darkness the sound rang above the bedlam of the gulls, and when she did not come, the tercel seemed to understand, because he descended to guard his chicks from the chill sea wind.

Possibly she was not the first mate he had lost, for in this land of ours the life of such as the peregrine is one of hourly peril. He has many friends, but they cannot show their friendship by defending him from his foes—and his foes are everywhere. So one day the tercel himself would fall, unless those wings bore him to some far-off land where the boom

of the shot-gun rarely breaks the mountain quietude.

There was no keeping pace with the growing hunger of those chicks, and before the first dawn-light till darkness closed upon the sea, he was a-wing. He fed them largely on puffins, which were nesting in thousands about a cliff only two miles away, though it was often remarked that the pigeons in that neighbouring town were perceptibly decreasing in numbers. It was said that the tercel came before there was sufficient light to see things clearly, and, indeed, there were grounds for this belief, for almost every morning a litter of pigeon feathers lay upon the cobbles down below the church clock.

Be that as it may, the peregrine ably carried on the task which was now his lot in life. He did his very best, blind, we have reason to think, to his own needs.

A little varmint! Yes, yet true to his colours—royal blue, touched with the ermine of kings.

The young peregrines soon left the nest, and, able to fly a few feet, they moved from shelf to shelf. This, if anything, increased the tercel's labours, for he could locate them only by their cries, and since each of the three screamed its loudest every time he appeared, he had no way of telling which was the hungriest—which he had fed last. But this difficulty soon solved itself, for one of the chicks, falling, alighted at length on a great rocky outcrop fifty yards out at sea. Another succeeded in gaining the castle ruins, and took up its perch on the topmost pinnacle thereof, while the third, the least adventurous, remained near to the eyrie. Thus the tercel knew them by their positions, and fed them each in turn.

Another two or three days and the young falcons were a-wing with their parent. It was a pretty sight to see them circling after him—clumsy, indeed, compared with his supreme mastery of the air, though already there was a gliding ease and swiftness in their flight which marked them out amidst the glistening horde. Up and up they climbed, the tercel encouraging them to follow by his shrill calls overhead, and all that evening, rejoicing in their newly found powers, the young falcons flew and screamed from shelf to shelf.

The following day a strange thing happened. It was a Sunday—a clear breathless Sabbath morn; and at the appointed hour the inhabitants of the little market town filed along the hot sidewalk to the parish church. Soon the bells ceased to clang, and, save for the hushed and intermittent droning of the organ, there was no sound about those gray walls, with their stained glass windows.

Aloft on the weather-vane a jackdaw sat idly chipping his comrades as they scurried by in shuffling flight; but all at once the jackdaw let go his hold and fell, as though shot, from his lofty perch. He simply let himself fall, ricocheting down the ancient tower, from tile to draining spout, then down again, calling wildly as he fell, to the very vestry porch. Then through the open doors he hopped, into that quiet shady place, and the old minister, looking up, saw the bird enter by the aisle, to seek sanctuary at last beside the font. So, indeed, have others, less worthy than God's wild children, sought sanctuary in their hour of need.

When the good citizens came out of church they found a little knot of people standing out in the High Street gazing up at the wind-vane, impaled on the topmost spike of which, and moving limply in the wind, was the body of a bird with long tapered wings. Some one said it was a falcon, that he had seen it descend from the blue in pursuit of a jackdaw, which had fallen to earth in the ace of time.

Later the old beadle went up to remove the body, which was no easy task, since the spike had passed clean through it, and was bent almost double by the impact. Taking the bird in his hands, he was surprised at its lightness. Indeed, it weighed only a few ounces, and the man held in his hand a mere shattered pulp of skin and bone—a beautiful bird all the same, though the lustre of the feathers had already faded. Later the taxidermist announced, 'Starved! Possibly a pinner. Must have gone hungry for several days, since there was no food in the stomach, and no trace of anything having been taken for some considerable time.'

The why and the wherefore of which only those could have told who had found the dead herring-gull, and who had watched the falcons day by day.

THE SANTA CATARINA.

I.

THE wild rocky coast of Buchan in Aberdeenshire is rich in attraction, whether for its sea-lore, its tales of storm and shipwreck, its reminders of smuggling days, or the unique features with which nature has

endowed it. At no point does interest reach a higher level than at St Catherine's Dub, a tiny cove on the northern outskirts of the quaint village of Collieston, where, in a V-shaped creek, behind some dangerous rocks, and distant only a few yards from the shore, lies a wreck which tradition asserts is a

ship of the Spanish Armada of 1588, the *Santa Catarina* (apparently a corrupted form of *Santa Catalina*).

No early accounts of this tradition appear to exist, and it is not till 1858, when Dr Pratt alludes to it in his *Buchan*, that we have anything definite to go upon. The substance of his statement (brought up to date in a recent reprint) is to this effect: 'The tradition receives support from the fact that Lt. Paterson, R.N., then on the Coastguard Station, Collieston, raised two guns in 1840. Mr Rust, Parish Minister of Slains, raised another in 1855, which was not even corroded. It was over 7 feet in length and 3½ inches in diameter of bore, and the ball, weighing 4 lbs., and the wadding were in perfect condition. It is now in possession of the Earl of Aberdeen at Haddo House. A diving party employed by the Countess of Erroll in 1876 raised two more guns and an anchor, which were sent to Queen Victoria at Balmoral. The largest and most complete gun was got in 1880, and is now in the possession of a London firm.'

Tales of Armada wrecks are so numerous and plausible that it is necessary to approach a tradition of this kind with extreme caution, and to apply as many tests as possible, which we are the better able to do by the rapid advance that has taken place in historical research within recent years.

II.

Let us first examine the name. In the fleet of 130 ships composing the Armada, there were three named *Santa Catalina*, one being a galleon of Castile 882 tons, another in the squadron of Andalusia 730 tons, and the third a tender without guns. The first two succeeded in limping back to Spain, and both arrived at the same port, Santander, while the third may be dismissed as not conforming to our quest.

Next as to environment. When the English abandoned pursuit opposite the Firth of Forth a review of the Spanish Fleet was held on the day following, about a hundred miles off the north-east coast of Scotland, at which time urgent repairs were carried out, and sailing directions issued. There was thus no need for any ship to make towards the coast at this stage, and the fleet appears to have sailed forward intact to the rendezvous north of Orkney.

Then, as to weather conditions. The English admiral satisfied himself, when giving up the chase, that no enemy ship could reach an eastern port in Scotland, for the reason that there was then a strong south-westerly wind bearing vessels away from land; while, for days thereafter, an approach to the coast was still more hopeless, because of 'squalls, rain and fog with heavy sea.' But even if a stray ship had battled her way inwards, it was impossible, with the swell then running, that she could

have rounded the obstructing rocks to the nook where the wreck lies, for only a small vessel in moderate weather could have found sea-room in the confined area.

Lastly, reports of wrecks even on the remote western coast travelled so speedily and accurately that any disaster within such easy distance of Edinburgh would certainly not have passed unnoticed, the more so as the whole country was in a state of high tension.

No serious writer has put forward a claim to more than four wrecks of ships of the Spanish Armada in Scottish waters, one at Fair Isle, another at Salen, one at Lochaline, and the much-discussed ship of doubtful name at Tobermory.

III.

From what has been stated it would seem that we must discount the theory that our wreck has any direct connection with the Armada. But that does not shut out the possibility of an indirect link, and we shall now discuss various side-lights that may help us to a solution. Spain, although crippled by her disastrous failure, was still a force to be reckoned with, and her king was still active in forming new plans for the conquest of England. In Scotland the small but influential Catholic party maintained a ceaseless agitation for the overthrow of the Reformed Church, and urged on King Philip by every form of argument to come to the rescue of the cause.

The north-east was the centre of this movement under the hereditary overlord, the Earl of Huntly, who was supported by members of the powerful Gordon family and many leading men of the day. Huntly's chief associate was the Earl of Erroll, a young man just turned thirty, full of spirit and daring, whose Castle of Slains lay a mile along the coast, north of Collieston, making it a convenient centre for the direct communications which were taking place between the leaders of this Scottish movement and their supporters in Spain. That there was this direct traffic appears clear, for we learn of a foreign vessel having landed a party of Jesuits in Aberdeen; and on another occasion we read of an emissary bearing a papal donation to the cause, who intimates his intention to land between Aberdeen and Peterhead, meaning in disguised language Slains Castle. For the carrying on of secret missions such as the foregoing there was no coast more suited to the purpose anywhere, especially as it was in a friendly country and directly in touch with most of the interested parties.

If we bear these facts in mind, it would appear reasonable to suggest that our wreck was one of certain ships sent by Spain as her answer to the many appeals for help which she had received, and that the vessel contained guns, ammunition, and other war equipment,

with possibly funds for the payment of an armed force. Incidentally, the ship would appear to have been capable of using guns, if we judge by the recovered gun which was loaded ready for action. But her evident small tonnage would not have admitted of more than very few mounted guns; so that if as many as six have been already raised without any serious attempt to explore the full possibilities, it could only mean that the surplus guns were in the nature of cargo.

Whether, in making for Slains Castle on the starboard or Collieston on the port side, the *Santa Catarina* had taken a wrong turning, or whether in the effort for privacy she had worked her way to the head of the dangerous creek, where some mischance had caught her as in a trap, is a question that we need not stay to consider. Being in effect an echo of the Armada, she would come as years passed by to be regarded as an integral part of that historic episode, and, viewed in that light, the tradition would have been handed down with a semblance of truth in it. With the keen demand for historical inquiry which is abroad, and in view of the encouraging results which have been attained here by the most simple equipment, there appears to be better scope for an effort on a large scale than in places which are now receiving attention, where the conditions are far less suitable or inviting. While it is little likely that any documents bearing on the question have escaped notice at home, there might be possibilities in the Archives of Spain, since doubtless a record of any transactions of this kind would have been kept either by the Treasury or by the Admiralty.

IV.

The outcome of all this Scoto-Spanish activity was the growth of a state of rebellion, chiefly in the north-east; and in 1594 King James VI. saw the necessity for departing from his double-dealing attitude, and of taking a definite line if he were to keep himself in the running for the English succession as well as retaining his throne at home. A force of 8000 was got together to cope with the rebellious intrigues, and the Earl of Argyle, a youth of eighteen, was placed in command. The Catholic host, although numbering less than a quarter of the government muster, was splendidly fitted out, mostly in the form of cavalry, and it had the advantage of three brass field-pieces, an equipment that was no doubt the reward of the long effort to interest Spain, and the explanation of the presence of ships like the *Santa Catarina*. After playing for position the two armies at length met at the foot of a range of hills in Glenlivet on 3rd October 1594. The combat began at noon, and two hours sufficed

to end it, the king's army with its inferior arms, its bows and arrows, being no match for the compact, well-equipped forces of Huntly and Erroll.

Argyle is said to have lost five hundred men. The Catholic Earls had only twelve of their number killed, but they were depressed because amongst the slain was Sir Patrick Gordon of Auchendoun, one of their best leaders, who, in contrast to his notorious brother and predecessor, was a man of piety and virtue. The van of the Catholic army was led by Erroll, who had to bear the brunt of the conflict till Huntly came to his relief, but not before he had sustained arrow wounds in the foot and the arm. The victory was a barren one, for King James, having meantime become seriously alarmed, marched north in force, and the prospect of fighting in a hopeless cause soon led to the break-up of the rebellion. The king passed an edict that certain castles 'salbe cassin doun in signe and memorie of unnatural defection and rebellious,' and he saw to it in person that the work of destruction at Slains was thorough, for there now remains but one desolate wall of the tower to indicate the massive stronghold which was then thrown down, to rise no more.

Erroll consulted safety in flight to Holland, where during the next two years he passed through various trials and hardships. He then obtained the king's pardon after having made a form of submission on the question of religion, although it is obscure whether he thereafter remained a Protestant. He built a new home about four miles farther north on the coast, and this in turn gave place to the later castle, which was made notable by the visit of Johnson and Boswell on their Hebridean tour, as recorded in their Journals. We may best learn what manner of man was Francis, ninth Earl of Erroll, if we judge the stormy outset in the light of the peaceful ending, when he had reached the three score years and ten: 'Upon Saturday the 16th July 1631, the high and mighty lord Francis, Earl of Erroll, is in his own place of the bounds departed this life, and was buried within the Church of Slains, upon the night, convoyed quietly with his own domestics and country friends with torch light. It was his will to have no gorgeous burial, nor to convocate his noble friends with making great charges and expences, but to be buried quietly, and such expences as should be wared prodigally upon his burial, to give the same to the poor. This was a truly noble man, of a great and courageous spirit, who had great troubles in his time, which he stoutly and honourably still carried, and now in favour died in peace with God and man, and a loyal subject to the king, to the great grief of his kin and friends.'

C.

THE POLITICAL AGENT.

AN EPISODE IN THE ANNEXATION OF NATAL.

I.

THE Political Agent did not expect visitors. So much could be deduced from the inadequacy of his attire. He had built himself comfortable quarters overlooking the bay, and he now sat in the shelter of the stoep composing dispatches to send to Sir George Napier at Cape Town.

Spasmodic jerks of the quill suggested mental hesitation, and after making several erasures it finally trailed off into inactivity. The mind behind the instrument had wandered into that dream realm of absorbed speculation in which it was neither asleep nor awake. Was it the subliminal self which kept asking, 'What are you, Mark Durnford?'

Question and answer went on revolving in what he had been accustomed to call his brain until he became more than half mesmerised by the very velocity of the process. Was he a spy or an honest Intelligence Officer, a mere popinjay or a real representation of British prestige?

With the Amazulus he was on the best of terms; he was trusted by the Trek Boers. It was his business to be all things to all men. He could flatter himself that he did his business well. Nevertheless, his position was unenviable. As diplomatic agent he had an undisputed social standing, for was he not supposed to know the mind of that capricious entity called the British Government?

But did he? He thought not.

The assumption of knowledge involved him in a thousand unrealities, and in not a few real physical dangers. He felt at times like a man who had invited a friend to dine at an expensive hotel without the wherewithal to pay the bill. There were trying hours when he envied the mouse under the claws of the cat.

To-day his Janus-headed lord spoke with the mouth of peace, and to-morrow with the harsh accent of war. In one mood South Africa was the apple of his lord's eye, and in another, a mote which had to be extracted at all hazards. And who was he, Mark Durnford, to presume to know better than the embodied essence of British wisdom what thing was good for Natal?

This dispatch was a morsel of cheese which the British Lion might roll on the tip of his tongue, leaving his shoulder of mutton for that inducement, or he might disdain to see it with the tail of his eye. Indecision and disgust finally kissed each other, and with a vicious stab of the quill in the inkpot Durnford left it there, and rose to look across the waters of the bay. Familiarity had dimmed his eye to the magnificent prospect, and so the

involuntary 'phew' which raced at the heels of his vision was caused by an unexpected detail in the scene.

A frigate had just dropped anchor and lay with a stately languor upon the placid water. Durnford picked up a telescope that lay on a table near, and, after a prolonged look, murmured, 'The *Isis*! But where are the tin men with the shooting-irons? Must be under hatches to keep out of the heat. Not a quiver of an eyelid anywhere. Lord, yes; there swings a cutter on the davits, with a middy glued to the tiller. What's up?'

II.

For a time, and unconsciously, the agent's body moved rhythmically to the long swing of the oars, and he watched the eager propulsion of the boat till an intervening sandhill restored the characteristic inaction of the scene. 'What vim these beggars have,' he ejaculated. It was the landsman's tribute to marine fitness.

The hour was 11 A.M., the heat 110 in the shade, a steamy heat in which man gasped and the tropical vegetation rejoiced.

A conspiracy of silence lay on the land. And away out in the bay H.M.S. *Isis* lay as if becalmed in a great circle of rippling light and glitter caused by the vertical and pitiless rays of an unclouded sun.

Suddenly little points of light began to dance among the aloes, and a moving shadow fell on the plumbago which lined the path to the agent's residence. It was the sunbeams making free with the brilliant spots upon the uniform of the middy as he ascended the long tortuous path up the hill, followed at heel by an able-bodied mariner, diligent and watchful as a faithful hound.

Durnford stepped from the stoep to meet the visitor. 'Good-morning.'

'Morn-ing,' replied the representative of the *Isis*, in a quick, jerky manner, saluting as he spoke. 'D'spatches, Mr Durnford.' With a side glance he indicated the blue apparition, who advanced and presented a bulky white packet.

'Heat trying?' suggested Durnford.

'Heat!' gasped the parboiled sailor. 'Call this heat? It's hell!'

'Come in and have something to drink.'

'Thanks—sorry—can't—must get on to the fort,' said the middy. He saluted again and wheeled off with a wooden pomposity, and a semi-conscious indifference, as if he detected a watchful eye at the end of a spyglass far out on the sun-bleached bay. The blue shadow moved after him at the regulation distance. The

whole performance suggested the unreality of a marionette show.

III.

For a while Durnford toyed with the packet. But to those versed in such movements it was an eager hesitation, for in the unostentatious bulk of this white packet lay the lives of men and, it might be, the future of a sub-continent.

Britain had acted toward Natal with the wilful indecision of a child that could at will keep or break its latest toy.

Dingaan, the Zulu chief, had treacherously immolated Piet Retief, demolished in blood the camps of the emigrant Boers, and had paid for it in the slaughter and reprisal of Blood River. The successful commando returned to the coast, only to find that the British Governor had put Major Charteris in command of a company of the 72nd Highlanders, and that he had proclaimed a protectorate over the colony. And, as this followed a definite abandonment of the country, the Boer reply was a warlike attitude.

Fifteen hundred Dutchmen, armed with swords, pistols, and double-barrelled guns, men inured to battle and splendidly united by common suffering, turned and faced the handful of Highlanders.

The result could not be in doubt—not unless the Cape Government, moved by the intelligence forwarded by Durnford, sent a ready and effective reinforcement. In the hand of the agent was the answer to hope deferred; was it to be a new departure, and at length the assertion of a strong hand?

With simulated deliberation he cut the cords and broke the seals, carefully rolled back the sheets till they were flat, and then began to read.

He followed the words with the impatience of one intent upon the fact. 'Whereas . . . heretofore . . . notwithstanding . . . in pursuance of'—would the meaning never emerge from the forest of words?

The only sound that broke the stillness of the hour was the ceaseless chorus of the insistent mosquito in the room, and, without, the raucous whirr of a guinea-fowl in the bush. To these at length was added an exclamation that sounded like the explosion of several forceful adjectives in the English language. To the accompaniment of the sound the manuscript fluttered to the floor, and the Political Agent rose to his feet in visible excitement.

'His Excellency the Commander-in-Chief has been pleased to appoint Captain J. C. Smith, 24th Regiment, Commandant of Port Natal. Captain Smith will march with his detachment to Port Natal,' &c., &c.

This was the tenor of what he had read. The room swam, Durnford folded his arms to hide his emotion, went over to the window and

looked out as if intently, but his eyes were fixed on vacancy.

IV.

So there was to be fighting. Smith was on the march. There had been no delay. He was off at an hour's notice—no meandering down to Algoa Bay to wait for a troopship. Up and off at the first call, the men inspired by the zeal of their captain, singing as they marched, 'We fight to conquer.' And he, Durnford, had called them. But they were marching in fighting order through a territory infested by savage tribes, foes who gave no quarter. What might happen by the way? There were a hundred and fifty rivers to cross; the weather had been bad, and these rivers had to be crossed at their widest and deepest, for the march was along the coast-belt. They were marching with artillery and with an extended line of wagons. It was a forced march, a journey of at least forty-two days, with the sand cutting the feet to pieces, with the rays of the sun reflected from the interminable beach till the eyes swam in liquid pain and the flesh became puckered with blistering heat. Roads would have to be made by day, and during the night a ceaseless watch preserved, for, in an hour, a charge of elephants or an onslaught of savages might reduce the camp to chaos.

Durnford knew what it meant, and he looked into that vacancy which, to the inner eye, is full of kaleidoscopic events; and as he looked the patriot and the man thrilled to the fact that here was one of the heroic journeys in the annals of empire-building.

But he did not realise all the toil nor the pathos of that march, for the day after leaving Faku's territory Mrs Giligan was delivered of a son, and the next day the Commissariat Issuer's wife of a daughter. And even as the Political Agent paced his room, girding inwardly at the seeming hopelessness of it all, James Devitt of the 2nd Company was being interred with military honours by the Umkomanzi River, a victim to the ardour of the march and the fatigue of the way.

It must be confessed that the agent had no mind for the minor events of the progress. He was strongly moved by the heroism of the deed, and no less by the fatuity of the thing; this last struck him like a buffet.

'Two hundred men and two field-pieces!' He repeated the statement mechanically, over and over again, as if it were the quotient of a sum. Two hundred men, mostly from the slums of the cities of Britain, unable to shoot straight in the South African atmosphere, and most of them unable to sit a horse. What experience they had so far gained in the art of war was against foes that entrenched themselves in the bush and scattered at the first sign of defeat. And these men were on the way to

meet an enemy who could shoot the head from a korhaan¹ at a hundred yards without soiling its body feathers, to whom riding was second nature, the bush like a highway, and the veld familiar as a back garden!

It had all the appearance of incredible folly. And the dispatches had not encouraged the Political Agent.

V.

The little force, however, came in on the 12th of May 1842, travel-stained and weary, and yet next day it was fresh enough to march to the Fort, haul down the Dutch Tricolour, spike the gun which supported the flag, and raise the Union Jack.

When the Boers saw by demonstration this British estimate of Dutch prowess, they were exasperated to the pitch of instant attack and speedy annihilation.

But forces were at work to weaken the Boer strength and to inspire caution. Between Durban and the inland town which they had founded under the name of Pietermaritzburg there lay the Zulu hosts of Panda. This astute savage realised that the easiest way to ingratiate himself with the British Governor was to harass the enemies of Britain, and no sooner did he proceed to carry out this policy than the Boers, to save their homes and families from desolation and butchery, found it necessary to scatter their commando.

At the same time the valiant Captain Smith, ever ready to act on the principle that a blow struck at once is equal to two struck later, prepared to bring the issue to a speedy decision.

The Boers were in laager, under the command of the celebrated Pretorius, at Congella, three miles from the British camp. And Captain Smith made his arrangements for a moonlight attack. He fitted a howitzer into a boat, and gave instructions that this floating battery should drop down channel and demoralise the foe by its discharge of shells. But the hopeful landsman had miscalculated the tide, and the boat grounded too far off to be of service.

The fatal nature of this miscalculation became evident when, eight hundred yards from the point of attack, the troops had to form without the cover of this important howitzer. The Boers opened fire from an adjacent mangrove bush, giving painful evidence of the superior carrying power of their arms, and also of their preparedness for what Captain Smith had regarded as a surprise attack.

The British oxen stampeded under fire, mixed the two six-pounders in inextricable confusion, and created a partial panic in the ranks of the soldiers. It became the story of an experiment

which failed. The decisive blow became a victory for the enemy, and the attacking party returned under the silence of the stars, with the moon acting as a searchlight for their foes.

Thirty brave men lay dead or wounded on the shore, and the advancing tide soon placed the disabled in the category of the lost. Next day the victorious farmers entered the town and took, without much resistance, the military position at the Point, annexed all the stores, and sent the soldiers, together with the hospital residents, as prisoners to Pietermaritzburg. So ended that historic march from the Umgazi Post in Faku's country to Durban. The intrepid Captain Smith with his handful of men were trapped in their own camp.

The Boers decided to starve them out, and in fact so acute were their privations that within a short period, having exhausted the food-supply provided by the horses, they were reduced to the consumption of crows and stirrup leathers.

VI.

Now that fighting was forward the Political Agent took his badge of office, a small Union Jack, and retired to the camp, where, if he did little execution on the enemy, he could at least record the quantity of round shot which the foe fired into the lines—in one day 122, in another 124, exclusive of the discharge from the 18-pounder, which they had captured and mounted at the Point.

There were also dispatches of real moment to be sent to those in authority, among them the urgent demand for reinforcements to extricate the lost regiment. With the Boers in command of the beach and of all the outlets to the Cape, the distracting problem was how to send such dispatches without their falling into the hands of the enemy.

This problem was speedily solved. Richard King, an elephant-hunter and trader, volunteered to carry the messages.

It is a story unique in the annals of daring, a fit theme for a South African epic. With two horses this intrepid man stole off in the darkness and silence of the night, with 600 miles of desolate country before him, a way made terrible by its loneliness and by the constant danger of attack from lions, elephants, or tigers, or still more savage encounter with the tribes that occupied the heart of Kaffirland.

One hundred and fifty rivers barred his way, and these, being mostly in flood, had to be crossed by swimming. By day and night his life hung upon the exercise of watchfulness and caution. Every bush might hide a foe, every open space betray his presence, each halt might be his last, and every advance a nearer approach to death.

¹ *Korhaan* or *Knorhaan* (Dutch, 'scolding-cock'), a South African species of bustard.

But, nothing fearing, never halting save for necessary rest, his eyes fixed forward, his heart steeled by the memory of the clamant need behind, Dick King pressed onward. At the end of ten days he entered Grahamstown in the last stage of exhaustion. The heroic messenger's tale stirred men to such activity that within thirty-one days the frigate *Southampton* dropped anchor in Natal Bay with reinforcements; and on their arrival they found that they had been preceded by a detachment of the 27th Regiment from Algoa Bay.

Captain Smith was liberated not a day too soon, and the Boers wisely submitted to the argument of superior numbers. A general amnesty was granted, and the Political Agent

came up smiling. He is reported to have said at a social function, subsequent to the amnesty, 'The Dutch are a great people; it is a delight to state on the authority of my Government that every assistance will be given the emigrant Boers against the depredations of Um Panda.'

He finished a speech remarkable for its conscious want of lucidity by saying, 'England never commits itself to the line of abandonment till it has bound its gallant foes by the ties of amity.'

'Sounds all right,' said the wooden midshipman to an ancient lieutenant of inscrutable demeanour, 'but I'm blessed if it don't feel jolly like saying that you pay the piper without hearing the tune.'

IN THE VALLEY OF DECISION.

CHAPTER IV.

I.

THE next day saw me not only in London, but at Lennox Gardens.

The young lady, concerning whom I made particular inquiry of the butler, was not at home; but the butler affably informed me that Colonel and Mrs Chichester were in, and likewise Sir Thomas and Lady Weston.

I had decided, however, upon my course of action, and before handing the butler my cards, I scribbled upon one a message for Miss Weston that I would call at twelve o'clock on the morrow, upon the chance of finding her in.

This was so far successful that, before breakfast at my club the following morning, I had a note from Vera, containing a message from Colonel Chichester inviting me to luncheon.

And so to lunch I went. No sooner was the meal over than, forthwith, I proposed a walk, with Vera for my companion; and in due course away we went.

It seemed to me incredible that Hubert should be so foolish as to run the risk of losing her. Great charm of voice and manner, an alert upright figure, pretty brown hair and an attractive face, an intelligent mind, and a good heart—all these were a very part of her. No one could wish for a more pleasant companion; and I discerned in her certain qualities which seemed to me to distinguish her above her fellows, the girls of the present day.

That her happiness was bound up with that of Hubert became more and more evident as we talked about him. But it also was easy to see that she was a girl of a high spirit, and that, if once her self-respect took alarm, Hubert, however much he might sigh for her in the future, would sigh in vain.

II.

To return, then, to our walk. We had gone some distance, and were emerging from Hyde Park at Stanhope Gate. 'Let us now drive back,' I said; 'you have walked enough.' And then, presently, as our taxi glided smoothly along, 'I am reminded,' said I, 'of the last time that Hubert and I were together, in that twelve mile drive from Richmond.'

She did not answer me.

'I have long wanted to ask you, Vera, whether that unfortunate Major Spicer was the man who came up to us; do you remember?'

'Oh yes! that was his name,' she hurriedly answered. 'I really can't bear to think of it; and it was all that, I am sure, which upset poor Hubert so thoroughly, and made him so unsettled.'

'Now tell me,' I said, 'why should Hubert feel more upset about it than myself or any one else? We were all upset.'

'He felt it, I think'—and here her voice faltered—'chiefly on my account.'

'Do you mind telling me?' I asked.

She paused. 'Well, if you will promise me not to repeat it—'

'My dear,' I said, 'let my love for Hubert be the pledge of my loyalty to you.'

'You are so kind to me,' she said, 'and I really do feel I want a true adviser just now. Father and mother, I know, are beginning to be quite annoyed about Hubert's continued absence. I used to stand up for him; but oh! how can I say it?'—and here her pretty lips trembled.

'Wait a bit,' I said. 'I'll tell our chauffeur to take us round by Queen's Gate and the Albert Hall, so just take your time about telling me; and if you would rather say nothing, I will only say this: if at any time you want my help or advice, do not hesitate to write to me.'

'I would rather tell you now,' she replied, as with one hand ungloved she half veiled her troubled eyes. 'I am not surprised at father being vexed, for he thinks that Hubert has slighted me; and he said the other day that no girl of proper spirit would put up with it. And I certainly do feel'—and here I could not but notice that a tear was stealing down her cheek—'I feel that something has come between us. He writes so seldom, and his letters are so different; and I know quite well that he is unhappy.'

And very woebegone the maiden herself looked, as she thought of Hubert's unhappiness, and her own.

'And the cause?' I gently asked.

'Well, what I'm going to tell you seems to me a sort of reason why I ought to be patient, and try to make every allowance for him.'

III.

I waited, and then she proceeded. 'I have never told mummie or dad, but (you see) you were at the ball that night, so you will be able to understand. Of course, every event of that evening is graven on my memory——'

'And so it is on mine,' I interrupted.

'You will remember, then,' she went on, 'how angry we were with poor Major Spicer when he tried to force his company upon us; and I recollect telling you how he had persecuted me for a dance.'

'Yes,' I nodded.

'Well, after I had left you I told Hubert, and he was furious about it; and I laughed to think how well-off any girl was with such a gallant cavalier to protect her. All at once when we were standing outside on the lawn, who should come up to me again but this same man! I felt sorry, then, I had ever said a word to Hubert about him, for there's no doubt Major Spicer had had too much champagne; and there was quite an unpleasant scene. And after that I did not see Hubert again until he came up to say "good-bye"; and then you both went away together.'

'Yes,' I said; 'we drove back to town together; but he was singularly silent, and never told me a word of all this. He said he felt rather seedy, and so when we parted I offered to call round at his hotel to see how he was next morning. But that was really the last I saw of him, for I returned home next day, and then he went off to Canada. I gather, Vera, from what you tell me that after we parted from you at Sussex Lodge you never saw him again.'

'No! never again,' she sighed.

'Well,' I said, turning to her, 'I fail to see in what you've told me any reason for coldness on his part now.'

'Is that really your opinion?' she asked. 'I attach so much importance to your opinion

about this, because, you see, you are a man, and look at things from a man's point of view. You don't know how I have questioned and questioned myself a thousand times whether there was anything—not in my actual conduct, you know, but in the view Hubert might take of my conduct that night. You don't think it possible, then, that he might have imagined that Major Spicer would not have behaved as he did towards me unless—unless I had given him some encouragement?'

'I know exactly what you mean,' I said, 'and I'm sure that no one who has any knowledge of you at all could dream of supposing that you would wish to attract a man like Major Spicer. But if you attach importance to a man's point of view, let me confess that you were looking quite splendid that night; and what man alive could help but admire you! I myself am one of your admirers, but then I am also privileged to be one of your friends. But in Hubert, remember, we have to consider not merely the friend but the lover; and it seems to me, still looking at it from the man's point of view, that every lover is liable to fits of jealousy, periods of insanity, and all sorts of vague alarms and overwhelming emotions.'

'No! Don't interrupt me,' I continued. 'Sometimes the lover is furious if any one ventures to glance at his fiancée; and then, perchance, he is still more furious if she is not the cynosure of all eyes.'

By this time I had brought a smile to Vera's face.

'Oh, he's not so foolish as all that,' she said, laying her hand upon my arm.

'At any rate,' I rejoined, 'he belongs to that "genus"—the "genus" lover! And now, here we are at your front door; and I have only this last word, dear—shall I do my best to get him back to this country, and see if I can't convince him that he must be head over ears in love with you, or else he would never have acted so foolishly as he has done?'

She placed her hand in mine. 'You are such an old dear,' she said, 'you will know what is best to be done.'

And so, when I got back home again to my old rectory in the country, I had nothing very particular to report to Hubert's mother; but I wrote what I earnestly hoped was a diplomatic letter to Hubert himself.

I was old enough to be his father, and I loved the boy; and I think he knew it.

As for Vera—well, if there had been no Hubert in the case, and I had not been so confirmed a bachelor, or if a thousand other ifs—why, I would—— But there's no use thinking what I would have done. I only know that for the sake of both those dear hearts, I felt it to be my duty to try to bring Vera and Hubert together again.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday*.

TRADE is seriously and dangerously bad.

Because the case of the nation in whole and of each one of us as units has become as critical as in the worst years of the war, the most thoughtful and sensitive men and women in this month of August will seek the seashore and the hills, not in the careless mood which is usual and helpful in less abnormal times, but as those who long for a ~~sense~~ sense of tranquillity, affording opportunity for the most serious reflections, the discovery of truth, and inspiration for action. For it is apparent that unless a change sweeps over the disposition of our people, their attitude towards work and life, they, as a great nation, will perish. In August here it is a custom to write gently upon the ease of holidays and the occupations of pleasure and relaxation; but Britain generally, whatever its outward mien, will surely be taking its vacation this time with an inward solemnity, yearning for encouragement and a new determination. Warnings clang upon the ears from every quarter. The high authorities are all turning towards pessimism. At the beginning of this year strong optimism was blown through all the public trumpets. The great trade revival was declared to be at hand; the dawn of the new prosperity was breaking at last. At it proved, this was but a fancy of the kind that is born from longing. Having no roots in fact and truth, it withered soon. By March it was known that the crisis, perhaps even the final crisis of our commercial status as a nation, was at hand. Company chairmen and the directors of the big banks expressed their anxiety in plainer terms than ever before. Individual authorities spoke out boldly. 'There is no hope whatever of translating into fact the delusion that Great Britain can once more become supreme as an industrial country,' said one of them. 'To put it bluntly, we must either export our goods or our population,' the Master Cutler of Sheffield declared. 'I fear thriftlessness, even a certain contempt for carefulness about money, is a characteristic of our generation,' the Deputy Public Trustee reflected. And, by way of stating that all the troubles of trade did not owe their origin to a single class, Mr Philip Snowden exclaimed, 'Let British em-

ployers of labour spend less time on the golf-course and attend to their own business; let them organise their business in a better way.' I do not side with anyone who suggests that in this Mr Snowden was speaking nonsense. Whatever be the cause—and there is probably a real cause in severe discouragement both by Government and Labour—some observant outsiders believe that our business men are losing in energy, acumen, inspiration, and ideas. Upon that matter of games Sir Frederick Lewis reflected some months ago that it was a remarkable thing that greater attention had been bestowed upon the reason for the defeat of an English polo team by Americans than to the cause of the defeat of British shipbuilders by the Dutch. Afterwards Britain was defeated at many other games, chiefly by Americans, and in the spring our trade and commerce received a staggering blow when a considerable British shipbuilding contract passed to Germany. Since then our industries have been further taxed, and now when we are preparing for the celebration of a very great industrial centenary, the establishment of railways, in which we led the world, the threat of a gigantic strike of the railway workers hangs upon us, and the quoted values of the railway stocks, which for many weeks past have been steadily and ominously falling, is lower than anyone remembers them to have been before. But at the beginning of the summer the nation was congratulating and priding itself—through the newspapers—upon the fact that in one week there were more great sporting events of the first class than ever before, championships galore the whole time, and the bulk of space in the newspapers given up to sport, and we were delighted to think that, however else we failed, we were a nation of sportsmen still! Has this sporting pride of ours not been overdone? And are we justified in it as once we were? The multiplicity of sporting events and the immensity of the crowds who witness them do not make us great sportsmen; and, even if they did, business came before sport when Britain was at her very best, and she will never rise to the heights again while the order is reversed. Yet with a large section of the community it seems verily to become a principle of life that

sport and pleasure are better than work and business.

* * *

No statement has struck the thinking section of the people more sharply than that by Dr Arthur Shadwell in the *Times*, in which he said that from pioneers we have become imitators, and slow at that. He sought to show that 'the present generation of young men took no interest in their work, and thought of nothing but their amusements,' and that the 'transference of interest from work to play is far more general to-day than it was twenty years ago, and it is common to all classes.' Then he said that 'the point is not that they play as a relaxation in leisure hours, or even that they watch others play, but that they think of nothing else. It is no longer recreation, but the chief preoccupation of life. And yet at these very sports and pastimes to which their whole attention is given—all invented in this country—they cannot hold their own against rivals who come from other countries, which a few years ago were thought incapable of any athletic prowess. . . . There is really something wrong with the present generation; they neither work well nor play well. They seem altogether lacking in energy and serious purpose. Those who are not go off to some distant region.' What rescued the country from its difficulties and perils a hundred years ago was work and economy. 'Until they are applied again,' says Dr Shadwell, 'there will be no recovery. There is much whining about German competition, but the lesson is not learnt. The Germans succeed because they work all round; not workmen only, but all of them.' We suffer in these days from a careless, negligent optimism, or an unreasoned confidence in the future. I think we need one million pessimists with imagination and constructive ability, and we could deal amply with the Germans then, and the Americans and French and all the others. Cabinet ministers, who have regularly sought popularity by dwelling upon the golden future that awaits us, and proclaiming the principle that all will come right in the end, have lately been compelled to face the truth and introduce a little warning pessimism into their speeches. Governments do little but talk and tax. It is remarkable that we have held the position so well for seven years after the war in face of all such difficulties; but the rest of the world is now preparing for a grand industrial campaign, and he who thinks that by sport, spending, and speeches we can still hold it, and that, in seven more years of such, England, Scotland, and Wales will stand where they did or ought to do, is wrong. In some form a cataclysm worse than war would have overtaken us. I have not quoted from these warning people because they have seized upon excess of sport—with failure at it—and of pleasure

as a key to our troubles. Any Briton who inveighs against honest sport and the healthy practice of it at the proper time might as well complain against the ordering of the universe. He would be a ninny and a nuisance.

* * *

Yet we should better understand what we mean by sport, and cease such nonsense as the talk about improving our foreign relations through its agency in the form of international matches. If statesmen cannot better these relations, how shall it be done by cricket, football, and golf? And the suggestion is humbug, for the history of the last half-century is strewn with bitter feelings and expressions instigated by international sport, culminating in the Olympic Games last year, which nearly collapsed through this cause. The world is not yet of sufficiently even temperament for the perfect success of international games. No people has yet reached that stage of simple unselfishness when it is indifferent to its own defeat in anything, and few of us think it desirable that it ever should. None likes to be beaten if victory or defeat is considered as a main issue in international games, while intense press propaganda forces and exalts this issue. But the best moral principle of all games is surely that they should be played purely for the love and the enjoyment of them—a lofty ideal which is approached, or, indeed, fully realised, regularly in our private play. It is neither realised nor even distantly approached in international games, or in professional shows for the attraction of spectators. Cricket and football with the Colonies are excellent; but cross-seas games might very well be left at that. We do wrong in forcing international sport in our present manner, announcing each bout with a proclamation of our own sporting strength and enthusiasm, and closing it, after defeat, with a measured expression of our sporting virtues. I am one of those who have loved sport keenly all their lives and have practised it in various forms regularly and with enthusiasm from schooldays until now. (I might claim—aver, if you permit—that I was the first in two countries to strike a golf ball.) So, with a multitude, I sicken at a new form of humiliating resignation that is being continually adopted by ourselves as losers towards our conquerors, and more especially—we must not fear to say it—the Americans. We are apparently afraid to offend these people—who are indeed now marvellously good at games, and in a certain way more efficient than ourselves, but possessed of an entirely different attitude towards them and understanding of them. British and American sport are oil and water. Much fearing to offend these Americans possessing so much power, we pay their players fulsome, adulatory compliments, in which I state, as one who knows, there is less than a full measure of

sincerity; and we praise our conquerors at times (I do not definitely refer to the Americans here) when we know beyond doubt that they have done sporting wrongs, upon which we feel compelled to be silent. For if we did not thus be humbugs, there would be trouble! For ourselves we are in danger of a great sporting decadence through too much publicity—much greater in our country even than in America—too much professionalism, too much spectatorship, too thin spine, and too little work, for the best sporting quality will never be produced in an individual or a nation that does not work in such manner that the pleasure flavour of the games is intensified thereby. However good we were at games, it would be foolish to expect us to retain any considerable degree of general supremacy now that they have become almost universal in the world. It is better that for a while we should move more slowly in these matters, especially in international sport, and lay ourselves well to work. So here we may pass to business.

* * *

A maxim of business enterprise is that the eyes should be 'kept open,' that the mind should be alert, acute, instantly receptive of fleeting impressions, to register them, to examine them, and to profit by them. The mass of business men believe with the full strength of their pride and conviction that they do thus keep open their eyes. Yet observation of them in many places and various circumstances leads one with some reluctance to the conclusion that this is a traditional and smug delusion. On their full establishment in business life they assume the virtues they should possess, and then in due season with self-satisfaction complain against governments, bewail the state of trade, and lament their unfortunate lot if they do not make satisfying profits. Such gloomy contemplations are commonly followed by spells of rest and recreation, or even prolonged holidays. The vision of a business man taking arms against a sea of trouble is rare, though not unknown. Disliking such warfare, he soon abandons it. And in the matter of hours of work, and days and weeks of rest and holiday, he is often an amazing humbug. Circumstances vary, but especially when things go well, it may be assumed, I think, that when the business man closes his office at five o'clock or earlier he has finished for the day, and usually leaves all work behind him as he meanders home. If he holds to his office from ten to five on five days a week—ten to one on Saturdays—for two months without a lapse he sometimes complains of overwork, and a sympathetic doctor suggests a sea-voyage. But professional men, including artists and writers—and I would say particularly these two—often work through fourteen or sixteen hours a day for seven days a week, and for many consecutive weeks, as I

very well know, yet complain not nor hanker after holidays. The humbug of business is great, and it is costly to the individual and the nation. The schools of commerce, which have been springing up everywhere in recent years, endeavouring to create a science of business and to define principles with details and methods with variations, should establish a Department of Ethics and Realities, designed to rid the business world of all the fungus of humbug that sticks upon it. Now, as already suggested, one of the features or principles of the general commercial humbug is that the business man is always 'keeping his eyes open.' For sweet tranquillity's sake I will accept and believe an assurance that all who are reading now do thus, to their good credit and for the enhancement of their deserts, keep open their eyes and are always alert, but the others do not. Were it not otherwise with those latter miseries trade would be better than it is, our commerce would not so much falter, the many splendid opportunities that still exist would not be missed. Observe the gigantic rewards that even now are being achieved in manufacture and commerce by those who keep open their eyes, are sufficiently alert and energetic, watching and taking the tide of fortune.

* * *

The schools of commerce and other business preceptors should teach the principles of acute, analytical, and applied observation. They should urge the necessity of refining the general wide and lazy vision to a sharp concentration on points, as in the game of golf, wherein the player finds that it conduces better to gaze intensely at a particular part of his ball rather than to slop a vacant vision on the whole of it. The old Red Indians were famous for a peculiarly acute trained manner of vision, by which they would examine with a microscopic minuteness, one by one, the most distant points, so that they could detect men and things on far horizons that the Palefaces could scarce discern through telescopes. It seems to some of us, their critics, that our business men should add to their abundance of merits this one of observing more acutely, and then pouncing like the hawk. Too often they fail to see wood for trees. They look, but they do not perceive that which is meant for their own case. I think of a story that was told of the artist Whistler by Sir James Rennell Rodd, who knew him well. The eminent diplomat said that there was a worthy and conscientious painter in water-colours who won the warm approval of Ruskin and achieved some mid-Victorian repute by spending years of his life on a camp-stool in front of St Mark's at Venice and carefully reproducing with a telescopic sight every detail, crevice, and tessera of mosaic in that astoundingly harmonious whole. Whistler

one day stood behind him, pretending to take a deep interest in his miniature brush-work, while with a piece of chalk he wrote in large white letters on the back of the poor man's coat, 'I am totally blind.' Having seen the chances missed by our business people abroad, listened to their admissions thereon, their faint excuses, with always their melancholy dirge, their gloomy accompaniment in the keys of Labour and Taxation, I think they are a little blind. Sometimes they still send out their catalogues solely in English to foreign communities who know not a word of our language. They do not readily offer to adapt themselves to the foreigner's conditions or to suit his convenience. They ask that the foreigner shall make round holes suit the square pegs they desire to sell him. The German and the American send him good round pegs on easy business terms, and nice pictures of their manner of fitting in attractive catalogues in the proper native language. Our consuls at many foreign places tell me that our manufacturers and traders have become too slow and lethargic; but then, also, I think there is often something to be said against the consuls and their old-fashioned ways. The American consuls are sharper and more enterprising. In search of inspiration I should like our business people to consider the Phœnicians. How wonderful was the enterprise, the perception of those ancient traders who came along the Mediterranean in search of markets! How they pounced upon every opportunity! They permitted no grass to grow under their Phœnician feet.

* * *

Are business houses, trading institutions in general, not too faithful still to some old forms and conventions? Like religion are some of these old ways in business. Once in my life, for a few months only on leaving school, I had a turn in the ancestral business, and the conventions wearied me. It appeared that unless a sheet of letter-paper were folded most precisely in the proper way it would never reach its final destination and never be read. I presumptuously proposed a new shape of paper and folding on the ground of attracting attention, and it was realised then that I had indeed but lately left my school. The heads of this concern seemed to feel it were better to be familiar with the gods than omit 'Messrs the' from the official title of a firm being addressed as the 'Something Coal and Iron Company.' However, I retired from business shortly after. I lost something then, but I sometimes feel in the least modest moments that business lost something too. I showed a certain promise. I recall most clearly my first trading adventure. I was then about eight years old, and played in a youthful community much addicted to the study and maintenance of the cheaper forms of live-stock. I bought a young rabbit one month

old for fourpence. The circumstances of the purchase are as clear in remembrance now as the happenings of this morning. A month was the earliest age at which the young rabbits could be taken from their homes; at six months they would breed. This was a very beautiful young white rabbit; it had pink eyes. It kicked with splendid vigour when I held it up for examination. Having paid the fourpence, I took it home, fed it at no cost whatever for the ensuing five months, and then sold it for one and sixpence. Perhaps in commerce it would not all work out like this; but it is easy to perceive that translated to mass production, as it were, this form and rate of business would yield the most gigantic dividends. It seems to the hero of this adventure that many good business men, old and well-respected, have too much conceit for their own old-fashioned forms, their 'yours of to-day's date,' their mock respect, their peculiar verbiage. A favourite joke of one of my business ancestors was that a firm he knew had such a large correspondence that it saved a substantial sum through omitting to dot the i's and cross the t's in the letters it sent out. But what might be saved by plain directness in most of the business correspondence of these times? What is meant by the old phrase 'business habits' is often something of a myth. Those habits are sometimes slow and stodgy. The business man often affects a fine superiority in sense over artists, writers, and other classes of persons who are supposed to deal only with films and fancies, and not to understand the grand realities of the business life as compounded in rows of figures. But is not something of the imagination of the artist and writer sorely needed in much of our commerce in these days? Surely imagination is more wanted than any other thing? It is imagination that has created that fine new industry in artificial silk which is now attracting more attention than any other. The business man has indeed called in the artist and the writer for his propaganda work. Pictures and paragraphs in advertising work are making great effect. Some years ago an old firm of seed merchants, disappointed with results, invited an eminent journalist of my acquaintance to their advertising assistance. He told me that he found that their only advertisement was the simple legend, 'Blank's Seeds,' which they thought most dignified and impressive. He strongly advised them to add two more words to it—'come up.' They were staggered at the idea; they resisted, but at last consented. The public looked and smiled—and bought. So the profits were increased. More artists and writers are needed in business—more new keen non-business blood. Years ago I had occasion to listen at times in court to the handling of commercial and patent cases by that acute scientific lawyer, the late Lord Moulton, and

was enormously impressed by the absolute mastery of every detail of complicated manufacturing businesses that he, not a 'business man,' acquired in the few days of the preparation of his case. Half-way through a hearing he was teaching the business experts, telling them of their faults, suggesting remedies. He

humbled them. The mysteries of business are not so deep as they are supposed to be; its difficulties are less exacting. Our trade must strike out with a new imagination and enterprise and freedom from old convention. Let us think of the Phœnicians, but keep in mind that we live and work among Americans and Germans.

IN THE VALLEY OF DECISION.

CHAPTER V.

I.

A MONTH went by, and still no letter from Hubert, and I began to feel nervously anxious about the result of my endeavour. And then one morning there it lay on my breakfast table, an envelope with the handwriting I knew so well.

The letter was brief.

'I have considered most carefully your letter urging me to return to England, and by the time this reaches you I shall be well on my way. The s.s. *Duke of Connaught* should reach Liverpool on Wednesday, the 3rd prox.

'As I am coming entirely in response to your letter, and to see you, and you alone, could you add to all your past kindnesses this last great favour and meet me in Liverpool?

'I shall go straight to the Lime Street Hotel, and await you there. You will understand from this that I am most anxious that not another soul shall know of my coming until after I have seen you.

'I shall value a talk with you more than I can say, for my difficulties, like a black cloud, blot out the light of heaven, and are a sore burden, too heavy for me to bear.'

'Poor boy!' I ejaculated; 'it looks as if he had got himself into some horrible mess, and can't find a way out.'

I wondered whether he had over-specified in land purchases, or anything else, and the very thought of the possibility of his appealing to me for a gift or a loan of money filled me with considerable anxiety; which was not allayed when I mentally took a peep at my bank pass-book. I earnestly hoped his difficulties were not financial, as any help I might give in that direction could only be very small—and yet my desire to help him was great.

However, it was no use surmising. I should know all about it on Wednesday the third; and if everything else were doubtful, there was no question but that I must be at Liverpool to meet him on his arrival. Unfortunately I had a church service and choir practice on that day, but these must be put off. I confess that I am a great stickler for the fulfilment of duties of this kind, when I have undertaken to do them; but I wasn't going to allow any friend of mine

to go hang at the end of a piece of red tape, if it was in my power to save him.

Therefore it was that on the following Tuesday evening I ate my dinner at the Lime Street Hotel in Liverpool, with a pleasing consciousness of being on the spot.

Next day an Express Service messenger awaited the coming in of the big liner *Duke of Connaught*, and succeeded in delivering my message to Hubert Carrington at the earliest moment, telling him that I was at the hotel, and that he would find me there.

It is unnecessary to dwell upon the intensity of the expectation which possessed me while I waited at that hotel. The arrival of the Allan liner was duly reported, but it must have been an hour and a half later ere I set eyes on my friend Hubert.

II.

There is something mysterious in any changes to be noted in the appearance of a friend whom one has not seen for some time; and one's own mental attitude may be described by a note of interrogation.

Hubert appeared strong and well, for he had lived an out-of-doors life, and was tanned by exposure to the air; but what I immediately noted was that he looked very much older than I had expected.

Only nine months had passed over him since I last saw him; but from his appearance it might have been nine years.

In my desire to cheer him up—and to hearten myself as well—I shook him very warmly by the hand, and bade him welcome back to old England.

'It is unspeakably good and kind of you to meet me here,' he said; 'as soon as I got your letter, I felt that the only thing was to come.'

'All right!' said I; 'we'll have a real good chat this evening—but not a word about your affairs now until after dinner. Table d'hôte is at seven.'

'Oh!' he rejoined, and stood looking at me in rather a confused and uncertain kind of way. 'Do you know,' he added, 'I think I would rather not appear at table d'hôte. You see I'm not supposed to be in England, and it's just

possible some one here might know me, and—and—'

'Quite so,' I interrupted; 'then I'll tell you what we'll do—they've plenty of rooms here, and we will dine snugly together in one of their private rooms.'

During the dinner a good many questions on both sides were asked and answered, but we studiously avoided the subject which presently was to engage all our attention.

In the course of our conversation, however, it transpired that, so far from his investments in land being a failure, he had achieved remarkable success. All my fear, therefore, about his financial position had been groundless.

What, then, could be that 'sore burden' to which his letter had referred as being 'too heavy' for him to bear?

The waiter had now brought us our coffee, and we had selected our 'smokes.' Hubert moved his chair closer to mine. 'That waiter fellow won't come in again,' he remarked; 'so may I begin?'

'Certainly, my dear fellow,' I replied. 'Fire away.'

'I come to you as my best friend,' he began; 'and the fact is, I am in terrible trouble. What I am about to confide to you is something of the utmost consequence to myself, and—to others as well.' He paused. 'You are a clergyman, and I am taking it for granted that everything I tell you will be regarded as absolutely confidential.'

'You wish me,' I asked, 'to consider your communication as being under the seal of confession?'

'Yes, yes!' he assented.

'Then may I take it for granted,' I said, 'that

what you wish from me is such counsel or advice as a clergyman may be expected to give?'

'Yes! that's just what I want,' he replied; 'but of course you won't mind my saying that I can't pledge myself beforehand to act on your advice.'

'Oh! I quite understand that,' I said; 'for just as I can't give you any advice until I've heard what you have to tell me, so you can't say you'll act on my advice until you know what it is. And there is one thing more,' I added, 'which I ought, perhaps, to mention. If, unhappily, a man has done anything wrong, and is longing for absolution and forgiveness, the condition, as you know, is true repentance. That is to say, he has to prove his repentance to be genuine, by doing his utmost to put right what has been done wrong.'

'Oh! God knows I do repent,' he murmured, 'but it is quite impossible for me ever to undo it.'

'Well! now, Hubert, tell me what it is,' I gently said; 'and you may be sure I will do my utmost to help you.'

He paused for a moment or two to recover himself; and then, 'Have you noticed that I tie up the sleeve of my coat now? I used, you know—'

'Yes,' I interrupted (for, as a matter of fact, I knew what he alluded to). 'That steel hand of yours, what made you give it up?'

'You remember,' he said, 'that fatal night at Sussex Lodge? Well, it was after that!'

I waited for him to say more, and presently he went on. 'That poor fellow, Major Spicer,' he said in broken tones—'it was I who caused his death, and it was with that hand.'

(Continued on page 557.)

LARGE FAMILIES.

By Rev. WILLIAM WATSON, B.D., D.Litt.

I.

ONE of the largest families on record, even of the mythical variety, must be that of the Indian god Krishna, who, in the Bhagavad-Gita, is credited with having had eighteen thousand sons. He, of course, was a polygamist to an extraordinary degree, with thousands of wives. In countries where polygamy prevailed large families were naturally not unusual. Rehoboam, the son of Solomon, for example, is said to have had eighteen wives, and to have begotten 'twenty and eight sons and threescore daughters.'

But not so very long ago in our own country the arrival of troops of children seems to have been counted a blessing. Susan Ferrier, our Scottish novelist, makes Mrs Violet Mac-Shake say to a young lady as she presented her

with a pair of diamond earrings, 'Hae, bairn, they belanged to your father's grandmother. She was a gude woman, an' had *four-and-twenty* sons an' dochters, an' I wuss ye nae waur fortin than just to hae as mony. But mind ye, they maun a' be Scots.' Large though many of the families were in the old days, it is difficult to beat that record without appealing to cases where there were at least two wives. Thus provided, a provost of Kirkwall in the eighteenth century had thirty-six children; and David Gregory, laird of Kinairdy, maternal grandfather of Professor Thomas Reid, the philosopher, had twenty-nine. George Bannatyne, whose name is famous in Scottish literary annals, was one of a family of twenty-three. In the kirk of Moneydie, in the eighteenth century, the same father had twenty-four children baptised; and the parish of Parton rejoiced in a man to

whom his four wives bore twenty-one children, the youngest of whom was baptised not a year before the death of his (or her) father at the age of over *ninety* years. There are several instances in which one wife bore twenty-two children. This feat was accomplished by the mother of Æneas Sylvius, afterwards Pope Pius II.; by Dame Christian, wife of Sir Henry Colet, and mother of the celebrated Dean Colet; and by the wife of a clergyman in the Synod of Kirkwall. It may be added that in the place last mentioned, over a hundred years ago, large families were the rule. Families of ten, twelve, and even fifteen children were not uncommon. In other parts of Scotland also children were numerous. The parents of Ralph and Ebenezer Erskine had fifteen, as had also the Rev. W. Mackay, minister of Wick. David Grieve, great-grandfather of William and Robert Chambers, had fourteen children. So, too, had Ralph Erskine, with two wives, and the parents of Dr Thomas Chalmers. Kenneth Mackay, the landless heir of Meikle-Torboll, afterwards a successful farmer, was equally blessed.

Conditions seem to have been much the same in England. The wife of John Speed, the chronicler, had eighteen children. The wife of Richard Bowes, whose fifth daughter was the first wife of John Knox, had fifteen—a number which was equalled by Milton's Earl and Countess of Bridgewater, and by the parents of the celebrated Robert Boyle. The parents of the famous preacher, Robert Hall, had fourteen. The poet Waller's second wife bore him thirteen children; and the mother of George Herbert had ten, as had also Milton's daughter Deborah. In other countries large families were not uncommon. Tycho Brahe, Zwingli, and Francis II. all belonged to families of ten; as had been the case with the great Greek Fathers, Basil and Gregory of Nyssa, in the fourth century.

The mortality in the case of large families was often very great—not a mere seventy or eighty per thousand. The mothers of Pius II. and Dean Colet, as we have seen, had each twenty-two children; in the one case only ten grew up, in the other only the Dean. The parents of Philip Doddridge, the original author of the 2nd Paraphrase, had twenty children, but only Philip and a sister survived their infancy. Thomas Gray, the poet, was the sole survivor of twelve. Of the fifteen children of the Earl and Countess of Bridgewater, famed in connection with Milton's *Comus*, five died young. Of the twelve children of Richardson, the novelist, all died young except four. Three of Ebenezer Erskine's ten children died in two months, and later he lost his favourite daughter. Of the eleven children of Edmund and Catherine Nelson, parents of Lord Nelson, three died. It thus appears that even in favourable circumstances children died at an alarming rate. The heavy

mortality was not always due to poverty. Dean Colet's father was twice Lord Mayor of London, and quite able, therefore, to bring up a large family. In the case of Ebenezer Erskine's children lack of proper sanitation was largely the cause.

II.

Have the children of large families much chance of success? Those of us who are acquainted with educational affairs know how frequently claims for exemption are advanced by the parents of large families, with the plea that poverty prevents them from keeping their children longer at school. But poverty may prove to be an incentive as well as an obstacle. Thomas Campbell, the poet, the youngest of eleven surviving children, was born when his father was sixty-seven years of age and had met with misfortune in business, the family having thereafter to be brought up on an income partly derived from boarders. Ralph and Ebenezer Erskine belonged to a family of fifteen children, and their father, suffering persecution, was very poor. Peter Cooper, the founder of the Cooper Institute in New York, was one of a family of nine children, and from early childhood was compelled to assist his father in making hats, his education being so neglected that he attended a poor school for the short period of one year; yet in spite of all he became a most successful manufacturer. Sometimes in a large family efforts may be made to push forward one child at the expense of the others, but probably few parents have recourse to the method adopted by an ancestor of our present Royal Family. William the Pious of Lüneburg, having fifteen children and not much property, received *by lot* a successor in Duke George, the sixth son, who was thus able to marry and continue the race of the Guelphs.

Has the eldest or the youngest in a large family more chance of success? Philip Doddridge, the celebrated divine, was the youngest of twenty, but only he and a sister had survived. Robert Hall, the famous preacher, was the youngest of fourteen; the poet Campbell, of eleven. Susan Ferrier, the Scottish novelist, was the youngest of ten. S. T. Coleridge was the tenth child of his parents, as was also Bishop Griswold (born 1766) of the 'Eastern Diocese,' U.S.A., who, in his youth, was alarmed by being told by a neighbour that when a child he had been led to believe that after bishops came to America they would claim from the people a tenth of everything, children included. Bishop Butler and John Fletcher, Wesley's designated successor, were the youngest of eight. Tycho Brahe, Lord Herbert of Cherbury ('Father of English Deism'), and Professor James Robertson (at one time minister of Ellon) were the eldest of ten. The Benjamin of the family may often be the favourite of his parents, but parents cannot

always 'command success.' Any member of the flock may be the genius. George Banuatyne, the collector of Scottish poetry, was the seventh of twenty-three; the celebrated Robert Boyle was the seventh son in a family of fifteen children. Zwingli, the reformer, and George Herbert, the poet, were respectively the third child and the fifth son in a family of ten. Thomas Chalmers was the sixth of fourteen.

III.

Large families have often produced distinguished men, but the converse is far from being always true. Dean Inge, in one of his *Outspoken Essays*, points out that, according to Mr and Mrs Whetham, 'before 1870, 143 marriages of men whose names appear in *Who's Who* resulted in 743 children, an average of 5.2 each; after 1870 the average is only 3.08.' Tycho Brahe (born 1546), the scientist, himself one of ten, had a family of nine. The poet Waller (born 1605) had by his second wife a family of thirteen. D. M. Moir ('Delta') had eleven children. If, however, we take men who were distinguished for their position rather than for their genius, we may easily add to the number. At the present time large families seem to be produced chiefly by slum-dwellers, miners, and probably farm servants.

A large family is not easily brought up under any circumstance, but circumstances are rendered doubly adverse if the father dies. What are we to think of the mercy of a king who 'reduced to a poor and desolate condition,' by putting to death their father, the twelve children of Archibald Johnston, Lord Warriston? George

Buchanan, the humanist, ever remembered with gratitude the fact that, when his father died before his family of five sons and three daughters had grown up, their mother, Agnes Heriot, successfully accomplished the heroic task of rearing them. In more modern times men who have attained to positions of distinction have sometimes a similar tale to tell of maternal devotion. The father of Governor Thomas Talbot of Mass., U.S.A., died when Thomas was only six years of age, leaving seven sons and one daughter to be brought up by their mother, on whom they were entirely dependent.

The chief care of a large family naturally falls upon the mother, and she has, therefore, usually a heavy burden to bear. Elizabeth Hall, mother of Dr Thomas Chalmers, and of his thirteen brothers and sisters, was 'a grave, methodical, and anxious-tempered woman.' Ebenezer Elliott, addressing his wife in *The Excursion*, says:

Bone-weary, many-childed, trouble-tried!
Wife of my bosom, wedded to my soul!
Mother of nine that live, and two that died!
This day drink health from nature's mountain bowl!

But the mother may live to enjoy a cheerful old age. The wife of John Speed, the chronicler, in spite of having had eighteen children, lived to celebrate her golden wedding. Dean Colet's mother, in spite of having borne eleven sons and eleven daughters, and lost them all save the Dean, reached her ninetieth year, and, says Erasmus, 'looked so smooth, and was so cheerful, that you would think she had never shed a tear.'

THE FOOL'S ERRAND.

By ALISON YOUNG.

I.

WHEN Henrietta Thornley married a man thirty years her senior she basked in a doting admiration that was abruptly terminated by her husband's death ten years later. She found that the effects of adoration are relaxing, and realised with difficulty her position as an independent woman. Her only child was a daughter, so the estate went to a cousin of her husband's, and she removed to the Dower House, in which she was life-rented, and proceeded to educate Mildred.

Mrs Thornley took herself very seriously. She plodded valiantly through a series of governesses. She went to London for the winter, and Mildred was sent to classes and had music lessons in bewildering variety. At eighteen Mildred was a charming child, in spite of the purposeful upbringing, with a curious old-fashioned composure and a wistful expres-

sion that Mrs Thornley liked to think was appealing. There was a strong vein of sentimentality in her own make-up, and Arthur Thornley had openly rejoiced in her dependence.

It was with a warm glow of self-satisfaction that Mrs Thornley forced herself to decisions and planned out her daughter's education and future. With busy fingers she smoothed out the creases of budding adolescence and worked herself into Mildred's every thought. She ruled the girl completely, and her strongest weapon, with the daughter as with her husband, was her obvious self-sacrifice.

There was a certain look that Mildred dreaded when she dared to make plans or suggestions; rather than risk its appearance she allowed her mother to arrange every detail of their comfortable life.

There was one person who was not quelled by that look, as Mildred was, nor irritated into hastiness, as Henrietta's own family had been.

Harold Jennings, the younger son of a neighbouring squire, had been a great friend of her husband's, and realising a 'good life' in the devoted and practical young man, Arthur Thornley made him one of his trustees.

When Mrs Thornley played her strong suit with Harold Jennings he merely met it as a matter of course. He had urged her to send Mildred to school, or at least to allow her more freedom with her own contemporaries; but in vain. The maternal eye was vigilant, and Mildred's friendships were carefully chosen and never allowed to become too intimate. The child, she declared, was the mainspring of her life, and she saw to it that no influence but her own should carry weight.

II.

For the last four years Harold Jennings had been lucratively employed abroad; his family made no secret of the fact that Harold had done well for himself at last. Mrs Thornley felt a faint flutter of excitement as she learned that he was once more in England.

'Harold is coming to-day,' Mrs Thornley said one morning. 'He writes to say that he would rather come here, as the Grange is filled with people for the dance and he has arrived unexpectedly.'

Mildred's eyes brightened suddenly. Cousin Harold had been a powerful ally once. 'Is he going with us?' she asked. 'Cousin Harold never cared for dances long ago. . . .'

Mrs Thornley smiled indulgently (one of her most irritating habits). 'Long ago, Mildred? Only four years. Well, I expect Jane would be greatly annoyed if he didn't go, but I quite understand his not wishing to arrive in the midst of one of their bear-garden parties.'

Mrs Thornley rarely spoke with such heat, but she missed the momentary frown in Mildred's clear eyes. She had been vexed lately by the revival of a childhood friendship between Harold's nieces and Mildred. Clare and Daphne Jennings had been away at school, and Mildred spent only the summer at the Dower House till now; wintering in London was an excellent check on the intimacy of her youthful companionships. But Mildred loved the Dower House and was anxious for a 'country Christmas.' Besides, Mrs Thornley had no mind to take the child about much in London, and, having completed the education, she intended to reap the benefit.

The Jennings family were disreputably modern, according to Mrs Thornley. The fact that two sons and their friends were constantly coming and going gave her a feeling of insecurity.

In her heart she dwelt on what she herself had given up for Mildred. Not very much, if the truth were to be faced; merely avoiding the tentative love-making of Harold Jennings

with such skill that matters never really came to a head. But the thought of losing Mildred was unbearable, and she had already broached the subject of a sojourn in the south of France as a means of breaking the friendship with the Jennings girls.

Mildred acquiesced with precocious wisdom and a mental vow to fight the matter out later. Mrs Jennings had already asked her to join a party in Switzerland after Christmas, and Mildred knew that her mother would be asked about this at the dance. The Riviera project hung like a cloud over her present happiness.

Herein lay Cousin Harold's possibilities.

III.

'Well, Henrietta, not a day older, I declare,' was Harold's genial, if tactless, greeting later on in the day. 'And where's my godchild?' He scrutinised Mildred. 'Somehow I'd overlooked the fact that she would be so grown-up.'

Then Mrs Thornley clinked and rustled at the tea-table, and Mildred was prettily interested in his rather annoying god-paternity, while Mrs Thornley mentally noted how bald Harold had become. Later on Mildred was sent upstairs to rest, and went obediently; but there was an argumentative set about her back, Harold thought.

'Remember, Harold, I strongly disapprove of Jane's methods with Clare and Daphne. She lets them run wild; they are so very independent. Mildred and I have always been so much to each other. . . . We are very old-fashioned, perhaps, but I still think that a girl's best friend is her mother.'

Mrs Thornley's satisfied smile crystallised into surprise as she realised that Harold was simply not listening.

'Yes,' he answered absently, 'she's a delightful child; does you credit. Now, Henrietta, about this matter of oil shares. I saw a man in the city the day before yesterday and he says—'

Harold talked oil shares for fifteen minutes by the clock, and it was Mrs Thornley's turn to lend an inattentive hearing; she pondered on the fickleness of man. Four years ago oil shares would not have supplanted a promising confidential talk, though, she reflected, Harold had done very well for himself and looked thoroughly prosperous. A nice safe person with money.

'You will send me the papers marked where I must sign them, Harold. And now I will show you your room. We promised to arrive punctually; dinner is at eight,' she said at last with a brave, weary sigh that was lost on Harold.

IV.

The Grange was an ideal house for a dance, Mrs Thornley remarked, with her striking originality. Certainly the old-fashioned double

drawing-room, with its empty shining floor, glowed an invitation to the crowding boys and girls.

Harold Jennings was as little introspective as successful business men are wont to be, but he found himself wondering vaguely if he too had ever known the care-free enthusiasm of these nephews and nieces. He watched them curiously, and then Johnny, his eldest nephew, claimed Mildred for the first dance, and he suddenly became aware of the reason for his god-daughter's suppressed rebellion. It had puzzled him again during dinner. They made a pleasing picture. She was fresh and slight, and her dark head was well set on; and Johnny was unmistakably British, with the reddish complexion that an open-air life brings to fair men.

Harold remembered Henrietta's remark before dinner—something about being old-fashioned. Evidently Mildred had been painfully old-fashioned enough to fall in love.

He sought for Mrs Thornley. She was serenely employed in roaring commonplaces to old Lady Falche, who would *not* use an ear-trumpet, and whose opinion of her as a 'good woman, and a devoted mother' was always a source of satisfaction to Henrietta. When they danced, he whirled her desperately round the room, suddenly reversing in as energetic a fashion. Henrietta did not care for dancing, and decided that Harold's style was painfully fatiguing, so she was relieved when they subsided on to a sofa under the staircase.

Harold immediately set to work to find out if she knew Mildred's secret. His methods were like his dancing—of a somewhat abrupt order—and Henrietta was not expansive. She was longing for an opportunity to criticise his sister-in-law's arrangements. Jane Jennings had the unpleasant and unusual effect of making her feel worthless. It was, therefore, an undeniable pleasure to disapprove.

But Harold had other views. He persistently talked of Mildred, even asked if she was fond of anyone.

'Certainly not. Mildred and I share every thought,' retorted Mrs Thornley, and made some pretext for returning to the ballroom, vaguely uneasy.

v.

Later on Harold took Mildred to the same retreat. He had decided that the dance of to-day was not suited to his robust interpretation; besides, he was intent on finding out how matters stood.

Mildred was anxious to tell him of the invitation to Switzerland, and he realised dimly that she dared not broach the subject herself and wished him to help her. In her eagerness she forgot that the dance was over long ago, and that Johnny Jennings would be waiting.

Mrs Thornley prepared to leave. Her larynx protested against further conversation with Lady Falche. Harold had disappeared, and Mildred, too, was nowhere to be seen. Never before had she regarded the girl as a separate entity, nor had the actual possibility of losing her thrust itself into her serenely satisfied mind. She crossed the hall, expecting to find Mildred in the 'schoolroom,' a haunt sacred to Clare and Daphne, since she was not to be seen among the dancers.

As she moved towards the staircase she was startled to hear Harold's voice: 'But she can't expect to have you always, Mildred. . . .'

And Mildred's wistful answer: 'No; but I simply can't leave her. She would hate to be alone. . . .'

Mrs Thornley's heart seemed to miss a beat, but she went slowly up the stairs.

vi.

Harold! The thought seared her brain. She had vaguely schemed to circumvent these Jennings boys, and now Harold, her own familiar friend, was the one to be dreaded. His clumsy inquiries and Mildred's absence for the last few dances pointed, in her opinion, to one conclusion.

She wandered to a dim corridor, stacked with the ghostly débris of the turned-out drawing-room furniture, and sat down in a gilt and brocade chair that was jammed between a William and Mary cabinet and a lacquer screen.

Mildred, too, whose every thought she shared! Her pet phrase brought a shudder. So it was for this that she had planned and schemed. Waves of self-pity chased each other in her mind, till suddenly the thought of Mildred's wistful eyes turned her self-engrossed thoughts to the child herself. 'At least,' she murmured, 'she showed great devotion.'

Then she leapt to a decision. She would accept Jane Jennings's offer made to-night. The child should go to Switzerland. She herself would pursue a lonely course to Cadenabbia, where her honeymoon had been spent. Clothed in resignation, she decided it was a fitting conclusion. Also, she hoped, Mildred would soon come to her senses, left with the young Jennings, and Harold would be forgotten.

She rose and hurried downstairs, to find Mildred dancing with Johnny Jennings, and Harold stifling yawns and saying he had hunted everywhere for her. As she left, Mrs Thornley accepted her hostess's invitation for Mildred, and intercepted an astonished glance between the girl and Harold. 'I am so glad to think that Mildred will be with people of her own age; and you will take care of my little girl, I know,' she added. 'Good-night, dear Jane—such a successful dance.'

VII.

Time dragged abominably at Cadenabbia. Mrs Thornley found that twenty-year-old romances, however personal, lose their power to engross the mind, and that the most angelic resignation of spirit palls as a pastime if there is no audience. The place was deserted just then. There were very few English people in the hotel, and she had a righteous detestation of foreigners.

Mildred's enthusiastic letters added to her dissatisfaction, and the fact that Harold had lately joined his sister-in-law's party did little to allay it. The bustle of preparation had in some measure lulled her feelings of annoyance. Harold's few letters were to herself and concerned oil shares.

Had she been unwise, she wondered, as she sat on the verandah of the hotel opening her letters. One from Mildred; she put that aside till the others were read. One from Jane Jennings. . . . Curious, and whose unknown writing was this? She tore the

envelope with a sudden misgiving. It was from Johnny.

Then . . . Harold was *not* faithless after all. The thought persisted as she read the letters one after another; Mildred's apologetic but blissful pages last of all. She was engaged, subject to her mother's approval, to Johnny.

Henrietta had known Johnny since he was crumpled and red and in long clothes, but Mildred used four perfectly good sheets of hotel notepaper in a description of his pleasing qualities. Furtively Mrs Thornley dabbed her eyes, awaiting composure to go to her room. She made a vain attempt to find it pathetic that she should have heard this news in just this spot, but she was curiously relieved in spite of herself.

Suddenly she became aware of some one beside her. 'Henrietta, I started as soon as I knew, because I was afraid you'd hate this. Mildred's terrified that you are lonely. . . . Henrietta, there's no need for you to be—'

Harold Jennings, blundering as usual, had chosen the worst possible place for the best possible conclusion.

APPALUCY.

PART II.

VII.

IN the process of raising dust on the flying trip back to Marysville one of the front wheels of the car dropped into an unsuspected chug-hole when they were within a quarter of a mile of the town. The car slewed wildly sideways and overturned. Harvey was thrown out unhurt. Johnson was pinned beneath the car.

He was severely and painfully injured; two of his ribs were broken and an ankle badly crushed.

Fyffer enlisted the aid of townspeople for the purpose of carrying his deputy to a hotel, where a surgeon was called to attend him. Then, having done what he could for the other's comfort, the sheriff cast about him for a means of continuing his search for the hard-boiled mug. His choice fell on Johnson's spotted pony.

'I can use up two stones and only hurt one bird,' he thought; 'take the cayuse back to the Triangle-J, and get myself there too. I wonder if the speckled hyena will let me ride him.'

In his equine way the spotted horse regarded Johnson as a friend who understood and sympathised with him, and who was to be trusted to do the right thing on all occasions. All other humans he considered his enemies until they might prove themselves otherwise.

Harvey Fyffer was fairly familiar with the vagaries of the dynamic little horse, and, being an accomplished and understanding horseman,

he respected Spot's idiosyncrasies, and rated them at exactly what they were worth.

An ounce of oil of rhodium applied to hands and clothing went a long way toward ingratiating him with the peculiarly marked cayuse; soothing speeches and fearless horseman's touch won his confidence to such an extent that he allowed the sheriff to mount.

Spot was not at all certain as to what he ought to expect from his latest rider, nor how he should conduct himself. He reared on his hind-legs tentatively; then performed a few minor crow-hops in a precautionary effort to discover exactly how Fyffer was disposed toward him. As neither quirt, spurs, nor reins were resorted to in retaliation, and the sheriff exhibited no slightest symptom of either fear or hostility, the pony decided to accept him temporarily on approval. Besides, the man quite evidently wanted to go toward the Triangle-J, and Spot wished most devoutly to go there too, in order that he might renew relations with his feed-box.

The little horse took the trail out of Marysville at a swinging fox-trot, which he was capable of maintaining indefinitely. Harvey sat his saddle in the loose, slouching style which rangemen long ago found to be the easiest possible saddle pose both for themselves and for their horses.

Night had fallen. There was little or no traffic on the road. Spot swung steadily along, breathing easily, and seemingly tireless.

It was after ten o'clock when they topped a rise of the road and from its summit saw the mile-distant lights in the windows of the Triangle-J ranch house. They crossed the crest of the eminence, descended its farther side, and stopped that the pony might drink at a stream which crossed the road at the foot of the hill.

The pony lowered his nose and drank; then threw up his head and snorted. Something stirred in the bushes at the opposite side of the creek. A man crawled weakly out on his hands and knees, and collapsed in the road with a moan.

Harvey urged Spot across the creek, hastily dismounted, and ran to the fallen man. He dropped on his knees beside him to see what had happened, and then . . . the man rose suddenly to his knees; his arm swept out in a swift, short arc, and the blackjack he held smote the side of the sheriff's head. Harvey Fyffer pitched forward and lay still.

VIII.

The man scrambled quickly to his feet and, without a glance at his victim, strode toward the waiting pony. Spot leaped back with a protesting snort when the man's hand touched the bridle reins. The malefactor sprang at him, caught the horn of the saddle, and swung himself nimbly up.

Here was Spot's opportunity to assert himself. This was no friendly hand on his bridle rein; these no kindly-intentioned heels that drove spurs into his startled flanks. This was a full-fledged enemy—one of the breed whom it was his inalienable right to undo.

Any rangeman who observed the clearly-defined sign of the cross on Spot's withers, or noted the feathery tufts of hair at the tips of his pointed ears, would have known him at once for a horse of the 'whale-bone' variety, which has to be killed to be conquered.

Spot rolled his eyes and bared his teeth. His little tufted spike-ears lay flat against his head. He knew exactly what to do. He'd endure the pain of the torturing spurs for a second or two, and sulk; then, when the rider shifted his balance in the saddle ever so little. . . . Spot went into action with a characteristic snort. His back suddenly bowed in a full half-circle and he sprang three feet straight into the air with his nose between his knees. He struck the ground stiff-legged and with bone-displacing force, rebounded instantly, and right-about-faced in the air.

Harvey Fyffer rose unsteadily to his knees, then to his feet. The stunning effect of the blackjack's hasty stroke had lasted several seconds and was rapidly wearing off. His head was throbbing painfully, but his senses were reasserting their sway. He had a revolver with him, but had no wish to slay the man who had assaulted him, and to threaten him with the

weapon, engaged as he was with the madly-fighting pony, was useless and entirely absurd.

The man was certainly an experienced rider of vicious and intractable mounts. He fought the little Opalousas with quirt, spurs, and reins, and Spot fought savagely back—sunfishing, fence-rowing, swapping ends, and weaving.

The rider's nose commenced to bleed. Blood oozed from his mouth and from his ears. He lost a stirrup. Spot reared and wheeled on his hind hoofs. The man leaned forward, struggling to regain his stirrup. The pony plunged wildly, then stopped, and bucked again. The man realised that the horse had outfought him. Frantically he clutched the saddle-horn. Spot reared again suddenly and threw himself bodily backward. This is a vicious horse's trick against which no rider can guard.

The man threw himself sideways from the saddle—too late. The pony crashed down on top of him and pinned him to the ground, with the saddle-horn crushing against his ribs.

IX.

Spot was on his feet again almost instantly. Harvey Fyffer walked toward him with outstretched hand. Spot snorted and drew back, hesitated, then advanced his nose somewhat timidly and softly nuzzled the sheriff's arm. He was accustomed to being petted by Johnson after he had creditably performed.

Having partially quieted and reassured the little horse, Harvey turned his attention to the fallen rider, whom he had already recognised as the hard-boiled mug whom he sought. The man was not seriously injured, though his escape from a horribly painful death was nothing short of miraculous. A hatful of water poured over his face revived him sufficiently to allow him to sit up. 'I guess you've got me, sheriff,' he said with an uneasy grin.

'It certainly looks like it,' said Harvey. 'Do you mind telling me why you wanted that cayuse so bad?'

'My own fell and broke his leg about half a mile from here,' the hard-boiled one answered promptly. 'I killed him, and hoofed it down here to the road in the hope of getting another. I saw you coming over the hill and laid for you. I thought it was Johnson.'

'I see,' said Harvey Fyffer. 'Then you figured on hiding in these hills for a while?'

The man hesitated perceptibly, then nodded his head.

'Look here,' said Harvey suddenly; 'I believe I can do business with you. The shortest and most direct route to Canada is up over the divide through the New Hope Pass and then straight north from there. I might say that I haven't figured on riding that way for a day or two at least. Suppose you tell me what's happened; then I'll leave you here while I go on to the Triangle-J to get a wagon to haul you in.

You're awfully badly hurt, you know, and, if you haven't done anything serious, I wouldn't be afraid to leave you here alone. How about it?'

The man considered the proposal for several minutes, and eventually said, 'It's a bet.' Then he proceeded to talk, and before he had finished his narrative the sheriff's eyes were wide with wonder.

'Here,' he said, when the man had told his tale, 'I've a fountain pen and a note-book. I'll write that down and you sign it. You've given me proof enough that you're telling the truth, or else you're the best single-handed liar that I've ever listened to yet. It wouldn't be hard to pick you up again if you are, but I'm willing to bet that you're not.'

He wrote steadily for several minutes, then handed pen and note-book to the hard-boiled mug, and asked him to sign his name. The man read what the sheriff had written, and affixed his signature.

'All right,' said Harvey Fyffer. 'I'm going to the Triangle-J now and I'll have to lead that cayuse in. Nobody but Johnson could ride him now, as excited and all as he is. Take good care of yourself. I'll be back inside of an hour.'

He picked up Spot's bridle reins and led the pony away. Before he had gone fifty steps, the hard-boiled mug got hastily to his feet and commenced to run in the opposite direction—straight north.

X.

At the Triangle-J ranch Harvey's first act, after turning Spot over to the care of one of the ranch hands, was to go to the telephone and put in a long-distance call for the County Attorney.

'Hello, Chris,' he called, when he got his connection. 'Fyffer speaking. I'm at the Triangle-J. Get me a warrant for the arrest of Maxwell Brant on suspicion of conspiracy or something, and send it out to me with one of my deputies as quick as you can shake it up. What? Maxwell Brant. I said it. Notify the State Bank Examiner right away. Yes, *Bank Examiner*. Oh! I see. Yes, Brant's been using the bank's funds, and hired a tough to fake a hold-up so he wouldn't be caught twelve thousand dollars short. Get the idea? He sent the clerk out, and this chap came in and locked Brant into the vault, then rode away on Charley Johnson's pony so everybody could identify the horse. How did I find it out? Pure accident, Chris. I just got the idea somehow that it didn't look like the real thing. When I chewed it over with Johnson I began to see that this guy wasn't acting natural. I got a whiff of oil of rhodium off his clothes when he was in Durkee's Place, and something that Johnson said afterwards gave me the tip that this guy was the one who'd been riding Johnson's horse. Yes, the speckled one.

'What's that? I'd make a good detective? Say! I couldn't detect a leg on a centipede. I thought all along that poor old Johnson was mixed up in the deal, and made him a deputy because I had some kind of a Nick Carter idea that if I kept him with me and kept talking to him he'd say something that'd give him away. —Oh! yes, I got the evidence all right, but it was a clear case of the luck that does you good beside helping you. We'd have all been up in the air if it hadn't been for that Appalucy horse. —So long, Chris.'

THE END.

THE MONTH: SCIENCE AND ARTS.

REVIVAL OF DAMPERS FOR OPEN FIRES.

ALTHOUGH the open fire has been improved almost out of recognition, one accessory which our forefathers found useful has been largely abandoned. This is the damper or 'register,' which was fitted to every old-fashioned fireplace. A modern open fireplace has lately been devised in which this feature is provided in combination with an adjustable canopy. When the canopy is pulled out, a butterfly damper behind it is pulled open also, and the strong draught causes the fire to burn brightly. Should less heat be required, the damper is partially closed by pushing in the canopy. In other respects the fireplace is similar to others of the modern type which have a barless grate and an ash-tray. A good feature is that the fire-brick back and sides are easily removable from the front.

THE LAST WORD IN KITCHEN-RANGES.

Only those who remember the kitchen-ranges of last century can realise the great improvements that have been made in this important item of domestic equipment. The following description refers to a recent model in which every device is incorporated that has been suggested by the makers' long experience in coal-ranges. Of the special features the chief is a lifting bottom grate which is raised or lowered by a fire-table in front, without using a poker or a special tool. The fire-table rises and falls with the grate, and is therefore always at the same level. The front bars are of planished steel, and their upper ends are cast into a top cross-bar which rests loosely in a recess at each side. At the bottom the bars pass through holes, and therefore expand and contract freely, instead of warping with the heat. They can be lifted out

in a moment, giving free access to the boiler flue and to the bottom grate for cleaning purposes. The fall bar at the top of the front bars is mounted on a hinged frame, which can be swung aside to facilitate roasting or toasting. The oven door may be opened by means of a pedal when the cook is carrying a heavy dish in both hands. The oven can be fitted with a glass door, which is protected by an outer steel door. It is then only necessary to open the outer door to observe the progress of the cooking. A heat indicator enables the cook to keep the oven at the required temperature by adjusting the dampers, which are provided with indicators showing how far they are opened. By means of a regulator the heat from the fire may be concentrated on the top or on the bottom of the oven as desired. Another refinement is a sliding instead of a lifting fire top. A heated-air inlet is provided for ventilating the oven in conjunction with an outlet to the flue. Dust is drawn into the flue if a pedal is depressed when the fire is poked or the bottom grate is moved. A hot closet for plates and food, which has a balanced glazed door, is provided at the top of the range. One type of range, with an oven one side of the fire and a water-boiler on the other, has provision for quickly fixing in position an extra collapsible oven on the hot-plate over the permanent one.

A STAINLESS KITCHEN TABLE.

White enamelled steel is so obviously advantageous for kitchen tables that one wonders why it has only lately been adopted. A table top of this description cannot be stained or damaged by hot cooking utensils, while its surface is ideal for rolling out dough for pastry. The combined kitchen table and dresser in which this feature is embodied also possesses other good points. With a top measuring 48 ins. by 27 ins., or 41 ins. by 25 ins., the underneath part is fitted with three drawers at one end and with a cupboard at the other. A wide folding flap at one side, having a bare wood top, is supported on a frame with two legs. When the flap is folded down this frame pushes in against the side of the table, the two upper cross members sliding into square holes under the table top. This method of supporting the flap is much firmer than the device of hinged legs. Supplied with or without the flap as desired, these enamelled steel-topped kitchen tables are finished in plain wood, or with the wood stained and varnished, or white-enamelled.

OLEAN MILK.

More than a decade of the present century had passed before a scientific study was made of the problems connected with the supply of pure milk. In 1912 the National Institute of Research in Dairying was founded by the Board of Agriculture under the Development

and Road Improvement Fund Act of 1909, being established at University College, Reading. An experimental farm was acquired in 1920 at Shinfield, to which place the Institute was transferred in 1923, on the completion of new laboratories. Much useful work has been done by the staff of the Institute towards producing clean, untainted milk, and the prevention of its contamination during handling and distribution. Efforts have also been made to improve the processes for making cheese and butter. Advice on these matters is given for the asking; hence, no dairy farmer can plead ignorance as an excuse for supplying contaminated milk. With a view to indicating the constituents of fresh milk which counteract the disease of florid rickets, some interesting experiments are reported as having been carried out on young pigs. A litter of eleven were fed on dried separated milk, toppings, barley meal, and phosphate of lime, direct sunlight being excluded. All developed florid rickets. Two were cured in the same surroundings, and on a similar diet but with the addition of half an ounce of cod-liver oil daily. Two others were cured by direct sunlight without any change in their diet. The remainder were slaughtered for the examination of their bones. Among the interesting features brought to light by the feeding and examination of cows were 'the superiority of meadow hay as compared with seeds hay as a source of the growth-promoting vitamin; the influence of cod-liver oil in increasing the vitamin A content of the butter; the lack of unpleasant flavour in the milk even when eight ounces of cod-liver oil were fed daily.' Other subjects investigated were the cause of the discoloration of Stilton cheese, which results in severe losses to the makers; and the effect of heat on milk.

THE MOST POWERFUL LIGHTHOUSE IN THE WORLD.

Certain guiding lights for aircraft now far exceed in power those which warn mariners of their proximity to the shore or to dangerous rocks or sands. Visible for three hundred miles on clear nights, the most powerful lighthouse in the world has lately been completed and lit up at night on Mont Afrique, on the Plateau of Dijon in France. It has been erected for the guidance of aircraft proceeding from Paris to Switzerland, Italy, and Africa. The light consists of eight powerful electric arc lamps with dioptric lenses. These elements are divided into two groups of four, the light from each of which converges into one beam. Since the groups face opposite ways, two beams are projected in opposite directions. Having only a slight angle of divergence, the light from these beams is strongly concentrated, and amounts to something like one thousand million candle power. As the light is projected almost horizontally, aeroplanes or airships within a

short distance of the lighthouse would not be able to see the light unless provision was made for throwing some rays upwards. This is done by arranging a narrow vertical slot in the upper part of each lens, through which the light shines toward the zenith. A good idea of the size of the apparatus may be gathered from the facts that each lens is five feet in diameter, and that the lantern measures eighteen feet across. The lamps and the lenses are mounted on two circular platforms, the one above the other. Two of the lamps out of the four on each platform form one group. Under the lower platform is a third, which serves as the floor of a circular compartment in which is kept a set of spare lamps, with a small hoist for raising a fresh one into position. All three platforms are mounted on a central pivot, about which they are rotated by an electric motor, the weight being carried on a ball-bearing. Mechanism is provided for varying the duration of the flashes and of the intervals between them, although for the present a constant speed of rotation has been adopted, which gives regularly-recurring flashes. The lighthouse is a cylindrical steel structure, with a lantern round the lamps, above which is a conical roof that rises to a height of over thirty feet. Enormously powerful as is this guiding light for aircraft, it is understood that the builders, the noted French makers of lighthouse apparatus, Messrs Barbier, Bénard, and Turenne, have prepared designs for lights of still greater range.

A COMBINATION DOMESTIC TOOL.

A novelty to be seen at the Wembley Exhibition this year is a combination domestic tool, consisting of a tin-opener, a knife and scissors sharpener, and a glass-cutter. The various devices are carried by a nickel-plated iron handle. Having a tiny cutting wheel with a V'd edge, the glass-cutter is much more effective than previous tools of this type; in fact, the results appear to be equal to those obtained with a diamond, while only a light pressure is needed. It will cut glass into any form in a few seconds, curved as well as straight edges being cut with equal facility. At the opposite end of the frame is a tin-opener of the type in which a puncture-making spur driven into the middle of the top of the tin acts as a fulcrum to a radially-adjustable cutter for different diameters. A carbon steel blade of great hardness at one end of the tool projects into the apex of a V-shaped opening in the handle. With the sides of this slot the blade forms an acute angle through which a knife to be sharpened is drawn, this action causing the edge to come in contact with the sharp edge at each side of the blade alternately as the knife is drawn through, first at one side and then at the other. The other end of the carbon steel blade is of such a form that, in conjunction

with the end of the handle, it will sharpen the edges of scissors at the correct angle. Owing to the extreme hardness of the sharpening bar, this appliance is specially suitable for stainless steel knives.

ICE BY TURNING A HANDLE.

Freezing and cooling appliances may be divided into three classes: (1) Power-driven machines, in which some substance, such as ammonia or CO_2 , is used for making ice in large quantities; (2) appliances employing mixtures of ice and salt; (3) hand-worked ice machines on the vacuum principle, for household use and similar purposes. A small machine of the last-named type, of an improved design, has recently been put on the market, and with it a carafe of water can be frozen in less than three minutes, or a 2-lb. block of ice can be made in twenty minutes. It can also be used in making ice-cream, and for cooling butter, wines, and mineral waters. A special advantage is that ice can be made when and as required, and therefore there is no loss due to wastage. The machine is always ready for use night or day, and in cases of illness such an apparatus may actually be the means of saving life. The action of the machine is very interesting, as will be seen from the following brief description. The principle is based on the fact that water will freeze when rapidly evaporated in high vacuum with a powerful absorbent to take up the water vapour, the best absorbent being sulphuric acid. This acid becomes weak on the surface unless it is agitated, and this is done by means of a simple and very effective form of rocking motion, which not only agitates the acid but oscillates the vacuum pump, the whole of the rocking portion being mounted on suitable trunnion bearings. The operation of ice-making is very simple after the machine is once ready for working. For icing water, about half a pint of water is put into the carafe or decanter, which is placed on a special elevator. This is lifted up until a joint is made between the mouth of the carafe and the vapour pipe, a slight twist of the elevator keeping it in position. The mouth is then water-sealed to prevent leaking, and the wheel turned by means of a handle at approximately a hundred revolutions per minute. In about a minute it will be seen that the water is 'boiling' (due to the vacuum), and in less than three minutes sufficient ice will be formed to permit of the decanter being filled up with water of ordinary temperature, when the whole of the contents will be found to be sufficiently cooled even under tropical conditions. By slightly twisting the elevator the reverse way the carafe can be pushed a little to one side. This breaks the vacuum and releases the carafe. For making block ice or ice-cream the operation

is very similar. Care must be taken, however, that only small quantities of water or ice-cream mixture are admitted at a time by means of the special stopcock and tube supplied, and each admission must be thoroughly frozen before any more liquid is admitted. It is impossible for the acid to get in contact with the liquid being frozen. One charge of acid ($\frac{1}{2}$ gallon) is sufficient for from fifty to one hundred freezings, according to the quantities of ice made.

A PROFILE GAUGE.

In several industries the profiles of objects are often wanted. If great accuracy is needed, a gauge has to be cut from a piece of tin or of sheet-brass and filed to an exact fit, an operation that takes considerable time and demands a high degree of skill. A very ingenious profile gauge has lately been devised, that, when pressed against any irregular object, such as a wood moulding, takes an exact impression of the contour. The device consists of hundreds of special brass strips, packed together on edge in an aluminium frame. Each strip has a thickness of .007 inch and a width of .1 inch. These strips can slide on each other endwise, but are held from movement in other directions by the frame. A rubber-faced clamping plate is pressed against the edges of the strips by two screws. When these are slacked off by half a turn, the strips will slide upon each other with a light pressure. To take a profile, therefore, all one has to do is to press the edge formed by the ends of the strips against the object, when an accurate replica of the contour will be produced. A feature that is often useful is the production of a reversed profile at the opposite ends of the strips. Once the profile is taken the screws can be tightened up and the gauge becomes fixed. These profile gauges are being used for many purposes. One is to take the profiles of the treads of railway wheels, so as to show the wear. There is no limit within reason to the size of profile that can be reproduced. Instruments have been made that will take profiles eighteen inches in length.

A THERMOS ICE-MAKER.

When it is desired to produce ice in the home, the only way of doing so, apart from mechanical refrigerators that require power for their operation, is to use a chemical mixture. A machine has been brought out recently that will not only make ice in a few minutes, but will also store it; moreover, the container can be used as a thermos flask for keeping foods and drinks hot. The body consists of a short, wide thermos flask, uniform in diameter from top to bottom, and open at the top. This has an aluminium outer container with the usual silvered-glass inner container, a vacuum being produced in the space between the two. On

the top is an aluminium lid with a thick cork under it which fits tightly into the mouth of the flask. A spindle, with a cranked handle outside the lid, passes through a hole in the middle, and carries on its lower part four detachable ice-boxes, the arrangement being not unlike a revolving cruet. The ice-boxes bear some resemblance to spectacle cases with sliding lids, but they are shorter and thicker, and have flat ends. They are 'drawn' from an aluminium alloy. Clips at the ends hold them vertically and equally distant from each other round the spindle. When ice is to be made, equal parts of washing soda and commercial ammonium nitrate, with a measured quantity of water, are placed in the flask, the ice-boxes are filled with water (or cream if ice-cream is wanted), and the lid is put on. If the handle is then turned for two minutes, and the flask allowed to stand for a few minutes longer, the contents of the ice-boxes will be found frozen solid. To prepare the machine for use as a thermos flask, the spindle is removed from the lid, and the hole left is filled with a cork.

TWO NEW CHEMICAL ELEMENTS.

In our issue for April 1923 we referred to the discovery of a new chemical element, hafnium, and explained how X-ray spectroscopy had been utilised in making the discovery. From Berlin there comes the news that the same means have been employed to effect the recognition of two other new elements, to which the names *masurium* and *rhenium* have been given, in honour of Germany's eastern and western borderlands. These new substances, it is stated, have also been detected by chemical analysis, and have been obtained in minute quantities from a number of mineral substances, the principal of which is platinum ore. Their atomic numbers are 43 and 75 respectively, leaving only the elements corresponding to the numbers 61, 85, and 87 to be discovered to complete the ninety-two which scientists believe to be the full complement of the chemical elements forming the crust of the earth.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (a) a reply post-card, or (b) a stamped and addressed envelope or post-card, be sent to the Editor, *Chambers's Journal*, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

* * TO CONTRIBUTORS.

All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

For its return in case of ineligibility, a stamped and directed envelope (or postage-stamps) should accompany every manuscript.

To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

THE WHITE HEALER.

A TALE OF THE PACIFIC.

By DEMAIN GRANGE, Author of *The Impostor*, *The Cruise of the 'Corisande'*,
The Wind in the Whispering Canes, &c.

PART I.

I.

'WELL, what is it, Faring?'

James Logan, Deputy-Commissioner for Borua—and that meant for about ten square miles of diluted civilisation and something like one hundred and fifty square miles (including the dependent islets) of undiluted savagery—turned his head quickly, and regarded the young man standing before him with a slight frown of annoyance. It is a little annoying, of course, to be interrupted when one is deliberating weighty matters of State, extended in a comfortable lounge-chair, with one's legs stretched out on the rest, and one's eyes closed.

This appeared to be quite understood by Richard Faring, his official secretary, assistant chucker-out, and anything else that the exigencies of the moment might require.

'Sorry,' the latter said, smiling faintly. 'But this lady—Miss Temple—has called again.'

'Again? Bless the woman! What in Heaven's name does she want now?'

'She insists on seeing you personally.'

'Oh——' The Commissioner sat up, a very decided look of annoyance upon his face this time. 'Insists, does she? Well, you can just tell her——'

'I've told her twice already that you are—er—busy, and cannot be disturbed. She said, Oh, very well then, she would wait until you were at liberty; and when I suggested that I might be able to deal with the matter, she snubbed me pretty badly.'

'She did?'

'Yes.' A tinge of colour spread over Faring's cheeks. 'Said she hadn't come to be interviewed by underlings—or words to that effect. Then she got talking about her rights as a British subject, and all that tosh, you know. What was I to do?'

James Logan pursed his lips thoughtfully. 'Um—exactly,' he said. 'That's where they all have me in a cleft stick, confound it! What sort of a person is she? The high-browed, aggressive type of female, I suppose, with a

self-imposed mission to improve the social condition and habits of the gentle savage.'

'No—oh no,' the young man declared, with some haste; 'she isn't a bit like that! In fact, she's——' The colour in his cheeks deepened. 'She's quite different,' he concluded, rather lamely.

The Commissioner glanced at him sharply. 'That so!' he said. 'Well, I'd better see her anyhow, or she'll be writing a furious letter to the papers when she gets back, and making unpleasantness generally. I know the sort.'

And again the young man smiled faintly as he withdrew.

But the Deputy-Commissioner for Borua was very much surprised, not to say utterly taken aback, when a few moments later a tall, slender, exceedingly graceful girl, with big lustrous brown eyes, and a distractingly pretty face, stepped out onto the veranda and advanced towards him with a shy, yet wholly charming smile.

'I am so sorry to disturb you——' she began.

James Logan was hoisted up to his feet by some inward force of which at the moment he was barely conscious. 'Not at all; not at all!' he protested gallantly. 'I am delighted to see you.' He jerked forward a chair, and spun it round with almost boyish eagerness. 'Pray be seated, my—er—Miss Temple, is it not?'

She inclined her head gravely, and sat down with a slightly preoccupied air, as if she was debating in her mind how best to introduce the matter which had brought her there.

'I asked to see you personally, Mr Logan,' she said, 'because what I have to tell you is of a private and confidential nature. It must remain strictly between ourselves, you understand?'

'You can rely upon me absolutely, Miss Temple,' he assured her.

'Thank you.' She turned a dazzlingly radiant smile upon him. 'I felt sure that I could trust you.' Throwing a glance round the veranda,

Miss Temple continued, in a voice charged with suppressed emotion: 'Twelve years ago, Mr Logan, my brother, believing that he had killed a man, disappeared suddenly and completely. What it was they had quarrelled about I don't exactly know—something to do with a woman, I think. Anyhow, the man didn't die after all; though my brother apparently never learned that. At any rate he never came back, and neither my father nor I, his only living relatives, could find any clue to his whereabouts. Then, after dad's death six years ago, I heard something which made me think that possibly he might be hiding under an assumed name in one or other of the South Pacific islands. That is no uncommon thing for men who—men like him—is it?'

'As you suggest,' said Logan, 'there are many such in the islands. Or, rather,' he added, 'many who have a truer cause to seek a refuge from the past.'

The brown eyes flashed a grateful look at him. 'Of course,' she went on, 'I had no actual proof that it was so, and couldn't very well do anything then. You see, for one thing, I was too young——' He nodded, judging that she would have been about sixteen. 'But when I came of age and inherited the small fortune which my father had left me, I resolved to visit this part of the world on the chance of picking up a thread of evidence which perhaps might lead me to my brother's hiding-place. It was rather a forlorn hope, you know; but something—a sort of unreasoning conviction that Arnold was still alive, and that we should meet again—urged me to the task. For two years I have wandered up and down these seas, visiting island after island, from Manilla to Samoa, making inquiries everywhere, sometimes with what seemed to be a prospect of success, but never more than that.'

'And you have done this alone, Miss Temple?' he asked wonderingly, knowing the difficulties and discomforts such an undertaking would involve.

'Oh no!' she replied, flushing a little. 'I have a companion with me, a middle-aged lady, who—who——'

'Quite so; quite so,' he assented hastily. 'But you must have found it a somewhat trying experience at times, Miss Temple?'

'And a very disappointing one, so far as any tangible result is concerned. True, I have talked with people, old traders and others, who seemed to have encountered a man answering to Arnold's description years ago; but none of them could ever tell me where he lived, or what became of him. Indeed, I had almost persuaded myself that he must be dead, when a chance alteration in the running of the inter-island steamers landed us here in Borua. And now——' She paused, the light of re-kindled hope shining in her eyes.

'You have heard news of him?' said Logan, with an eagerness that contrasted strongly with his annoyance of but a few minutes before.

She shook her head in a doubtful way. 'I don't know,' she answered. 'It hardly amounts to that, perhaps. Yet—I have heard some talk down there in the town of a mysterious witch-doctor, who lives far away in the north, and is said to perform wonderful cures amongst the natives. They call him "The White Healer," I believe.'

'Oh!' Logan gazed at her with a startled expression upon his face. 'And you think——'

'Well, my brother was on the eve of completing his medical course in Edinburgh when he—when the accident occurred. It sounds rather improbable, even a little foolish, I know. But—The White Healer—don't you see——'

'By Jove, yes!' Logan started to his feet, and stood for a moment frowning thoughtfully. 'There's something in that—if this White Healer really exists, and isn't merely a fanciful creation of the native mind, as I've hitherto always thought was the case.'

'But why should they imagine him to be *white*, Mr Logan?'

'Um—precisely. That is a point I had not considered. One rarely takes any notice of these tales that come through from the wild country. They are, as a rule, pure inventions, or gross exaggerations at the best. But *this* one—well—it certainly is rather curious when you come to think of it.'

The girl leaned forward suddenly, her hands clasped, and her slender young figure tense with excitement. 'It is more, Mr Logan,' she said. 'I believe it to be absolutely true. That there is a white man up there, I feel sure. Whether he is my brother Arnold or not, I don't know. But I must find out. Oh! you see that, Mr Logan, don't you?'

'Of course, of course!'

'That is why I came to you. I want you to help me. Will you?'

'Assuredly—so far as I can. But——'

'You would rather not?'

'No, no! You misunderstand me. I was about to suggest that you should allow me to speak of the matter to my secretary, Faring; he has quite a remarkable knowledge of the country and its native inhabitants—far more so, indeed, than I have—and his assistance would be invaluable.'

'Is that the young man whom I saw just now?'

'The same, Miss Temple. A very excellent fellow, I assure you, and one whom you need not hesitate for a moment to trust.'

With a pensive air she looked out between the trailing masses of purple bougainvillea to the sea glittering beyond the palm-tops. Then a gentle smile played furtively about the corners

of her lips. 'Yes,' she said, 'I think that I could trust him.'

II.

Ka-Ka, Paramount Chief of one of the larger of the string of coral islands extending from the northern end of Borua, sat in the doorway of his sago-palm hut with his huge splay-fingered hands spread out over the girdle of tappa-cloth about his middle, and an expression of acute anguish upon his dusky, wrinkled face. He was an exceedingly fat, heavy-jowled, villainous-looking old savage, whose aspect on most occasions was one of truculent ferocity. At the moment, however, he was feeling uncommonly sick. 'Belly he walk about too much inside me,' he wailed, in *bêche-de-mer* English, addressing the tall, hooded, monk-like figure standing a few paces away from him in the centre of a wide semi-circle of awed natives. 'I plenty sick. No can eat. No can—'

Suddenly the tall figure strode forward, the hood falling back and revealing a lean bearded face, with pinched cheeks, and steel-blue eyes deeply set in cavernous hollows beneath the lofty brow. It was the face of a white man; but of a strange chalky whiteness that in its even colourlessness resembled the hue of death.

Ka-Ka shrank back, his eyes dilating with fear. The other stopped short, regarding him with a thoughtful, half-whimsical smile. 'How is this, O Chief?' he said, speaking easily in the native dialect. 'You have sent for me across the narrow water that I might cure you of your sickness. Yet, when I come, you draw away from me with terror in your eyes. Is it, then, that you fear me more than the devil-devil which I am here to drive out? Know you not that he who would be made well must have faith in the magic which heals him?'

'It is true, O White Healer, and your magic is beyond doubt very great,' said the trembling Ka-Ka.

'Then have no fear, O Chief! For that which takes away evil must in itself be good.'

Thus encouraged, Ka-Ka retired into the hut, and there submitted his ungainly person to the strange rites which seemed to be a necessary part of the white medicine-man's magic. He thrust out his thick flabby tongue when ordered to do so, suffered with protesting grunts much prodding in the more sensitive portions of his anatomy, and obediently swallowed a draught containing a curious gray powder, which had the miraculous effect of making cold water boil, and was manifestly intended to prevent the return of the devil-devil, which he had distinctly felt departing in the thin tapering fingers holding his wrists. Ka-Ka was amazed. Nay, he was dumbfounded, stirred to the depths of his unsophisticated nature, and, if the truth be told, very thoroughly frightened. Beyond question, the magic that could perform such wonders was of no ordinary kind.

Then, while the bewildered savage was yet gasping from the effects of the mysterious potion he had swallowed, and experiencing no small degree of astonishment on finding that the apparently boiling liquid was actually cold to the taste, an interruption occurred.

A wild-eyed, obviously much-excited native thrust his head in at the door of the hut, with the breathless announcement that a strange ship—a white man's ship—had just entered the lagoon; and incontinently bolted.

Ka-Ka forgot the wonderful things that had been done to him, forgot even that he was sick, in the exuberant delight with which this unexpected news filled him. It was several years since a ship of any kind had visited the island; and then it had remained only for an hour or two, in order to take a supply of fresh water on board. But the captain had paid for the privilege—and possibly for some others not specifically mentioned in the contract—with a couple of bottles of trade-gin. The memory of the glorious time which had followed was like a torch to Ka-Ka's desires now.

The other occupant of the hut, too, seemed to be powerfully affected by the news, if in quite a different way. His face became sternly set, gravely anxious-looking, and there was an ominous glint in his pale blue eyes, as he seized the departing Ka-Ka's arm, and held it in a vice-like grip. 'Remember, O Chief,' he said, 'that you speak no word of me to those white people yonder. For assuredly if you do, I shall know of it, and though you were fled to the furthestmost ends of the world my magic should find you out and utterly destroy you. Do you understand?' The grip tightened threateningly. 'One word—and nothing can save you.'

'I will remember, O Great One,' mumbled Ka-Ka.

'It is well. Have my canoe brought round to the smaller lagoon on the eastern side of the island. And—remember!' The White Healer slipped out of the hut, and with a swift glance towards the distant beach, vanished into the thick grove of coco-nut palms which cast its shadow over the clearing.

Ka-Ka hung back for a moment irresolutely, as if checked in his purpose by the terrible warning he had just received. Then the ghosts of those two bottles of gin rose before his mind's eye alluringly, and reflecting that it would be quite possible to obtain others without breaking the condition imposed upon him, he left the hut and hastened down to the lagoon.

The rest of the natives were already assembled on the beach, gazing intently at a small fore-and-aft schooner, which had dropped anchor in the sheltered water under the barrier-reef. Ka-Ka, somewhat resentful of the neglect shown to himself, ordered his state-canoe to be manned without delay, hoping thus to impress the white

men with a due sense of his importance. He felt that much might depend upon it—much trade-gin, that is to say—and in ordinary circumstances no doubt he would have been right.

But as the canoe, propelled by eight stalwart savages, drew near to the schooner he perceived that the circumstances were not ordinary. This became evident to him in many ways; notably, in the absence of rough-looking, bearded men leaning over the side, pipe in mouth, with strange, blood-curdling, if unintelligible, words upon their lips; and in the remarkable (from Ka-Ka's point of view) cleanliness and shininess of the vessel herself.

It was, however, only when he stepped on to the smoothly-polished deck at the invitation of a tall sunburnt man dressed in curious white garments of what (to his untutored mind) appeared to be a sort of super tappa-cloth, that he realised fully the vast difference between this and the chance-brought trading schooners which at long intervals had visited the island. He also realised something else—something that, while it did not occupy his attention much at the time, was to be remembered by him afterwards, and to prove no small factor in determining the subsequent course of events.

Evidently the schooner was not prepared for trouble of any kind. By the side of the first white man stood a second, shorter and more broadly built, with the unmistakable stamp of the sea upon him; and behind them there was yet another, with two 'white Marys,' as Ka-Ka mentally designated the slim graceful girl and her stout middle-aged companion. The crew, except for a wizened-looking creature who popped his head out of a hut-like structure on the deck, and who in reality was the Chinese cook, seemed to be composed entirely of Kanakas—perhaps a dozen in all. The island could muster at least five hundred brawny warriors. . . .

Obviously, those on the schooner were not anticipating any trouble. Ka-Ka opened the ball, so to speak, in his quaint pidgin English, a smattering of which he had picked up in the far-off days of his youth, when for a year or so he had worked on a cane plantation in New Georgia. 'Plenty water you no have,' he said, with an ear-to-ear grin. 'I savvee. Him you wantum plenty bad?'

To his astonishment the tall sunburnt man answered him fluently in the Boruan language: 'No. We do not seek for water, O Chief, but for information which we think that you may be able to give us.'

The grin lost something of its engaging expansiveness. 'You give two, perhaps three gins,' murmured Ka-Ka.

'Perhaps. It depends upon how much you can tell us.'

'I can tell you anything.'

'Ahi! But they must be true words for which a price is paid. Is that not so, my friend?' Ka-Ka wagged his head in cheerful assent. 'Very well, then. What we want to know is where we may find this wonderful medicine-man who is called The White Healer, and who, we have reason to believe, dwells on one of the islands hereabout. Can you tell us that?'

For a few moments Ka-Ka was speechless, stricken dumb by the abject terror which possessed him. His eyes bulged and his features worked convulsively, while beads of perspiration shone on his black receding forehead. Then, seeing that the white men's gaze was fixed upon him curiously, he made a strong and very palpable effort to recover himself. 'I do not know—how should I know?' he stammered.

'Have you never seen him?'

In his fright, Ka-Ka resorted to no half-measures. He lied magnificently. 'I have never even heard of him,' he said.

The two white men exchanged glances. 'That is very strange,' the tall one remarked. 'All the evidence points to his having his headquarters somewhere in these islands. One would have thought—'

The other shrugged his shoulders. 'A prophet in his own country!' he laughed.

'I suppose so,' said his companion. He turned to the lowering Ka-Ka.—'Then we must seek elsewhere, my friend. Perhaps on the next island we may be more fortunate. Are any of these smaller atolls round here inhabited?'

'No, no!' Ka-Ka declared quickly, with an ill-concealed note of alarm in his voice. 'Only the sea-birds live there—and the currents are very dangerous.'

The shorter of the two white men turned his gaze seaward and then glanced aloft. 'The wind is freshening a bit from the nor'-west,' he observed. 'It may come on to blow before nightfall.'

'In that case,' said the other, 'it might be as well to remain here until the morning. What do you think, captain?'

'I certainly think it would be safer, Mr Faring,' was the quiet response.

A sudden gleam of intelligence, and it might have been of grim satisfaction, flashed in Ka-Ka's eyes. The two men had spoken together in English, but his knowledge of the *bêche-de-mer* variety of that language had enabled him to catch the drift of what was being said.

'You are staying here until to-morrow?' he asked eagerly.

'Yes. If you have any fruit or fresh vegetables you can send on board, we shall be glad to have them. You will be paid—'

But, strangely enough, Ka-Ka was not listening. Even the prospect of obtaining the much

desired gin no longer held the foremost place in his mind. It had become a secondary consideration, a mere side-issue in an affair of vastly greater moment. The sudden resolve, born of terror and savage lust, which had flamed up in his brain was more intoxicating than many bottles of trade-gin.

His thoughts, as the canoe glided shorewards over the glass-like surface of the lagoon, would have considerably startled those on the schooner could they have known them. These strangers,

he reflected, were bent on discovering the jealously guarded secret of The White Healer's abiding-place. Should they do so, as was more than likely, he would inevitably be held responsible, and the terrible curse would fall upon him. That must be prevented at any cost. The question of how this was to be accomplished troubled him not at all. To his primitive and savagely direct mind there was only one way.

(Continued on page 573.)

THE BUSH NEGROES OF DUTCH GUIANA.

By D. B. KIRKE.

I.

THE little-known colony of Surinam (Dutch Guiana) lies between British and French Guiana, on the north coast of South America. It is a wild, half-civilised country with great tracts of swamp along its coast-line; vast stretches of virgin forest in its hinterland; and, where the forest ends, range upon range of hills, growing higher and higher, until they become the huge mountains on the Brazilian frontier.

There is a very small area of cultivated land on the coast, and two towns, one small and one with about twenty thousand inhabitants, mostly of mixed descent. Beyond this the country may be said to be uncivilised.

There is no communication with the hinterland save by rivers on which are dangerous falls and rapids; with the exception of a few negroes working on timber grants or balata concessions this vast interior is left to the aboriginal Indian, and, in a few places, the 'bush negroes,' who are to be the subject of this article.

The origin of these 'bush negroes' is of great interest. From the days when negro slaves were first imported to the Guianas there were always some who, unable to stand the cruelty they suffered at the hands of the planters, took their lives in their hands, and disappeared into the unknown, where, whatever befell them, they knew they would at least be free from their persecutors. As time went on, these runaways increased in numbers, and began to form villages on the banks of the rivers above the falls, where they had little fear of pursuit, owing to the difficulties of navigation for large boats.

Freedom declared, they came out of their strongholds and went in numbers to the Governor of Dutch Guiana, begging that they should be allowed to remain where they were. The Governor, knowing that after their life in the forests they would never revert to the life on the plantations, granted their request, and to this day the 'bush negroes' remain in their villages, far up in the higher reaches of nearly every river in the country.

In appearance, strange though it may seem, the 'bush negroes' differ considerably from their brothers in the towns and civilised parts of the country. They are a much more powerful, cleaner built people, with smooth jet black skins, and abnormally large chests and shoulders. As the greater part of their lives is spent in their dug-out canoes, which they propel with a single paddle, this is not so extraordinary; but there is a difference in features and facial expression which is almost unaccountable. Maybe it is because they have, for all these years, remained free from degeneration—the curse of the negro wherever there is civilisation.

II.

The villages, which are always built on a high piece of ground on the river's bank, are usually small, not having more than eighty or a hundred inhabitants. The houses are large, strongly built structures, made from mora wood, and the tough leaves of the ita palm, which are woven into large thick screens, and make excellent roofs and walls. All are usually clustered round one larger than the rest—the house of the chief.

Every village has its own chief, chosen by vote, and he remains chief, unless he has committed some great fault, until he dies. His duty is to settle all disputes, make rules, and to give consent to marriages.

Before a young man can 'marry' a dusky maiden to whom he inclines, both his family and the girl's are brought before the chief. A long consultation is held, and should both families be agreeable to the union all is well; but should one disagree, then the chief will not give his consent until that point which is disagreed upon is adjusted, which may be never. And woe betide the young man who is found paying attentions to a young lady before the chief's consent has been given! He is caught, bound, and mercilessly flogged, but, after he has undergone his punishment—if, indeed, he survives it—he is allowed, without comment, to return to and live with his choice.

Sometimes the chiefs get so old that they

become incompetent to rule their people properly, and then there is little law or order in the village.

The writer visited a village on the river Coppename, the chief of which, an old man, Witta by name, was so infirm that he could hardly drag himself down to the river's edge. He must have been nearly a hundred, and looked it. His village was in an awful state of dirt and untidiness; women were brawling and abusing each other as only women of their race can; and some of the men told us that their boats and provisions were being stolen. Witta had allowed some of the wandering balata-bleeders from the lower forests to settle in his village—a thing which is always fatal, as these men are usually coast niggers who have either escaped from prison or taken to the bush for fear of the law.

The old man crawled down to the river to greet the writer's boat—a huge skeleton, completely bald and toothless, half-blind, and leaning on a long twisted staff. Some bad thing, he said, had pursued him ever since he became chief of the village, so much so that he could not leave it. As soon as he was out of sight of it something drew him back, and the spell on him was so bad that not even the 'Jiggers'¹ would enter his feet! Like all his race he was in the toils of superstition, and it must have been a very bad spell indeed, as the 'Jiggers' torment every human dweller in the bush!

Once a year, the chiefs of all the villages, at least of those near to it, go down the rivers to Paramaribo, the chief town of Dutch Guiana, to pay tribute to the governor. For this purpose they dress in the most extraordinary collection of garments, and, accompanied by some retainers, make the ten days' journey down the river to Government House. They usually carry gifts with them in the shape of canoes, carved stools, &c., for which they get in exchange knives, salt, axe heads, or fish hooks.

III.

All 'bush negroes' are splendid axemen, and the writer has seen a man fell a tree, three feet in diameter, and square it inside half-an-hour. Some owners of timber grants in the interior have tried to get them to work on their grants, but the 'bush negro' will work for no man. Other negroes, who come to the bush as boatmen in expeditions such as the writer's, are treated scornfully by the 'bush negroes.' They are offered nothing in the way of food by their 'brothers,' and are looked down on as 'the white man's slaves.'

The 'bush negroes' lead an easy, careless life. As dawn breaks each grown man takes his dugout and goes up or down the river to where his 'ground' is situated. There he grows his

provisions—yams, plantains, and beans; and, after doing any work there that is required, the rest of the day is spent in hunting or fishing.

Very few of the 'bush negroes' have guns, but they are wonderful trappers and extraordinarily good shots with bow and arrow. Nearly all their fish are shot in the water, a long piece of 'bush rope' (i.e. string made from silk-grass, and as strong as hemp twine) being attached to the arrows. The writer has seen sting rays shot in the water by a 'bush negro' twenty yards distant.

Like all native races the 'bush negro' is in the thrall of superstition. Most extraordinary rites are performed at certain seasons of the year, and it is certain that ceremonies take place in the South American 'bush' that are performed in the wilds of Africa. These ceremonies have never to the writer's knowledge been witnessed by a white man in Dutch Guiana, but he has been told by a coloured man, long a surveyor to the Dutch Government, the following extraordinary anecdote.

Whilst staying in a 'bush negro' village on the Marowijne, the river dividing Dutch from French Guiana, this surveyor was the guest of the chief, a man named Atta, who had governed his village for many years. He was a fine strong man in spite of his age, for he was nearly seventy; but one day, while out hunting alone, he dropped dead, evidently from heart failure. Sudden death, amongst an uncivilised race, is a fearsome thing. When the chief was found a few hours after by some of the younger men, the village was thrown into a state of extreme terror; the surveyor, returning to the village from his work, found it completely empty. Man, woman, and child had taken to the woods. After some trouble he discovered a terrified old woman, who, too old to drag herself from her hut, had hidden herself beneath a heap of palm leaves. She told him what had happened, and he at once set off for the spot where she said the chief was to be found. When he arrived there he discovered that the old man was indeed dead, and as there was no wound or snake bite on his body, surmised that he had succumbed to heart failure. He began the task of carrying the huge body to the village, but was soon relieved of his burden, as some of the people, seeing that he was not suddenly struck down by the same strange hand, plucked up their courage and came forward. There was great lamentation in the village that night, indescribably sad wailing, and the muffled beat of drums.

Next day the body was carried by the chief's family round the village, halting in front of every single house. Should any slight, unimportant incident, such as the slipping of one of the bearers, an animal's howl from the bush, the flight of a vulture overhead, take place during these halts, then the death of the chief would be put down

¹ *Jigger*.—A minute insect which bores its way into the foot, and there lays its eggs, causing intolerable itching.

to the family outside whose door the procession had halted at the moment. Their punishment would be too horrible to mention.

Nothing untoward, however, took place on this occasion, and, having completed their round of the houses, the bearers halted in the centre of the village, where a large framework of bamboos had been erected. On this they laid the body of their chief, and, having built over it a shelter of palm leaves, left it. The body remained there for ten days. One can imagine what this meant in a country where the thermometer registers 108° in the shade. Every morning and evening during that time the family of the chief visited his body, covering it with herbs, and actually rubbing themselves with the exudations from the corpse! Can such a proceeding be imagined! Eventually the body was buried miles away from the village, and a huge cairn of stones built over it, which the writer has himself seen.

IV.

The 'bush negroes' are great believers in the supernatural. Should a man be drowned in the rapids, then the 'water mamma' has taken him below the water to live in her home in peace and contentment. Some of them have seen the 'water mamma,' so they affirm, and she is a huge black woman with four arms! Before passing a rapid, or, indeed, any dangerous part of the river, the 'bush negro' will always throw into the river a few yams or plantains 'for the water mamma,' so that she will grant him a safe passage.

Once, while on a hunting trip with four 'bush negroes' in one of their small dugouts, the writer noticed that every few hundred yards or so the negro in the stern threw a yam into the water. The creek in which the boat was was a very narrow one, with countless dead trees on either side. Of a sudden, one of them crashed down, falling right across the creek, and missing the boat by inches. Great excitement prevailed, and the man who had been so thoughtful as to feed the 'water mamma' was looked upon with great reverence for having delivered the company from certain death!

The 'bush negro' is a great doctor. Every herb in the bush has some healing use for him, and numerous decoctions are made, which, when taken, are marvellous in their results; but he will never divulge these remedies to anyone outside his own people. He is supposed to be the only person who has an antidote to the poison of the 'bushmaster,' probably the most poisonous snake in South America, and his 'make cut,' as it is called, is much sought after by those who run the risk of being bitten by these reptiles. There are instances on record where this 'medicine' has proved its worth, but none has come directly under the writer's notice. 'Tiger'

cut' is a concoction made from the ashes of the roasted feet of pumas or jaguars, which is given to their dogs in their food, or else rubbed into cuts in their heads and noses. The idea is that the dog will smell out a 'tiger' anywhere, and never lose its track until it has it at bay, when the unfortunate tiger suddenly loses all power of resistance, and waits quietly until the hunter arrives to kill it! This notion, of course, is entirely erroneous, but it is extraordinary what faith the 'bush negro' has in his 'tiger cut'!

There is very little disease of any kind amongst these people, and for what there is they usually have a remedy handy. Any illness, however, they do not understand is treated as an evil spirit having entered the body, and the unfortunate is banished from the village.

Whilst visiting a 'bush negro' settlement, the writer came on a large savannah,¹ some distance inland from the river, on the bank of which the village was built. Away on the other edge of this savannah, fully three miles away, was a small grass hut, standing all alone, and without any sign of life about it. On asking what this was, the writer was told that it was a 'bad place,' that no one must go near it, and that two people lived there who had been sent away from the village a long time ago. In spite of protestation on the part of the 'bush negroes' accompanying him, the writer set off alone to discover the mystery, and, arriving at the hut, found an old man and a middle-aged woman, who cowered away in fear as he approached. They were very much frightened, and would have run away into the bush, but they could not. Both were in an advanced stage of leprosy.

The language of the 'bush negroes,' if it may be called a language at all, is a mixture of African, Dutch, Spanish, Portuguese, and here and there a word of English, borrowed from the 'talkee-talkee' of the negroes on the coast. It is a most difficult language to understand, as many of the words are made up on the spot! The writer had with him on one occasion a tin-opener, which he showed to a 'bush negro' who had never seen one before; he at once gave it the name of 'ita,' because on the handle was the engraving of a pear (the advertisement of some canning firm), and this homely fruit bears a slight resemblance, in shape only, to the nut of the ita palm! To this day in that particular village any tin-opener will at once be recognised as an 'ita.'

'Bush negroes' live to a great age. The chief of a village the writer visited must have been at least eighty. He was, as all his race are, of enormous proportions, and practically covered with short white wool! His great pride was his mother, to whose hut he conducted the writer with much ceremony. Inside was a tiny

¹ The puma and the jaguar are commonly called tigers in the Guianas.

¹ A large open space in the bush, usually covered with short grass.

shrivelled-up negro woman, completely bald, deaf, and blind; she managed to raise herself and hold the writer's hand in hers for an instant, mutter a blessing or something of the sort, and, after a great deal of fumbling, presented him with a jaguar's tooth. She wore a huge necklace of these round her neck. She was the

oldest woman the writer had ever seen. No doubt Africa had been her birthplace, and, carried off to a strange country under the thrall of cruel masters, she had chosen the wild life of the bush, where, free from the hardships of plantation work, she had lived to this tremendous age in peace and quiet.

THE REMORSELESS RULING.

By H. MORTIMER BATTEN, F.Z.S., Author of *Habits and Characters of British Wild Animals, Tracks and Tracking, &c.*

I.

THE young sparrow-hawks had left the nest and were now able to fend for themselves, but though no longer held together by any family bond, they still regarded the fir planting in which they had been reared as their home quarters. It was a hidden-away little forest lying at the foot of the range, and only an occasional shepherd went that way. So any morning or evening one might have seen a whole flock of wheeling, screaming sparrow-hawks about the fir spires—the two parents and their five young—and as the young grew stronger on the wing, the destruction they began to wreak among the wild bird life of their locality was truly appalling. There were, it must be admitted, too many hawks in that locality, and if allowed to flourish unchecked they would, ere long, spoil their own hunting by the annihilation of the wild life on which they depended.

But one curious thing was noticeable—that about the home wood of the raiders other birds were safe. Numbers of ring-doves had built their scanty platforms and laid their pearl-white eggs within sight of the sparrow-hawks' eyrie, and all had safely reared their broods. Even now, with the young hawks a-wing, several of the wild pigeons were busy with their second broods, and they went boldly back and forth under the very eyes of the pirates.

Yet, had one come to examine the eyrie of the birds of prey, one would have found it littered with the legs of pigeons and chickens, and pigeon feathers strewed the ground below—pigeons which had been killed evidently beyond the one mile radius of that sacred area. The why and the wherefore of this I cannot explain, but we know it is a rule among the killers to keep their thresholds clear of murder, and—listen to this.

When a hawk sets out in pursuit of its quarry it will not readily abandon the quest, sometimes becoming so fiercely intent that it will follow into the open arms of death. One evening the hen hawk was seen in hot pursuit of a stock-dove, which was flying straight

and fast across country, as though with some fixed goal in view. Twice the hawk struck, and on the second impact the feathers flew. The pigeon was weakening, its fate seemed sealed, and as the bird of prey rose to strike the final blow, the fugitive swerved and headed in a desperate dive down the slope. At the foot of the slope, not fifty yards distant, was the fir wood, and now, true to the rules of the game, the hawk spread her tapered wings and rose vertically, abandoning the chase when success seemed certain. The pigeon had reached home. She had touched wood!

II.

Let us follow for a while the lives of these fierce birds which haunt our forests, and we shall see how those who fear none, and whom others fear, live the most precarious lives of all.

In these early flights the young hawks regularly followed their parents, straggling by easy stages from tree to tree, and in this way, no doubt, they were shown the best hunting-grounds and were advised of the risks which accompanied each. Among these hunting-grounds was the Adams Hewlitt Poultry Farm, eight miles distant from the home wood. It was a huge farm, its rearing pens and wire screens covering an area of at least a hundred acres, and here an old man was employed to keep down the vermin. He had been a noted poacher in his day, and what he did not know by experience in the extermination of rats, crows, weasels, hawks, and the like, he seemed to know by instinct.

But the parent hawks were cunning, and many and many a chicken had they snatched when the old man's back was turned. Well they knew that he was their arch-enemy, and on their visits to the farm they would alight first on the branches of a giant ash which overlooked the wire pens. Close at hand a woman was filling the drinking troughs from a large watering-can—she was not to be feared. A little farther away two men in brown suits were strolling with their hands in their pockets—they were the owners of the place, and to the hawks they were of no consequence. Nor was

the joiner hammering down some felt roofing about a mile away, but—ah! there he goes, the old fellow with the gray coat and the cloth gaiters and the gun under his arm!

So the hawk, watching from the giant ash, would look before she leapt, and when she had made sure that the old man was safely out of range, there was a swish of wings, a stampede among the poultry, and much wild cackling. And the girl with the big watering-can would turn about, to see a large blue hawk skimming over the wire-netting, carrying a shapeless bundle in its claws. This kind of thing became of daily occurrence, and the poultry men agreed that the hawks were becoming bolder.

'You'll have to get them somehow, Tim,' they told the old vermin-killer. 'How about fixing up a shelter and waiting for them?'

'No good, sir,' announced the erstwhile poacher. 'I'd wait all week and get nothing else done. Them hawks don't come till they see me; then they go right in at the other end of the farm.'

At this Tim's employers were thoughtful. Would it be possible to disguise Tim as a female worker, and to rig out some one else to represent him? On second thoughts the idea hardly seemed practical, for surely even a hawk would spot the disguise—Tim with his short bow legs, his immense width, and his square bulldog chin covered with ginger stubble—no, not even a hawk would be deceived into mistaking Tim for a lady.

'I'll tell you what,' said one of the proprietors eventually. 'Come along to-morrow morning, Tim, in your blue Sunday suit. Set to work repairing the roof of the Ancona pen, and keep your gun handy. While you are at it I will stroll about at the other end in your old gray overcoat, and carrying a gun.'

So Tim went away chuckling his approval, and next morning the cunning ruse was carried into practice.

Man's brain is bound to triumph over the wild folk when he sets himself that task, and old Tim in his Sunday suit was busy hammering nails into the roof of the Ancona house, when out of the corner of his eye he saw some bird alight swiftly in the branches of the giant ash, only eighty yards away. He glanced at his gun lying handy under a plank, and he went on whistling and hammering. At that moment a figure appeared from a hen-house half a mile away—a figure wearing a famous gray overcoat, which hardly seemed to fit, and carrying a gun.

Down came the hawk, and old Tim turned. His hands were steady and his eyes were clear. The gun spoke once, and an unshapely bundle of feathers bounced and somersaulted all amongst the startled fowls.

'It's only a young bird,' Tim told his employers. 'Just about clear of the nest, and

that's all. But I'll tell you what, sir. If that big old ash were felled we should be less troubled with the hawks. It's an old tree anyway, and it's time it came down.'

So the big ash was cut, and from that day on the hawks were never again known to visit the poultry farm.

III.

Within a mile of the fir planting a tiny village nestled at the river-side. At one end of the village, deserted and alone, stood a square stone building, which once had been the schoolhouse. But for some reason it had been abandoned for that purpose, and now the local seat of learning was a wretched tin shanty at the opposite end of the 'town.'

Sadly neglected, the old schoolhouse had fallen into disrepair. For years its windows had been glassless, staring with blank unseeing eyes across the laughter of the river, and the starlings had come to regard the deserted building as sacred to their possession.

But recently the big estate had changed hands, and the new laird was an enterprising man who realised that if he was to keep the best of his young people about him, he must improve the conditions of living. Why were the Colonies claiming so many? Was it because the life at home was not worth while? Well, perhaps under the old régime—a niggardly and indifferent landlord, a disreputable, tumble-down old village, farms worked by obsolete methods, pasture-lands sinking into swamp—life at home *did* hold few prospects; but the new laird would alter all that.

For a time the joiners and builders had been busy, and now at last they attacked the old schoolhouse, which was to be converted into a concert-hall. Re-floored and re-roofed, it would serve well in the direction of making life at home more attractive.

One of the young hawks was accustomed to visit the village in the dusk of evening, and skimming low from garden to garden, darting now round the corner of a building or diving from the shadows of one of the giant elms, it was seldom he returned to the planting without a song-thrush or a blackbird, or perhaps even a wary starling, dangling limply in his claws. The stone-breaker announced that he had seen the bird fly in at one of the glassless windows of the schoolhouse to snatch a starling from the rafters, and depart hastily from the opposite window with a screaming mob at his heels.

Be that as it may, within forty-eight hours of the old hall being renovated one of the new window-panes was found shattered to fragments. At first it was thought to be the work of some mischievous urchin, but on further examination a dead sparrow-hawk was found inside the building, its slender body traversed by a bayonet of glass.

'Only a young bird,' said the finder, 'possibly just clear of the nest, and I guess it won't happen again.'

He guessed rightly, for in this way was a tradition of the Wild broken—a tradition which said that those windows were glassless.

IV.

It is during the first few weeks of their existence, while they are yet wanting in experience, that Nature exacts the most remorseless toll upon her children. Each day finds them a little wiser, each day teaches some new lesson, and those who live to see the dawning of winter are well on the highroad to survival.

So far only eight days had elapsed since the young hawks became able to feed themselves, and two of the five were already gone. The third met his fate on the tenth evening, and once more there was an eye-witness.

Just below the village the river narrowed between the hardwood forests, taking a downward plunge through the blue-bell slopes, and across the white cataract was a cable bridge, slung from four stone pillars and affording a bridge way to the gray stone mansion on the slope above. In the centre of the bridge was an iron gate, which could be locked, and about the gate, to prevent people climbing round it, was a wicked *cheval-de-frise* of long iron spikes.

One evening an angler sat at the water's edge watching the swifts wheeling and screaming up and down above the rapids, when a sparrow-hawk flashed into view and proceeded forthwith to pursue the 'devil birds.' That hawk could fly to some tune—but so could the swifts, and for five minutes or more a dozen of them kept him busy, crossing and criss-crossing, while the hawk, screaming angrily, strove in vain to separate one from the rest. Time after time he dived like a ray of light into the thick of the little pack, but with screams of defiance the swifts would scatter, and every time he missed—just missed!

At these repeated failures the young hawk became more and more furious. Several times he almost dashed himself into the river, several times only a mighty wrench from the line of travel saved him from collision with the branches. Finally he shot skywards from a dizzy stoop, his pinion feathers singing in the still evening air. And then, in the twinkling of an eye, the angler heard a metallic thud, and the hawk, with drooping wings, hung poised against the cloudless sky.

At first the angler did not realise what had happened. The whole performance had been so meteoric that his mind had been unable to keep pace with it. But at length he rose to his feet, muttering, 'Well, I'm blessed!' Then he set out to cross the cable bridge.

Reaching the iron gate, he took the dead hawk in his hands and tried to dislodge it,

but it was so firmly wedged that he could not do so. Two of the iron spikes had passed through its body. Such was the force of the impact that one of the spikes had bent, and, jammed against the next, it held the hawk in a vice-like grip.

'A young bird!' was the angler's summing up. 'Had he lived another month or so he would have realised the folly of chasing swifts!'

V.

Two little nigger boys—and yet another week and there was only one. A shepherd returning from the hill by the long white road which follows the burn till that merry personality is swallowed up in the fir woods, when the road mounts steeply over the brae—a shepherd, returning rather wearily from his long day's tramp, witnessed the fall of the fourth, though he played no part in it.

He noticed a number of jackdaws feeding down the centre of the road constantly ahead of him. As he trudged on the nearest would rise and alight behind him, and so he learnt that a migration of caterpillars, moving from the forests on one side to the rough pasture lands on the other, was the attraction which drew them. Becoming interested, he watched the flotilla rise and fall, till he was surprised to see a hawk swoop down at one of the birds.

Now, of all birds of the woods and the hills the jackdaw is well able to guard its own interests, and as the hawk descended the jackdaw turned, belly upwards, to parry the thrust. The feathers flew, but there were as many gray feathers as black ones, and promptly both birds fell into the centre of the road, their claws interlocked. There they proceeded to fight it out, the jackdaw parrying savagely with his sable bill, the hawk striving to pin down its quarry and to hold it helpless.

Now it happened that the shepherd's dog was running a hundred yards ahead of him, as sheep dogs do when home and supper-time are near, and, seeing the general scuffle in the centre of the road, the dog charged. The hawk saw him coming, and strove to disengage itself, but the jackdaw was too frenziedly busy to notice anything at all, and clung desperately to its opponent. So the dog caught them up—but his fangs closed only on the body of the hawk, and next moment the jackdaw was mounting with eager shuffling flight.

'You've settled him, anyway!' said the shepherd, as the dog brought the dead bird to his feet. 'Serves him right for being such a dern fool as to interfere with jackdaws.'

VI.

Thus within five weeks of their leaving the nest, the brood of five sparrow-hawks was reduced to one. Three had perished by Dame

Nature's chosen ways, and only one at the hands of man; for the keeper, like everything else about that estate when the new laird came, was old and beyond his work. Had he been young and active the hawks would probably have died by shot and powder, but even so the keeper would merely have achieved a task which, had it been neglected by him, would have fallen to wiser hands. For Nature is ever striving to retain her balance—to keep an even keel. She does not allow the strong to triumph nor the weak to multiply beyond the limits of economy. Her rules are the simplest of all rules; their working is infallible. They were made without man's aid, and without man's aid they attain their ends. No species is

allowed to prosper at the death-sum of another, and left to herself Nature does her own killing. So it is only when man demands an unnatural order, the superfluity of one and the exclusion of another, that he must take the matter into his own hands, and run counter to a ruling wiser than his own.

All that winter three sparrow-hawks haunted the fir planting, and next spring the sole surviving chick, a wise hawk now, brought his bride to nest within a few score feet of the tree in which he himself was reared. Thus there were two hawks' nests in the planting; but by then the old keeper had gone his way and a new man had come, so another story begins where this one ends.

THE LARGE BLACK PIG.

By SIDNEY ROGERSON.

I.

ALTHOUGH it has been extolled through the ages as pork, the pig, so far, has not received its due share of appreciation as an animal. Abuse, as well as brief life, has been its portion, and against one 'Dissertation on Roast Pig' can be set a score of tirades reviling the 'belly that walks on four legs.'

This is not fair. There are pigs and pigs, and it is as idle to judge all members of the piggy tribe by the back-yard porker, as all dogs by the street-corner mongrel. What of the Large White, the pampered pet of the north-country miner; of the Gloucester Old Spot, which looks as if it had strayed from a child's Noah's ark; of the rufous Tamworth, lineal descendant of the ancient British hog; of the Wessex Saddleback; of the Berkshire with its genial mien and retroussé snout? True, they all come at the last to table, but, this mournful eventuality apart, they are as different as dachshund from collie. They are the aristocrats of the pig world, rejoicing each in an ancient name and jealously-guarded pedigree; but, blue-blooded though they are, they have fallen on evil days, and have been displaced in popular favour by that vulgar parvenu, the Large Black.

Oh, he is a mighty fellow, the Large Black, but swollen with a crass consciousness of his exalted position. Little has he to recommend him in appearance or character. His popularity rests solely on his large families and his eminent convertibility into foodstuffs. Grossness is in him a virtue. Yet with all his vulgarity he has done much to improve the lot of his gentler relations, for he has given the Englishman a new idea of the pig.

It was not long ago that the pig's only proper surroundings were considered to be the four

walls of a small and smelly sty, where it was cribbed, cabined, and confined for the period of its natural existence. If he was sometimes spoken of as the 'gentleman who paid the rent,' he was allowed to wallow in a state of filth which he was supposed to like, but which was certainly not the proper setting for a gentleman. Dirt and a pig were inseparable in the public mind. If tackled on the subject, a pig-owner would explain that pigs were delicate animals, and made more fat when deprived of exercise. Which was, in a limited sense, true enough.

But then the Large Black was developed, and people began to see that there was money in him. Unlovely as he was, he was a commercial proposition—not kept as a despised but necessary member of the household, alone in his back-yard sty, but roaming in the open in as large numbers as possible. Pig farms were started on a large scale, and the word 'herd' crept back into use. There is a fine ring about that word, placing as it does the domestic porker at once on a level with the lordly bison or the graceful antelope. It heralded the dawn of a new era. Nowadays, as one travels through the country-side, either by road or by rail, one sees large boards bearing such legends as '—herd of pedigree Middle Whites,' '—herd of Berkshires.' But most herds are Large Blacks, and if the Large Black has lifted others with him it has only been incidental to his own popularity.

II.

If there is one corner of England that the Large Black has made peculiarly his own, it is Sussex. The county crawls with pigs. Here is a farm in which a retired general of artillery has sunk his pension, and which he works with the assistance of a solitary boy. There is

another on a larger scale, started by a business man from the East—'I must either go back to China, get married, or keep pigs.' He has now over six hundred. There are two or three herds of over a thousand, though such large numbers are admittedly exceptional.

One farm is much the same as another. The only sties are those for farrowing sows, and these bear scant resemblance to the old-fashioned sty. Imagine a long line of fifty or sixty of them, built back to back, of oak or cedar, floored with wood inside, and red-tiled outside; down the front runs an open drain with water laid on at intervals for flushing, while in one case even electric light is provided. Each pen contains the sow and her litter of from eight to fifteen young, the sty scrupulously clean, and the little pigs shining like well-blackened boots.

When the litter is old enough to leave the shelter of the sty it is passed out into the fields. The young are weaned, and, as they grow, pass from one wired enclosure into another until they are large enough for market, when they start upon their last mournful journey to the bacon factory. Except for the breeding-pens, the pigs live in the open all the year round, though shelter for them at night is provided by semicircular iron huts, usually of the familiar Nissen type. The 'fug' that could be got up inside these huts was sheer bliss to many a trench-weary soldier during the war; but the pig more often than not prefers to follow the latest hygienic fashion and to sleep out of doors. It is as if he were anxious to dispel the impression that he is a dirt-lover, to emphasize the distinction between dirt and mud. For mud, honest mud, is, after all, but the soap and water of brute creation, and is essential to the pig for cleanliness and also, in summer, for coolness. If there is no stream or pool available he will bathe in his drinking-trough, upset it, and pound the soil into paste. Then, thoroughly plastered and happy, he wanders away to some neighbouring shade, there to bask in stertorous slumber and dream of the next meal. In winter the fields get so ploughed with rooting that they resemble a water-logged battlefield, and no bombardment could churn up grassland better than a troop of healthy swine. The Nissen huts stand in a characteristic setting. But even in pouring rain it is no uncommon sight to find all the huts empty and a mass of pigs lying piled one atop of the other in the mud, in which they have wriggled a circular depression. Frighten them away and, however sodden the ground around, it is a curious fact that the place where they have been is bone-dry, even hot.

Nor, for all the apparent damage he does, is the pig a blind agent of destruction. A field furrowed by the plough does not suggest ruin. It presages a future crop, just as the sight of a hop-field caused the tramp to observe to his

mate, 'Lawks, Bill, ain't that a grand crop of beer?' Before the fields were turned over to pigs they produced, perhaps, a poor yield of oats, or mere uninteresting hay; but how the constant grubbing of many snouts transforms them, and the coming of summer clothes the barren mud with a wild mantle of flowers, weeds, and shrubs! Surely the pig is nature's finest landscape gardener! He is a true worker, enriching the soil on which he lives.

III.

To watch him at work or at play is to discover all kinds of unsuspected qualities in the pig. He is a friendly, almost lovable beast, and his intelligence is rivalled only by his inherent inquisitiveness. His memory and his sense of direction are uncanny. For example, a large bunch of young pigs had been undergoing quarantine after purchase, and, the period of segregation over, were driven one morning a distance of over a mile across rough country they had never seen before to the farm proper. Late the same night the foreman heard sounds of feet scurrying past his cottage, little grunts and squeals in the darkness, and next morning every pig was found back in the quarantine enclosure waiting for its breakfast.

The kindness of its character seems to be recognised by other animals, especially birds, and where there are pigs there will the birds be also. Of course, it will be said that it is the food which attracts the latter, but this is only partly true. It probably does attract sparrows, starlings, partridges, and even pheasants. But on one farm the pigs have brought back the plovers, and, whereas a year ago there was not a peewit to be seen, the fields are now full of them, nesting in the holes where the hogs have rooted. On the same farm a pair of semidomesticated Manchurian cranes—the sacred bird of Japan—even chose to build in the middle of a pig-field, where the hen managed to hatch her eggs, not, it must be admitted, without constant attention from inquisitive porkers, many of whom felt the sharpness of her long beak when they ventured too close.

Still more eloquent was the attempt made by a common fowl to mother a litter of newly-born black pigs. Had this not been amply attested by photographs, it would have been almost unbelievable, but such was the fact. The hen wandered into the sty and promptly tried to take charge of the youngsters. She clucked and strutted fussily about with them, and when they went to sleep she perched herself on them, trying idiotically but heroically to cover them with her wings. Again and again she was driven off, only to return, and not until the pigs were really active on their feet did she give up her hopeless task.

Yes, treated like an animal, and not fatted for 'foie gras' like a goose, your pig, be he

Large Black, Middle White, or any other breed, shows up astonishing well. Perhaps to assert that there is poetry in pigs would be an exaggeration, but certainly to see him under

modern conditions is to realise the truth of the saying that 'A dog looks up to you, a cat looks down on you, but a pig looks upon you as another human being.'

IN THE VALLEY OF DECISION.

(1) THE STEEL HAND.

By ASHLEY L. BARNES-LAWRENCE, Author of *Jacob Bateman's Ladder*.

CHAPTER V.—*continued*.

III.

A MOMENTARY silence ensued; an unendurable silence like the silence of the grave.

I felt I must say something. 'My poor, dear boy!' I said.

Hubert nervously stroked with his left hand the empty sleeve. 'It is soon told,' he continued. 'This man Spicer was quite a stranger to me, and also to Vera; but he seemed very much taken with Vera, and made quite a nuisance of himself by following her about.'

'I suppose he had been introduced to her?' I inquired.

'Oh yes! just at the beginning; but later in the evening his attentions became so marked as to be very objectionable to her, and she complained to me about him. So I kept my eye on him, and soon saw that he had had too much to drink.'

'That was just my opinion,' I observed.

'Oh! you noticed it also?' he said. 'Well, then, that just confirms what I say. Of course I was determined to put a stopper on him, for I felt that Vera had virtually appealed to me to protect her. So I made a point of speaking to him out in the garden about it; and that was just my mistake, for it's no use speaking to a man when he's the worse for drink. I spoke quietly to him, and had expected he would say something apologetic; but he was quite hoity-toity and insolent.'

'So I called him a cad, and then he struck me a blow which I warded off with my left arm. And then, in a sort of rage I suppose, and without thinking what I was doing, I found that I had seized him with my right hand by the throat.'

'What! with the steel hand?' I ejaculated.

'Yes. It was a sort of instinctive thing; what I suppose I might have done before I lost my poor hand. Anyhow, with an artificial hand, as you may imagine, it is impossible to feel anything; and I really had no conception what had happened until I found the poor man staggering backwards and pulling me along with him. And then I realised that I couldn't let go, for the more he pulled, and the more I pulled, the tighter my grip became.'

'I see exactly what occurred,' I remarked; 'it is on the same principle that a bird sticks all the tighter to the bough of a tree when a wind is blowing; there is an involuntary contraction of the sinews. But, tell me, what happened next?'

'The end of it was, he suddenly sank down on the grass, with me on the top of him, and that relaxed the tension; and I then managed to release myself. I left him lying there, as I imagined, in an exhausted condition; and wasn't sure he hadn't fainted.'

'Feeling very shaky myself, I went off and took a mouthful of brandy, and then to avoid any further scene or unpleasantness, I ordered our taxi to come round. I managed to pull myself together sufficiently to say good-bye to Vera, and then, as you know, we got away.'

'How dreadful!' I exclaimed. 'To think of your going through all that, and none of us knowing anything about it! Of course I recollect very well that you said you were indisposed; but, good God, what you must have suffered!'

'The next day,' he continued, 'I didn't go to Paddington to see Vera off. For one thing my arm was very bad; and I knew also her friends would see to her all right. Then, again, I confess I funk'd meeting her, for I dreaded to hear something about the previous night.'

'Did you know at that time about Major Spicer's death?' I asked.

'No! I had no idea of it until I saw it in the evening papers. I ought, of course, to have gone off there and then to Admiral Chapman, and told him all about it, and given myself up. But it seemed such a dreadful thing to have Vera's name mixed up with such a scandal, and the whole thing seemed so low and horrid, and very difficult to explain—and then, you see, the newspaper account suggested that the death might be due to apoplexy, or something of that sort. In my heart of hearts I hoped before God that it really was so.'

'It may have been,' I murmured; 'it may have been. It is just possible it was brought on by the sudden excitement.'

IV.

'Anyhow,' said Hubert, 'I thought that in the circumstances I would wait in town, in case

I might be wanted; and in fact I wrote a line to Admiral Chapman, giving him my hotel address. Of course, if I had been wanted, I should have told the truth. But I was not sent for, and, as you know, the verdict was an open one.'

He paused, and lit another cigarette.

'You went abroad immediately afterwards,' I observed; 'and have been in Canada ever since.'

'Yes! I had a letter from my agent, and at once decided to be off. I felt I must have instant occupation and a complete change. I didn't even go home to say "good-bye." The fact was, I couldn't face it; I wanted time to recover self-control and to think out the whole position.'

'If you don't mind,' I said, 'I should like to get at your mental attitude in regard to this point. If you wished, quite naturally, not to draw attention to yourself as being implicated in this unfortunate affair, how is it that you did not consider that your conduct in leaving England so hurriedly, and staying away so long, was just the sort of thing to draw attention to yourself, and to make people begin to put one and one together? Have you never contemplated such a possibility?'

He looked searchingly at me. 'Do you mean that people have been suspicious about me?'

'No! I don't mean that! Of course, I can only speak for myself. I had not the least suspicion; and indeed I feel equally sure that Vera hasn't any idea of such a thing. But my point is that, knowing what you did, I wonder at your doing the very things that were likely to lead to questions and surmises. And, as I told you in my letter about Vera, she, poor girl, has been connecting your absence from England with the happenings at Sussex Lodge. Your conduct had led her to fear that perhaps you thought that on the night of the ball she had not been so discreet as she might have been, and that you had cooled in your affection for her.'

'Never!' cried Hubert; 'never doubt my love for her. Why have I done as I have done, do you suppose? Why have I kept away from her? Why have I all these months been breaking my own heart? Hasn't it been with the view of getting her to break off her engagement with me? And what has been my reason? Is it because I don't love her? It is because I love her with all my heart.'

He uttered all this with intense passion, and then, rising quickly from his chair, he took a half-dozen hasty strides up and down the room.

'My dear Hubert,' I said, as I laid my hand upon his shoulder, 'Vera is far too precious a treasure for any man to throw aside like this. A girl of truest perception, and finest feeling, intensely loyal—my dear man, she is just the girl to be trusted.'

'Thank you! thank you!' he murmured in broken tones.

'Now, Hubert,' I continued, 'I believe you are worthy of her; and you must show you are worthy of her by trusting her. Come, sit down again,' I added, 'and let us see what we ought to do.'

v.

'No!' said Hubert, presently. 'No! I can hardly expect you to realise my intense conviction that for Vera to marry me would be fatal to her happiness. And Heaven forbid that I should be the wretched cause of unhappiness to the very being I love most in the world.'

'I want to be quite sure,' I replied, 'that I apprehend your standpoint; so tell me quite plainly in what way you think that your marrying Vera would lead to unhappiness. Have you never thought that if you don't marry her, or if you lead her to think you have ceased to care for her, she is certain to be very unhappy?'

'Oh yes! I've thought of all that; but then she might get over that. The other thing she could never get over.'

'What other thing do you refer to?' I asked. And the question was prompted not by ignorance, but by the necessity of drawing from him something definite, so that I could deal with it. It was a case of being cruel in order to be kind.

'Don't you see,' he said, 'I must either tell her all about this dreadful affair of Major Spicer before I marry her, or else hereafter for ever hold my tongue?'

'Well!' I rejoined, 'supposing you did keep silence and told her nothing?'

'In that case,' he replied, 'I should always have the dreadful feeling that I had deceived her, and that if she had known, perhaps she would never have married me. On the other hand, what good could come of telling her after marriage? Her first and last thought would always be that I ought to have told her before, and not have waited till she was tied to me for life.'

'Then what about the alternative?' I inquired. 'Suppose you did tell her before you married her?'

'In that case,' he replied, 'I should have to bind her to secrecy; and then, just think of the dreadful burden of such a secret! No!' he proceeded, as he bent his head and covered his face with his hands, 'I have learned what it is to carry about with one a load of this kind—to know that there is a man wanted by the police, and that you yourself are that man—and yet never a whisper of such a thing to one's fellow men. How could I impose such a burden on my beloved Vera? Just think of her life under such a cloud! A life of dread, and a life of deception! Do you think that I could bear to see her live like that? Her dear eyes troubled with a nameless dread? Her cheek blanching and her heart breaking? Never! Never! Never! Do you know,' he

went on brokenly, 'I have sometimes thought I would put an end to myself.'

'No! my dear boy; that is truly the devil's own temptation. "Cast thyself down," is his cry; whereas what you have to do is to cast your burden on Him who is the great bearer of all human burdens; "surely He hath borne our griefs and carried our sorrows." And now I want to lead you on a little further, until, please God, you shall be able to say with me, "and with His stripes we are healed."'

'Oh, sir!' he exclaimed, 'how can healing in such circumstances as mine be possible?'

'With God,' I answered, 'nothing is impossible. I need scarcely say, Hubert, as the friend of Vera and yourself, how greatly I wish to see both of you happy, and trusting in each other. I cannot believe that these dark clouds may not be dispersed by Him who is the light of the world.'

He looked questioningly at me.

'The only way,' I whispered, 'is the way of the Cross.'

VI.

Hubert's hand gripped my arm, and a spasm of pain contracted his brow. 'I'm afraid I don't quite understand,' he said.

'Let me explain,' I answered. 'You have put two or three propositions before me, and you have put them on one side. There was first the idea of marrying her without first telling her; you have put that aside, and I honour you for that—you are quite right. Also you have put away all idea of telling her and binding her to secrecy, because it would impose upon her your secret burden and sense of guilt; and this would simply mean a doubling of the burden, bringing no relief to you, besides being unfair to her. Is not that your view?'

He nodded acquiescence.

'What, then, is left?' I continued. 'I have referred to it as the way of the Cross. It is the trying to act in such a way as our Saviour would have us act. There is no other right way but just that. We may confess our sins a thousand times over, and think we have repented of them, but there is never any real pardon and peace from Him unless the confession includes amendment of life. And this mending up of what is wrong in our lives entails considerable humility and self-sacrifice. Do you not agree with me?'

'Yes!' he said; 'I follow what you say, but how does it apply in my case?'

'Well, my dear fellow,' I said, 'all this present misery of yours, with its prospect of more misery in the future, arises from the mistake you made in trying to conceal what you ought to have confessed on that fatal night at Sussex Lodge. Isn't that so? Well, then, you must retrace your steps to that point, and do now what you ought to have done then.'

I could see plainly that my words had sent a chill to his very heart.

'You will never know anything of pardon and peace until you do,' I said; 'and meantime you stand to lose another of God's greatest blessings—the love of a true-hearted and unselfish girl.'

'I must lose her in any case,' he replied; 'and I do want you to believe that my chief motive in keeping silence was to save her from any distress or shame on my account.'

'Yes! I quite believe that,' I exclaimed; 'but the whole course of events afterwards must surely prove to you that your motive, however good, was mistaken. And now the whole question is, what are you and Vera prepared to bear for each other? You and she had come into each other's life before this tragedy happened, and now it only remains to be seen whether each of you is possessed of the true spirit of self-sacrifice. If the love be genuine, the spirit of self-sacrifice will not be lacking; "love never faileth."'

'Do you really mean,' he asked, 'that I am to make public confession of my share in that dreadful event, now at this eleventh hour?'

'That is just what I do mean,' was my reply. 'Of course, you must insist upon releasing Vera from her engagement to you. That is a *sine qua non*. You must give her entire freedom, and if I judge her aright I think I know how she will use her freedom. She will help you, I believe, to bear this cross, hers and yours, and she will win her crown.'

'God bless her!' he cried with deep emotion.

CHAPTER VI.

I.

THE next morning we breakfasted betimes, and then I went off to consult a well-known solicitor in the city of Liverpool as to Carrington's best mode of procedure, while he himself wrote an all-important letter to Vera. Any interview with her was clearly out of the question.

I also sent her a brief note by an earlier post.

'MY DEAR VERA,—I am here for a couple of nights in Liverpool, and Hubert, dear old fellow, is with me. He is now writing to you, so I will say no more except that, as I told you in London, I am sure all will come right at last. —Yours ever, A. B.'

My visit to the Liverpool solicitor confirmed me in my admiration of Lord Bacon's aphorism, 'I would that every man knew enough of the law to keep clear of it.' He made me feel how easy it is to get into the clutches of the law, but how far from easy to get out of them.

'You must be prepared,' he said, 'for a Treasury prosecution on the part of the govern-

ment. Major Spicer's executors, if any, are little likely to move in the matter. And then, you see, your friend Mr Carrington apparently took great pains to conceal his connection with the event, and went abroad for nine months, and practically treated the law with contempt.'

'Of course he must have had a motive for attacking Major Spicer, and a motive for fleeing from justice; and I need hardly tell you that the prosecution is not likely to attribute good motives. It is quite on the cards, you will understand, that in the public interest they may deem it to be their duty to formulate a charge of murder.'

'Oh, surely they could never convict him of murder!' I exclaimed. 'The whole thing admits of explanation.'

'Well,' he dryly observed, 'there may be valid explanations, but it will need a great deal of explaining. Mind you,' he added, 'I don't for one moment say that a jury will convict him of murder, but the law is bound to take a very serious view of this nine months' concealment; and in the circumstances I should say that the case is pretty certain to appear in the list as a murder charge.'

He further advised that as Carrington had no warrant out against him, the better plan would be not to surrender to the police in Liverpool, but to go quietly down to Richmond and surrender himself there; otherwise the authorities in Liverpool would have to communicate with the police at Richmond, and an officer would be sent to convey him there. And this was an unpleasantness to be avoided.

II.

I hurried back to the hotel. Hubert had just finished his letter to Vera, and had sealed it.

'You are quite sure,' I said, 'that you are prepared to go through with this business, whatever the consequences may be.' And I told him what the lawyer had said.

At the first mention of the word 'murder,' he gave a sudden start, and turned an ashen gray. But he faced the question bravely. 'I can do no more than put my trust in God,' he said, 'and believe that truth will prevail.'

'There is one other thing I wanted to say to you,' I proceeded, 'and it is of the utmost importance. Have you got that steel glove of yours? I earnestly hope you haven't destroyed it.'

'No!' he said. 'I did at one time think of getting rid of it, but later on I realised the importance of keeping it.'

'Thank God for that!' I exclaimed. 'Where is it?'

He coloured up. 'I carry the hateful thing about with me. It is stowed away among my baggage in my bedroom.'

'That's excellent,' I answered; 'and, in addi-

tion to that, we must secure the evidence of Dr Mackenzie who invented it, and of the people at Birmingham who actually made it. They will be able to show exactly what happened.'

'Yes,' Hubert assented, 'that's the tragic part of the whole business; the thing was made in that way on purpose, so that when one laid hold of any object to bring it towards one's self the clutch was automatic, and could only be released by ceasing to pull.'

'I have been thinking, Hubert,' I next said, 'that you had better stay here quietly to-day, and very carefully rehearse with me what you propose to tell the police of Richmond, and in fact put it down in writing; for you don't want to be recollecting or forgetting this or that, on the spur of the moment, when you are under examination. And then we will go up to town to-morrow, and I will introduce you to a Mr William Thurlow, as good a lawyer as you could possibly have to prepare your defence, and a well-known man into the bargain.'

Hubert gladly agreed.

'This will be far better,' I continued, 'than going to Richmond straight off. It is one of our present advantages that we can choose our own time and mode of procedure. Then, after we have made sure of Thurlow, I will go with you to Richmond, if I may, and have a word with the police people myself. And there is something else we ought to settle—what about your mother and sisters?'

Poor Hubert! how dolefully he shook his head. 'Of course they ought to be told,' he said, 'before it becomes public news; but I really do shrink from telling them.'

'Would you like me to go to them?' I asked. 'I could go straight back from Richmond, and your mother is just the person to understand your motives, when they are explained to her; and perhaps I am in a position to explain them even better than yourself.'

He grasped by hand with much emotion. 'Thank you,' he said; 'there is nothing I should like better.'

(Continued on page 568.)

PIXIE-TIME.

SUMMER-TIME is Pixie-Time!

You may glimpse them, as you pass,
Chasing shadows in the grass,
On green stalk and twig a-climb;
Hammocked in some cup-shaped leaf,
Dancing with the circling bee—
All these wonders you shall see,
If you have a child's belief.

After birds have nestward sped,
In the woods at sunset glow
Elfin-bugles softly blow,
Calling tiny folk to bed;
Linger 'neath the starry sky,
Soon upon your spell-bound ear
Steals the music, faint but clear,
Of a Fairy-lullaby!

FRANK LIND.

Chambers's Journal

SEVENTH SERIES

COLLARS.

By JAMES T. JOHNSTON.

I.

ESSAYISTS have from time to time discoursed on various articles of dress. *The Spectator*, in the days of Addison and Steele, abounded in descriptions of Fashion's whims. Leigh Hunt has left us a dissertation on hats and sticks, and Pope sang of the 'nice conduct of a clouded cane.' But no one appears as yet to have given us a treatise on collars, of which there are so many types, one denoting knight-hood, another masonry, another widowhood, and so on; others, again, some particular profession, such as that of a cleric or a nurse. It is, however, with the everyday linen collar that we are here more immediately concerned.

We owe it to ourselves as well as to our neighbours to appear agreeable objects. Bacon says that 'a pleasing figure is a perpetual letter of recommendation,' and Hazlitt parodied Pope's couplet to read:

*Dress makes the man, and want of it the fellow;
The rest is all but leather or prunella.*

A little work lately compiled by a medical man, *How to be Useful and Happy from Sixty to Ninety*, closes with a chapter of axioms, one of which runs, 'When you reach sixty, turn over a new leaf, and if you were careless of your appearance before begin to dress well. It makes you look better and feel better, and you will be no older than what you feel.' On the same principle, as has been said with perhaps more than a grain of truth, a new hat is of more use to a woman than any tonic.

The wearing of a collar makes all the difference in the appearance of a man; its presence renders him comely, its absence unsightly. True, the wearing of one involves the addition of a cravat; and it is a moot point whether a shirt without a collar or a collar without a cravat is the more unseemly. Collar-law used to be rigidly enforced at Eton. The wide collar worn outside the jacket by the junior boys is familiar throughout the land, but a member of the Sixth Form would never in the old days have been seen without the full 'stick-up.' Even there, in this utilitarian age, things appear to be changing, judging from a wrathful letter in a recent number of the *Eton College Chronicle*,

from an old boy who was disgusted, on paying a visit to his *Alma Mater*, to observe a swell, as the term was in his day, 'actually wearing an effeminate turn-down (or "Portland") collar.'

A collar occasionally stamps the personality of its wearer. Just as Wellington and Blücher gave name to a type of boot, so Gladstone and Byron may be said to have sponsored a certain pattern of collar that furnished a fair index to their respective nature and character; for it would be as difficult to imagine the fiery and energetic Grand Old Man in anything but a stiffly starched 'stick-up' as to picture the free and easy Byron in any other than a loose and comfortable 'turn-down.' There is no question that a hard upright neck-band, like the old military stock, makes a man hold up his head and keeps him alert, while a soft one tends toward slackness, developing often into untidiness, if not into slovenliness. Among the bits of sound advice that Lord Chesterfield gave his son was this: 'I should be sorry you were an egregious fop; but I protest that of the two, I would rather have you a fop than a sloven.' As in all else, the happy medium between a fop and a sloven is what a man of sense will endeavour to keep.

II.

Such a trifling omission as the non-wearing of a collar may have serious consequences. In a recent case heard by Mr Justice Darling, before his retirement from the bench, one of the reasons given by a wife for leaving her husband was that he sometimes sat down to meals without one, to which the husband very justly retorted that, while his wife and mother-in-law wore blouses half-way down their front and back, they expected him to appear in a starched collar. Sergeant Sullivan, the husband's counsel, pleaded that he had seen some of the greatest financiers of New York sit down to lunch without a collar on a hot day; from which it would appear that our cousins across the herring-pond are not so punctilious in the matter of this appendage, an omission endorsed by Lowell in *The Biglow Papers*,

So wen one's chose to Congress, ez soon ez he's
in it,

A collar grows right round his neck in a minnit.

It is interesting to note, in passing, that Sergeant Sullivan, mentioned in the above lawsuit, is the last surviving sergeant-at-law, an order so ancient that its origin is wrapped in mystery. It was certainly extant in the reign of Edward I., and figured in Chaucer's list of pilgrims, in whose day each sergeant had his appointed pillar in the porch of St Paul's Cathedral, by which he stood and waited for clients, and, as they came, took their instructions, writing upon his knee. When the pillars became inadequate they established themselves in Scrope's Inn, Holborn. Sergeants Buzfuz and Snubbin in the leading case of *Bardell v. Pickwick* will occur to our readers. The year 1873 saw the end of the order, thus severing another link with the past.

How often to an unfortunate child a collar with a frayed and iron-like edge has proved the crowning sorrow. Lovers of Dickens will remember how poor little Tozer, a pupil in Dr Blimber's school, was so constantly galled and tormented by a starched white cambric neckerchief that his mother insisted on his wearing during the holidays in preparation for the Church, to which he was destined, that, choosing between two evils, the lad thought he would rather stay at school than go home.

III.

But it is not only man that is fettered with a collar. Draught animals are likewise victimised, and every tax-paid dog nowadays must also endure—though, when Burns wrote his tale of 'The Twa Dogs,' it would seem that the wearing of one was a mark of blue blood, since Cæsar's

locked, lettered, braw brass collar
Showed him the gentleman and scholar;
. . . he was o' high degree;

which naturally calls to mind the haughty epigram engraved on the collar of the dog which Pope gave to the then Prince of Wales:

I am His Highness' dog at Kew;
Pray tell me, sir, whose dog are you?

Ancient slaves, like the modern dog, used to wear collars bearing their owner's name and address, the material varying with the value of the slave and the importance of his owner.

It is not so many years since men played cricket in top-hats and stiff shirts and collars. How much more rationally clad is the 'flannelled fool' of to-day.

A tight neckband, which, like tight lacing, is injurious as impeding circulation, may seriously affect both eyesight and hearing. The danger of celluloid, owing to its inflammability, is now generally recognised.

The movement recently afoot in Cairo to substitute mufflers for collars and ties was anticipated in America soon after the United States declared war against Germany. A New York lawyer, named Frooks, organised an Anti-collar

League 'to relieve mankind and help to win the war.' 'Wearing collars,' he announced, 'prevents the free movement of the neck muscles and the flow of blood. There are few men who do not wish at some time or other that collars were never invented. Approximately in America alone 125,000 men and 200,000 women are engaged in making this suffocating harness for our throats. Thousands more are engaged in washing and ironing them. Valuable time, too, is used in making the button-holes in shirts to which the collar is attached, and thousands are making collar studs, which labour would be more usefully utilised in a collarless country. . . . No author ever wrote anything worth reading with a collar on. Edison takes off his collar before he can invent anything; so did President Wilson when he sat down to pen his great messages.'

A modest centenary which, however, deserves mention is that of the detachable collar. In 1825 Hannah Lord Montague, the wife of a blacksmith in Troy, New York State, conceived the idea when washing her husband's shirt. Her neighbours bought collars from her, and then one, Ebenezer Brown, scented money in the invention, and exhibited 'string collars,' as he called them, in his shop-window.

Maybe too much store is set nowadays by this fetish of respectability, this 'insidious cincture of torture,' as it has been exaggeratedly termed, to which comfort is often sacrificed, as in the case of little Peter Cratchit, who, having borrowed his father's monstrous 'stick-up' for the family Christmas dinner, found its corners constantly getting into his mouth. One thing Hannah Montague's device has certainly done, and that is to make men—owing to the collar's consequent development of multiple shapes and sizes, soft or starched, plain or coloured, single or double, high or low—less distressingly similar in appearance than they were before.

AT EVENTIDE.

LIKE a sea of wine, the heather
Glowed red in the setting sun,
As I took my way o'er the moorland
When the long day's work was done.
The harebells were all a-chiming
(For those who had ears to hear),
And the 'Angel of His Presence'
Seemed very very near.

The fetters that bound my spirit
Were loosen'd, and fell away,
As I rose, on the wings of vision,
From my chrysalis of clay.
Alone on the wide, wide moorland
My soul was filled with peace,
And from the tyranny of life
I found me sweet surcease.

And as I laid down my burden
I cried, 'It is good to be here!'
And the 'Angel of His Presence'
Was very very near.

M. HEDDERWICK BROWNE.

THE WOLF.

By ALBERT G. MACKINNON, Author of *Hospital Jock*, &c.

I.

‘YOU brute!’

There was horror and also venom in the words. The speaker was a big man, who somehow looked ungainly in his tailor-cut clothes. His unwieldy figure uttered a protest at every angle against the dictates of convention.

In front of him stood ‘The Wolf,’ as it had stood for three thousand years. The same cruel leer was on its face, the leer that had fired the ancient Romans to deeds of blood. It had not lost its power to move the souls of men, for the big man who gazed fiercely at it was strangely agitated.

The company of tourists, startled by the exclamation, turned to the member of their group who had so unceremoniously interrupted their guide and cut the thread of his discourse, thus compelling him to begin all over again. The party half-filled the little room in the Capitol Museum in Rome, and had been gaping open-eyed at the bronze figure of ‘The Wolf.’ It returned their stare with a crafty savagery, which plainly said, ‘If I could only jump out of my bronze body I would soon make short work of your vulgar curiosity.’

One of them interpreted the meaning of that look, but then he knew wolves. They had been his enemies all his life.

‘You have found me again, you villain!’ continued Bret Hixon, taking no note of his fellow sight-seers. He hitched his trousers (though they did not require it), spat on his hands and doubled them up into two formidable fists, and looked as if he were going to break his knuckles against the wolfish face. ‘If there be a howl in yer I will bring it out,’ he snarled.

‘Be careful, zur,’ said the guide, stepping between the speaker and the object of his sudden fury. ‘This is ze great “La Lupa.” It is *multo* precious. It costs millions of lire now. Once it stood in ze forum, on ze pedestal in ze Comitium. It tells ze ancient Romans to be like itself—wolves, savages; to tear zeir enemies zo.’ The guide made a gesture to signify ferocity.

‘Very pretty, young man; but the way the wolf tears is—so,’ and Hixon suddenly gripped the guide by the neck until he gasped for breath. ‘What did you mean by saying “No” when I asked you if you were going to a Zoo to-day? I told you that you could take me anywhere except to see animals. I am fed up with them. At Brussels the guide nearly lost his head for bringing me within scent of the wild beasts.’

‘But, zur, this wolf is not living. Ze bite is not in it. You need not be afraid.’

‘Bret Hixon afraid of wolves! I like that!’ sneered the stranger, relaxing his grip of the guide. ‘The only wolf I fear is the ghost of a wolf. That is different. It has tracked me for years, night and day. I came to Europe to throw it off the scent. I thought the Atlantic was broad enough to spoil the trail, and here I am faced with *that*.’ He pointed with an action of terror to the figure on the pedestal. It would have taken little imagination to fancy that the leer on the wolf’s face changed into a grin; Hixon thought it did, and his fists clenched once more.

The tourists turned their gaze from the bronze to the big Canadian. Tragedy was shadowed on his face, and they feared what would happen next. Fortune turned the wheel to comedy instead.

Another party came trooping into the room at that moment. It was headed by an American girl, who, on seeing the wolf, darted forward with the exclamation, ‘Oh Golly!’ and flung her arms round the neck of the bronze.

‘What are you doing that for, you silly?’ called her companion after her.

‘It is such a dear old thing. I want to hug it. I love wolves. Think of it being three thousand years old, Cora! There!’ and she gave the nose a smack with her lips. ‘I wonder if it was ever kissed before. What if I, Letitia Tucker, were the first ever to have kissed “The Wolf of the Capitol”? That’s what I call fame. The first woman to—never mind what she did, so long as she was the *first*.’

‘Guess you have a right to that honour. I don’t suppose any woman ever thought of kissing that ugly snout. Seems to me people are daft to rave over a thing like that. What a head! It is enough to give one a nightmare,’ answered her friend.

‘But think of what it stands for—the Roman people which conquered the world! Remember what Byron says:

And thy limbs black with lightning—dost thou yet
Guard thy immortal cubs, nor thy fond charge
forget?

Letitia Tucker had stepped back from her embrace and was gazing admiringly at its object.

‘Guess it would take a mighty good coating of poetry to gild that thing. It’s hideous,’ laughed Cora Bowman. ‘If you want to waste sentiment on a wolf, go to the New York Zoo and see that big chap they trapped somewhere away up on the Mackenzie River. He would knock all the points out of this one. I always

want to let him out; only some people and creatures have a strange way of showing their gratitude, and he might be one of them.'

'Perhaps I am too. That is why I kissed this wolf. It was gratitude to all wolves in general, and one in particular. We should not have been here to-day, Cora, if it had not been for a wolf. I should have been teaching a lot of noisy ruffians in some little school out West; but the wolf changed all that. As I cannot take off my hat to its representative, that not being the fashion amongst ladies, I did the other thing. Don't you think it has got a little more kindly expression in its eyes since I kissed it?'

'You can imagine anything of a face like that. I should not like to be at its mercy, anyhow. Come along, Letitia; we are blocking the way.'

Certainly a crowd had collected. The Wolf had had an exceptional audience that morning. What between threats and caresses, its brazen heart ought to have been flustered, but it went on leering as it had done for centuries.

II.

Bret Hixon, so occupied with his own feelings, had scarcely noticed the action of the girl. He hurried out of the museum and back to his hotel. 'When is there a train leaving Rome?' he demanded of the proprietor, something of the fierceness of the Wolf still clinging about him.

'Where do you wish to go?' was the response.

'To a place where there are no wolves.'

The proprietor's face reddened. He did not know whether a personal reference was intended, and he began to recall his sins, especially those committed against his guests in the matter of accounts. 'Wolves? We have none in Rome,' he said, with some pretence at dignity.

'In the Capitol you have one whose face is going to haunt me all my life. Let me see. I shall go to Genoa. They are sailors there—and sailors are not likely to be such fools as to put a wolf on a pedestal.'

'You can get a train this afternoon.'

'Well, have my luggage sent to the station. I sha'n't want ever to be back in this wolfish den again.'

Bret Hixon stumbled upstairs, and, entering his room, threw himself on a sofa and stared out of the window. Beneath, the Imperial City spread out its proud domes and roofs. In the distance St Peter's added that touch which will always give distinction to this ancient capital. But for once that fascinating vista was slighted. The visitor's eyes saw nothing of it. Before his vision rose up a lonely stretch of snow, shadowed by the sad pines. In a cluster of the trees stood a little shack with two outhouses adjoining, one on each side. From inside one came a ceaseless patter, with occasionally a thump against the door.

'What have you got in there?' asked a trapper, whose face the dreamer was afraid to look on even in vision.

'That's "Jack o' the Mountains." He's the biggest wolf that has been seen in these parts for many a year. He's as fierce as they make 'em, a perfect demon, and has done no end of mischief. I sent word down to Winnipeg that I had caught him. I mean to sell him to a Zoo; that will fetch more money than his skin.'

Bret Hixon started as he heard again in fancy his own voice.

The two men entered the shack and seated themselves at the table. Bret produced whisky and eatables, and as the men ate and drank the trapper's tongue became unloosed.

'Look here, Bret, I must push on to-night to the Fort,' he said. 'I will return in a few days. Will you keep my kit for me? I have some nuggets there I want to take down to Edmonton. I expect they're worth a pile of dollars. I will leave my gun too, as it's heavy. A good stick is all I need. No wolves about here just now, are there?'

'None. All the packs have gone North. You're safe enough.'

'So-long, old fellow, then,' said the trapper, rising. 'Look for me in two days;' and he passed out into the gathering dusk.

Bret saw himself drinking long at the bottle on the table, and the fierce look on the face told of a desperate struggle with the wolf of temptation within. Then he rose and went over to where the trapper had left his bag. Opening it, he searched until he found the parcel of nuggets. Emptying these on the table, he handled each carefully, and with the scrutiny of an expert summed up their value. 'Five thousand dollars' worth, not a cent less. Ned was a fool to leave them with me.' He stared at the little heap as he fought and lost the big battle in his soul. When it was over, and his better self was vanquished, there was an ugly look on his face. He wrapped the nuggets up into their bundle again and placed them in his own pocket; then he paced the floor as the good within him fought vainly a rear-guard action. 'Dead men tell no tales,' he muttered. 'Ned's got to be put out of the way. Sarves him right for being such an ass! It's a good fifteen miles to the Fort, but he can be caught and wiped out before he gets there, and I have got the one that can do it. No incriminating traces left, either. Those Zoo people wouldn't give me anything like a thousand dollars for the wolf, and now I can make five times that amount by simply letting him loose.'

Bret swallowed another glass to keep the idea down. Then, taking a rope, he stepped out of his door. Night was falling now, and a death-like stillness was shadowing everything.

There was no eye to see. Besides, what seemed more innocent than merely opening the door of an outhouse? He fastened the rope to the bolt so that a sudden jerk would draw it and the door would open. Then he sought the cover of the shack, for the wolf was famished and, therefore, in a dangerous mood.

'Jack o' the Mountains' was dozing when he sniffed liberty. The door of his cage had opened miraculously. He had had too many narrow escapes in his short life not to value chances. He rose, and trotted out. A fresh trail was on the snow, that of a man. With a low howl he started on it, and Bret watched him from a window disappearing amongst the pines.

Some hours later, when the fumes of the whisky had subsided, conscience awoke, and Bret experienced the worst time of his life as it cudgelled him unmercifully. There was no peace now in that shack or in that countryside, and with the light of dawn he started to flee from the spot. He knew that 'Jack' would finish his job thoroughly; he had already several scalps to his belt. And so Bret started on his long trek with conscience on his heels.

III.

'Well, of all the fixes to be in I guess this is about the worst!' Letitia Tucker as she spoke sat down on the bed, consternation on her face and tears not far from her eyes.

'What's the matter now?' asked her friend.

'My purse is stolen!'

'That's the Wolf's fault, then,' answered Cora. 'When your arms were round its neck somebody's hand has slipped into the pocket of your jacket. It is the everyday thing in Rome. I suspect that Wolf. You could see the craft in its eyes. It had an accomplice, you bet.'

'It means my going back to Genoa, to the banker there who knows me, and getting a new supply of notes. Thanks to the wolf there are plenty left. I shall go right now, for there are heaps of things I want to buy, and one can't stay in Rome without money. You just wait here until I come back to-morrow.'

'You had better take your fur, as it may be cold in the train. Besides, I do not want to be left alone with that wolf-skin in the room; it is too life-like,' answered Cora Bowman as she helped her friend to pack for her journey.

'The dear old thing—of course I will not leave it with you. It is my mascot;' and Letitia carefully folded the fur with its wolf's head, and placed it amongst her wraps.

The compartment her porter chose for her in the Genoa train had only one other passenger. He had settled himself in the far-off corner and was evidently fast asleep. At a glance Letitia recognised him as the Canadian who had be-

haved so strangely in the Museum that morning. Still, as he looked quite peaceable, and as there was no other compartment so empty, she settled herself at the opposite window.

The train started, and she unloosened her wraps to take out a book. Lifting her fur, she flung it over her knee. As she read she stroked the wolf's head, a frequent action of hers.

A jolt of the train disturbed Bret Hixon's slumbers. He awoke from a nightmare in which the Wolf of the Capitol was the principal tragedian. The first thing he saw was the head on Letitia's lap. His eyes opened into a horrified stare, and he pinched himself to make sure that he was awake. 'Run to earth at last!' he gasped. 'The brute has got me this time.'

Letitia looked up with a smile. 'Doesn't he look fierce?' she said, patting the head.

Bret pulled himself together, and realised that the cause of fear was in himself and not in the object at which he was staring. 'I hate wolves,' he said.

'I love them,' she answered.

'I have reasons for my hatred.'

'So have I for my love.'

'Guess they must be strange ones.'

'No, just the commonest sort—mere gold. This wolf brought me a fortune—that's why I love it.'

'Mine has robbed me of peace—that's why I cannot bear to think of it. Seems to me we are both interested in wolves from opposite sides. Just let's hear what good you have got to say about the brutes. How did this one bring you luck?'

'Oh, that's easily told. My Uncle Ned was a trapper.'

'Guessed there was some connection atween them. Sure as I live, this is "Jack o' the Mountains"! Was your uncle old Ned Blake?'

'Yes. Did you know him? How very strange!'

'He was eaten by a wolf up Edmonton way,' murmured Bret, passing a hand over his forehead, which was wet with cold perspiration.

'Not he! Uncle Ned was far too tough to be eaten. He skinned the wolf.'

'Skinned "Jack o' the Mountains"! exclaimed the Canadian, jumping to his feet in his amazement.

'Uncle Ned would skin anything alive. But that's not how he made his pile. Sit down and I will tell you the whole story.'

'Guess I know a bit of it you don't know,' said Bret, as he seated himself directly opposite the girl.

'Uncle Ned was making a lonely trek through the pine forest one winter's night. He had been assured that there were no wolves about, and so had left his gun with a friend.'

'A friend!' interrupted Bret with a groan.

'Suddenly he saw a big wolf dodging along

his trail, and he knew he was in for the fight of his life. He made for a little cliff, and stood with his back against it. He had just time to pull out one or two small boulders from the loose earth when the wolf came on. I wish I could tell you the story as Uncle Ned did. It was a cunning brute, and it did not rush in at once. I expect it wanted to see what weapons Uncle Ned had. But he was as cunning. He made a feint that lured the creature within range. Then he let him have one of the boulders right on the head. You can see the marks here yet, though Uncle Ned knew how to stitch up skins so well that there ain't much after all to show; and the girl pushed the head of the wolf towards her companion. But he shrank back, the old look of terror coming into his eyes for a second.

'It must have been a mighty sure aim. Ned Blake had nerves of iron,' said the Canadian.

'Yes, he stunned the brute,' continued the girl. 'Then he drew his jack-knife and finished him off, so as not to spoil the skin. He said it was the best wolf-fur he had ever seen, and when he came down home he gave it to me.'

'I am mighty glad to hear this story!' exclaimed Bret Hixon as he reached out his arm and, taking the girl's hand, gave it a hearty shake. 'It has driven the black wolf off my back; but you will not understand that until I tell you my bit of the story.'

'Wait, I have not finished,' said Letitia. 'I have not come to the fortune yet. That's the most important point to me.'

'The killing of "Jack o' the Mountains" is the greatest piece of news I could hear; but even his skin wouldn't bring your uncle a pile, especially if he gave it away.'

'The fight with the wolf did, though. When it was finished, and uncle looked at his hands, he found them all black. They were covered with something which had come off the stones he had been handling. It was coal dust. He examined the holes from which he had dug them out, and discovered a coal bed right on the surface. You bet he did not waste much time. He put the stones carefully back, so that no other chap might see the marks of the coal, then started with the skin straight for Edmonton. He had money in a bank there, and he bought up the whole bit of land all round the spot of the fight. Next he approached a mining company, and took out some of their experts to examine the find. The coal was there right enough, and within a week he had sold the rights of mining for over a hundred thousand dollars, with a fourth share in the company as well. The thing has boomed ever since. Then he came back down East. He said he had made his pile, and had had enough of snow and ice and wolves, and meant to sit by the fireside for the rest of his days, burning his own coal. Poor uncle, he caught a cold just after we had settled

into a comfortable house, and that carried him off. As I was his only relative he left all his fortune to me, and that's how I am doing the world now; and that's why I love this dear old head;' and she gave the wolf's skin a hug.

'Did your uncle happen to mention about another little tidy sum he had in gold nuggets, which he had left with—ahem—a friend?'

'Oh yes, I remember; but the friend had moved off, and he never found him. However, he did not worry about it.'

'Well, here he is right in front of you, and here are the nuggets back safe and sound, not one of them missing. They are worth over five thousand dollars.' Bret took from his suitcase the parcel, and handed them across to the girl, who received them with astonishment. 'I set the wolf on to your uncle. I did it in drink, and I have never had a peaceful hour since. I thought he was dead—couldn't see how it would be otherwise—and I have been a Cain ever since, running away from my sin and it catching up on me, until right here it has run me to earth.'

There was a choke in the thick voice, and the glister of a tear in the eye, which the speaker brushed away with his sleeve. 'I don't know how I can ever repay you for bringing me relief. The best I have is yours for the taking,' he added.

'Then, in a kind of way, I owe my fortune to you. If you hadn't done what you did, then I should have been a poor girl earning my living with a pointer. Guess I owe you some gratitude;' and Letitia cast a look of sympathy at the big Canadian. He was a handsome man, every inch of him.

'Gratitude is akin to love, they say. Let's start with gratitude together. I am a lonely man, and I would like to make it up to you for what I did to your uncle,' Bret said, taking the hand of the girl once more.

Now Letitia was not pretty; her chances of attracting a husband were few. She read character quickly, and saw that the big lump before her was a good sort. His repentance had been genuine. 'Guess Uncle Ned would have forgiven you if he had been alive. He was that kind. He would have laughed over it, and thought you had made the biggest mistake of your life in imagining that he couldn't tackle a wolf single-handed. I don't mind doing what he would have done, and going a little further.'

The Canadian was on her side of the carriage in a jiffy, and their hands together patted the head of the wolf. 'Guess we had better go right back to Rome, and tell that big wolf in the Capitol all that he has been the means of doing,' he said.

They did, and the leer of 'The Wolf' changed to a grin—at least in their eyes.

A NIGHT WITH THE FISHING FLEET IN
KILBRENNAN SOUND.

By N. MORRISON, F.Z.S. (Scot.).

WHEN one is served with a fresh, well-cooked, and, perhaps, well-flavoured Lochfyne herring for the breakfast-table, one takes this dainty delicacy with good relish, and as a matter of course, without even giving a thought to the adventures and discomforts endured by the toilers of the deep in following their dangerous calling.

I have always had a keen desire to spend a night with the fishermen on the bosom of the mighty deep, in order to see them engaged in their interesting and, I may add, fascinating vocation. Recently, through the kindness and courtesy of the owner of a herring screw who invited me to spend a night on board his steamer, this deferred wish was at last gratified. I should like to mention here that a herring screw means a small steamer which patrols the firth all night amongst the fishing fleet and buys up their catches on the spot—in other words, a floating market—and then steams at top speed for Fairlie, in order to despatch the cargo of herring by the early train to the Glasgow market.

About 10 p.m. on 19th July, immediately after sunset, we sailed from Campbeltown and cruised up to Skipness Point, taking a mid-channel course. The sky was overcast and a gentle northerly breeze was blowing, and the air was rather chilly for a night in July. The Kintyre hills and the Arran mountains were shrouded in a dark pall of mist down to their base. Through an opening in the northern horizon the afterglow of the sunset could be faintly seen, tinting the upper ragged edges of this window in light crimson and orange hues. The sea between the steamer and Kintyre shore had taken on a sheen of gray, cold leaden shade, while away on the starboard side towards the Mull, the surface of the deep was of a sombre dark colour. To the right, Pladda Lighthouse was blinking brilliantly, like a flaming eye of a monster of the deep peering out from beneath the waters of the Sound. Sternwards, Davaar Light was nodding leisurely against a dark shadowy background.

The steamer was enveloped in an atmosphere of solitude and eerie isolation which was of an impressive and fascinating character. Save for the throb of the engines, and the swirl of the waters passing by, an awesome stillness was brooding over the scene. There was no other craft in our purview. The fishing fleet, which was operating near the shore, was swallowed up by a strip of inky darkness fringing the coast-line.

At twilight and dawn, the boats, which work in pairs, cruise slowly in and out of bays and creeks, keeping a sharp watch on the surface of the water for any signs of herring. These are usually the two periods when the herrings rise to the surface. They make their presence known by patches of the sea becoming brilliantly coated with a phosphorescent sheen; and next moment these areas are transformed into a boiling surging mass, from which issues a fizzing buzzing sound caused by the herring disporting themselves on the face of the waters.

Immediately this sign appears the shoal is encircled with a seine net by two or more pairs of boats, and in a short time the net is dragged on board one of the boats. If they have a good catch the next move is to set up a flambeau—that is, a double flare for large herring and a single flare for small herring—and the fishing steamers in the neighbourhood will steam straight for the light. Then a pithy, hot discussion will ensue between buyer and fishermen regarding the quality and market-value of the herring till at last a bargain is struck, very often by splitting the difference between the price asked for and the price offered.

As we were sailing slowly up the Sound a flare appeared in Cour Bay near Carradale. A straight course was at once set for this light, and, on arriving on the scene, a boat with fifty baskets of herring came alongside and was made fast to the steamer. The buyer then went on board the skiff, and after a wordy duel about the price, &c., the buyer and the seller came to terms. Of course, it should be noted here that the fishermen, when not satisfied with the first offer they get, exhibit again the flare signal in order to attract other steamers, and thus will sell their catch to the highest bidder. However, on this occasion, as I have already indicated, the first offer was accepted, and immediately afterwards the operation of shipping the herring on board the steamer began. The recognised standard of measure for selling herring is a basket, four of which go to a cran. Therefore, during transhipment, two men kept tally of the number of baskets sent on board the steamer, where the herring were being boxed ready for the market.

The fish in the hold of the boat under the glare of the torches were truly a beautiful sight—a glittering, sparkling heap, constantly changing colours into gorgeous hues and shades, resembling exquisite bars of silver set with precious stones. A quivering, fluttering move-

ment here and there amongst the scintillating mass showed that some of the herring were still alive. This was the first time I had seen a live herring. This species is a delicate creature, and it will succumb shortly after being taken from its natural element.

I noticed, also, that the fishermen in their oilskins and sea-boots looked dignified, sturdy, and manly, harmonising beautifully with their environment, and totally different from their shore appearance. Indeed, if one wishes to see the fishermen at their best, one should see them at sea following their calling.

We repeated the above operations several times during the early morning, while several other steamers were sailing about and carrying on the same work. Sometimes there was an exciting race between two or more steamers making for the same signal, which gives a touch of adventure and spirit to the enterprise.

A flock of sea-gulls followed the steamer all night, and, during the process of transshipping, small herring were thrown overboard and others would drop accidentally into the sea. No sooner had a herring dropped over the side than a cluster of gulls, setting up a chorus of screeches and shrill cries, would dive or rather plunge for it. I often noted that a gull would miss its mark, which goes to show that these birds cannot see very well at night—the gull, of course, is not a night bird. At times a bunch of them would plane down majestically right over the hold—coming into the zone of the torches—and the light reflecting on their white bodies against the dark background of

the night gave them the appearance of a shower of gigantic snowflakes.

The gull referred to here is known as the herring-gull. It differs from the common gull in certain colour characteristics. The former has its lower mandible decorated at the angled part by a splash of red, and has flesh-coloured legs; the legs of the latter are of a yellowish green shade, and the red splash is absent from the mandible.

At dawn the gannet or solan-geese came on the scene, and the gulls then had no chance of getting any of the spoil. Every fish that went over the side was immediately caught up by a gannet. These creatures are graceful divers—taking the water at a slanting angle when fishing at a low altitude, and never missing their quarry. The dive is vertical in working from a high altitude.

About 5 A.M., as the glorious sun was rising over the rugged mountains of Arran, painting sea and land in golden hues, we left the fishing-ground, homeward bound for Campbelltown.

The other steamers left earlier in order to catch the early train at Fairlie, and send their fish off to the city for the morning market so that the citizens of Glasgow might have a fresh herring for breakfast.

My night's cruise in Kilbrennan Sound amongst the fishing fleet made a lasting impression on my memory, and gave me a fuller insight into the factors which weave so splendid a romance round the arduous calling of the fisherman.

IN THE VALLEY OF DECISION.

CHAPTER VI.—*continued*

III.

ALL was now arranged between us, and nothing remained but to carry out the arrangements we had made. We went from Liverpool to London next day, and had the interview, which we had secured by telegram, with Thurlow.

I had known him previously; but never before had it been my lot to elicit from him a legal opinion, or to fix his attention upon a matter so important as that which now confronted Hubert and myself. He seemed to me to be just the man we wanted; the very embodiment of sound legal knowledge wedded to good common-sense.

By his advice we stayed another day in London on purpose to secure the attendance at his office of Dr Mackenzie, and also of an expert from Messrs Swallowfield, the Birmingham manufacturers.

These interviews were eminently satisfactory.

And then Hubert went with me to Richmond. It was as silent a journey as the one we had taken on our way back from Sussex Lodge to my club nine months ago. Both of us were deeply engaged with our own thoughts. It is not every thought that may be uttered, and there are 'thoughts that do often lie too deep for tears.'

The surrender to the police was not so painful an experience as I had anticipated. The official attitude, the business-like tone, the routine questioning, even the good humour of the spider on seeing the fly walk into his parlour—all this tended to put us at our ease.

In due course the charge sheet was filled; and then with a promise to Hubert to return to Richmond in good time for the trial before the justices, away I went, like a homing pigeon, as straight and as quickly as I could to my own home.

I had written a line the day before to Mrs Carrington to tell her that I proposed to call

and see her on the evening of my return, as I wanted (so I wrote) to talk to her about Hubert.

Over my interview with this brave-hearted and true mother it were well to draw a veil; but let this at any rate be said, would that every son had such a mother!

IV.

I was back again at Richmond for the trial. Needless to say, it created a great sensation; and the newspapers made the most of it.

The Treasury, represented by one of the Treasury Counsel, prosecuted; and alas! the charge brought against poor Hubert was that of murder. A good deal was made of the fact that he had fled from justice, and for nine months had concealed from the police his knowledge of the event.

Another point which was pressed was the cause of quarrel between the deceased officer and the defendant, and it was argued that there must have been strong animus to provoke so much physical violence and such a deadly struggle.

I was called as a witness on behalf of the prisoner not merely to testify to the excellence of his character, which I did *con amore*, but to substantiate what he had said as to the inebriety of the deceased on that particular night.

Hubert had determined, previous to the trial, that nothing should induce him to bring Vera's name into public notice, but, in the course of the proceedings, it became obvious to me that his reticence might very seriously prejudice his case.

I took the opportunity, therefore, when I was in the witness-box, to ask that the name of the lady should be written on a slip of paper and made known only to the magistrates and to the counsel on either side; and this was done.

The evidence of Mr Mackenzie was then taken; and he described lucidly enough, and by means of diagrams, the powers and limitations of the artificial hand which he himself had designed for the most beneficent of purposes, but which, by sheer inadvertence, had been the cause of such grievous disaster.

His evidence was confirmed by the junior partner of Messrs Swallowfield & Co. of Birmingham, and also by the very mechanic who made the steel hand, and who remembered every detail of its manufacture.

The steel hand itself was brought into court, and was an object of supreme interest to everyone who could manage to obtain even a glimpse of it.

It was inspected by the magistrates, but the attention they bestowed upon it was but scanty, and I was led to suppose that after the evidence they had just heard as to its manufacture and design, they did not consider that a more

minute examination could serve any good purpose.

But as a matter of fact (so Mr Thurlow subsequently told me), the decision of magistrates in such a case as this would not be influenced by a detail of this kind, for it is upon broader issues that they have to decide whether they shall send the case for trial to the Higher Court, or not.

Nevertheless the appearance of that hand in that court, witnessing, silently but eloquently, to the part it had played in the tragedy that had taken place, was to me a very pathetic and remarkable circumstance.

Hubert had been accustomed to wear over this hand an easy but well-fitting glove, which helped to conceal both from himself and from others the loss he had sustained. Thus very few persons had ever had opportunity of seeing the hand itself, and still fewer had had opportunity of making acquaintance with its mechanism.

The tiny plates of steel of which the surface of the hand was formed were beautifully constructed, and so delicately adjusted to each other as to present the appearance of a fish's scales; and they served to give to the hand that elasticity without which it would have been but a useless appendage. Within this outer covering of steel plates a most ingenious system of pulleys had been contrived, whereby the working of the more important sinews of the natural hand had been artificially reproduced. These pulleys were riveted inside the gauntlet to the extremities of the finger-stalls, and from there they passed along the arm to a strong but elastic bracelet which encircled the arm just above the elbow.

Thus the flexing and reflexing of the fingers of the hand depended upon the contraction and expansion of the muscles of the upper arm. These muscles were brought into action by the bending and unbending of the elbow, and in process of time Hubert had acquired considerable adroitness and power in laying hold of objects and in releasing them from his grasp.

V.

There was a full bench of magistrates, and it was evident that their duty weighed somewhat heavily upon them. At the close of the trial they consulted together in private for about twenty minutes; and then upon returning into court the chairman announced that, in view of the arguments adduced by counsel for the prosecution, it became their duty to send the prisoner for trial; and that he would be tried at the Central Criminal Court at the next assize.

All this fulfilled our worst anticipation, and I left the court with very gloomy feelings.

Notwithstanding all the warning conveyed by Mr Thurlow, and by the Liverpool solicitor,

that a commitment of this kind was not unlikely, I yet had buoyed myself up with the hope that the magistrates, taking into consideration the fact that Hubert came forward voluntarily, and was the victim of his own crippled condition, would deal summarily with the case, and allow common-sense to prevail against mere legal practice. But this was not to be.

The practice of the English law is a curious thing, and the one certainty about it is that it exhibits all the glorious uncertainty of a game of cricket.

The only person, curiously enough, who seemed quite satisfied with the result, and rubbed his hands together after a joyous fashion, was Mr Thurlow, the eminent solicitor, who was responsible for the defence.

'Everything has gone much as I expected,' he said to me, 'and now we are in a position to estimate the relative strength of the prosecution and of the defence. They've had their say, and we've had ours; and indubitably we've got the best of it.'

I could but hope so: and felt very anxious.

VI.

Moreover, there were other matters of which the lawyer knew nothing, but which caused me infinite concern. Two days after the account of the trial had appeared in the newspapers a letter reached me, from Sir Thomas Weston, as follows:

'DEAR SIR,—I am given to understand that you are not only the clergyman, but also in a special sense the personal friend, of Mr Hubert Carrington, who is now in prison awaiting his trial for murder. I feel myself precluded from writing to him personally in the unhappy circumstances in which he has placed himself, and, therefore, pardon me for addressing myself to you. I do not wish to say one unnecessary word to cause pain, but it is imperative that he shall be informed without delay that no further communication now, or at any future time, whatever may be the result of the trial, can be permitted between him and my daughter Vera. I am tempted to say a great deal in justification of this decision, but with your knowledge of the world I feel that I need not enter upon further explanation. I shall be greatly obliged to you, reverend sir, if you will convey to Mr Carrington, in suitable terms, this my irrevocable decision. And I beg to remain,

Yours faithfully,

THOMAS WESTON.'

In some circumstances I should not have felt called upon to answer such a letter as this, beyond writing a bare acknowledgment. But for Hubert's sake, and, indeed, for the truth's sake, I curbed a rising feeling of irritation, and tried to view the position from the general's

point of view. In this I was partly successful, and I sent him a conciliatory rather than an indignant reply.

None the less it was with feelings of satisfaction that I wrote that as Hubert himself, out of a chivalrous regard for the feelings of Vera and her family, had already renounced his engagement and given back to the young lady her freedom, it did not seem to me at all necessary to add any further sting to his troubles by communicating to him the painful message conveyed by the general's letter.

I also took occasion to add that my fuller knowledge of all the events which led up to this trial enabled me to say that, in my estimation, Hubert's character stood higher than ever; and that, so far from his being condemned by his fellow-countrymen, I could not bring myself to believe that any judge or jury was likely to censure him, except for the one thing, that he had not communicated immediately with the police.

I added that probably General Weston was unaware that Hubert's real reason for this silence had been his extreme reluctance to have Vera's name publicly associated with the quarrel which had led to such disaster.

CHAPTER VII.

I.

THE Assize at the Old Bailey now began to draw on apace. Hubert had already been four weeks in prison, but as the charge against him had been formulated as one of murder, the question of bail could not be entertained.

Often during that period did I think of St Peter's imprisonment as recorded in the Acts of the Apostles; 'Peter was kept in prison: but prayer was made without ceasing of the Church unto God for him.'

Hubert within the walls of the prison was prayed for by some of us outside those walls; but to say that he and we, during those anxious days, were sustained by prayer might be misleading. We felt ourselves to be sustained by Him to Whom we prayed; and we tried to cast our anxiety upon Him, knowing that He careth for us.

It was now within three days of the opening of Assize, and I had come up to town so as to be at hand until the trial was over.

The authorities had been kind in the matter of allowing me to see Hubert from time to time, and as for Mr Thurlow he had been the very incarnation of patience in listening over and over again to my oft-repeated tale.

I had determined, therefore, that I would not go down to his office again, nor weary him with any last words, or final instructions. And yet, behold! here was I, to my amazement, going once more to his office as fast as motor power

was allowed to take me, perhaps a little faster. Mr Thurlow had telephoned hurriedly for me.

Within half-an-hour I was at his office, and was shown at once into his private room. He rose from his chair alertly, and held my hand. 'She's come!' he exclaimed; and his eyes twinkled.

'Who's come?' I gasped.

'Why, who do you think? The young lady herself, Miss Vera Weston.'

'You don't mean it?' I said.

'Yes! I do; and if you had been a few minutes sooner, you would have found her here. You are surprised?' he added.

I confessed I was surprised; and then I told him of the letter I had received from Sir Thomas Weston absolutely forbidding any further communication with his daughter, and putting an end to the engagement.

'Ah! well!' said Mr Thurlow, 'he reckoned apparently without his daughter. Sir Thomas, you know, was a daring cavalry officer in his time; he was known throughout India as "Dare-Devil Tom." And now his own daughter dares her own father. Depend upon it she's a chip of the old block. But, whatever she is, she's a girl after my heart, though I myself am the most cautious man now living.'

All this seemed pleasant enough talk for Mr Thurlow, but I continued to stare blankly at him. 'Do you mean,' I interrupted, 'that she is determined to stick to Hubert, and has run away from home?'

'It looks very much like it,' he observed.

'And where is Miss Weston?' I anxiously asked.

'Oh, she's all right. She is now staying with old friends of her family; some people called Chichester, living in Lennox Gardens.'

'I know them,' I said; 'very nice people.'

'Yes!' he rejoined; 'Mrs Chichester accompanied her here.'

'That was kind of her,' I remarked; 'but tell me, what was her purpose in coming to you?'

'I see,' observed the lawyer, 'that you are more surprised by this visit than I was. The fact is, I had been somewhat prepared for it.'

II.

Mr Thurlow unlocked a safe in one corner of the room, and taking out a letter, unfolded it and laid it carefully on the table before me, but kept his outspread hand upon it.

'This is a very private letter,' he remarked; 'indeed, I may say that it is a very sacred letter.'

'It is addressed, as you see, to our client. It is the outpouring of a girl's true love for the man to whom she has given her whole heart. It is not many men who have the privilege of receiving such a letter. You and I may esteem it a privilege that we are allowed by Mr Carrington to read it.'

'Are you sure,' I asked, 'that he intended me to see it?'

'Quite sure,' Mr Thurlow replied. 'He sent for me yesterday, and placed the letter in my hands. Not, he assured me, because he wanted advice upon it; but because, being shut up in a cell, and feeling so utterly helpless to do anything himself, he wanted me and you also to do all we could to prevent Miss Weston from coming to town, or taking any step which might make a breach in her own family circle. However, she has given us no chance. She has followed up the letter promptly by arriving. But there's the letter; perhaps you will kindly peruse it.'

I required no second invitation. And this was the letter:

'MY OWN DARLING HUBERT,—When I read your letter from Liverpool I felt as mortally wounded as if I had received two death blows. One great wound was the discovery that you had not trusted my love for you sufficiently to enable you to make a confidante of me when you first got into that dreadful trouble. If only you had told me, I should have advised you to make a clean breast of everything without a moment's delay, and I should never have failed in my love and loyalty to you.

'The other great wound you gave me was your telling me that now you had got into such trouble, and were sinking so deep in the mire, you could not think of dragging me down with you, and that our engagement must cease.

'All this so paralysed my senses that I did not know how to answer you; and you also purposely gave me no clue as to where I could write to you.

'And then my father must needs come down upon me with all the weight of parental authority, saying that there must be no further communication between us. Well! I have had plenty of time for consideration, and I want now to make some amends for my long silence, and to thank you with all my heart, dear one, for all the tender and loving consideration which caused you to think more about my position than about your own.

'But oh! how mistaken you have been about me. I can't tell you how my heart has ached for you all the time you were in Canada.

'Oh! if only I had known that you were in exile on my account. I am fully resolved now what I ought to do, for I have thought and thought of you unceasingly, and of the shipwreck of my own life if you go out of it.

'Dearest Hubert, you are in a very great trouble and danger, and I could never be happy again if I failed you in such a crisis.

'I am acting on the supposition—though it is not a supposition, but the truth, is it not?—that you still love me as I love you: and so we cannot and must not be parted from each other.

'How I do wish that I could be with you

in your prison life to share it with you, and to cheer your solitude. But it won't be for long, for this horrible trial will soon come, and soon be over; and I want you to know that in it all, and at the end of it all, I am as much your own loving Vera as ever I was before, only more so. For I think when people suffer together and for each other, as you and I have, it endears them to each other. Isn't that your own feeling?

'I am coming to London at once, so as to be as near to you as I can; and also to arrange with the lawyers to let me give my own evidence in open court as to what I know of that night at Sussex Lodge. I shall be staying after to-morrow with Colonel and Mrs Chichester in Lennox Gardens. You are quite mistaken if you think that your Vera could feel any shame in taking her stand beside you. It will be a dear delight to me to testify my belief in you to the whole world. They are bound to see that it was all an accident, and I can show what led

up to it. Quite innocently I was partly to blame, and so how could I ever forgive myself if you suffered through any cowardice or backwardness on my part now?

'But, however this trial may end, whether they let you go free now, or not till a later period, I wish to be the very first to be clasped again in your dear arms when you are free again, and to feel that after all that has happened you still are mine.

'I cannot contemplate any other issue; but as the occasion of my writing this letter to you is such a solemn one, I would like you to know that if you are altogether taken away from me in this life, the one thing I shall pray for and look forward to is the meeting you again in the better country, and in the presence of Him Who judges righteously.

'I am ever, my darling, what you once called me,—Your own true VERA.'

(Continued on page 589.)

MID-ASIA'S DEAD SEA.

By N. TOURNEUR.

MID-ASIA holds many secrets and mysteries, and her 'Dead Sea' is one of them. Few of us but know of Palestine's expanse of brine and desolation, with which many British troops became familiar when driving out the Turks. But only one or two Westerners have set eyes on the barren waters of Lake Issikul, that lies surrounded by vast mountain ranges in 'Old' Moghulistan. This stretch of very briny waters, that is some 120 miles long and 40 miles at its widest, has occupied its valley, 5300 feet above the sea level, since the prehistoric ages when Mid-Asia was the cradle of the Old World. And tradition there gives it an origin much the same as that connected with the Dead Sea in Palestine.

Old Moghulistan is to-day the land of the wandering Kirghizes and their flocks of cattle, sheep, and goats. But under its soil, and along its mountain-sides, are the remains of great and once prosperous cities, many of which were flourishing until put to the sword and destroyed by the dread Tartars in the thirteenth century. Here, too, lies Karakorum, their lost capital with its buried treasures.

In ages farther back, where Issikul laps its shores, there lay a great city and some small towns. Then came deep rumblings beneath the valley, the earth rocked, and the nearby mountains shook. Fires burst from volcanic depths and consumed the city and towns, and were followed by briny waters gushing from underground.

To-day this lake of very salt water is known among the natives of Western Turkestan as Tuzkul, the salt lake, as well as Issikul, the hot

lake, for not only are its waters very brackish, but owing to the hot springs supplying it the surface never freezes in winter—notwithstanding the severe winter in these regions, which is almost like that of Alaska.

The lake is very deep, and no islands are now found on it, although in the fourteenth century one existed, to which Timur Khan, greatest and most terrible of the Mongol sovereigns, who changed the history of the Old World, banished the Tartar chiefs of Asia Minor and their clans. In consequence of numerous springs of boiling chemical water issuing from the bottom of Issikul the temperature of its waters reaches between eighty-five and ninety-five degrees Fahrenheit. The bottom of the lake appears to contain a great quantity of pure iron ore, which is cast up on the shores after one of the frequent tempests, and out of which the tribesmen manufacture iron. The scimitars and daggers of Samarkand, so famous throughout Mid-Asia for the strength of their material and the keenness of their edge, are fashioned out of the flotsam ore of Issikul.

Like those of the Dead Sea of Palestine its salty shores are sterile, but have banks of bituminous deposits. In these, it has been stated, are embedded the remains of beast and bird of far-off centuries. But Issikul is no new discovery, for it is mentioned in the Chinese annals as early as the seventh century. All the geological evidence points out that here, in Old Moghulistan, a cataclysm occurred which was exactly like that which destroyed the cities of Sodom and Gomorrah.

THE WHITE HEALER.

PART II.

III.

'I DON'T know why it is, Mr Faring,' said Iris Temple, 'but I feel oddly depressed to-night—uneasy—just a little frightened.'

'Frightened?'

'Yes. That sounds rather absurd, doesn't it?'

'It doesn't seem quite like you, Miss Temple.'

'I suppose not. Still, there it is, you know. I have a sort of presentiment that something is going to happen. Something terrible——' She broke off, shivering slightly.

Dick Faring nodded, regarding her with a thoughtful air. They were standing in the lee of the deck-house, sheltered from the strong wind which was blowing across the lagoon. His face, in the pale moonlight streaming down between fast-travelling clouds, had a grave, troubled look.

'I think I understand,' he said gently. 'You are feeling the strain of this prolonged search, and are anxious as to the result. It's the uncertainty that is worrying you—getting on your nerves a bit. That is very natural, of course, since it means so much to you. But the suspense will soon be over. I feel sure that we are on the right track now; and if The White Healer turns out to be your brother, well and good. If not—and it's an even chance, after all—at least you will have the satisfaction of knowing that you've done your best. No one can do more.'

She turned to him with a grateful smile. 'Perhaps you are right,' she said. 'It has been an anxious time, and no doubt I am a little overwrought. I will try not to think about it.'

And he took it upon himself to help her, with quite an astonishing degree of success.

Perhaps, after all, it was not so very astonishing either, the circumstances being duly taken into consideration. Here were two young people, of opposite sex and attractive personality, thrown together in the daily intercourse of ship-board life for a matter of some three weeks. Add to that a common interest of no ordinary kind, with a strong feeling of sympathy on the one side, and of gratitude on the other; and it is little to be wondered at if a warm friendship springs up between them—or something even deeper, if it comes to that. And the latter, though possibly neither of them was as yet fully aware of it, is precisely what had happened in this case.

But amongst other things Dick Faring had helped Iris Temple to forget was the passage of time. She realised suddenly that they must have been standing there for the better part of

an hour. She glanced at her wrist-watch hastily, and a little gasp of dismay broke from her.

'Dear me!' she cried. 'I had no idea it was so late! I must go down now, Mr Faring. Jane will be thinking all sorts—I mean wondering where I am.'

'Why should she? A turn on deck——'

'Yes'—smiling. 'But then, you see, at dinner I happened to make some very pointed remarks about the—the chilliness of the wind.'

'And I have kept you out in it all this time! I am sorry.'

'Oh, well——' For a second their glances met, and a faint blush stole into her cheeks. 'It doesn't really matter. I expect she has forgotten.'

'Let us hope so,' he said cheerfully.

Dick walked with her to the head of the companion-way, and there bade her good-night. For some reason or other, which he could not very well have explained, he did not go down with her into the saloon, though there was nothing particular to keep him on deck. Possibly a due regard for Miss Jane Harvey's speculative habit of mind may have had something to do with it.

As he stood with one hand resting upon the frame-work of the hatch, deep in thought, a thick black shadow fell across the deck by his side. He started round, for a moment overcome by a quite absurd feeling of panic. Then, in a rather shamefaced way, he exclaimed: 'Hullo, captain! It's you, is it?'

Captain Jackson laughed heartily—perhaps even a trifle boisterously. 'Why, yes!' he said. 'Who did you think it was, Mr Faring?'

'Dashed if I know,' was the somewhat vague reply. 'I'm a bit jumpy to-night—on edge, as it were. I think something of Miss Temple's uneasiness must have communicated itself to me.'

'Oh——?' The captain stared at him.

Faring nodded. 'This business has got a little on her nerves,' he said.

'But what is there for her to be nervous about?'

'Nothing. That is—nothing definite. She just has a feeling—a presentiment, you know—that something unpleasant is going to happen.'

The two men looked at each other steadily.

'Odd that,' muttered the captain. He moved away from the hatch, drawing Faring with him by a glance. After they had taken a few steps along the deck, he said: 'To tell you the truth, Mr Faring, I've not felt quite comfortable myself since we got in here. These islands have a pretty bad reputation generally, and if there was to be trouble of any kind—well——'

'Trouble?' Faring put in sharply.

'The possibility is never very remote where these head-hunting savages are concerned. They're a treacherous lot, and devilish awkward customers to deal with, as more than one white man I could name has found to his cost. Personally, I don't mind taking the risk, of course. But—we've got two women aboard, you know.'

'I know, captain. That makes what you suggest a very terrible thing to contemplate. I wish I could have persuaded Miss Temple to let me undertake this quest alone. But she simply wouldn't hear of it, and—in the circumstances—what was I to do!'

'Quite so. I can understand how you were placed, Mr Faring, and since they're here with us we must make the best of it.'

'But do you think there is likely to be any trouble with the natives?'

Captain Jackson was silent for a few moments. Then—'Between ourselves,' he said, 'I think it would be wise to clear out of this at day-break. I didn't like the look of that old chief much. There was something shifty about his manner, I thought. The way he kept eyeing us, as if he was measuring up our strength, had a peculiar significance to my mind. Then, his sending off those vegetables and what not—'

'Doesn't that seem to indicate a friendly attitude towards us?'

'On the face of it, perhaps. But I noticed that they didn't arrive until close upon sundown, and that the matter of payment was treated with an indifference, amounting almost to contempt, very unusual on such occasions. Further, the total absence of any lights or movement ashore is in itself somewhat remarkable. As I was saying to Mr Carter, only half-an-hour ago, the thing isn't natural. These islands are visited by white men only once in a blue moon, and—— Eh? What the devil——'

There was a sudden loud clamour of voices forward, and the sound of bare feet pattering along the deck. A moment later, one of the Kanakas rushed up to them in a state of apparently uncontrollable excitement. 'My word, cap'en—you come quick!' he gasped. 'Black fella he here one time catch 'm this fella ship. We plenty fright——'

'Hell and thunder!' roared Captain Jackson, striding over to the rail.

Faring sprang after him, and together they peered shorewards with anxious, straining eyes. The moon was hidden behind a mass of dark clouds, but by its diffused light they could make out dimly the line of the beach, and what at first sight appeared to be a broad curved shadow advancing slowly across the water towards them. In reality it was a vast fleet of canoes, closing in upon them from three sides. The rapid

swish of the paddles came to them like a harsh whisper out of the night, and here and there a spear-blade flashed ominously.

'Hundreds of the beggars,' groaned the captain. 'We're up against it now. There's not a moment to lose——'

He turned quickly, almost colliding with a man in a white duck suit, who had raced aft from the forward part of the ship.

'My God, sir!' cried the latter. 'D'you think the brutes mean to attack us?'

'Not much doubt about that, Mr Carter,' Captain Jackson answered grimly. 'Five minutes or so 'll see hell let loose aboard. Get up the spare rifles, and arm the Kanakas—as far as they 'll go. Look slippy, man!' The mate spun round, and dived down the companionway. Captain Jackson glanced at the group of dusky figures huddled round the main-mast. 'You fella Kanaka fight plenty dam' hard! Savvee?' He turned to Faring. 'We 'll form a ring round the hatch. That 'll give us the width of the deck, and we 'll be able to keep together. We're too few to prevent them from getting aboard. Come along, Mr Faring!'

IV.

What happened immediately afterwards Faring could never very clearly remember. He had a hazy recollection of following Captain Jackson down into the saloon; of seeing Iris Temple's face, white and distressed-looking in the light from the hanging oil-lamp; and of exchanging a few hurried words with her which expressed far less than the unspoken message in their eyes. Then he was up again on the moon-lit deck, rifle in hand, one of the grimly silent figures standing in a ring about the hatch, waiting for the moment that should bring the first of their savage assailants upon them.

It came suddenly, heralded by a discordant yell, as a score or more of frizzy heads bobbed up on either side of them, and dark lithe bodies swung themselves over the bulwarks on to the deck.

'Now!' Captain Jackson shouted.

The rifles cracked, and spat venomously. Unaccustomed as the Kanakas were to fire-arms, some of the bullets went wide. Nevertheless, at that short range most of them found a billet, and for a moment stopped the rush. But it was only for a moment. Other naked figures, brandishing spears and clubs, leaped on board, followed by others, until it seemed that the little band of defenders must be overwhelmed by sheer weight of numbers.

It was then that Faring, who had emptied the magazine of his rifle, and was about to use the weapon as a club, felt something tapping against the calf of his leg. Glancing down quickly, he saw Iris Temple crouching under the hatch, with two automatic pistols in her hands, and a small box of cartridges on the step

before her. 'Iris!' he cried. 'What are you doing here? Go back, dear—'

She shook her head, smiling at him confidently. 'Take this,' she said, giving him one of the pistols, 'and when it is empty you can have the other while I reload. There are twenty-four—that is—twenty-two cartridges. You understand?'

And Faring, who understood only too well, bowed his head in assent.

There was, in truth, no time for any further words between them. The savages were closing in, and for the most part the conflict had resolved itself into a hand-to-hand struggle, with the odds rapidly mounting against the already diminished few. Faring, Captain Jackson, and Mr Carter still survived, the two officers fighting desperately with clubbed rifles. But six of the Kanakas had fallen, killed or seriously wounded by thrusts from the short keen-bladed spears, and in all human probability the end could not be very far off.

Then, when it seemed that nothing on earth could save them, when Faring had deliberately fired his twenty-second shot, and there only remained the last hard duty to perform, a voice rang out through the night, loud and clear above the din of battle, uttering a stern command in the Boruan tongue. 'Hold! Hold, I say! Who wars against the white man wars against me!'

The effect was magical, instantaneous. As if drawn by some invisible force, the mass of the invaders fell back slowly, with awed faces and fear-dilated eyes, leaving a wide space between themselves and the remnant of those whom but a moment before they had been seeking to destroy. Into this space stepped a tall gray-robed figure, wearing a hood which partially concealed its face. A movement swept through the ranks of cringing savages like that of wind playing over corn. The newcomer flung out his arm in a superb gesture of authority. 'Go!' he commanded. 'Return to Ka-Ka, the chief, and say that for this I will deal with him presently. You hear my words?'

'*Ai, Ai!*' wailed a hundred voices.

'Then go quickly, lest an evil thing befall you!'

V.

They went with almost incredible swiftness, vanishing over the side like leaves caught up in a gale. Within the space of three minutes, there were left on the deck only the dead and the wounded, the six Kanakas, Captain Jackson, Faring, Mr Carter, and their mysterious rescuer.

'Thank heaven, I was in time,' came a barely audible murmur in English from beneath the cowl-like hood.

Captain Jackson stepped forward, still clutching his rifle by the barrel in one hand, and with

the other outstretched. 'We owe our lives—and the lives of the two women on board—to you, sir,' he said.

The man pushed back the hood with a startled gesture, the moonlight falling clean upon his lean, bearded, strangely white-looking face. 'Good God!' he exclaimed. 'There are women—white women—on board!'

Then, before Captain Jackson could frame an answer, Iris Temple rushed out from the shelter of the hatch, her lips parted in a gasp of breathless astonishment, and her eyes shining with a glad light of recognition. 'Arnold!' she cried, going towards him.

He shrank back, holding out his hands as if to ward her off. 'No—Iris—you mustn't touch me,' he said in a hoarse whisper. 'You do not know—'

The girl halted, staring at him in a dumb-founded way. 'But, Arnold,' she protested, with a ring of dismay in her voice, 'what is this? I have searched for you through two long years, and now—I want to take you back with me. I want you to come home with me, dear.'

'No, no! I cannot come. You don't understand—'

'Yes, I do,' she interposed quickly. 'You are thinking of what happened long ago. But you need have no fear, Arnold. The man did not die after all.'

'I know.'

'Yes?' She looked at him wonderingly, a puzzled frown creasing her brow. 'Then, if you knew, why did you not return!'

'Because the knowledge came to me too late—as you have come, Iris.'

'Too late!' she echoed.

'Even so,' he answered gravely. 'There can be no return for me. My home is here amongst these wild untutored savages, children of the outer darkness, to whom, for the little time that remains to me, such skill as I have may be of some service. And that time is very short now.'

'Arnold! what are you saying? What do you mean?'

Suddenly he bent towards her, the blue gleam of his eyes contrasting sharply with the dead whiteness of his face. 'Iris, look—look!' he cried. 'Don't you see? Oh, my dear, can't you see that I'—his voice sank to a tone of hopeless, absolute finality—'I am that accursed thing, *a leper!*'

For the space of perhaps five seconds there was an intense, heart-gripping silence. Then a pitiful little cry broke from Iris Temple.

Faring caught her in his arms as she fell.

VI.

The schooner lay hove-to off the pinnacled mass of rock rising like a fantastic dream-castle from the sea, her bow dipping gently in the

heavy ground-swell. A couple of miles southward a faint purple blur marked the position of Ka-Ka's island, and to the north a streak of white showed where the breakers foamed against the encircling barrier-reef of a distant atoll. Westward, glittering under the tropical sun, stretched the wide sapphire-blue waters of the Pacific.

Dick Faring and Iris were standing by the accommodation-ladder with Arnold Temple, to whom they were bidding farewell ere he descended to the waiting canoe. It was a sad leave-taking; yet not without some measure of resignation and hopefulness, so far as Iris was concerned. They had talked the matter over long and earnestly the night before, and Temple had convinced his sister and Faring that any change in his present mode of living would be undesirable, if not impossible.

'It is too late to think of that now,' he had said. 'The terrible disease with which I am afflicted is advanced to a stage beyond all hope of cure, or of amelioration. I am reconciled to that, and content to spend the short remainder of my life in this beautiful island on which I have made my home. There is nowhere else I could go where I should be free to live as I do here. No, no! I have my flowers, books, everything that I want; and am even able to be of some small service to those around me. That, for such as I, is a happiness not to be relinquished easily. I could never find it again elsewhere.'

And when Iris had spoken of her desire to be with him, he had answered, with a shake of his head, 'You mustn't think of that, dear. It is quite impossible. Apart from the sacrifice involved—a sacrifice no brother would allow a sister to make—the risk of infection is too great.'

'Yet others take it. Those men of yours——'

'Ah, that is different! The natives on these islands appear to be immune from the disease. I have never known a case during the years I have been here. But for you, my dear, putting all other considerations aside, it is utterly out of the question.'

'Then I—I am never to see you again, Arnold?'

'Well,'—and a smile of rare tenderness had lighted up the shrunken face—'as to that, now, perhaps it might be managed—occasionally. Let us suppose that you found it convenient to reside for a time in Borua——' He broke off, with a quick, involuntary glance at Faring. 'Then you might take a little cruise in this direction now and again, and we should be able to see something of one another. Eh?'

'Oh yes! And I could bring you things——'

'Um—perhaps——'

'Of course I shall, Arnold!'

'Provided you don't—er—give anything away, you know.—What do you think, Mr Faring?'

'I think the plan is an excellent one,' came the prompt and very hearty reply.

And so it had been arranged.

Now, therefore, that the moment of parting was come, Iris found herself able to face it more bravely than she could otherwise have done. It was very quickly over.

Temple turned to Faring. 'Good-bye, Mr Faring,' he said. 'I am glad to have known you. Our meeting was a rather strange one, but——'

'A very lucky one for us, Mr Temple. If you hadn't come just when you did——'

'I know. It was indeed fortunate that the wind had prevented my leaving the island. Otherwise—but we must not think of that! And in a lowered voice: 'You will look after my sister, won't you?'

'Trust me for that,' said Faring, returning steadily the searching gaze bent upon him.

'Ah, yes—I do.' Then, to Iris, 'I leave you in Mr Faring's care, dear. It has been a very great happiness to me to see you again after all these years, and to know that your loving faith in me has never wavered. God bless you for that, Iris, and—good-bye, my dear, good-bye.'

'Good-bye—for the present, Arnold,' she responded, smiling at him bravely through a mist of tears.

They watched the canoe glide shoreward over the heaving water, until it vanished through a narrow opening in the coral-reef. Shortly afterwards, a small gray figure appeared on a rocky ledge running obliquely across the face of the cliff, and stood there waving its hand to them.

It seemed to be giving them to one another.

THE END.

WOODLAND ECHOES.

(Translated from Geibel.)

DEAR Love sat as a nightingale,
Beside the rose—and sang,
And hark! the sweetest melody
Throughout the woodland rang.

And as he sang, a coronal
Of fragrance crowned the air,
And softly whispered rustling leaves,
As zephyrs floated there.

The brooks were silent—from the height,
Low murmuring they fell,
The deer stood still as in a dream,
And listened to the spell.

And clear and ever clearer flowed
The sunbeam's glowing stream,
Whilst flowers, wood, and glen rejoiced
In gold and ruddy gleam.

I also listened to the spell
As soft I passed along . . .
Ah! what within my heart remains
Is but an echo's song.

Chambers's Journal

SEVENTH SERIES

A ROMANCE OF THE REEL.

By N. M. GUNN.

PART I.

I.

THAT there could be anything uncanny about angling had never before touched the mind of Davie Dunbar, though half a century recorded his devotion to the sport—and the art. Never before had excitement, whipped by exasperation, been held in leash by the fearsome. For it is not that the long black pool in the still hush of a late September evening contained many salmon; it was possessed by them, as, of old, bodies were possessed by spirits. From filmy copper to purest silver they launched themselves into the air, to fall again with resounding splash, in front of him, down the long vista of the pool, above him, by his very waders. And yet to his thunder-and-lightning—no slightest offer.

Covering the leaping fish became a game in excitement that wore thin to an exasperation that quivered—because in this game hope cannot die. His nerves renewed their youth as so many live wires stringing his body to an awful expectancy . . . and then *splash!* behind him, and his heart would be in his mouth. Uncanny! . . . maddening!

Yet Davie Dunbar was normally a mild retiring little man, and his gray eyes looked straightly and simply at you, notwithstanding that most of his life had been spent along the tortuous alley-ways of a dealer in curios and antiques. But then his little shop in an Edinburgh side-street had made him no fortune. For alas! he not only knew old beautiful things when he saw them—he also loved them; so that, even blindfolded, the cool, soft, almost velvety touch of old silver to him spelt a caress unmistakable. Indeed, were it not for old Jamie Forsyth, at once his managing director, accountant, salesman and caretaker, it is at least doubtful whether there would ever have been any fishing expeditions at all. Not but that these expeditions were of the most modest, and for ever winding along the dubious ways of 'free fishing'—except for the rare red-letter windfall that landed a day or two on 'private water.' Ah, private water—how it threaded its dark mesmeric way through his dreams! Some day

to sell out, to retire, to live where the autumn of his days would fall softly and coloured and exquisitely as September leaves on a dark deep-flowing pool—of private water!

And then suddenly he had had this windfall—a few days' salmon fishing on a northern river; a spring river, to be sure, yet with the wise, unfathomable autumn fish there too. The greatest windfall he had ever experienced. The real thing. The dream. Yet here the waning of the first day, and in his basket not a scale; and round him, splashing in silver mockery, a dream, nay, a nightmare of—of the brutes!

He reeled in and examined his thunder-and-lightning. 'Far too dark,' he muttered, though he had but just changed from a dunkeld. 'Ah—this silver doctor—two sizes too big—but—it might mesmerise them—it might exacerbate them!' and his lips shut firmly. He changed the fly accordingly, and then, as he was preparing to get his line out again, his eye ran naturally along the pool, to encounter what it had not encountered that day—a fish no more than breaking the surface in a fine business-like swirl.

Excitement was up again, pure and throbbing, but he strove deliberately to keep it in check. He methodically felt for his gaff. He took a steadying glance about him, up to the still sombre pine wood, which persisted so involuntarily in reminding him of that old picture of his, to the opposite bank, down the river. He had the lonely scene to himself.

He fished steadily down, hoping to cover the spot naturally, cunningly. But now the water rose gradually about his waders at each short step. A fear began to grip at him that he might not be able to cover the spot. The floor sloped. The water continued to rise half-inch by half-inch; it was lapping round his waist, a lightness was coming to his feet, the black flood was beginning to suck at his body; once as he half-turned he experienced a very insecure, bobbing sensation, as of a cork. And then Davie Dunbar paused, knowing he had gone as far as he should, as he durst.

He was casting with so much line now that

it caught the water behind him. He tried to 'shoot' a few feet. Yet he was still short, though it could not be by more than a couple of yards. Only, now the off-swirl caught his fly so readily and whisked it away, he got no chance. He began to blame his luck, and the more he blamed the more certain he became that if only he could get his fly over that particular spot in front of the gray stone in the bank-face opposite, he would—he would strike! He would feel that sudden heavy resistance, that momentary incredible pause on the part of man and fish, and then—the music of the reel! He licked his lips. Perhaps he might venture a step or two, very cautiously, yet. He was getting more used to the depth, and for all he knew it might get no deeper. If only he could see bottom! Putting all his weight on his right foot, he began to feel carefully, inch by inch, with his left. But he had to admit he was going deeper. But surely one step more—two steps. . . . Things were becoming insecure. He paled. His eyes rounded a little. He felt his body sway. This was madness—but then he could always return in the attitude he was now in, little by little, side on. He would try him once more.

He reeled in till he got his line under control. Yard by yard he let it out at each cast. Yard by yard the weight of the jerk back and the throw forward was compensated by the swaying body. The line reached the maximum length he could wield. With a final effort, every muscle tense, he sent it shooting for the gray stone. The fly landed, there was a swirl, the fly was stuck, the line taut. . . . Emotion became tumultuous. With left foot he instinctively 'dug in' against the extra weight in this dangerous game of balances. With such small margins the digging in was done the least trifle too impulsively, too heavily. The small round stone under the ball of the left foot slipped, slithered. He pulled himself up, stumbled, thrashed the water, felt himself going. One lucid moment of agonised amazement, and panic rushed the brain.

A mad fight for a moment or so, with an all-engulfing, choking, deadly enemy. He cried out, thin yell on yell, cried and fought—and knew he was done for. He had long known the danger of waders, where the air trapped in the legs assist, in the case of a sudden overturning, to keep the feet up and the head down. His head was now under. The water was choking his throat in great suffocating gulps. He fought to the surface madly, but it was the hectic madness that precedes final exhaustion. Already his brain was giving way, side-slipping into phantasm—for lo! in front of him was not that his picture of the sombre pine wood, and flying from it, hair streaming, the maiden on horseback; that old old picture he had picked up in a sale lot, and that had

interested him because of its somewhat unusual medieval symbolism? Giving way . . . down . . . down . . . and the last flicker dies in a strange comforting quiescence, touched vaguely by a grotesque, fading sensation that he had a salmon on, taking him down . . . down.

II.

If death be a pale shadowy dream of earthly things, then he is dead. This body of his has at last no substance, wavers uncertain as a smoke wisp in a calm. There, apart from him a little, is his own hand knotted on the cork handle of a sixteen-foot rod, and by the rod, silvery and gleaming, the most exquisite of all shapes in the world, of all desires the most beautiful.

A legend this of the land under the waves, where the salmon is all-knowing and all-wise. And even that dark pool which seems to flow below him, this bank, that sombre wood, all this phantasmagoric dry land which wavers so uncertainly—even that dark shadow of something like a centaur coming yonder, two shadows. . . . But all gets blurred, blurred—vanishes as frail smoke.

Out of black nothingness things waver back again. The face of the maid in the picture takes on a glowing, frightful light. The glowing light is sunlight—yet no, it is spirit, it is a burning from within. And she is crouching forward, fleeing the wood. Fear . . . terror. . . . He struggles to dismiss the picture; shuts tight his eyes. But they open in spite of him, and lo! overhead is a great unsearchable whiteness, palely luminous, stretching into remote infinitudes of shadow. Nearer, nearer, it comes; nearer, till his eyes grow dazed, till his eyeballs get oppressed by the intolerable closeness of the focusing. . . . And in a sudden queer amazement, he, Davie Dunbar, realises he is staring at the white-washed ceiling of a real room. Spasmodically his fingers clutch at bed-sheets; his head rolls on a pillow; a dim night-light is burning on a table. . . . Verily, he is alive.

It was enough to go on with. He let himself slip down again into exquisite unconsciousness. He would take things easily. And presently when he returned, he decidedly felt calmer, more real. An utter stillness was about him as his eyes opened and encountered the ceiling. Then suddenly a shadow detached itself from the bed-head and stood over him. It was his landlady, smiling gently.

'You'll be feeling better now?' she asked softly.

'Yes.' He was feeling perfectly all right, though queerly enough his voice was no more than a whisper.

'I have been waiting for you to waken. Now I'll be getting you something to drink,

and then you'll sleep. I won't be a moment!' and she was gone.

She returned with a steaming bowl.

'Tell me,' he whispered, 'how—how——'

'Not a word till you take this and have a long sleep. 'Tis what the doctor ordered. And oh! it's me that's glad to see you as you are. I've been waiting and watching. But now you are well again, and in a day or two you will be fine.' Anxiety and motherliness and relief mingled in word and action. She tenderly lifted his head up, held the bowl to his lips.

'I am so sorry,' he said in a little while, 'to have kept you. Please—I am all right now, and will sleep.'

III.

Daylight was glowing in the yellow blind of the little window in his bedroom when Davie Dunbar awoke to a consciousness of an outside door opening and a half-subdued breezy voice in the passage-way.

'Well, Mrs Fraser, how's our patient this morning?'

'Not awake yet, doctor.'

'Splendid! You'll find he'll be all right—but shaky for a few days, and no more fishing this week.—Ah, that you, Kennie?'

The footsteps receded, but not far enough to render talk inaudible. There was a little laughter.

'Has he been talking, Mrs. Fraser?'

'No, doctor, no; I wouldn't let him. He was going to——'

'I'm sure he was! It must be a bit of a puzzle to him. It was the nearest thing I ever struck—and the pluckiest—ready-witted.'

'From what I've heard, it was surely,' came Kennie's soft Gaelic voice. 'She has enough pluck for many a one. I was saying to the wife just that.'

'The old fellow was game, too. Stuck to that rod and fish of his like grim death. If he hadn't stuck to the rod, of course, it would have been all up.' The doctor gave a chuckle. 'She got hold of the point of the rod, for the current, you see, had sucked him in and across a bit, so that the point walloped the bank. She got hold of it and hauled him in, waders and all, hand over fist. Then she dragged him on to the bank, turned him over on his stomach, and squeezed the water out of him.'

'She had that ambulance during the war,' said Mrs Fraser. 'It came in handy for once.'

The doctor chuckled again. 'But the old chap wouldn't give up the rod—not he. And there at the end of the line, with an odd screech now and then from the reel, was the fish, playing himself beautifully. Eh! I've heard of a man playing a fish when not quite in his sober senses, but never yet of a dead man doing the trick!'

'It wasn't canny nearly,' said Kennie.

'She couldn't get his fingers off the butt, tear at them as she might; so she just pumped the water out of him and left his hands alone. When she could do no more and was coming away for me 't seems she had a sudden queer feeling that—that the fish might pull him in, or something, eh?'

'Just that,' said Kennie.

'Why, now, you don't think it would, really, Kennie?'

'Whoever would be thinking that?' asked Kennie, laughing softly.

'You're a queer lot, all the same, and I do believe that in this sort of thing the Big House and the Black House are but and ben!'

'Nonsense, doctor! And you were saying she landed the fish. . . .'

'Yes, she landed the fish. At least, she stuck the rod up on end and began to reel in. Instead of sulking, the fish, as it happened, had played himself out. No doubt he was mad at the gut being all round his fins; then there was no strain on him after the first rush or two, so that he did not think of leaving his own ground, but thrashed about, trying to break with his tail what there was no longer any strain on.'

'I can see it happening,' said Kennie.

'But the really amazing thing was this. Of course, if we examined the ground we'd probably find an odd little hole in it, or maybe the cleft edge of a bit of rock sticking up, or something like that. Anyway, she says that when she let go the rod to get the gaff, the rod remained standing up, with his hand holding it there!'

'You're not telling me that?'

'I thought that would get you! And it's a fact. Determined, wasn't he, to play his own fish? It must have been a sight for the gods! He deserved to get the fish right enough. In fact, she felt that he had to get the fish. Must get it now. That feeling was stronger even than the commonsense which told her she ought to be rushing for help. And she got him, too. Gaffed him clean. He remained lying close in, exhausted, his white mouth opening and shutting, when she stole on him.'

'It was well done,' said Kennie.

'Wasn't it?' The doctor's tone, for all its half banter, held an undernote of something like enthusiasm. 'That twisted drowned body holding on grimly, lank wisps of gray hair, gaping eyes—it wasn't a bonny sight for a young woman.'

'No, indeed!' said Mrs Fraser. 'No, no!'

'So she laid the fish beside him, leapt on her pony again, and came fast as the beast could carry her.'

'I am wondering,' said Kennie, 'what he would be thinking himself if he had woken

up and found the rod and the fish, and no one beside him at all.'

The doctor chuckled. 'I wonder! I bet, Kennie, you'd have been looking about you for signs of the Last Day.'

'Indeed, now, and there's no saying what one would be looking for at all.'

'Not for Auld Nick, because it wasn't poaching, Kennie; he had permission from the factor in Edinburgh.'

'You will have your joke, doctor!'

'Ah, well! Have a look, Mrs Fraser, to see if he's awake yet. I must be getting on.'

And as Davie Dunbar heard the footsteps coming to his door, he closed his eyes. The door opened quietly, the footsteps came softly to his bedside. He opened his eyes.

'Ah, you are wakening, Mr Dunbar! How are you feeling now?' Her voice was all the tenderest solicitude.

'Very well, thank you,' and he smiled.

'Now, isn't that fine! And here's the doctor himself come to see you.'

The doctor stumped into the room. He eyed his patient shrewdly for a moment. 'What's this I hear you have been attempting at the Dragon Pool, sir, eh?' He stooped and gently caught the pulse in a wrist.

'Oh—I'm afraid—' stammered Davie self-consciously.

'Afraid! I hear that it did not look at all as if you were afraid. I thought such new-fangled ways of catching fish were peculiar to these parts, where they catch them every way—but quite unknown about the Water of Leith!'

Davie smiled.

The doctor nodded. 'Good! You're all

right. Bring in the real medicine, will you, Mrs Fraser, please?'

'Wh-what medicine—'

But her husband was by the door. 'Ach, woman!' cut in his voice, and in the same instant his footsteps were stamping to the kitchen.

The doctor chuckled aloud. 'When it comes to a matter of intuitive intelligence, Mr Dunbar, I am sorry to say that we of the Lowlands haven't a look in. Wait!'

Kennie reappeared, a couple of fingers at the gills supporting the weight of a most beautifully-proportioned eighteen-pounder.

And Davie's smile gradually faded in a strange gleaming increase of light. Another moment, and he was struggling valiantly to get up on one elbow, to stretch out a hand. . . . He collapsed uncertainly.

'Ay, better wait a while! You'll do it before another day is gone. Mr Fraser here says that it is a phenomenally fine specimen for this time of the year.'

'The doctor—' began Kennie, when Davie, gasping mildly, interrupted him in all seriousness: 'Yes, a silver doctor,' he said.

There was an amazed hush for a moment, then the doctor's laugh rang out. 'How's that, Kennie?'

'That's a good one, and no mistake,' replied Kennie.

And Davie, grasping their meaning, blushed.

'Now, you must be wondering how on earth all this happened to you. So I'll leave Mrs Fraser to explain. Between fish and the girls, you have most certainly created history in Glenelg. I'll look in to see you before the night is done.'

(Continued on page 603.)

THE PUZZLE OF THE SWALLOWS.

By MILDRED PERRIN.

THERE is always a certain pleasure in detecting in an occasional error the man who knows everything, and when we find the great Samuel Johnson asserting, with his usual *ex cathedra* manner, that swallows spend the winter under water, we smile our smile of superiority and feel profoundly comfortable. How absurd the words of the great man seem to us now! 'Swallows,' he says, 'certainly sleep all the winter. A number of them conglobulate together, by flying round and round, and then all in a heap throw themselves under water and lie in the bed of a river.' Johnson pronounced this choice bit of natural history in 1768, and he was really only quoting the theory generally accepted at the time by professed naturalists; his error, a serious one, lay in stating it as a proved fact.

The strange notion that swallows hibernated under water prevailed in England for close on a century and a half at least, for it is mentioned in the *Philosophical Transactions and Journal of the Learned* for 1666 and 1667, and crops up at intervals until the close of the eighteenth century.

The annual disappearance of swallows and other migrant birds in the autumn and their reappearance in the spring must have set men speculating from earliest times, wherever the ways of birds were observed, and the ancients seem to have had an inkling of the truth. To the majority of seventeenth and eighteenth-century naturalists, however, the idea that small frail-looking birds like swallows could travel over land and sea to distant countries seemed far more wonderful than that they should hibernate like butterflies and squirrels.

They had observed, too, that in the autumn swallows were wont to collect in numbers near water, and in the evening to disappear among the osier beds, their roosting-ground. The next morning there were none to be seen; hence it was concluded that they had retired to their damp winter-quarters. Some few observers believed in migration, and some thought that both hibernation and migration were practised. For example, in *Nature Displayed*, a work which appeared originally in French, and was translated into English and ran through several editions during the middle years of the eighteenth century, we read the following: 'While some cross the sea, others, in most northern countries, continue in Europe, and conceal themselves in caverns of the Earth, riveted to one another with their Claws and Bills. They flock to places unfrequented by Man and even bury themselves in the Water. The precaution they take to lubricate their Feathers with their own Oil, and to roll themselves up like a Ball, their Head within, and their Back without, preserves them in the Water, and even under the Ice.' This description certainly shows a good deal of imagination, as, of course, no one had ever seen a balled-up swallow.

Gilbert White, writing in the closing years of the eighteenth century, was greatly puzzled by the problem of migration. He could laugh at the Swedish naturalist who, in his *Flora*, 'talks as familiarly of the swallows going under water in the beginning of September, as he would of his poultry going to roost a little before sunset,' but he could not give up the hibernation theory altogether. In one of his letters he says: 'I acquiesce entirely in your opinion—that, although most of the swallow kind may migrate, yet some do stay behind and hide with us during the winter.' He arrived at this conclusion through observing that a few martins were often to be seen on the wing on a mild day in November. It is now generally thought that such loiterers are birds which were either too young or too weakly to join in the autumn migration—but this is one of those matters connected with natural history which are not yet finally proved.

White was honest enough to declare that no case of hibernation had ever been authenticated, though, like other observers, he had sometimes come across birds rendered torpid by a sudden cold spell. Some naturalists, however, gave credence to all kinds of absurd stories about birds remaining torpid for great lengths of time, and some of these stories were current until quite recent times. For example, in a book published in 1890, the writer, a F.R.S., although not committing himself personally to a belief in hibernation, gives several instances of swallows being found torpid 'which have come to our knowledge, on the most respectable authority.'

Some of the instances are likely enough, but among them is this gem: 'Again, about half a dozen swallows were found a few years ago, in a torpid state, in the trunk of a hollow tree, by a countryman, who brought them to a respectable person, by whom they were deposited in a desk, where they remained forgotten till the following spring, when one morning, on hearing a noise, he opened the desk, and found one of them fluttering about; the others also began to show signs of life, and, upon being placed out of doors in the sun, speedily arranged their plumage, took wing, and disappeared.'

We cannot imagine any present-day naturalist having the hardihood to relate stories of this kind as having come to him 'on the most respectable authority,' but it is doubtful whether we have outgrown all our 'strange notions' about migration. One that dies hard is that the larger birds carry smaller ones on their backs. This myth is of respectable antiquity, for a saying of the Tartars that 'each crane carries a corncrake on its back' was referred to as an old legend in 1740. The notion originated from partial observation and from reasoning. It was reasoned that the weaker fliers must be carried somehow, and it was observed that small birds often appeared, as it were from nowhere, immediately after the arrival of the larger species. It is probable that they had travelled in company, and that, being small, they had remained invisible until quite close to the observer. Careful modern observers have sometimes noticed birds dropping from the sky at the time of the spring migration, and it is thought that these were migrants that were flying so high as to be invisible.

Although the fact of bird-migration is indisputably established, there are many problems connected with it which are still unsolved. We have learnt to be humble before the workings of Nature since the days of the great Doctor; even the experts are shy of dogmatising, and are content, for the most part, to record their patient observations, thus adding to the vast mass of data from which the ultimate truth will be unfolded. We of the laity may have our own theories; we may even cherish some 'strange notions,' but if we are wise we do not reveal them, except perchance, tentatively and apologetically, to some trusted friend.

THE GIFT.

HER faith is the sound of the running stream
And the breath of the child who sleeps.
Her heart is the core of the wide-open moor,
And the glorious light of the steepes.

Her love is the break of the early morn,
And the light to life's sinking day,
Her love is the gift of compassionate God—
For worthiness I pray.

J. P. DAVIES,
Pretoria.

A NATURAL PHENOMENON.

By D. E. STEVENSON, Author of *Peter West*.

I.

THE hot tropical sun beat down upon the barrack-square, turning the dry brittle surface to a pool of dust, blindingly white in the glare. Above the low white buildings the blue sky was cloudless and pitiless. George Anderson stared round him in a bewildered manner—stared from the low-roofed cantonments to the few sickly palm-trees, whose leaves were scorched and withered by the heat and long-continued drought. He had been here before—something was going to happen—but here his memory failed him. Across the square was a door—a red door—blistered and cracked. George knew that he must reach that door. . . .

Suddenly he heard a shout, and saw a huge black horse galloping down upon him. It was harnessed to a high cart, which rocked from side to side. George was held rooted to the spot by a nightmare-feeling of sheer horror. He could not move. The dust rose in a cloud. At last a shout startled him out of his apathy, and with a violent effort he wrenched his mind into action and jumped aside—but the action came too late. He tripped and fell. . . .

The pawing hoofs whirled above his head—the wicked eyes, bloodshot and staring—the huge black body, shiny with sweat. An intolerable pain tore at his body, while the dry dust, rising about him like warm smoke, clogged his lungs and muffled his cries of agony. . . . Then all was dark.

George opened his eyes, to find some one shaking him with no gentle hand. 'For Gawd's sake be quiet, can't ye!' a voice said.

He sat up, rubbing his eyes, and found himself in the familiar barrack-room which he, as a private, shared with fourteen other men.

'You bin dreamin',' the voice continued more amiably.

'Shriekin' somethin' awful,' another voice put in plaintively.

George Anderson shuddered. He had had the ghastly dream before, and each time that he had it he wakened like this, wet with fear, every nerve in his body quivering like taut wires. 'I'm — sorry, boys,' he said between his chattering teeth, so making the 'amende honorable' in the vernacular of his kind. Then, hunching up his brown blanket over his shoulder, he turned over and pretended to go to sleep. For a few moments there were murmurings of annoyance, but these soon subsided into snores, and once more comparative quiet reigned in the big dark room.

There was one man, however, to whom sleep did not come. George Anderson slept no more that night. He lay and watched the moonlight on the floor, and saw the dawn come into being over the big building on the other side of the square, which was the officers' quarters. Although he was fatigued almost beyond endurance by his hard day of physical exercise and by the tumult of his nerves, George fought against sleep with every ounce of strength and will-power that he possessed, for sleep might bring a recurrence of that terrible dream. . . .

The dream had haunted him from his boyhood. Sometimes months would pass without his having it, and then, when he was lulled into security, it would come to him with renewed horror and fear, making his nights a misery of wakefulness and his days a long slow torture of jangled nerves that cried out for the sleep which he denied them.

George never spoke of his sufferings to any one. He bore them, as was his nature, in stoical silence, with a bewildered dour courage which he had inherited from his V.C. father. The place that he dreamed of—the low cantonments, the burning sun and white powdery dust, the queer smell of burning rubbish—was like no place that he had ever seen, for the battalion had finished its tour of tropical service before he joined it four years ago.

When the older men spoke of India, George would listen with mouth agape, but his secret prevented him from wishing to go abroad and see for himself the wonders described by his companions. Most of all he liked to hear about the campaign in Tirah when his father, then a private in the battalion, had won the most coveted distinction in the British service. He had won it for his devotion under fire to his company commander, Captain Logan, and now George, his only son, was servant to that officer's son, and held a unique position in the regiment by reason of his father's prowess.

Captain Logan, junior, was a great favourite in the battalion; he was young and cheerful, and keen as mustard. His company adored him, and would have followed him through fire and water. To his seniors he was always known as 'The Boy,' doubtless on account of his round face and fair curly hair.

George liked being servant to this popular officer, not because he escaped certain parades and fatigues by this favour, but because he took a real pleasure in serving him—polishing up his buttons and boots until they outshone those of any other officer in the battalion. His pride and pleasure were therefore not unmixed with regret when he had learned the

previous day that a decree had gone forth detailing him for the next N.C.O.'s course.

'I mustn't be selfish any longer,' Captain Logan had said, with one of his boyish smiles which had endeared him to everyone, from the C.O. downwards. 'I shall be awfully sorry to part with you, Anderson, but it will only be for a time, and then I shall have you back in "A" company as a lance-corporal.'

George never thought of questioning the decision of his idol, but his eyes strayed regretfully from the shining buttons on Captain Logan's tunic to the perfectly polished field boots. 'Very good, sir,' he said; and then added, 'You'd better have Taylor, then, sir.'

'The Boy' nodded. 'Yes, I'll take Taylor; and the momentous interview was at an end.

II.

The afternoon sun was warm and golden. A cool breeze blew across the barrack-square, flapping George Anderson's kilt against his knees, and at the same time blowing the cobwebs of his miserable night out of his handsome head. He threw his shoulders back and saluted the sentry on duty at the gates with a smart gesture of greeting.

The sentry spat reflectively—there was no officer about. 'Eh my, yon's a terrible hole ye've got, Geordie!' he sighed.

'A hole?' cried the wretched George, glancing down at his braw new hose in consternation.

'Niver heed. Aiblins she'll no' see it.'

'Whaur's it?'

'In yer hairt,' was the grave reply.

Geordie's remarks, much to the point, but scarcely printable, were cut short by the timely appearance of an officer, and he sallied forth into the High Street with a little swagger which became his well set-up figure in its becoming rig-out.

Who wouldn't swagger a little with Geordie's consciousness of good looks and good conduct, with a kilt to swing at his knees and a pretty girl in the offing?

Lily was waiting for him opposite Galloway's, the big draper's shop which had usurped a dozen small holdings in the busiest part of the town. She was very conscious of a new pair of silk stockings and high-heeled shoes. A green jumper in Galloway's window had caught her eye; it was very attractive, and she was wondering in her busy little brain how many times she would have to go without dinner so as to save enough money to buy it. Several men passed and nudged each other, and she glanced at them sideways from beneath her pink hat.

Lily knew that George was coming long before he saw her; *how* it would be difficult to say, for she had never glanced in his direction. Her little squeal of astonishment, when she found him at her elbow, would have deceived a more worldly fellow than our poor soldier boy.

'Whit a stairt ye give me!' she said, raising her eyes to his face with a simper which would have completed her capture of his heart had it not been effected long before. 'I wis jis' lookin' at that jumper,' she added. 'Div ye think it would fit me?'

Thus questioned, George tore his eyes from his captor's face and looked at the garment in question, which was hanging in the window. He turned over the few shillings of his week's pay which remained to him, and looked again. The price-ticket was placed conspicuously, and alas for poor Geordie, whose pay had a habit of melting away like snow in April!

'It's real pretty,' he averred; adding in a shamefaced manner, 'weel, is it tae be the movies, Lily?'

Lily turned away with a little sigh. She had not really expected him to buy it for her—she was finding out that soldiers were generally hard-up. If George had not been so good-looking she would have given him the cold shoulder before this, and taken up with a 'clurk' who had shown her, in a delicate manner, that he was quite ready to walk out with her. But Geordie was very good to look upon—she knew that people gazed after them as they passed.

On this particular afternoon Lily voted for the park, and led her companion past the swing-doors of the 'Grand Picture Palace' with a firm little hand on his arm. She did this partly because she liked to be seen with the big handsome soldier boy, and partly because she knew he wanted to sit beside her in the dark solitude of the picture palace and hold her hand. Thus did Lily punish him for his inability to satisfy her desire for the green silk jumper.

As they walked round the park, listening to the band and watching the people, George unburdened his heart to Lily on the subject of the N.C.O.'s course. 'I dinna want tae leave Captain Logan,' he explained. 'But if I get tae be a N.C.O.—weel, I'm nearer being able tae mairry ye. An' oh, Lily, I'm wantin' ye sae bad.'

Lily was only half-listening. It took her all her time to keep pace with her companion's long-limbed saunter, with the mincing little steps dictated by her tight skirt and high-heeled shoes.

III.

The next day there was much grumbling in the barrack-room, for the C.O. had decreed a route-march of fifteen miles. This necessitated an extra polishing up of arms and equipment until they shone again, and it also entailed—in the case of many of the men—a week's purgatory from blisters and corns. George did not join in the general grouching. He enjoyed marching, loved to step out with the battalion as one man, with his kilt swinging free from his hips and the skirl of the pipes in his ears.

There was a rush to doors and windows as the battalion turned the corner of the High Street and marched up Pollock Street towards the big stone bridge. It was fine to see them. Many a woman brushed the tears from her eyes with her apron as she looked after them with misted gaze; many an old man found a lump rise in his throat.

'Eh, they're fine!' was the general opinion. 'Oor laddies; there's nane tae come up tae them!'

The song of the pipes, wailing and sweet, drew a motley crowd of followers, who kept pace with the soldiers along the congested pavements.

'I wonder if Lily sees us,' thought Geordie with a surge of pride.

Old Mr Watson (late quartermaster-sergeant of the regiment, now retired) was taking a swarm of bees, when he heard the wild music and the tramp of many feet. The sound was as strong drink to the old soldier; he dropped the hive and rushed to the gate. 'Eh, they're braw,' he whispered, his feet marking time to the familiar tune; and he was not far wrong. They came up the street marching as one man, their arms and accoutrements winking a dazzling heliograph in the bright sunshine.

Mr Watson leaned on the gate, wishing that he were twenty years younger; he had quite forgotten the bees, which swarmed out angrily from their overturned hive and flew over the fence in a buzzing cloud. The baker's cart happened to be standing outside Mr Watson's gate, and the bees settled upon the black horse, which was awaiting its master with model patience, and stung it severely. It was more than any horse could stand, and with a neigh of terror the poor creature threw up its heels and bolted down Pollock Street towards the advancing battalion.

'A' Company happened to be leading, and Captain Logan shouted to his men to break ranks and stop the animal before any accident happened. He had hardly done so when the enraged horse was upon them, snorting with pain, and quivering with fear of the unknown enemy which had attacked it. . . .

When George Anderson came to himself he found that he was in a narrow dark close; his knees were knocking together, and he felt physically sick. He had no recollection of what had happened after his first glimpse of the black horse—the incarnation of his ghastly dreams—coming towards him at full gallop. How had he escaped from the battalion? What had happened?

The shock had completely shattered his nerves, which were already on edge from insomnia, and it was some time before he regained control of his trembling limbs. When he could do so he crept to the entrance of the close and gazed up

and down the street in a bewildered manner. The street was deserted . . . no signs of the battalion, no sound of its pipe band. . . . A girl lounged on the door-step of a neighbouring shop, watching him with inquisitive eyes. 'Lily!' he gasped.

She laughed shrilly, and disappeared into the dark little doorway.

IV.

'Pull in your chair to the fire, padre,' said Jack Logan hospitably. 'It's funny how cold it gets at night, even in summer, in this—er—hole.'

'It is the damp,' replied Mr Trevor in his low musical voice. 'The place lies very low, you see, and those flats by the river exhale a thick mist at night.'

'Beastly spot,' agreed Jack Logan laconically. He was pouring some amber liquid into two small glasses as he spoke—it seemed uncommonly precious, judging from the care employed in the process.

The padre stretched out his hand and took one with a smile. 'I never can resist Benedictine.'

'Why should you?' his companion wondered. 'It is the best thing to counteract the evil poisons contained in the mess dinner. Macfarlane is the rottenest mess president we've ever had. He ought to sack that cook. Look here, padre, honestly now, don't you think it's positively——'

'It is, it is,' Mr Trevor said soothingly. 'But, Logan, it isn't the mess dinner that is worrying you, is it?'

'What d'you mean?' The young face was turned to that of the older man in surprise.

'You know quite well what I mean—you're worried about something. I suppose it has got to do with all that talk in mess. Not having the clue, I couldn't make head or tail of it, but I saw they were getting at you about some protégé of yours——'

'Oh Lord!' groaned 'The Boy.' 'Look here, padre, I just must tell somebody about it or I'll burst. You know Anderson, who used to be my servant——'

'Of course; Will Anderson's son.'

'Yes. Well, I recommended him for the next N.C.O.'s course. He didn't want to leave me, but it seemed such a waste—he appeared just the man for an N.C.O.—and then his father's record in the regiment——' The voice trailed off into silence.

'Well?' prompted Mr Trevor after a little silence.

'I was going to give the chap a first-class chit and all—he's a fine specimen; at least I thought he was—but after this morning——'

'What happened?' asked the padre. He was very fond of 'The Boy,' and admired the keen interest which he took in every detail of

the regiment, and the endless trouble expended over the men of his company. George Anderson was also a favourite of the padre's, and he wondered of what 'crime' in the army calendar the man had been guilty.

'You may ask what happened,' replied Logan. 'I almost can't believe it myself, though I saw it with my own eyes—it's like Gilbert and Sullivan; if only it were not such a tragedy I could yell with laughter whenever I think of it. Well, we were marching along Pollock Street about twelve o'clock this morning when a horse ran away. It got stung by some of old Watson's damned bees—pardon, sir!'

'All right, Logan, go on,' said Mr Trevor mildly. Nobody deprecated the use of bad language more than he, but he was wise enough to know that it really meant very little to the men who used it, and that there was as little chance of stopping it as there was of stopping the flow of the river which wound its way through the outskirts of the town.

'Well, the brute came careering down the street with the cart rocking behind it, and the loaves and cookies scattering right and left—you never saw anything so comic. I ordered my company to break ranks, and we stopped it easily—it's a tame creature, and even the bad stings didn't madden it up for long. Anderson didn't wait,' continued 'The Boy' bitterly; 'remembered an important engagement, I suppose! Anyhow, you couldn't see him for dust; he went down Pollock Street like a streak of lightning, and disappeared round the corner. Gad, it was funny!'

'But what was the meaning of it?'

'Funk,' replied the young officer grimly.

'Funk?' echoed Mr Trevor incredulously.

'I can't believe it of Will Anderson's son.'

'I know, it's—it's—— But, padre, I saw his face—sheer panic—you can't mistake the signs, if you've seen it before.'

The padre knew that you couldn't—he had 'seen it before' also. He was silent, and his companion continued with a shamefaced laugh, 'It's beastly infectious; for the moment I felt I wanted to run myself. The men were all laughing.'

'They saw too?'

'Oh, everyone saw—they couldn't have helped it, unless they'd been stone blind.'

'What happened after that?'

'I never saw him. He must have gone straight back to the barracks——'

'Perhaps it was an excuse to escape the route-march.'

'The Boy' laughed scornfully. 'Why, the man's a born foot-slogger—positively revels in a route-march; besides, there's his face. Lord, padre, I can't forget it! He must be having a hellish time now,' added his officer, looking out of the uncurtained window across the square to where the barrack-rooms were situated.

Mr Trevor leaned forward, and knocked out his pipe preparatory to re-filling it. 'Have you spoken to him?' he wanted to know.

'Of course; I sent for him as soon as ever I got back. He stood there with his face as cold and proud as Lucifer——' Mr Trevor followed 'The Boy's' eyes across the room, and seemed to see the young soldier standing on the mat at attention, with that hard defiant look marring his handsome face. 'I asked him if he had any excuse for his extraordinary behaviour.'

'What did he say?'

'“No, sir.”'

'And then?'

'Well, I made him come in, and talked to him a bit about my plans for him—and about his father—and—and all that. When he saw that I was really interested, he told me a long yarn about a dream that he had. It was about a horse that savaged him—a great black horse in an Indian compound——'

'Was it true, do you think?'

'Oh yes! Yes, I'm sure he was speaking the truth; but—— Well, you see, it doesn't make much difference so far as his promotion is concerned. What control is he going to have over the men with a ridiculous story like that attached to him?'

'He might live it down.'

'He might; but ridicule is the worst thing for undermining discipline. And then, supposing he were in a tight corner requiring nerve—N.C.O.s can't afford to indulge in dreams like that! It's a question of *moral*, you see, padre.'

The padre saw. Of course 'The Boy' was right; he had a sure touch for everything connected with the regiment. The padre was also seeing something else. 'A great black horse in an Indian compound'—these words called a memory out of some locked cell in his brain. What was it that the words conjured up? An old memory, faded with the passing of twenty-two years, a memory elusive as a will-o'-the-wisp on an Irish bog; yet with 'The Boy's' words it rose clear out of that wonderful storehouse which is in every man's brain.

'That's—odd,' he said slowly. 'A black horse in an Indian compound, savaging him.' He was thinking aloud, forgetful of his companion, who was looking at him in surprise. 'Did he—does he know of any—any reason why he should have that dream?'

'Reason!' The word was echoed wonderingly. 'There isn't any *reason* for dreams, is there, sir?'

'There is—or might be for this one,' Trevor thought. 'Rather a queer thing,' he went on, sitting forward in his chair and tapping his well-worn briar against his teeth ruminatively; 'rather queer.'

The younger man waited impatiently for Mr Trevor to explain himself, and after a few moments the latter began: 'As you know, I

was out with the battalion at Julapore in nineteen-one. I had just joined up then, and I was very keen and interested in everything. I liked the men, and, of course, I was often round the married quarters seeing the women and children. It's odd how, out there, the married quarters are so like *home*—it's a magic word, Boy!—they used to remind me so of home. I've often wondered why those women take Pollock Street east with them—as it were—and I think now that it is because they *resent* the East. They hate it, you know, all of them—hate it as if it were a living thing (women always hate like that, I think). So they take Pollock Street with them, and put it between four walls, and call it home. Their bits of rugs—rag-rugs I think they call them—and their rep curtains, and oleograph pictures, dreadful things, but just *speaking* of home. I suppose I was a bit homesick and I liked it. I was friends with most of the women, but especially with Mrs Anderson.

'Well, to get on with the story, I was crossing the square one grilling hot afternoon, when I saw an accident happen. Brown had a black waler—an awfully vicious beast. He drove it in a *tum-tum*, and had the greatest difficulty in getting a syce to touch it. On this particular afternoon the creature had broken loose, and I saw it come tearing across the compound with the *tum-tum* rocking behind it. I saw suddenly that there was a woman crossing the square towards the married quarters. She evidently did not see the horse coming until it was almost upon her—the noise of its hoofs was deadened by the thick dust which lay there inches deep. When she did look up she seemed to quiver all over; she stood quite still—hypnotised by fear, I suppose. I ran and shouted—and she must have heard, for she tried to struggle out of the way, but—it was too late—another second, and she was down in the dust amongst those cruel hoofs. Boy, it was a ghastly thing to see. When I got to her she was unconscious. We sent for the M.O., and she was carried into the nearest house. Can you guess who that woman was, Boy? She was Will Anderson's wife and George's mother. He was born that night.' There was a little silence, and then the speaker added brokenly, 'She—died.'

'Good God!' Logan ejaculated. 'And you mean—that's what he—dreams?'

The two men sat and gazed at the fire, which was sinking into a bed of red-hot cinders. The elder was occupied with visions of the past, the younger—as befitted his calling—with plans for the future. Did this disclosure change the situation? Was Anderson any more fitted for a responsible position because his panic was the result of pre-natal impression rather than sheer cowardice? Had he the moral strength to live down the ridicule of his fellow soldiers?

It will be observed that the regiment was everything to this not very imaginative young officer.

'Should we tell him?' The words were spoken half-aloud, but the padre heard and answered them.

'I think so. You see, he may be imagining all sorts of horrors—that his brain is affected, or something equally unpleasant. It is easier to fight a nightmare if you know that there is a natural cause—better far than struggling in the dark.'

'Yes, I suppose so,' said his companion doubtfully. 'Still, I don't know that I can recommend him for the N.C.O.'s course.'

The padre smiled inwardly. Oh these boys, these mad keen soldiers! Did they ever think for five minutes without coming back to the regiment? His thoughts went suddenly to George Anderson struggling in the black grip of the nightmare which had secreted itself in his unformed brain. 'I think you'll find,' said Mr Trevor, choosing his words carefully—'I think you'll find he will be able to bear that with equanimity in view of your other communication. It is queer that he should never have heard from anyone how his mother died—his father felt it too hardly to be able to mention it, I suppose, and—well, it is wonderful how soon one is forgotten. By the time little George was old enough to understand, the regiment had come home. You must explain to George,' went on the padre, 'that it is not cowardice on his part, and that it is through no fault of his own that he is haunted by this dream—it is merely a natural phenomenon—'

He broke off as a loud knock sounded on the door, and 'The Boy' said 'Come in.'

A man entered clumsily, a heavy-built man with close-cropped black hair, and a face as white as paper, and staring eyes.

'Will you please come at once, sir,' and then suddenly the years of discipline and training dropped from him like a cloak. 'Oh Gawd!' he cried wildly, and covered his face with his sleeve, as if to shut out some dreadful sight.

Captain Logan's chair clattered to the ground as he jumped to his feet. 'Corporal Burke, stand up—attention! Now, tell me at once what is the matter.'

The man stood before his officer, blanched and trembling, with a pitiful attempt at self-control. 'It's Anderson, sir—fell out of the barrack-room window, sir—dying—'

'The Boy' pushed him aside and strode out of the room. They could hear him going down the stone stairs three steps at a time.

'Come now—er—Burke,' the padre said with intentional cruelty. 'Pull yourself together at once. This isn't a girls' school. You must have seen worse things in your time than a man falling out of a window.'

'Yes, sir.' Burke replied with a force of habit; and then, with an unconscious gesture of despair, he threw out his arms. 'But—but this is peace. He did it a-purpose. I saw him do it. If you saw him all crumpled up on the ground——' And then, in a husky murmur, 'We was chipping him. I never thort——'

Mr Trevor shook him by the sleeve. 'Pull yourself together—you're a corporal, aren't you? What kind of an example is this to show the men?' The curt words acted like magic. Burke straightened his shoulders, and the colour came back to his lips. 'Now, follow me,' said Mr Trevor sternly.

The little group on the cobbles beneath the barrack-room window moved aside to make a passage for the padre and his escort. 'The Boy' was on his knees beside the shattered heap of humanity which had so recently been full of youth and beauty. The atmosphere seemed charged with tense emotions, and when some one called out, 'Here's the M.O.,' a murmur of relief went up from the waiting men.

Only Captain Logan gave no sign of relaxed tension; he rose and faced the newcomer gravely. 'We are both too late,' he said.

The padre sensed the agony which underlay these simple words. 'The Boy' was taking it terribly to heart. If only he could help.

He stood aside while the necessary instructions were being given to the orderlies, and wondered a little at the stern, hard voice. When that was done the two friends walked back together across the square in silence. The night was darkening swiftly now, and lights had sprung up all over the big block of buildings which contained the officers' quarters.

Still 'The Boy' spoke no word, and his friend

began to be afraid. 'You couldn't help it. Don't take it to heart, Boy,' he said as comfortably as he could.

A low even voice replied out of the darkness, 'He was my friend, and I failed him because I did not understand. I—failed him.'

V

Two days later a little cortège passed through the barrack-gates and proceeded down the High Street at the slow march with arms reversed. The sun was shining brightly, and everything looked the same as it had done on that memorable day of the route-march. A little group of officers followed the coffin, which was laid on a gun-carriage and covered by the bright folds of the Union Jack. Captain Logan, with his head erect and a hard expression on his young boyish face, walked alone, for he was chief mourner.

At the corner of Pollock Street a crowd had collected to watch the little procession pass; a motley group, such as might be found at any street corner at any hour of the day with time hanging heavy on its hands. Amongst them was a young girl in a bright green silk jumper; she was hanging on the arm of a young civilian, in a shiny blue suit, with a weak chin and a bowler hat—he was obviously a clerk.

'Come away, do,' he said, pulling her arm in an irritable manner. 'What are ye gazing at noo, Lily?'

'Whose funeral is it?' she wondered idly.

'Well, it's no' mine, anyway,' he replied with the perverted humour of his kind.

The girl in the green jumper laughed shrilly, and followed her witty companion through the swing-doors of the Grand Picture Palace.

SIAMESE SUPERSTITIONS.

By ERNEST YOUNG, B.Sc., M.A., F.R.G.S., Ex-Inspector of Anglo-Vernacular Schools, Siam.

FROM birth to death the native Siamese is enveloped in an atmosphere of superstition. There is no act of his life that is not ruled by some tradition or other that has held authority and power through many ages. The infant is a gift from the gods, and the legendary deities of the parents demand due observance of many customs. As the time of its birth approaches, the mother retires to the seclusion of her own chamber, where she lies on a long flat board in front of a fire. Kindly hands stretch a protective cord all round the exterior of the building, and this is blessed by the priests, and so forms an efficient barrier against all those evil spirits lying in wait to cause trouble. Scarcely has the tiny mite wailed its first feeble note than its nurses make three balls of rice and throw them in three lucky directions. By this means certain bene-

ficent spirits are invoked to be present and to watch over the future of the baby.

Even in these days, when an Education Department is seeking to instil knowledge into the young, there are still thousands of children in Siam who never go to school, and who gain all their ideas about nature from the stories told them by parents and friends. When the big giant in the sky above chases his cantankerous wife and hurls his hammer after her, the sound of his voice and the noise of the falling weapon, as it crashes against the floors of heaven, give rise to the rolling of the thunder; the 'sky cries.' When the long waves of purple lightning flash across the horizon, the angels are amusing themselves by striking fire with bricks. When the mighty crab comes out of its hole in the sea, the tide ebbs, and when this same denizen of the deep

retreats once more to his subaqueous residence, the tide flows again. When too many angels get into the same bath at the same time, the water pours over the side and it rains. And when the earth is wrapped in darkness, and the night winds sigh across the rice-fields and the plains, you can hear in those evening breezes, if you will but listen as you should, the voices of all the little children who have long since gone to their eternal rest.

When the Siamese child wants a fairy-tale with which to while away the hours, nothing so insipid as Cinderella will suit his fancy. His hero is the man who meets single-handed a million foes in a deep ravine. When the assembled hosts laugh at his daring he takes up the mountains in his right hand and his left and, crashing them together, annihilates the opposing forces in the twinkling of an eye.

If a person be travelling far from home he will not mention the word 'alligator' as he passes by the river-bank, or whisper the word 'tiger' as he threads the jungle, for fear the beasts should hear him and answer to their names.

And so the boys grow up to manhood and the girls to womanhood, and, as happens everywhere, they fall in love and seek each other in marriage. Then the parents of the lovers go to the astrologer and state the facts of the case, and the astrologer notes the respective birthdays of the young couple and consults his oracles. For the years run in cycles of twelve, and are ruled over by the rat, the cow, the tiger, and nine other animals. And should the man have been born in the year of the dog and the woman in the year of the cat, there could by no possible means be any happiness in the wedded life of these two. If no inauspicious births have taken place the marriage may be solemnised, and the man will build a house for his bride. But in this house the number of rooms, of doors, of windows, of everything within and without, must be an odd one, for even numbers are unlucky.

No one lies down to sleep with his head pointing to the west, for that is the point where the sun dies his daily death, and so is symbolical of the end of all things. The only safe direction for repose is north and south. On Sunday, if you travel, you must travel to the east, for that will bring you luck. On Monday you may go west; on Tuesday, south; on Wednesday, south-west; on Thursday, north; on Friday, south-east; and on Saturday, north-west.

Again, every day is ruled by some particular planet, and if you wish that planet to bring you success you must dress in the colour of the planet itself. On Sunday, when the Sun is the ruling luminary, dress yourself in red, and wear rubies. The Moon controls Monday and demands

white moonstones; Mars asks for light red and coral on a Tuesday; Mercury requires green and emeralds on a Wednesday; Jupiter looks out for the cat's-eye on a Thursday; Venus is not satisfied unless you wear silver-blue and diamonds on a Friday; while Saturn takes charge of Saturday, and expects dark blue and sapphires.

Get your hair cut on the proper day, or much woe will befall you. Go to the barber on Sunday, and long life and happiness will be your lot; but beware of Monday's tonsorial operations, for they bring disease, sorrow, and unpleasant surprises; Tuesday means peace, prosperity, and success in war; Wednesday brings trouble from your enemies; the angels grant protection to all those who lose their locks on Thursday; Friday is the glutton's day, for all food will be palatable to those who are then shorn; Saturday's haircutting brings success in all deeds and ceremonies performed on the last day of the week.

Wherever credulity flourishes the medicine man reaps a rich reward, and quacks are in great evidence. They combine, in Siam, the double function of healer and destroyer, for they will cure or kill for an adequate financial compensation. If you can afford it, you can, by the help of the doctor, rid yourself of an enemy in the following manner. The wizard will buy a buffalo at your expense, and then say charms over it. As the process of bewitching the animal continues his body decreases in size until the huge beast has dwindled to the size of a pill. Then you arrange for your enemy to swallow this highly condensed extract. No sooner has he partaken of the pill than it begins to swell to its original size. It is scarcely necessary to add details as to the dramatic close of your enemy's career.

At last the time comes to each one to die. There are several methods of disposing of the dead, and one of these is burial. None, however, are buried except those who have died of sudden death, of cholera, or by the executioner's sword. Down in the depths of the subterranean regions there dwells an enormous monster, who sits through all eternity warming his feet in the fire. In order to prevent them from being utterly consumed by the flames it is necessary, from time to time, to pour water over them. This water is brought to him by an army of slaves. The slaves are the spirits of the people who have been buried after death. To get the water they have to travel over perilous bridges, through dark ravines, and across dangerous swamps. Their every step is beset with danger, darkness, and pain. They bring their precious burdens back in sieves, and through endless ages they must perform the same ceaseless, terrible, and hopeless task.

The deceased can be liberated from this cruel existence only if their living relatives are willing to call themselves the relations of the fiend,

and to do homage to him. The method of doing homage does not appear very serious to us, but it is sufficiently efficacious. The earthly relatives bind on neck and wrist a few red and yellow strings, which they can obtain from a priest. Then they make a tiny cart, and put into it a number of clay images, one for each member of the family. With the images they

put offerings of fruit, flowers, and rice, and they deposit the whole gift in an out-of-the-way corner of a field. The wind and the mice soon play havoc with the propitiatory offering, but the demon takes no notice of that, and the minds of the living are satisfied with what they have done in mitigation of the miseries of the departed.

IN THE VALLEY OF DECISION.

CHAPTER VII.—*continued.*

III.

IT was a minute or two before I dared look up and meet Mr Thurlow's eye.

I was aware, when I looked across at him, that he too avoided looking at me. I think we both of us felt that we had been treading on holy ground, and that we ought to have taken our shoes from off our feet.

'Our client,' and Mr Thurlow was speaking in his driest tones, 'would never have allowed us a sight of this letter, had he not been consumed with anxiety about the young lady. His chief idea is to keep her out of the affair altogether; he can't bear that the breath of scandal shall touch her. And so you and I are to devise the means for keeping her name out of it.'

'Mr Thurlow!' I exclaimed with some warmth, 'I will never lift a finger to prevent those two from coming together again. They have been parted; there has been misunderstanding; but the moment the light of truth has shone, she has seen her path of duty quite clearly, and is determined to walk in it; and in my opinion, God bless her, she is doing exactly the right thing.'

'You speak,' said the lawyer, 'as if I were of a contrary opinion; but I have not said so. What I have to consider, however, is the character of the defence which we set up; and the responsibility for this rests upon me.'

'Well,' I queried, 'would not her witness be helpful?'

'That is just the point,' he replied, 'which I have very carefully to weigh. The "pros" and "cons" seem to me to be these. The cause of antagonism leading up to this deadly quarrel was undoubtedly this young lady; but, you see, the more strongly a motive is made to appear—and that I assume is the idea in allowing Miss Weston to give evidence—the more strongly does it appear that our client's act was wilful, and as one might say of 'malice prepense.' And, of course, we don't want to show that: so that is against our putting her in the witness box.'

'On the other hand, when we were before the justices, it became practically impossible,

as you know, to keep her name out of the case altogether. Now, my experience of judges and juries is that they are apt to resent the keeping back of any witness who may seem to them to be material to the case—they become a little bit suspicious. They have, you see, to come to a decision, and they want everything that may contribute to a true verdict to be placed fairly and squarely before them.

'I should say that Miss Weston would probably make a good witness, and would be likely to impress the jury favourably; and even a judge, you know, is not wholly uninfluenced by sentiment and feelings of pity.'

He paused.

'Then, on the whole, you agree with me,' I said, 'that we should let her appear?'

The lawyer's eyes twinkled. 'I doubt if there is much "let" about it,' he remarked; 'we can't hinder it. She has appeared, and she will appear; and what we have to do is to coach her just a little bit as to the dangers of overstatement, in case she gets carried away by her feelings.'

'And what,' I asked, 'are we to say to Carrington about disregarding his wishes?'

'You can leave that to me,' was Mr Thurlow's reply. 'When a doctor of medicine has a patient very sick, and perhaps about to die, he doesn't look to his patient for orders, but gives his own orders. And a prisoner is something like a sick man—he doesn't always know what is best for him.'

IV.

I said 'good-bye' to Mr Thurlow, and as I had missed Vera at his office, I now drove to Lennox Gardens on the chance of seeing her, for I greatly wished to see her, and to speak a word of appreciation and encouragement.

By good luck she was in, and we had a great deal to tell each other.

And then Mrs Chichester came into the room, and I found she had espoused Vera's cause with great enthusiasm. 'I am going to look after Vera,' she said, 'and am only too delighted to do it. There was some talk of Hubert's mother or one of the girls coming up; but that's been vetoed. They would only have made Vera

nervous, and perhaps made themselves ill. No! I am going with her to the law-court myself; so she'll know she has one friend at court anyhow.'

'Many more friends than one,' I declared. 'She has quite won Mr Thurlow's heart already, to say nothing of yours, and mine; and if I were a betting man, Mrs Chichester, I'd wager you she will win the case.'

'That's just what my husband says,' she exclaimed; 'in fact, he says so much that I tell Vera I shall be getting quite jealous.'

'He has written such a funny letter to General Weston—you know they are old Indian friends—and he has told him that his old regiment would disown him if they knew he was opposing his daughter in what she was doing; and he strongly advises Sir Thomas to yield with a good grace now, and not to wait till the trial is over, when everybody, however it may end, will cry "Shame on him."'

'Poor, dear old Dad,' said Vera, 'I'm sure he meant what was right; but he so often calls me "my child" that I suppose he still thinks I am one.'

I did not attempt to see Hubert again before the trial. After what Mr Thurlow had said, I thought I would leave him in the lawyer's hands.

But I went down to Wingate for the Sunday, to take the church services, and to see Hubert's mother and Cecilia and Alice, and to tell them how matters stood.

V.

I was back again on Monday, and made my way at once to the Central Criminal Court.

There I found Mr Thurlow, and Vera and Mrs Chichester, and, to my great surprise and satisfaction, no less a person than Sir Thomas Weston himself.

'I wasn't going to leave my daughter,' he told me, 'to wander about in these unsavoury purlieus all by herself, so I've come up to look after her; and I only hope we sha'n't be detained here very long.'

'A good deal depends,' Mr Thurlow observed, 'upon when our case will be called. I have ascertained that there are seventy-nine cases down for trial, and over 400 witnesses are in attendance.'

'Good gracious me!' cried the general. 'Why, we may be here a fortnight! But whereabouts do we come in the list?'

'I fear,' said the lawyer, 'that the place in the list won't tell us much. There are three judges trying these cases in different courts, and the proceedings in some of them may be very protracted, while in others the prisoner may plead guilty at once. In that way some of the cases get remitted from one court to another, and the order in the list is quite upset. I shall be able probably to find out pretty early each day whether our case is likely to be taken on that

day, and if it isn't, then you will be free for that day at any rate. But it isn't safe to absent yourself altogether, so I'm afraid it means coming here every day.'

The general looked so disgusted, and so furious, that Mr Thurlow nimbly beat a retreat; while I, with a sense of the ludicrous, could hardly restrain a smile.

But, in all seriousness, if prisoners at the bar have their trials, it may be averred with truth that witnesses have theirs also, and that their trials begin long before they set foot in the witness box and face the jury.

The swarms of witnesses, many of them belonging to the great unwashed; the foetid smell of overcrowded courts; the lack of proper accommodation; the pervading sense of crime, and evil, and unhappiness, and anxiety—all these things in combination make the kicking of one's heels at the Old Bailey anything but a pleasing pastime.

However, it is a long lane that has no turning, and in the afternoon of the second day we were informed that without fail we must all be in attendance in good time on the following morning, as we were almost certain to be called before the Grand Jury.

This sifting of cases by the Grand Jury before they are actually tried in open court is sometimes a mere formality, but not always. For the Judge of Assize, previous to charging the jury, is accustomed to give special attention to such cases as demand consideration. Then, in his opening address to the Grand Jury, he is in a position to advise them as to the actual law obtaining in such cases; and if he has seen that the evidence against the accused is inadequate or contrary to the law, he directs the attention of the Grand Jury to the points in question, and sometimes will advise that an indictment must be ignored. By this means much time is saved, and also a good deal of expense to the country.

VI.

It was not without some thrills of emotion, and a deep sense of anxiety that at last we found ourselves conveyed as witnesses to the very door of the room in which the Grand Jury was sitting; and there we had to wait until such time as we might be called, individually, to give our evidence.

Our little party included Admiral Chapman and three of his servants, and one of the three doctors who had made the post-mortem examination, and Vera and myself.

Mr Mackenzie and Mr Swallowfield, junior, were also in attendance as representatives of the Birmingham firm, although they had been informed that they would not have to appear before the Grand Jury, as the Grand Jury only called witnesses for the prosecution.

In this aspect of the case, as it presented

itself to my mind, there seemed to be such a topsy-turvydom of justice, and such a jumble of proceedings in all that we were required to say and do, that I seriously debated whether, by our own fault, we had been turned into a pack of fools, or whether the law itself was 'a hass.'

For here we were, myself and my fellow-witnesses, who were all wishing to be regarded as for the defence of the prisoner, and yet some of us had been subpoenaed for the prosecution.

Moreover, the prisoner himself, as it turned out, who was presently to appear at the bar, although he was the very man who had given himself up on the plea that he had been guilty of assault, if not of manslaughter, was now about to plead 'Not guilty,' in view of the more serious arraignment by the Crown. How would it all end?

VII.

The end was not far off. First Admiral Chapman was called into the room to give his evidence before the Grand Jury. In about ten minutes he came out again, looking extremely disturbed and ill at ease.

Then came the doctor's turn. And he, too, came out again. And then in I went, and at once was sworn to speak the truth, the whole truth, and nothing but the truth.

The examination was very brief, and proceeded upon the lines of evidence given before the

bench of magistrates at Richmond. I said what I wanted to say; and then out I came.

Vera looked at me with anxious and troubled eyes; but the nervous tension added a set look of firmness and almost fierceness to the whole face, as though she had prepared herself to go through fire and water, if need be, for the man she loved.

She was expecting every moment to be the next witness to be called. But we had to wait, and waiting in such circumstances is more than a trial—it becomes a martyrdom.

And then the door once more opened, and a court official came out. 'Are you the witnesses in the Carrington case?' he hurriedly asked in the gruffest and roughest of whispers.

'We are,' I said.

'Well then,' he continued, 'you needn't stay any longer; the Jury has thrown the bill out. They found there was no true bill against the prisoner, and so the case is at an end.'

And as I turned to Vera she just threw herself into my arms and cried like a little child.

Six months afterwards there was a very grand wedding at Bath. Sir Thomas Weston certainly did the thing well. And I did my little best; for I had the privilege of placing Vera's hand in Hubert's, and saying, as I joined their hands together, 'Those whom God hath joined together let no man put asunder.'

THE END.

LONDON GOVERNMENT.

By WILLIAM ABDOUN.

I.

THROUGH the courtesy of the Deputy Clerk of the London County Council the writer, in company with a body of Overseas engineers and architects, was recently conducted over the new headquarters of London government. The present building on the Surrey side of Westminster Bridge has been erected at a cost of three million pounds. It possesses about nine hundred rooms, and when the northern extension has been completed at the cost of another million, the housing accommodation for the L.C.C.'s tremendous staff will stretch almost half-way from Westminster Bridge to that eye-sore of the Thames, which has a crossing by the name of 'Hungerford.' Much useful information was disclosed, not only in regard to the building, but in connection with many important phases of London government.

The London County Council are the largest landlords in London, their capital expenditure exceeding twelve million pounds. They house nearly a hundred and twenty thousand persons, at an approximate rent-roll of eight hundred thousand pounds. But some of the largest

individual owners are scarcely known. The 116,000 square miles of the administrative area of the county of London are divided amongst 38,200 owners. Lord Northbrook (Eltham) and Dulwich College hold over two square miles each, and the following four persons own more than one and a half square miles: Lord Forster (Lewisham), Mr H. T. B. Barron (Plumstead), Lord St Germans (Blackheath), and Sir Spencer Maryon Wilson (Hampstead and Carlton). The Duke of Westminster is the owner of three-quarters of a square mile of London territory. The Earl of Dartmouth receives rents for over half a square mile of property in St Pancras and Lewisham; Magdalen College, Oxford, owns half a square mile in Wandsworth; and the Prudential Assurance and Mercers' Companies own about the same quantity throughout London.

II.

In connection with the furniture contained in the building there is one fact which is not generally known, and that is, the seating accommodation for members is of oak, some of which is believed to be several thousands

of years old. It was found some thirty-five feet below the level of Villiers Street, Strand, during the process of erection of the Hampstead Tube at Charing Cross Station. The columns and pilasters are monoliths of Veine Dorée, an extremely beautiful marble quarried over five thousand feet above the sea-level in the Italian Alps. 'The heating and ventilation of the chamber,' said the guide, 'are obtained by air which is drawn from alternative positions on the fifth floor, is completely saturated at a predetermined temperature, automatically controlled, and all dust is removed. In the chamber an individual supply is provided for each occupant, and the direction of the current can be regulated by the lever in front of each seat.' The clocks in all the rooms are worked by electricity; there are six boilers in the sub-basement for supplying hot water through thirty miles of pipes to 2150 radiators, 690 basins, &c., and the staff refreshment-rooms and kitchens, which are designed to supply two thousand luncheons a day. When completed there will be four miles of corridors; four million floor blocks will have been used in the work; the total area paved will be about eighteen acres; and hundreds of miles of electrical wire will be required.

One of the most interesting disclosures made concerned public health and the disposal of sewage. It appeared that formerly the drainage was carried off in open watercourses, which was unsatisfactory. Afterwards, main sewers, running approximately at right angles to the Thames, discharged their contents at different points within the London area. The great innovation, however, was the construction at different levels of sewers running from west to east, which intercepted the sewage and conveyed it mainly by gravitation to outfalls well below London—at Barking on the north and Crossness on the south side of the river, five pumping stations being erected to assist the flow of the sewage. When the sewage reaches the outfalls it is run into reservoirs. The solid matter, or sludge, is then precipitated, and the effluent, or clarified liquid, after chemical treatment, flows into the Thames. The sludge is deposited by special vessels in the black deep, twelve miles off the coast of Essex. One hundred million gallons of sewage and two million tons of sludge are dealt with every year, the length of the sewers running to three hundred and seventy miles. In addition there are two thousand miles of local sewers controlled by the authorities. The total cost of maintenance in 1922-1923 was £617,000.

III.

The L.C.C. have a million children in their schools and some 160,000 students in their evening institutes. Their new education officer, Brigadier-General G. H. Gater (who is only

thirty-nine years of age), joined the army at the outbreak of war as a private soldier.

The ages of the students in the evening classes range from fourteen to seventy-eight. The curriculum includes all subjects which are calculated to equip one for a professional, a literary, or a commercial career. Laboratories and workshops are distinct from class-room education, in which technical and scientific instruction is given right from the elementary to the most advanced stages, thereby releasing at the polytechnics and technical institute rooms for development along technological lines. Law is taught by lawyers, hygiene by medical experts, journalism by journalists, banking and the like by specialists who are well versed in their subjects, and, what is equally important, know how to teach them. At the same time 'it links up all the different grades of institutions by numerous scholarships, which enable boys and girls to pass through every grade of education from the lowest to the highest without payment of fees, and with the assistance of maintenance grants. Every London home has the chance offered to it for the clever boy or girl to pass right through from the elementary school to the university, and there win the highest academic honours that the country can bestow.'

When excavations were commenced on the site of the building, for the purpose of laying the foundation of it, an old Roman boat was discovered, which has been presented to the British Museum. The coins and rounded stones found in it have enabled students of antiquity to form the conclusion that before the upper and lower marshes (which are situate not far from the structure) were converted into arable land, the occupants were fisher-folk, who inhabited rough hovels on adjacent territory. It may incidentally be remarked that in the days of Roman London the site of Westminster Abbey was known as the 'Isle of Thorney,' and historians state that it was the centre of a busy trade. Merchants would ferry across the river and essay to negotiate the crossings of the marsh, which were precarious, expansive and swampy, and often resulted in the loss of valuable merchandise. The site of the present building was known in bygone years as 'Pedler's Corner,' a notorious resort of river thieves of the period.

SEPTEMBER.

NIGHTS full of beauty; calm and gracious days
That lay cool hands on Summer's fervid hours;
Fruit ripening fast in quiet country-ways;
The garden-beds ablaze with gorgeous flowers.

So comes September in a regal dress,
With vine-leaves crowned and golden harvest moon.

O who amid this Autumn loveliness
Could sigh for Spring, or miss a vanished June?

E. MATHESON.

Chambers's Journal

SEVENTH SERIES

CLAY IN THE HANDS.

By EUSTACE AINSWORTH.

I.

TO say that man is the creature of circumstance may be true enough, provided that Circumstance is admitted to be of the female sex. Circumstance must be, of course, for she will not be gainsaid. John Storrs discovered that fact at the mature age of forty-two, but he will be dead and in another life before he realises how inevitable was his defeat.

For close on twenty-five years John Storrs had concentrated his whole energy upon the upbuilding and extension of Wilberforce, Storrs, and Wakefield, at the head of which he now stood. Wakefield had died very early in the venture, and Wilberforce had become so alarmed at John's ambitious notions that he had suffered himself to be bought out at a large profit, and spent the rest of his years accusing John of having swindled him out of the business. John did not mind that because it was not true, but as time passed and nothing came to him but wealth, and work that brought more wealth, John began to speculate upon the saying that it is not good for man to live alone. There was something so isolating about great success. It cooled a man's old friendships, as one by one comrades of early days found the pace too warm and dropped behind, and hung one up, so to speak, between the everyday working crowd, from which John had sprung, and Society with a capital initial, which—so far as John could detect—consisted largely of the grandchildren of such men as himself. And it was in this vein that Storrs, after much careful thought, decided to marry.

Unfortunately he knew that his choice of a wife would be limited. He had gone far enough to let go the hands of one set without reaching the feet of the layer above, and the only young woman he could think of as a possibility was Wilberforce's daughter Vic. Wilberforce was a fool, or he would not have lost his nerve and sold out when he did, but he was sound, and from what John remembered of Mrs Wilberforce, Victoria should be well-bred in the only way that John Storrs understood that much-abused phrase. Then again Victoria was distinctly pretty, and would make a splendid hostess at Holly Bank. Of course Vic might

have other ideas, and her father's constant grievance against Storrs might have prejudiced John in her eyes. But you never could tell.

So, to pass over a period rather sordidly uninteresting, John Storrs, aged forty, was married, with as much pomp as money could buy, to Victoria, aged twenty-six, only child of Robert Wilberforce, widower, of Myrtle Grove; and the happy couple left for a fortnight in Cornwall, subsequently taking up their abode at Holly Bank.

Victoria had a free hand to take up, or be taken up by, whom she wished, and on those occasions when entertainments came out of working hours, John was a complete success either as guest or as host. His simple directness and modesty made friends on all sides, and the fact that he was completely at ease himself in any company assisted Victoria's social success.

'Must I know the people at the office?' she asked one day.

'Not unless you choose. I'm the only link between this house and the business.'

'Dad thinks I should. He says it's snobbery not to be friendly with the other directors' wives.'

'Rubbish. The snobbery is on their side. I don't know them myself.'

'Dad says it's their only chance of getting onto the Assembly list—'

'That's not my department,' John replied.

'Do as you wish. Personally, if I were you, I would not. But it's all the same to me.'

'Then I won't,' she said, with a feeling of relief.

II.

The months passed, and John found that, as usual, he had made no mistake. Vic was charming, slight in figure, quick, and clever enough to conceal more intelligence than she displayed. Her manner, while apparently deferential, was fearless and unhesitating, till from small venturesome beginnings she succeeded eventually in ruling John and his household as that gentleman had never been ruled before.

Strictly speaking, it had not been a love match, of course; that is to say, it had not begun with any passionate or sentimental feelings on either side; but perhaps for that very reason it

passed the more quickly into that lasting stage of liking, confidence, and respect which, after all, is the shape into which successful marriages merge. In fact, if anything, the liking between husband and wife increased rather than dulled, until John could hardly imagine any request that Vic was likely to make with which he would not at once agree.

And Vic was wise. On the return from their honeymoon she had cast one shuddering look upon the furniture and decorations of Holly Bank, had said nothing at all, but had spent the next six months entrenching herself safely in John's heart. Once there, and a suitable opportunity arising, she had proposed a move into another neighbourhood, the purchase of a modernised old house, and refurnishing throughout. John had asked what it would cost, and eventually had left the whole thing in her hands.

He liked the new house better than the old, noticed the very few articles of furniture and decoration that Vic had preserved from Holly Bank, and noticed also that in every case they were things which had belonged to his grandfather when that gentleman was a tenant-farmer some seventy years ago. He was fully aware that Vic knew nothing of their history, and so began his first lesson in taste.

III.

John never talked 'shop' to Vic, but once or twice a month old Wilberforce would drive over for dinner and critically discuss the doings of Wilberforce, Storrs, & Wakefield before the servants, in a way that John did not like; nor did it mend matters when he more than hinted that he had been legally—oh quite legally, of course—jockeyed out of his share. Like many another, Wilberforce, living on an assured income of some fifteen hundred pounds a year, felt it deeply unjust that John, once his junior partner, should be making at least ten times that amount. John was very patient over this treatment, because, whenever Wilberforce said anything particularly galling, John knew that Vic was looking at him, and either said nothing or smoothed the point over with a soft reply. Vic's eyes, he sometimes thought, would be worth a million pounds if they could be put to their full use.

Unfortunately, too, John had discovered that his father-in-law, not content with annoying him, was actually borrowing money from Vic. So one day he told her that he had doubled her very ample allowance, and suggested that she should drop her father a hint that he had better draw in his horns.

'I can't think what he wants to spend so much money for,' he said kindly. 'Now I hear he's buying another car.'

Vic looked across the cosy study where a reading-lamp fell on John's copy of *The Times*, and said, 'I've often wondered why God was

so good as to give me you for a husband, John.'

'What's that!' John gasped. 'I say, you shouldn't say things like that!'

'Why, I hadn't a chance,' Vic went on, unheeding, 'and now, just look!'

'Well, look!' he agreed, 'and what d'you see? A man that can make money and can do nowt else'—John's rare emotion had swung him back twenty years—'and a woman that he shouldn't have dared to touch!'

Vic shook her head. 'A man's opinion of a woman, John—'

'Don't you make any mistake,' he interrupted, 'I haven't got no "opinion" about you, my lass. Opinions are things that haven't been proved!'

Vic laughed. 'You are certainly the best flatterer I ever met.'

'Flatterer!' he exclaimed indignantly.

'Of course. There are two kinds of flattery, John—that which a woman likes to hear, but which she knows is not true and is not meant to be true either; and the more rare kind which she still knows is not true, but which she also knows is honestly believed by the flatterer. That is the sweetest of all. But seriously, what are we going to do about Dad?'

'I've doubled your allowance, and if there's anything else you can suggest—'

'There is, though I hardly like to suggest it.'

'Go on.'

'Well, you know what's wrong with him—he has no work, no place in the world. He sees Wilberforce, Storrs, & Wakefield on every signboard through the land, and yet he knows that he's out of the concern. That's what makes him extravagant.'

'An odd reason,' John ventured.

'Not as odd as it seems. Dad is vain. He wants acknowledgment by other men, he wants to be looked on as Somebody. Did you see what a newspaper called him the other day?'

'No; but what matter? What do they call me?'

'They call you John Storrs, and every time the printer puts your name in type he raises his hat.'

'You certainly know something about flattery,' he remarked with a smile; 'but what did they call the old man?'

'They called Dad "Mr Robert Wilberforce, father-in-law of Mr John Storrs."'

John laughed quietly and looked into the fire.

'And you see that just makes Dad mad, and he goes out and buys a car, or does some other foolish thing, simply to attract attention to himself. Of course his view is all wrong; but it is his view all the same.'

'Well, we're not responsible for his views,' John said; 'if it's just a matter of money, up to a certain point—' But as he looked across at his wife an extra brightness in Vic's eyes nearly stopped his heart.

'Couldn't he go on the Board?' she suggested, after suffering a long scrutiny from John's troubled gaze.

IV.

This was something entirely new. Never since their marriage had Vic asked for anything for old Wilberforce, and never had she attempted to interfere with the Firm's affairs. And not only was Vic attempting this astounding thing, but, unless he was much mistaken, she was on the point of tears.

Of course he could shelve the matter, as Wilberforce himself always did when a disagreeable question arose, but it was not in the character of John Storrs to take that line. On the other hand, suppose Vic were to lose her tense control for a moment and positively cry! It was a terrible predicament, and took John's mind back to the first week of the war when his accountant had told him, with a white face, that strictly speaking the Firm was insolvent; and John had sacked him there and then.

Wilberforce on the Board would be impossible. John's directors were heads of departments only, who spoke, each in turn, on their own specialised subjects and then held their peace. The policy of the Firm was in one pair of hands, and there it must stay. Yet supposing Vic should cry!

'Couldn't you arrange that he had no real authority, signed cheques or something like that, as lots of other directors do who don't really direct?'

'The cheques are signed by the cashier,' John replied.

'Then they could be countersigned by Dad; that makes it easier still. You once said that the only things Dad could do were to keep books and buy broadcloth, whatever that may be.'

'You don't understand, Vic,' he replied, the unusual use of her name showing that he was distressed. 'My directors are merely heads of departments. Sykes, for instance, is cashier, and runs the financial side; Ellison is buyer; Murgatroyd has charge of sales, and so on; and at Board Meetings these fellows just speak on their own particular subjects. The "directing," as you call it, is done by me.'

There was such a tone of finality in John's voice, so complete a refusal, as though the thing asked for were entirely out of his power to give, that Vic turned away to the fire. He watched her adjust one piece of coal after the other with the tongs, her face still averted, and then sat in torture as she went quietly out of the room.

V.

It was the biggest thing John Storrs had ever done. He cast his mind back to every seeming disaster that had loomed up before his path or chased him wildly through weeks of tight money and bad debts in early days, back to the time when even his bank had for the

moment lost confidence in John Storrs's ability and had shut down on the Firm in the middle of a big deal; but none of these things had shaken his nerve in the same way.

Yet what could he do? Not that the presence of Wilberforce on the Board, with limited power, could do much harm, but the cardinal principle of deciding every such thing from an absolutely hard and fast test of increased efficiency ruled it out. What would the secretary, or Sykes, Ellison, or Murgatroyd think of his wisdom if he brought that old fool back onto the Board? There could only be one opinion amongst them, that John Storrs was losing his grip, that his judgment had ceased to be infallible; and there was no room for opinions such as that.

The house was deadly quiet. Suppose Vic were actually crying now. She would do it in complete silence. She would never show her disappointment, for fear it should cause him grief. Then John remembered that she had not said 'Good night.' There could only be one explanation of that fact; she dare not trust herself to speak. But Wilberforce must not come on the Board.

John sat up late, the paper still lying untidily on the floor, and then went quietly up to his dressing-room, where he crept into a seldom used bed and lay awake all night.

VI.

During the next ten days no stranger would have noticed anything but the most cordial comradeship between husband and wife, because neither had any intention of expressing what lay at the back of their mind. That John, for instance, had occupied the dressing-room for the first time, and still occupied it from sheer reluctance to open up the difference that lay between them, passed without comment; whilst Vic had only changed, if at all, in a greater attention to John's comfort in little details, which, of course, merely increased the tension that hung in the air.

John went out of his way to refer kindly to Mr Wilberforce on several occasions, and Vic looked gratefully at him while venturing the opinion that the old man was very comfortably fixed and much better off than he deserved. She even volunteered that her father had nothing whatever to complain of any more than had she. To which John countered, 'Still, he's your father, and for that reason I shall always be in his debt.' In fact, things could hardly have been worse.

Then came the fortnightly Board Meeting, and John, bravely reminding Vic of the fact, warned her that he might be late home.

To John the world, as he was beginning to love it, had come to an end. In business, if one disagreed with a man, well, one disagreed and talked about the disagreement so openly that in the end it often formed the basis of a friendship

that lasted through life; but with women it was different. Women were so set on having their own way—in fact you could not stop them. But he had stopped Vic. That was the awful part of it. Women should never be stopped, he felt sure of that, and yet he had done it. He sometimes wondered whether he were different from everyone else, whether, as Napoleon had said of himself, he was not a 'man' but a 'thing.' In business, yes. Business and private life, money and affection, were divorced as the poles. He had defied his wife, and made both her and himself miserable. It would last for the rest of their lives. He began to wonder whether it was worth while. Suppose he sold out and went to live in the country—let old Wilberforce onto the Board? No, that would not mend matters. The new Board would turn the old fool out and the trouble would begin all over again. Well, it could not be helped. Apparently Fate took a swipe at a man every now and then, and the man just had to grin.

The secretary coughed and looked at his watch.

'I beg your pardon,' John said; 'go ahead.'

VII.

John listened to the reading of the minutes, signed them, and thereafter for three-quarters of an hour tried to pay attention to reports and suggestions read out by the others round the Board. He wondered whether he would ever again succeed in keeping his home affairs separate from his business. In time, of course, he would get hardened, he supposed. Vic would become just an obliging lady-housekeeper and entertainer of his friends, while he would spend more time at his club. The mischief of it was that this was the ideal with which he had started off married life. It had only been lately, for the last six months perhaps, that his home had become a joy to him such as he had never expected could exist.

'I beg your pardon, Mr Sykes?' John was punctiliously polite at a meeting of the Board.

'I was saying, Mr Storrs, that it might be better if the Firm's cheques were signed by another director after being countersigned by me.'

'What for?' John snapped. There was a flavour of repetition about that suggestion. It was what Vic had proposed. He remembered now.

'It is customary,' Sykes went on rather uneasily, 'and as a matter of fact the bank would prefer the arrangement from their own point of view.'

'There's no one here who has time to do that properly,' John replied, looking round the Board. 'We're all stretched to capacity, and what use would it be for one of us to sign as a matter of form?'

'None, Mr Storrs,' Sykes agreed. 'What I suggest, with all deference, is that another director be found, part of whose work would be to keep track of finance. This business is very large and growing fast—'

'Another director!' John gasped. 'But who?'

Apparently no one cared to reply at the moment, so Mr Ellison, who was buyer to the Firm, chipped in.

'That gives me an opportunity, Mr Storrs, of pointing out a weak spot in my department, which Mr Sykes's suggestion might help to remedy. In the early days, when we were mostly concerned with broadcloths, Mr Wilberforce was of the greatest assistance, having been more or less brought up to that particular business. But now the variety of purchase is so large that it would add to the efficiency of my department if some assistance could be given, say twice a month, in that particular direction.'

'Wilberforce!' John exclaimed, gazing from one to the other of his faithful servants.

'It was more or less of Mr Wilberforce that I was thinking,' Sykes remarked. 'If you will remember, sir, Mr Wilberforce, though a little limited perhaps in vision, was a most reliable man at books.'

VIII.

John Storrs pushed the clean blotting-pad along the shiny table and sat far back in his chair. This was a most astounding thing. And then like a flash there came to him, as it had come many a time before, a feeling that Fate was on his side after all. Over and over again in a busy life he seemed to have rescued a project from wreck by clinging to some fragment of luck, and convincing himself that that showed the way if he had but nerve to follow; and over and over again his luck and courage had carried him through.

Wilberforce lay between him and happiness. The heads of departments would think him crazy if he put the old man on the Board; worse even than that was the fact that Vic had interfered with business, had tried to cloud hard facts with sentiment, and that could not be done. And now the Board themselves were asking for the very same thing, not from any sentiment, but as a matter of pure business. He saw it at once. Sykes was right, so was the bank, and Ellison, usually a most reliable man. They had talked it over, of course, as business men should, and had decided that Wilberforce was the best man. Why? Because he was a good bookkeeper and could judge broadcloth as few others could. Quite sound.

So, 'Why Wilberforce?' he asked.

'Easy man to handle,' came from the secretary, a pencil still between his teeth. 'I should do it, Mr John.'

The secretary was the only man who still spoke of 'Mr John,' and then only when he

particularly wished to impress Storrs with his earnestness and to recall with a single word the years of devotion that he had given to the Firm.

'You would?' John said slowly, but with an air of relief. 'All right, then we'll agree on that. Any other business?'

'I think not, Mr John,' the secretary replied; and as the Board filed out of the room John was astounded to notice that each man turned at the door and made him an uncomfortable, almost shamefaced, little bow.

'What's the matter with those fellows?' he asked the secretary, who was collecting his books. 'There seems something unusual in the air.'

'Times change, Mr John,' the other replied casually, 'and influences are set to work. But you're making no mistake. Leave Wilberforce to me.'

'I'm afraid of him interfering——' John began.

'I know. Leave him to me.'

'Well, I hope it will turn out all right. I can't do with him near my room——'

'Leave him to me, Mr John, and you won't know he's here.'

'There are times,' said John to his old secretary as they left the room together, 'when I feel, as you said just now, that there are influences at work——'

'Good ones, Mr John, good ones.'

'No doubt; and yet it gives one an uncomfortable feeling to be swept off one's feet.'

'It's momentary,' the other replied, helping John into his ulster. 'Just once in a while influences may conspire against a man, and he's drowned; and at other times, why, they just sweep him right up onto the shore!'

IX.

'I've got some news for you,' John remarked, after Vic and he had settled down by a blazing fire.

Vic looked up with a smile. 'It's good news, too,' she said happily.

'How d' you know?'

'How should I not know?' she replied. 'I saw it written all over your face when you came in.'

'Yes, it's good news,' he agreed. 'Your father's to go on the Board.'

Vic put down her empty coffee-cup and crossed to the other side of the hearth, sitting down by John's side on a deep settee.

'But are you sure it's wise?' she asked anxiously.

'It's necessary,' her husband corrected.

'John,' said Vic, slipping an arm round his neck, 'you don't deceive me the least bit! You're just a great big, transparent, darling bear, and there isn't another woman in all the world with a man to her name one half as good!'

'Well, well,' he said, taking gentle possession of her hand, 'maybe there were influences at

work, who can tell, but it'll be all right! It'll work out all right, you'll see!'

Of course, he ought really to have told her that he was half driven to it by his own Board; but then John Storrs was wise. Vic was getting what she wished and John was getting the credit for it, which he certainly required. A true recital of the facts could do no good and would positively do harm. So, 'Well, well,' he repeated slyly, 'maybe there were influences at work; who can tell?'

But the curious part of it all never came to John's knowledge, namely, that the wives of John's trusty directors were all added to Vic's social list and helped gently up to the heights of their several ambitions, including the Assembly balls.

After all it had been quite simple. Here was the great John Storrs driven to abject misery by a slip of a woman like herself; was it too much to assume that his directors were in some manner under like distress? The secretary had, of course, been the man to tackle. He had known her as a child. And the secretary, while non-committal as regards himself, he being a bachelor, had been of opinion that under the circumstances the heads of departments would probably agree that Mr Wilberforce was the man required. The rest was easy.

On the other hand it would have been foolish of Vic to explain to John just how the thing had been brought about. That would deprive John of his comfortable feeling of satisfaction and could do no good at all. So she nodded in sage silence and returned the pressure of John's hand.

As for Mr Wilberforce, he spent the very short remainder of his life explaining to casual acquaintances how Storrs had tried to run the concern himself, and had been obliged to bring him in at the end to keep the great Firm on its feet.

So that in that way everyone was pleased.

TRAMPING SONG.

O ROUGH the way,
And steep the brake,
But light the heart I carry;
For I've no care,
No grief to bear,
No cause to turn or tarry.

I trudge along
With idle song,
And never look behind me.
To-day's the day,
And this the way—
The past holds naught to bind me.

I love the trees,
I love the breeze,
I love the world around me.
No tears I weep,
And sound's my sleep,
For happiness has found me.

C. ETHEL EVANS.

CABLE-LAYING ACHIEVEMENTS.

AN EPIC OF THE SEA.

By J. and S. HARRISON.

I.

EMPIRE rests on communications. The Romans, with the menace of the barbarian ever at their frontiers, were able to maintain their boundaries, only because they were careful to construct fine military roads wherever they ruled. The earlier far-flung empire of Alexander the Great had fallen to pieces very soon after his death; for, in the absence of any consolidation, any welding together of subject territories by means of a network of communications, it was easily possible for a tributary monarch or governor to rebel successfully against a central government.

In comparatively recent times, in 1815, after the first phase of colonial expansion, the British Empire consisted mostly of insecure trading outposts and penal settlements. In a world of uncertain and difficult travel it seemed that the Empire was incapable of any real development. Two factors were, however, presently to enter the lives of men, which seemed to cause the world suddenly to become smaller. The steam-engine and the electric telegraph solved, in the course of a few decades, two of the chief problems which faced Britain. The railway made the unification of India and the development of Canada possible, and the steamship provided a means of transport and a weapon of defence of a potency hitherto undreamed of.

It was the electric telegraph, however, which swept away the age-long difficulty of administering over extensive sparsely-inhabited territories. Because of it the British Empire has become, in the course of only a century, a consolidated group of nations capable of infinite development. And the United States of America is an economic unit with an electric nervous system linking up all the centres of her activities.

But the civilised world is now become one wherein the oceans are the highways, and the spanning of the length and breadth of those highways with the electric cable is one of Britain's proudest achievements. In these days, when three hundred and twenty-five thousand miles of cable have been laid, and the industry is capitalised to the extent of sixty million pounds, it is hard to realise that only eighty years have elapsed since the first submarine telegraph lay on the bed of the sea.

II.

On 23rd July 1845, the brothers Jacob and John Watkins Brett addressed themselves to Sir Robert Peel (Prime Minister and First Lord

of the Treasury) with a proposal to establish a general telegraph system, including a cross-Channel cable. They were referred to the Admiralty and the Foreign Office, and, as is usual with government departments, months were wasted in futile correspondence. Eventually a concession was obtained from the French and British Governments authorising the brothers to lay a line from Dover to Calais. The cable, which was a single strand of copper wire covered with gutta-percha half an inch thick, had weights fastened to it at a hundred yard intervals. The line lived long enough to deliver a few incoherent words and a complimentary sentence to Louis Napoleon Bonaparte. It transpired that a Boulogne fisherman had hooked the cable in his trawl, and, thinking it to be a new kind of seaweed, had cut a sample out of it. But his ignorance was far more forgivable than that of the critic of those days who was of the belief that one pulled the cable after the manner of mechanical house-bells, and who gravely pointed out that the bed of the Channel was too rough for the submarine cable ever to be a success.

The message fortunately had the effect of saving the concession, which was renewed by the French Government in 1850. The failure had made investors shy, and until some few weeks before the expiration of the renewal new capital was not forthcoming. The undertaking was saved by the energy and talent of Mr T. R. Crompton, an eminent railway engineer, who raised the necessary fifteen thousand pounds, of which he himself subscribed half.

Crompton's cable consisted of four copper conducting wires, each covered with gutta-percha, the bundle being wrapped in Russian hemp. The outer cover was composed of thick galvanised iron wire to protect the insulation from chafing. This cable was the true forerunner of the modern type; it proved to be a lasting success, for it was worked until the beginning of the present century.

III.

In 1857 certain bold spirits embarked on an attempt to lay an Atlantic cable. They did so in the face of popular prejudice and scientific ignorance. The Astronomer-Royal announced that 'it was a mathematical impossibility to submerge a cable in safety at so great a depth,' and that 'if it were possible, no signals could be transmitted through so great a length.' Owing to the impossibility of finding a ship sufficiently large, the cable was carried in two

steamers. One started from the Irish coast, and the other was to meet her and join up in mid-Atlantic. When three hundred and eighty miles had been paid out the cable was broken, owing to the misjudgment of the brakeman. Besides losing a year of time and three hundred and thirty-five miles of cable, the expedition cost a hundred thousand pounds.

The many errors of the first attempt led to more care being taken with the second, and in the following year the fleet made a series of experiments in the Bay of Biscay before proceeding to actual operations. This 1858 attempt would doubtless have succeeded had not one of the cable ships, the *Agamemnon*, struck a particularly violent storm. The occasion was one of enormous hardships, for the steamer, a warship, was unsuitable for her task. The crew worked with the utmost heroism in the endeavour to keep the appointment in mid-Atlantic, the arrangement being that the two boats should splice the cable in the ocean and then proceed, one to Ireland, and the other to America. So badly was the *Agamemnon* buffeted that of her crew of two hundred, forty-five were in the sick-bay suffering from the effects of injuries and exhaustion. One had a broken leg, another a fractured arm, and a third had his fingers crushed off in holding to what he thought was a ledge in the planks. Unfortunately it was the beams straining apart, and when the ship righted herself they closed up together. One of the crew was driven out of his mind with terror.

The *Agamemnon* and the *Niagara*, however, kept their tryst and, after splicing the cable-ends, started on their journeys, only to return within a few hours because of a breakage. Again they started . . .

It was only after a return to port and an entirely fresh beginning that the cable was completed, and on 16th August 1858 England transmitted the following message to the U.S.A.: 'England and America are united by telegraphy. Glory to God in the highest, on earth peace, goodwill towards men!'

Unfortunately for the life of the cable the electrical engineer of the Atlantic Telegraph Company believed in very high-tension currents for signalling, and the line breathed its last on 20th October. It had, however, proved its usefulness in transmitting messages to Canada announcing the quelling of the Indian Mutiny and cancelling an order for troops to return to England.

IV.

A considerable feeling of disappointment reigned everywhere. There was much difficulty in obtaining capital for another venture, though the American Civil War stimulated capitalists to further efforts. Mr Cyrus Field, as a special inducement to his fellow-countrymen, preached the doctrine in the U.S.A. that a cable would

be a means of helping America to capture the grain market which was so largely held by France. His mission had the warm support of John Bright and other free-traders. What success he had may be gathered from the following letter written by his brother:

'The summer of the year (1862) Mr Field spent in America, where he applied himself vigorously to raising capital for the new enterprise. To this end he visited Boston, Providence, Philadelphia, Albany, and Buffalo, to address meetings of merchants and others. He used to amuse us with the account of his visit to the first city, where he was honoured with the attendance of a large array of 'the solid men of Boston,' who listened with an attention that was most flattering to the pride of the speaker addressing such an assemblage in the capital of his native state. There was no mistaking the interest they felt in the subject. They went still further; they passed a series of resolutions in which they applauded the projected telegraph across the ocean as one of the grandest enterprises ever undertaken by man, which they proudly commended to the confidence and support of the American public. After this they went home feeling that they had done the generous thing in bestowing upon it such a mark of their approbation. *But not a man subscribed a dollar.*'

The fact must be recorded that the enterprise, like all the previous ones, was entirely British, the work of British brains, British capital, and British labour, stubbornly fighting against unprecedented difficulties.

V.

In 1865 enough money had been subscribed for a new attempt. The single cable-laying ship for this venture was the *Great Eastern*, the conception of Isambard Kingdom Brunel. It is a pity that she was not available at the time of the laying of the first cable. She was in advance of her time; for nearly ten years previous to her use by the telegraph company she had suffered three different ownerships and had, for the most part, lain idle.

On 23rd July 1865 she left Valentia. When forty-eight miles of cable had been paid out a fault was indicated, and the ship had to pick up and examine ten and a half miles of cable before it could be discovered and rectified. This happened again at seven hundred and sixteen miles and at eleven hundred and eighty-six miles, when, after a series of accidents in which the lifting tackle was lost, the *Great Eastern* returned unsuccessful.

She had, however, indicated unsuspected possibilities, and money was found for the 1866 expedition, largely through the faith and determination of Mr (afterwards Sir John) Pender. The giant steamer left Valentia on the *thirteenth* of July, and during a successful

voyage of only fourteen days laid her cable, once more joining the two continents.

On 9th August she again put to sea, and recovered the 1865 cable six hundred and five miles from Newfoundland. After repeated failures the cable was hooked, and on 2nd September the steamer was in communication with Valentia. Six days later she completed the line, thereby making two cables to join England and America within three months.

There followed upon these achievements a boom in submarine telegraph enterprises, and in 1872 Sir John Pender amalgamated the various short-length cables between England and India and formed the Eastern Telegraph Company. Within a few years his concerns were operating lines as far as New Zealand and Shanghai, southward to the Cape, and across the Atlantic to South America.

I'll put a girdle round about the earth
In forty minutes,

wrote the author of *A Midsummer Night's Dream*, little suspecting, no doubt, that science would so far outvie magic as to girdle the earth in eighty seconds. But His Majesty the King, when he opened the British Empire Exhibition, sent a message right round the world and back to Wembley in this amazingly short space of time. 'I have this moment opened the British Empire Exhibition' was flashed from Wembley to Penzance, and thence *via* Fayal, Halifax, Montreal, Vancouver, Bamfield, Fanning, Suva, Auckland, Sydney, Adelaide, Perth, Cocos, Rodriguez, Durban, Cape Town, St Helena, Ascension, St Vincent, and Madeira back to Wembley; also from Sydney *via* Singapore, Madras, Bombay, Aden, Suez, Alexandria, Malta, and Gibraltar.

VI.

The advances in laying and transmission have resulted in an enormous reduction in rates. The pioneer Atlantic Telegraph Company began with a minimum of twenty pounds for twenty words, with one pound for each additional word. By stages it dropped to thirty shillings for ten words of five letters each, and now it is possible during a week-end or in the night-time to send telegrams *via* Imperial or Western Union from door to door, from London to certain towns on the Atlantic seaboard of the U.S.A., for five shillings for twenty words and threepence per additional word. (The ordinary rate is a shilling per word.)

The war service of the cable companies is a proud one. The call from the Motherland reached the outposts of the Empire almost immediately after the declaration of war. In international diplomacy the cable proved itself invaluable. Without it, decisions made within a few hours, and arrangements completed in a

few days, would have taken many months. Throughout the time of hostilities much special work was undertaken in laying and repairing cables all over the world. The most remarkable of the war-time expeditions was the laying of a telegraph from Peterhead (in Aberdeenshire) to Alexandrovsk, by the ship *Colonia* under the supervision of the Post Office. This was performed in 1915 in the cold and darkness of an Arctic winter.

Within four hours of the outbreak of war, Germany was entirely devoid of cable connection with the U.S.A. One line was taken in at Penzance and another was diverted from New York to Nova Scotia. A third was captured by the French at Brest. A year later the crew of a German cruiser landed at Fanning Island and cut the All-British Pacific cable there. The notorious German raider, *Emden*, met her fate after cutting the Eastern Telegraph Company's line at Keeling-Cocos. She succeeded only after the superintendent had sent out the alarm signal which led to the *Emden's* ultimate destruction by the cruiser *Sydney*.

Twenty thousand miles of German cable was captured during the war, for these lines mostly passed through the English Channel.

VII

In the period after the war the cable companies, in common with the rest of mankind, have had manifold difficulties to contend with. During the time of fighting no cables excepting Government ones were put down, and repairs became overdue. The traffic had nearly doubled, and the result was serious congestion. In spite of the competition of wireless, however, the submarine telegraph systems continue to grow; one company alone spent three million pounds on new cables recently. Where secret and reliable transmission is essential the cable holds undisputed sway, for it is not affected by atmospherics, and its messages cannot be picked up by any ingenious schoolboy.

Among recent scientific improvements is the use of automatic relays, wherein the human element is entirely eliminated. Men are necessary only to see that the machines are working properly, and to feed the tape that has been punched out by the receiving machine into the transmitter to the new cable. When one remembers how many times the King's message at the opening of the Exhibition was relayed, it is possible to realise the immense advantage arising out of the freedom from human error that the use of the machine ensures. Carefully compiled statistics by the Eastern Telegraph Company show that the percentage of error in manual working is .190 per cent, and with machine relaying .037 per cent.

An innovation for use on duplicated cables (and all cables are now duplicated) is one which enables two messages to be transmitted simul-

taneously in one direction while another is being transmitted in the opposite one—three messages on two wires. Hence local calls can come through without interfering with long-distance telegrams.

Last year the greatest of the cables to date was completed. It extends from Weston-super-Mare to Far Rockaway, Long Island. It is capable of transmitting twelve hundred letters per minute—six hundred from each end simul-

taneously, a capacity nearly twice that of any other long-distance cable. The slender strands continue to reach out along the bed of the oceans, and the electric network is drawn more closely over the world; though through the ether spread the messages of the new wonder. Each has its sphere of usefulness, and such compelling agencies mould our civilisations, though most men are ignorant, or shut their minds to a knowledge, of their achievements.

HOW ABOUT WATER?

THIRTY years ago this was the oft-repeated question on the gold-fields of Western Australia. It was the all-important query put by the men who met on their travels in opposite directions. Each was anxious to know what were his chances of finding water on the track that lay ahead of him—for upon water life depended.

When in 1891-92 Bayley and Ford rode the 120 miles from Southern Cross and discovered Coolgardie, they 'blazed' the track for thousands of their fellows. In making the journey they took a great risk, for they would meet no one who could tell them where water might be found. They could go for two or three days on the water they carried, but if, before that time expired, they failed to find other water they must return, or die on the track. In their particular case the season favoured them. Rain had fallen not long before and here and there rock-holes had been filled. Also, there was young green herbage for their horses. But rainy seasons were rare in that part of the state, and the men who followed Bayley and Ford did not meet with equal good fortune in finding water—or gold, for that matter!

A marked feature of the country lying between Southern Cross and the eastern gold-fields is the presence of immense dome-shaped masses of granite. These rise, dark and sombre, above the surrounding forest and scrub, and, in area, may cover many acres. For the most part their surface has been worn smooth by weathering, and very little vegetation grows upon them. Here and there on these domes may be found holes worn by some process of attrition perhaps, and in these water may frequently be found. The natives named them 'gnamma' holes, but I do not know the precise meaning of the term. The capacity varies from a few gallons in the greater number of holes up to hundreds of gallons in a few. The water is fouled with the dead bodies of birds, mice, and lizards; but famished men are not faddy, and it was found that after the more solid 'remains' had been picked out, and the water boiled for tea, no harm came to the drinker.

But larger and more permanent supplies were necessary to provision the thousands of men

who tramped along the track to the wonderful gold-fields. The immediate demand was met for a time by the discovery of what were called 'soaks.' The water, shed year by year from the granite masses, disappeared in the soil at their bases. And men, urged by dire necessity, dug for it. They found it, not perfect in quality because of the presence of salt, magnesia, and other minerals in solution. But it was water, and drinkable, and that was what was wanted. Very soon, however, this supply was found too small to meet the demand. The soaks quickly drained, and the cry still was, 'Give me water!'

Wells were sunk deeper, and large supplies of water were met with at no great depth—but salt and bitter! Very much more salt than seawater, and heavy with dissolved minerals. But the men were not to be beaten by drawbacks such as these. They built condensers, and from the bitter liquid produced an absolutely pure water. It was tasteless and insipid—but it was water on which life could be maintained.

The condenser-plants were primitive, but effective. The ordinary 400-gallon iron malt-tanks were brought into use. They were usually placed tandem-fashion in pairs, with a connecting pipe. One edge of the tanks rested on a rough masonry sill, and masonry—stones and mud—was built around and upward to the edge of the tank. The end elevation was diamond-shaped. The masonry formed a flue through which the heat of a wood fire circulated freely. When once the water was brought to the boil a small fire kept it under steam. The steam passed from the boilers along hundreds of feet of piping, and was condensed into water by the air and stored in tanks. The solids in the water fell to the lowest angle of the tanks, and could be removed through an opening as required.

The sinking of wells and the erection of condensers were pushed on vigorously, and at intervals of not more than twelve miles they bordered the road to the fields. They made the journey safe for man and beast. But, as a rule, the man had to pay sixpence a gallon, and at first the price was higher. It cost money to water a team of horses, but the

teamster passed it on to his customers, and it was they who had to pay.

At these watering-places there usually were one or two eating-houses, built of house canvas and galvanised iron. Here, in addition to food, customers could get a wash; but they were cautioned not to throw away the dirty water. This had to be emptied into a near-by tub. Thence it passed back to the condenser, and again came forth as pure drinking water. The idea was not pleasant!

Then some man—name unrecorded—who was possessed of a fine stock of common-sense, deplored the loss of good water that during rains ran to waste from the granite domes. Acting on his suggestion, the Government caused deep gutters to be cut round the bases of the domes, and tanks to be excavated in the earth at the lowest point. And this simple scheme saved many million gallons of water from being wasted. Whenever these tanks were filled the condenser-men were thrown out of business for the time, and they would curse the Government heartily. But, being practical as well as profane, they set to work to overhaul and repair the condenser-plants, ready for the day on which the tanks would be dry and useless. Seeing that the average annual rainfall in that part of the state is about nine inches, they never had long to wait.

But the cry was still 'More water!'

The supplies that had so far been obtained sufficed only for the most urgent needs of the people, and were also very dear. There were few people who could afford to buy water for a decent bath; a sponge-down from a two-gallon bucket of water at long intervals was a luxury, and not within the means of everybody.

The gold-mines also were calling for water, and wanted it by hundreds of thousands of gallons per day. At first the supplies of salt water met with in shaft-sinking sufficed, and for ore treatment the salt water was not harmful, but it could not be used in boilers to raise steam. For this purpose condensing had to be resorted to, but the results were meagre in face of requirements, and very expensive. The cost amounted to a minimum of twenty-five shillings and a maximum of seventy-five shillings per thousand gallons. Strict economy was practised, and no exhaust steam was allowed to blow to waste; it was carefully condensed, and the water returned to be again used. This system still obtains, and no feathery plume of waste steam is to be seen anywhere floating in the air.

For the energetic and thorough development of the mining industry it became an urgent necessity to bring water to the mine in great quantities and at the lowest possible cost to the consumers.

This was brought about, ultimately, by means

of a scheme initiated by the late Mr C. Y. O'Connor on behalf of the Government. A weir was to be formed at Mundaring, in the Darling Ranges near the coast, and from there water was to be pumped to Coolgardie and Kalgoorlie. The estimated cost of the scheme was three million pounds, and the daily supply of water to be 5,600,000 gallons. The length of the pipe-line was 351½ miles, and the maximum height of lift 1290 feet. Eight pumping stations were provided at various points along the line until, from the highest point, Bullabulling, thirty-two miles from Coolgardie, the water was able to gravitate to Kalgoorlie.

The foundations of the Mundaring weir were begun in May 1898, and the charging of the great main was started in April 1902. This water reached Coolgardie, at 328 miles, just before Christmas 1902, and Kalgoorlie in January of the year following. It was a great work well carried out, and has stood the test of time. Moreover, it reduced the price of water to five shillings and seven shillings per thousand gallons.

Not only did it serve the needs of the gold-mine—it saved the railway great expense in hauling water for the locomotives; and as time passed districts adjacent to the pipe-line demanded water, and were supplied by branch pipe-lines. Farmers drew upon it for their needs, and here and there on the gold-fields beautiful gardens came into being and glorified places which previously had been the abomination of desolation.

The pioneers of the track had carried their meagre supply of water in canvas bags or in canteens, on foot or by horse and camel. To-day the traveller on the railway follows the same old track, and the great pipe-line is in evidence the whole way.

But farther back, beyond the reach of the Mundaring supply, the travellers along the bush tracks still ask the men they meet, 'How about Water?'
E. D. C.

THE LIKENESS.

You, whom I asked for a portrait,
You, who bade me 'forget'!
Who would bury the jewels of Passion in the
grave-cold sands of Regret;
What of the night-wind's whisper, sweet and
faint as your sighs?
What of the blue of the heavens—the fathom-
less blue of your eyes?
What of the cornlands that borrowed the glorious
gold of your hair?
What of the lark's high ecstasy?—the thrill of
your voice is there;
What of the poppies that matched your lips, when
we gathered them dew-wet?
You, whom I asked for a portrait,
You, who bade me 'forget'!

WILLIAM FREEMAN.

A ROMANCE OF THE REEL.

PART II.

IV.

MRS FRASER had not much to explain to her visitor that he had not already overheard, though he paid most careful and properly astonished attention.

'And who—who is this young lady, Mrs Fraser?'

'She is Miss Sheena of the Lodge.'

'Miss Sheena Cattanach?'

'Yes.'

'Ah!'

'Perhaps you know—' suggested Mrs Fraser.

'No. Only, it was a big enough obligation to be under for the fishing; but when it comes to getting your life saved as well, it—it embarrasses, Mrs Fraser.'

'Indeed, no!' she vouchsafed. 'Miss Sheena herself would just enjoy it. She'll be round to see you this afternoon for certain.'

'You see, I got the two or three days from Mr Robertson, the factor in Edinburgh, for whom I did a little commission. It seems Mr Cattanach has an interest in antiques.'

'They say he would just sell his soul for a bit old picture, and as for the gallery of pictures he has—there's no end to it. Some of the things that queer-looking and foreign, the keeper was telling Kennie that he wouldn't be seen taking them away in a barrow for nothing.'

Davie ventured his timid smile, but no comment.

'He doesn't fish much himself nowadays, except maybe an odd time. But there are friends who come for spells now and then. The last of them is that dark, foreign-looking man—and he's just going. The fishing is really over now, but in the spring—'

'Yes, in the spring,' said Davie Dunbar. 'I can understand.' And his eyes became contemplative.

And when Mrs Fraser thereupon retired to make him something, he dreamed of the great annual spring run and the swift, strong bodies cleaner than new silver. . . . Till slowly, imperceptibly, there crept over his dreams a shadowy film, the dark pool gripping at his deathly experience became darker, the leaping fish more uncanny, more symbolic of the fear-some. He tried to shake it off as a man strives to shake off a horrible imputation on the thing he loves. And he knew it was not altogether mere fear engendered by the physical mishap as a mishap. It was something elusive, sinister, like—like that picture of his, which had so strangely been at once illusion and reality when he had been going down—down. 'Just sick fancies,' he mumbled. And after Mrs Fraser

had ministered to his needs he felt decidedly more able to cope with all shadowy things. 'And that picture—after all, it's a mere surface fancy o' a mad painter, who must aye twist every clear, sweet feeling into something contorted and unchancy.'

He shook himself. He tried to feel better, to get a grip of the philosophic imperturbability that winds with the doric. 'Ah weel, tae a richt mind the mischance was no-but the kitchen tae the triumph; an', Gudesakes, is he no' eichteen pun'! What wad Jamie say tae that!' But the picture remained, the shadow haunted. 'Mistress Fraser!'

'Yes! Yes!' She came quickly.

'I was jalousin' mebbe that as muckle speerits as wad gang i' a thim'le—'

She looked at him, vainly striving to follow.

He pulled himself up, coloured a trifle. 'I thought perhaps a spoonful of whisky—'

'How stupid of me—' And just then there came a knocking. 'Now I'm not thinking but that will be Miss Sheena herself come to see you;' and the good lady bustled to the front door.

Mrs Fraser's expectation proved to be correct, and presently Davie Dunbar saw his door open and a young woman enter, bringing with her a fresh cool swirl of air that fanned his face, his senses, with fragrance of the wide out-of-doors.

'Mr Dunbar! How glad I am to hear you are little the worse of—of—'

'Ma dookin'' were the words that rose impulsively to his lips, wildly, and that he only just managed to choke down. For the light that he thought he had visioned on her face was there naturally. His heart began to beat unreasonably. And she finished her sentence not with words but with a smile where humour blended perfectly in a soft-welling sympathy.

'No, I—I am none the worse. Thanks—thanks indeed to you!'

'That was nothing—nothing at all;' and she sat down on the chair by his bed. 'Though I take not a little credit, perhaps, for having acted the gillie so well!'

(Exit Mrs Fraser, with a mumbled reference to a 'message'.)

'It was the first time ever—ever I had a gillie,' said Davie; 'and—and,' concluded Davie in a rush, 'it was worth having gone without one for. I mean—'

Her eyes danced. Her colour rose a shade. 'It is kind of you just to mean that,' she said.

And suddenly looking into her eyes, he smiled. She was so plainly no-but a bit lassie herself. A sudden warmth whirled about his heart. 'You saved the life of a poor old man—'

'Who was fighting like ten young ones!' Plainly she was going to take no thanks. 'How stubbornly you refused to give me that rod!'

'So they have been telling me. But I had tried so hard to get into him, was it any wonder?'

As eyes met smiling eyes a perfect accord seemed to be established.

'And then—' she began, as on a sudden impulse, and paused.

He noticed the hesitation, the slight instant sobering of her expression; but in a moment it had passed.

'Tell me,' she said cheerfully, 'did you see me coming?'

And for an instant there was a slight sobering of Davie Dunbar's expression also. 'Well, yes—' he hesitated.

She looked at him.

It came in a rush. 'To tell you the truth, I saw you and yet I didn't see you.' He forced a doubtful smile.

'You mean it was just a glimpse?'

'No, it was a picture,' he said; 'but it just shows you how the mind gets all mixed up at such a moment. I have a picture in my shop in Edinburgh—and it was that picture that seemed to rise before my eyes. It sort of fitted in—and it was that I thought I saw. But really, it is foolish of me mentioning it at all. Actually I did see you, of course.'

'How interesting! And what is your picture like, really?'

'Oh, a foolish old-fashioned picture!' Drat the picture! There was no need to have mentioned it at all.

'But now you have roused my curiosity! You must tell me. You say it "fitted in."'

'Well, that's just what it didn't do in a way. In what way?'

He twisted in his bed a trifle. She laughed. 'Surely the picture is not so bad as all that?'

He gave in. After all, it was foolish to pretend there was anything in it. By holding back he was merely creating the wrong sort of mysteriousness.

'Well, you see, the picture has a great sombre pine wood in it. I don't mean your pine wood holds any of the darkness. A pine wood, and out of it a woman is escaping on horseback. That's all. It did fit in a little as a picture, didn't it?'

She nodded, but a queer intangible uncertainty had been created. 'Escaping, you say?' she asked.

'Yes, yes. One of those old symbolic things, you understand. Virtue flying before the darkness, and all that. Merely a silly hallucination of mine at such a moment!'

'That's queer,' she said quietly.

He looked at her. 'How could it be queer?' he asked with a sudden gentleness.

'Well, I can imagine how heavy is the

feeling of debt one has to carry when some one else has saved one's life. I can understand that, believe me. And I have thought it might lighten and make glad the burden—if, if at the same time some compensating great service had been done that some one else.'

His eyes watched her invitingly, waited.

She suddenly looked at him impulsively. 'You did me a service, too, by—by diverting me. Before I saw you I was not flying from that pine-wood with fear in my face. I was going into it, to an appointment, with black misgiving, yet somehow mesmerised, knowing I shouldn't, yet going—desire, fear. . . . Oh, I can't explain, but to-day—I know that I—escaped.'

There was a listening silence of revelation between them for a moment, then his hand came out and caught hers. 'You saved a poor old man's life, and now how deeply happy you have made that old man's heart in the saving! To have waited for that was worth my whole life.'

The white flame of earnestness, fear, that had touched her face, gradually receded before returning colour, a softening in the eyes. 'You said that about the gillie, you know!'

He smiled, and there was a brightness upon his face. 'But what I will say to my own heart will be known only to myself—and no one else shall hear a mystic word of it.'

v.

The year dies and the year is born. And the rebirth, according to the poets, is accompanied by many signs and wonders from the fancies of a young man to the red on a robin's breast. Yet to Davie Dunbar the poets missed the subtlest wonder of all, for the fancy and the feather, the flower and the sap—these, like the blessed poor, we have always with us. There are other things.

He moved about the shop restlessly. Twice he went through to the back-place, where, away from Jamie's measuring eye, he could behold the picture that hung above his own little desk. The amount of diplomacy, of tact, he had had to exercise in order to get it removed from the immediate purview of Jamie's salesmanship! How lame the excuse that he 'thocht he wad keep it by him a wee'! The removal of the sale ticket with its cryptic lettering that, being translated, signified £3, 3s.—Jamie's price, argued out on the basic value of the frame! He had not looked at Jamie, and putting as bold a front on it as possible, had simply walked away ben with the picture, feeling the while Jamie's eye like a shaft in the small of the back.

Not that he had dared absolutely to forbid its sale. But who, beyond a deluded and gambling Yankee, would ever offer five shillings? In its possession he felt perfectly secure.

And in the little universe of it, the picture signified much to Davie. Already time was

lending its enchantment, smoothing over the physical harshnesses of a past misadventure, of a past Adventure, leaving only the subtle meanings, the deep significances, the strange wonder. A little universe wherein he had acted the principal part—even if too literally he had blundered into acting it. It was something to have lived for. And how exquisitely kind and just Fate had been to him, even in that matter of the salmon. Ah, that was a matter! Yes, the picture was a magical picture, even with its shadow, with its still undissolved film of the uncertain.

Not that that shadow had anything any longer to do with a dark pool and leaping fish. It stood for the life of a young woman, who had wavered within the edge of it. And that life now? Davie gazed at the fleeing figure, the fear on the bright face, till his gray eyes softened.

He turned away from it again, came through to where Jamie, with emphatic niceness, was polishing the silver on a great cairngorm brooch. Jamie did not pause in his rubbing, paid no attention to the figure that moved about restlessly, yet every rub indicated that he was enigmatically privy to much.

Davie wandered to the door, looked abroad, and found the air of a fine thin blueness tempered by an enlivening suspicion of frost. It was early afternoon, very still, and full of a sort of listening reverie. He sniffed the air. The coolness ran along his veins. No, it wasn't reverie, it was an awakening. It was spring. The time the poets speak of so inadequately. On a sudden impulse he turned to the only figure near him, and 'They will be running noo, Jamie!' he said softly.

Silence hung portentously, till there was the sound of the brooch being laid on the top of the glass case with a metallic deliberateness.

'I wad hae thoct,' said Jamie, 'ye'd 'a' been cured o' that; cured o' a' that, by now!'

Colouring a little, Davie laughed uncertainly. 'Hoots, man, it's the best winter season we've ever had! We're gettin' rich!'

'Yes, I'm no' denyin' the season; an' for the first time oor stock hes reached pre-war heicht—if no' a little ayont.' And thereupon the brooch was taken in hand again.

'Weel, then—I dinna see—'

Jamie waited ruthlessly, but apparently Davie had thought better of it.

'P'raps ye dinna,' agreed Jamie at last. 'P'raps ye dinna.'

A position of the most delicate; losing none of its difficulty because Davie knew in his heart that Jamie's concern was not altogether for the business. Had he not sternly refused to let Davie work in Davie's shop for a full week after the return from Glenuel, because he, Davie, was alleged to 'hev a colour on him that nicht weel frichten a decent customer'? Of the most delicate—yet to be faced—yet how?

His dilemma was resolved in a manner that appeared to him little short of the miraculous, though, when regarded calmly, there was possibly nothing out of the way in the fact that Mr and Miss Cattnach of Glenuel should elect, as usual, to break their long northern journey from London at Edinburgh. Yet he most indubitably glared upon them as they advanced, in the body, to his very doorstep.

'Ah, Mr Dunbar!' It was her voice, her face with the clear light on it. Her hand came out quickly. It took him yet a moment to respond, and even then his handshake was half-mechanical. She laughed. 'I have brought dad with me. Besides, I think he was a little intrigued over the perfectly lovely silver!'

That did it! Davie had sent, privily, one or two exquisite pieces of old Tudor silver by way of acknowledgement of the Adventure. The pieces were, of course, his own, and, everything considered, there was no need of running the gauntlet of any salesman's comment, verbal or silent. 'Nothing, nothing at all!' he hastened to say, and turning immediately to her father, 'How do you do, sir?'

Mr Cattnach acknowledged. 'My daughter has often spoken of you.'

In build the two men were not unlike, and the blue eyes of the owner of Glenuel Lodge had much of that dreamy quality which not infrequently lay like a mist of reverie in the gray eyes of the dealer in antiques.

'And,' said Miss Cattnach, 'this is Mr Graeme.'

Then Davie looked upon the third member of the party, who proved to be a young man of a hand-grip in which there was the friendliest lack of indecision.

'Welcome, welcome, indeed!' said Davie, half recovered, the other half still overcome.

'And now we are going to look at all the queer things you have. May we?' Her understanding was subtle. Davie as host came to himself in a moment.

He ushered them into the shop. He introduced Mr James Forsyth, and thereupon, without apology for store or stock, he indicated such treasures and curios as he possessed. He had really a rather fine collection of old Georgian silver, over which he was inclined to linger. But as he warmed to his task in front of such obvious interest, he even unearthed an unusual knowledge of the homely cairngorm—and its foreign birthplace.

In the end they reached the back-shop, where the more choice items were kept. He preceded his visitors, and then, turning to welcome them in, suddenly interrupted a little action that in its instinctive nature told him something more surely than would the most intimate words.

The light from a side window shone right across the rather small room on to the face of

ment here and there amongst the scintillating mass showed that some of the herring were still alive. This was the first time I had seen a live herring. This species is a delicate creature, and it will succumb shortly after being taken from its natural element.

I noticed, also, that the fishermen in their oilskins and sea-boots looked dignified, sturdy, and manly, harmonising beautifully with their environment, and totally different from their shore appearance. Indeed, if one wishes to see the fishermen at their best, one should see them at sea following their calling.

We repeated the above operations several times during the early morning, while several other steamers were sailing about and carrying on the same work. Sometimes there was an exciting race between two or more steamers making for the same signal, which gives a touch of adventure and spirit to the enterprise.

A flock of sea-gulls followed the steamer all night, and, during the process of transshipping, small herring were thrown overboard and others would drop accidentally into the sea. No sooner had a herring dropped over the side than a cluster of gulls, setting up a chorus of screeches and shrill cries, would dive or rather plunge for it. I often noted that a gull would miss its mark, which goes to show that these birds cannot see very well at night—the gull, of course, is not a night bird. At times a bunch of them would plane down majestically right over the hold—coming into the zone of the torches—and the light reflecting on their white bodies against the dark background of

the night gave them the appearance of a shower of gigantic snowflakes.

The gull referred to here is known as the herring-gull. It differs from the common gull in certain colour characteristics. The former has its lower mandible decorated at the angled part by a splash of red, and has flesh-coloured legs; the legs of the latter are of a yellowish green shade, and the red splash is absent from the mandible.

At dawn the gannet or solan-geese came on the scene, and the gulls then had no chance of getting any of the spoil. Every fish that went over the side was immediately caught up by a gannet. These creatures are graceful divers—taking the water at a slanting angle when fishing at a low altitude, and never missing their quarry. The dive is vertical in working from a high altitude.

About 5 A.M., as the glorious sun was rising over the rugged mountains of Arran, painting sea and land in golden hues, we left the fishing-ground, homeward bound for Campbeltown.

The other steamers left earlier in order to catch the early train at Fairlie, and send their fish off to the city for the morning market so that the citizens of Glasgow might have a fresh herring for breakfast.

My night's cruise in Kilbrennan Sound amongst the fishing fleet made a lasting impression on my memory, and gave me a fuller insight into the factors which weave so splendid a romance round the arduous calling of the fisherman.

IN THE VALLEY OF DECISION.

CHAPTER VI.—*continued*

III.

ALL was now arranged between us, and nothing remained but to carry out the arrangements we had made. We went from Liverpool to London next day, and had the interview, which we had secured by telegram, with Thurlow.

I had known him previously; but never before had it been my lot to elicit from him a legal opinion, or to fix his attention upon a matter so important as that which now confronted Hubert and myself. He seemed to me to be just the man we wanted; the very embodiment of sound legal knowledge wedded to good common-sense.

By his advice we stayed another day in London on purpose to secure the attendance at his office of Dr Mackenzie, and also of an expert from Messrs Swallowfield, the Birmingham manufacturers.

These interviews were eminently satisfactory.

And then Hubert went with me to Richmond. It was as silent a journey as the one we had taken on our way back from Sussex Lodge to my club nine months ago. Both of us were deeply engaged with our own thoughts. It is not every thought that may be uttered, and there are 'thoughts that do often lie too deep for tears.'

The surrender to the police was not so painful an experience as I had anticipated. The official attitude, the business-like tone, the routine questioning, even the good humour of the spider on seeing the fly walk into his parlour—all this tended to put us at our ease.

In due course the charge sheet was filled; and then with a promise to Hubert to return to Richmond in good time for the trial before the justices, away I went, like a homing pigeon, as straight and as quickly as I could to my own home.

I had written a line the day before to Mrs Carrington to tell her that I proposed to call

and see her on the evening of my return, as I wanted (so I wrote) to talk to her about Hubert.

Over my interview with this brave-hearted and true mother it were well to draw a veil; but let this at any rate be said, would that every son had such a mother!

IV.

I was back again at Richmond for the trial. Needless to say, it created a great sensation; and the newspapers made the most of it.

The Treasury, represented by one of the Treasury Counsel, prosecuted; and alas! the charge brought against poor Hubert was that of murder. A good deal was made of the fact that he had fled from justice, and for nine months had concealed from the police his knowledge of the event.

Another point which was pressed was the cause of quarrel between the deceased officer and the defendant, and it was argued that there must have been strong animus to provoke so much physical violence and such a deadly struggle.

I was called as a witness on behalf of the prisoner not merely to testify to the excellence of his character, which I did *con amore*, but to substantiate what he had said as to the inebriety of the deceased on that particular night.

Hubert had determined, previous to the trial, that nothing should induce him to bring Vera's name into public notice, but, in the course of the proceedings, it became obvious to me that his reticence might very seriously prejudice his case.

I took the opportunity, therefore, when I was in the witness-box, to ask that the name of the lady should be written on a slip of paper and made known only to the magistrates and to the counsel on either side; and this was done.

The evidence of Mr Mackenzie was then taken; and he described lucidly enough, and by means of diagrams, the powers and limitations of the artificial hand which he himself had designed for the most beneficent of purposes, but which, by sheer inadvertence, had been the cause of such grievous disaster.

His evidence was confirmed by the junior partner of Messrs Swallowfield & Co. of Birmingham, and also by the very mechanic who made the steel hand, and who remembered every detail of its manufacture.

The steel hand itself was brought into court, and was an object of supreme interest to everyone who could manage to obtain even a glimpse of it.

It was inspected by the magistrates, but the attention they bestowed upon it was but scanty, and I was led to suppose that after the evidence they had just heard as to its manufacture and design, they did not consider that a more

minute examination could serve any good purpose.

But as a matter of fact (so Mr Thurlow subsequently told me), the decision of magistrates in such a case as this would not be influenced by a detail of this kind, for it is upon broader issues that they have to decide whether they shall send the case for trial to the Higher Court, or not.

Nevertheless the appearance of that hand in that court, witnessing, silently but eloquently, to the part it had played in the tragedy that had taken place, was to me a very pathetic and remarkable circumstance.

Hubert had been accustomed to wear over this hand an easy but well-fitting glove, which helped to conceal both from himself and from others the loss he had sustained. Thus very few persons had ever had opportunity of seeing the hand itself, and still fewer had had opportunity of making acquaintance with its mechanism.

The tiny plates of steel of which the surface of the hand was formed were beautifully constructed, and so delicately adjusted to each other as to present the appearance of a fish's scales; and they served to give to the hand that elasticity without which it would have been but a useless appendage. Within this outer covering of steel plates a most ingenious system of pulleys had been contrived, whereby the working of the more important sinews of the natural hand had been artificially reproduced. These pulleys were riveted inside the gauntlet to the extremities of the finger-stalls, and from there they passed along the arm to a strong but elastic bracelet which encircled the arm just above the elbow.

Thus the flexing and reflexing of the fingers of the hand depended upon the contraction and expansion of the muscles of the upper arm. These muscles were brought into action by the bending and unbending of the elbow, and in process of time Hubert had acquired considerable adroitness and power in laying hold of objects and in releasing them from his grasp.

V.

There was a full bench of magistrates, and it was evident that their duty weighed somewhat heavily upon them. At the close of the trial they consulted together in private for about twenty minutes; and then upon returning into court the chairman announced that, in view of the arguments adduced by counsel for the prosecution, it became their duty to send the prisoner for trial; and that he would be tried at the Central Criminal Court at the next assize.

All this fulfilled our worst anticipation, and I left the court with very gloomy feelings.

Notwithstanding all the warning conveyed by Mr Thurlow, and by the Liverpool solicitor,

that a commitment of this kind was not unlikely, I yet had buoyed myself up with the hope that the magistrates, taking into consideration the fact that Hubert came forward voluntarily, and was the victim of his own crippled condition, would deal summarily with the case, and allow common-sense to prevail against mere legal practice. But this was not to be.

The practice of the English law is a curious thing, and the one certainty about it is that it exhibits all the glorious uncertainty of a game of cricket.

The only person, curiously enough, who seemed quite satisfied with the result, and rubbed his hands together after a joyous fashion, was Mr Thurlow, the eminent solicitor, who was responsible for the defence.

'Everything has gone much as I expected,' he said to me, 'and now we are in a position to estimate the relative strength of the prosecution and of the defence. They've had their say, and we've had ours; and indubitably we've got the best of it.'

I could but hope so: and felt very anxious.

VI.

Moreover, there were other matters of which the lawyer knew nothing, but which caused me infinite concern. Two days after the account of the trial had appeared in the newspapers a letter reached me, from Sir Thomas Weston, as follows:

'DEAR SIR,—I am given to understand that you are not only the clergyman, but also in a special sense the personal friend, of Mr Hubert Carrington, who is now in prison awaiting his trial for murder. I feel myself precluded from writing to him personally in the unhappy circumstances in which he has placed himself, and, therefore, pardon me for addressing myself to you. I do not wish to say one unnecessary word to cause pain, but it is imperative that he shall be informed without delay that no further communication now, or at any future time, whatever may be the result of the trial, can be permitted between him and my daughter Vera. I am tempted to say a great deal in justification of this decision, but with your knowledge of the world I feel that I need not enter upon further explanation. I shall be greatly obliged to you, reverend sir, if you will convey to Mr Carrington, in suitable terms, this my irrevocable decision. And I beg to remain,

Yours faithfully,

THOMAS WESTON.'

In some circumstances I should not have felt called upon to answer such a letter as this, beyond writing a bare acknowledgment. But for Hubert's sake, and, indeed, for the truth's sake, I curbed a rising feeling of irritation, and tried to view the position from the general's

point of view. In this I was partly successful, and I sent him a conciliatory rather than an indignant reply.

None the less it was with feelings of satisfaction that I wrote that as Hubert himself, out of a chivalrous regard for the feelings of Vera and her family, had already renounced his engagement and given back to the young lady her freedom, it did not seem to me at all necessary to add any further sting to his troubles by communicating to him the painful message conveyed by the general's letter.

I also took occasion to add that my fuller knowledge of all the events which led up to this trial enabled me to say that, in my estimation, Hubert's character stood higher than ever; and that, so far from his being condemned by his fellow-countrymen, I could not bring myself to believe that any judge or jury was likely to censure him, except for the one thing, that he had not communicated immediately with the police.

I added that probably General Weston was unaware that Hubert's real reason for this silence had been his extreme reluctance to have Vera's name publicly associated with the quarrel which had led to such disaster.

CHAPTER VII.

I.

THE Assize at the Old Bailey now began to draw on apace. Hubert had already been four weeks in prison, but as the charge against him had been formulated as one of murder, the question of bail could not be entertained.

Often during that period did I think of St Peter's imprisonment as recorded in the Acts of the Apostles; 'Peter was kept in prison: but prayer was made without ceasing of the Church unto God for him.'

Hubert within the walls of the prison was prayed for by some of us outside those walls; but to say that he and we, during those anxious days, were sustained by prayer might be misleading. We felt ourselves to be sustained by Him to Whom we prayed; and we tried to cast our anxiety upon Him, knowing that He careth for us.

It was now within three days of the opening of Assize, and I had come up to town so as to be at hand until the trial was over.

The authorities had been kind in the matter of allowing me to see Hubert from time to time, and as for Mr Thurlow he had been the very incarnation of patience in listening over and over again to my oft-repeated tale.

I had determined, therefore, that I would not go down to his office again, nor weary him with any last words, or final instructions. And yet, behold! here was I, to my amazement, going once more to his office as fast as motor power

was allowed to take me, perhaps a little faster. Mr Thurlow had telephoned hurriedly for me.

Within half-an-hour I was at his office, and was shown at once into his private room. He rose from his chair alertly, and held my hand. 'She's come!' he exclaimed; and his eyes twinkled.

'Who's come?' I gasped.

'Why, who do you think? The young lady herself, Miss Vera Weston.'

'You don't mean it?' I said.

'Yes! I do; and if you had been a few minutes sooner, you would have found her here. You are surprised?' he added.

I confessed I was surprised; and then I told him of the letter I had received from Sir Thomas Weston absolutely forbidding any further communication with his daughter, and putting an end to the engagement.

'Ah! well!' said Mr Thurlow, 'he reckoned apparently without his daughter. Sir Thomas, you know, was a daring cavalry officer in his time; he was known throughout India as "Dare-Devil Tom." And now his own daughter dares her own father. Depend upon it she's a chip of the old block. But, whatever she is, she's a girl after my heart, though I myself am the most cautious man now living.'

All this seemed pleasant enough talk for Mr Thurlow, but I continued to stare blankly at him. 'Do you mean,' I interrupted, 'that she is determined to stick to Hubert, and has run away from home?'

'It looks very much like it,' he observed.

'And where is Miss Weston?' I anxiously asked.

'Oh, she's all right. She is now staying with old friends of her family; some people called Chichester, living in Lennox Gardens.'

'I know them,' I said; 'very nice people.'

'Yes!' he rejoined; 'Mrs Chichester accompanied her here.'

'That was kind of her,' I remarked; 'but tell me, what was her purpose in coming to you?'

'I see,' observed the lawyer, 'that you are more surprised by this visit than I was. The fact is, I had been somewhat prepared for it.'

II.

Mr Thurlow unlocked a safe in one corner of the room, and taking out a letter, unfolded it and laid it carefully on the table before me, but kept his outspread hand upon it.

'This is a very private letter,' he remarked; 'indeed, I may say that it is a very sacred letter.'

'It is addressed, as you see, to our client. It is the outpouring of a girl's true love for the man to whom she has given her whole heart. It is not many men who have the privilege of receiving such a letter. You and I may esteem it a privilege that we are allowed by Mr Carrington to read it.'

'Are you sure,' I asked, 'that he intended me to see it?'

'Quite sure,' Mr Thurlow replied. 'He sent for me yesterday, and placed the letter in my hands. Not, he assured me, because he wanted advice upon it; but because, being shut up in a cell, and feeling so utterly helpless to do anything himself, he wanted me and you also to do all we could to prevent Miss Weston from coming to town, or taking any step which might make a breach in her own family circle. However, she has given us no chance. She has followed up the letter promptly by arriving. But there's the letter; perhaps you will kindly peruse it.'

I required no second invitation. And this was the letter:

'MY OWN DARLING HUBERT,—When I read your letter from Liverpool I felt as mortally wounded as if I had received two death blows. One great wound was the discovery that you had not trusted my love for you sufficiently to enable you to make a confidante of me when you first got into that dreadful trouble. If only you had told me, I should have advised you to make a clean breast of everything without a moment's delay, and I should never have failed in my love and loyalty to you.

'The other great wound you gave me was your telling me that now you had got into such trouble, and were sinking so deep in the mire, you could not think of dragging me down with you, and that our engagement must cease.

'All this so paralysed my senses that I did not know how to answer you; and you also purposely gave me no clue as to where I could write to you.

'And then my father must needs come down upon me with all the weight of parental authority, saying that there must be no further communication between us. Well! I have had plenty of time for consideration, and I want now to make some amends for my long silence, and to thank you with all my heart, dear one, for all the tender and loving consideration which caused you to think more about my position than about your own.

'But oh! how mistaken you have been about me. I can't tell you how my heart has ached for you all the time you were in Canada.

'Oh! if only I had known that you were in exile on my account. I am fully resolved now what I ought to do, for I have thought and thought of you unceasingly, and of the shipwreck of my own life if you go out of it.

'Dearest Hubert, you are in a very great trouble and danger, and I could never be happy again if I failed you in such a crisis.

'I am acting on the supposition—though it is not a supposition, but the truth, is it not?—that you still love me as I love you: and so we cannot and must not be parted from each other.

'How I do wish that I could be with you

in your prison life to share it with you, and to cheer your solitude. But it won't be for long, for this horrible trial will soon come, and soon be over; and I want you to know that in it all, and at the end of it all, I am as much your own loving Vera as ever I was before, only more so. For I think when people suffer together and for each other, as you and I have, it endears them to each other. Isn't that your own feeling?

'I am coming to London at once, so as to be as near to you as I can; and also to arrange with the lawyers to let me give my own evidence in open court as to what I know of that night at Sussex Lodge. I shall be staying after to-morrow with Colonel and Mrs Chichester in Lennox Gardens. You are quite mistaken if you think that your Vera could feel any shame in taking her stand beside you. It will be a dear delight to me to testify my belief in you to the whole world. They are bound to see that it was all an accident, and I can show what led

up to it. Quite innocently I was partly to blame, and so how could I ever forgive myself if you suffered through any cowardice or backwardness on my part now?

'But, however this trial may end, whether they let you go free now, or not till a later period, I wish to be the very first to be clasped again in your dear arms when you are free again, and to feel that after all that has happened you still are mine.

'I cannot contemplate any other issue; but as the occasion of my writing this letter to you is such a solemn one, I would like you to know that if you are altogether taken away from me in this life, the one thing I shall pray for and look forward to is the meeting you again in the better country, and in the presence of Him Who judges righteously.

'I am ever, my darling, what you once called me,—Your own true
VERA.'

(Continued on page 582.)

MID-ASIA'S DEAD SEA.

By N. TOURNEUR.

MID-ASIA holds many secrets and mysteries, and her 'Dead Sea' is one of them. Few of us but know of Palestine's expanse of brine and desolation, with which many British troops became familiar when driving out the Turks. But only one or two Westerners have set eyes on the barren waters of Lake Issikul, that lies surrounded by vast mountain ranges in 'Old' Moghulistan. This stretch of very briny waters, that is some 120 miles long and 40 miles at its widest, has occupied its valley, 5300 feet above the sea level, since the prehistoric ages when Mid-Asia was the cradle of the Old World. And tradition there gives it an origin much the same as that connected with the Dead Sea in Palestine.

Old Moghulistan is to-day the land of the wandering Kirghizes and their flocks of cattle, sheep, and goats. But under its soil, and along its mountain-sides, are the remains of great and once prosperous cities, many of which were flourishing until put to the sword and destroyed by the dread Tartars in the thirteenth century. Here, too, lies Karakorum, their lost capital with its buried treasures.

In ages farther back, where Issikul laps its shores, there lay a great city and some small towns. Then came deep rumblings beneath the valley, the earth rocked, and the nearby mountains shook. Fires burst from volcanic depths and consumed the city and towns, and were followed by briny waters gushing from underground.

To-day this lake of very salt water is known among the natives of Western Turkestan as Tuzkul, the salt lake, as well as Issikul, the hot

lake, for not only are its waters very brackish, but owing to the hot springs supplying it the surface never freezes in winter—notwithstanding the severe winter in these regions, which is almost like that of Alaska.

The lake is very deep, and no islands are now found on it, although in the fourteenth century one existed, to which Timur Khan, greatest and most terrible of the Mongol sovereigns, who changed the history of the Old World, banished the Tartar chiefs of Asia Minor and their clans. In consequence of numerous springs of boiling chemical water issuing from the bottom of Issikul the temperature of its waters reaches between eighty-five and ninety-five degrees Fahrenheit. The bottom of the lake appears to contain a great quantity of pure iron ore, which is cast up on the shores after one of the frequent tempests, and out of which the tribesmen manufacture iron. The scimitars and daggers of Samarkand, so famous throughout Mid-Asia for the strength of their material and the keenness of their edge, are fashioned out of the flotsam ore of Issikul.

Like those of the Dead Sea of Palestine its salty shores are sterile, but have banks of bituminous deposits. In these, it has been stated, are embedded the remains of beast and bird of far-off centuries. But Issikul is no new discovery, for it is mentioned in the Chinese annals as early as the seventh century. All the geological evidence points out that here, in Old Moghulistan, a cataclysm occurred which was exactly like that which destroyed the cities of Sodom and Gomorrah.

THE WHITE HEALER.

PART II.

III.

'I DON'T know why it is, Mr Faring,' said Iris Temple, 'but I feel oddly depressed to-night—uneasy—just a little frightened.'

'Frightened?'

'Yes. That sounds rather absurd, doesn't it?'

'It doesn't seem quite like you, Miss Temple.'

'I suppose not. Still, there it is, you know. I have a sort of presentiment that something is going to happen. Something terrible——' She broke off, shivering slightly.

Dick Faring nodded, regarding her with a thoughtful air. They were standing in the lee of the deck-house, sheltered from the strong wind which was blowing across the lagoon. His face, in the pale moonlight streaming down between fast-travelling clouds, had a grave, troubled look.

'I think I understand,' he said gently. 'You are feeling the strain of this prolonged search, and are anxious as to the result. It's the uncertainty that is worrying you—getting on your nerves a bit. That is very natural, of course, since it means so much to you. But the suspense will soon be over. I feel sure that we are on the right track now; and if The White Healer turns out to be your brother, well and good. If not—and it's an even chance, after all—at least you will have the satisfaction of knowing that you've done your best. No one can do more.'

She turned to him with a grateful smile. 'Perhaps you are right,' she said. 'It has been an anxious time, and no doubt I am a little overwrought. I will try not to think about it.'

And he took it upon himself to help her, with quite an astonishing degree of success.

Perhaps, after all, it was not so very astonishing either, the circumstances being duly taken into consideration. Here were two young people, of opposite sex and attractive personality, thrown together in the daily intercourse of ship-board life for a matter of some three weeks. Add to that a common interest of no ordinary kind, with a strong feeling of sympathy on the one side, and of gratitude on the other; and it is little to be wondered at if a warm friendship springs up between them—or something even deeper, if it comes to that. And the latter, though possibly neither of them was as yet fully aware of it, is precisely what had happened in this case.

But amongst other things Dick Faring had helped Iris Temple to forget was the passage of time. She realised suddenly that they must have been standing there for the better part of

an hour. She glanced at her wrist-watch hastily, and a little gasp of dismay broke from her.

'Dear me!' she cried. 'I had no idea it was so late! I must go down now, Mr Faring. Jane will be thinking all sorts—I mean wondering where I am.'

'Why should she? A turn on deck——'

'Yes'—smiling. 'But then, you see, at dinner I happened to make some very pointed remarks about the—the chilliness of the wind.'

'And I have kept you out in it all this time! I am sorry.'

'Oh, well——' For a second their glances met, and a faint blush stole into her cheeks. 'It doesn't really matter. I expect she has forgotten.'

'Let us hope so,' he said cheerfully.

Dick walked with her to the head of the companion-way, and there bade her good-night. For some reason or other, which he could not very well have explained, he did not go down with her into the saloon, though there was nothing particular to keep him on deck. Possibly a due regard for Miss Jane Harvey's speculative habit of mind may have had something to do with it.

As he stood with one hand resting upon the frame-work of the hatch, deep in thought, a thick black shadow fell across the deck by his side. He started round, for a moment overcome by a quite absurd feeling of panic. Then, in a rather shamefaced way, he exclaimed: 'Hullo, captain! It's you, is it?'

Captain Jackson laughed heartily—perhaps even a trifle boisterously. 'Why, yes!' he said. 'Who did you think it was, Mr Faring?'

'Dashed if I know,' was the somewhat vague reply. 'I'm a bit jumpy to-night—on edge, as it were. I think something of Miss Temple's uneasiness must have communicated itself to me.'

'Oh——?' The captain stared at him.

Faring nodded. 'This business has got a little on her nerves,' he said.

'But what is there for her to be nervous about?'

'Nothing. That is—nothing definite. She just has a feeling—a presentiment, you know—that something unpleasant is going to happen.'

The two men looked at each other steadily.

'Odd that,' muttered the captain. He moved away from the hatch, drawing Faring with him by a glance. After they had taken a few steps along the deck, he said: 'To tell you the truth, Mr Faring, I've not felt quite comfortable myself since we got in here. These islands have a pretty bad reputation generally, and if there was to be trouble of any kind—well——'

'Trouble?' Faring put in sharply.

'The possibility is never very remote where these head-hunting savages are concerned. They're a treacherous lot, and devilish awkward customers to deal with, as more than one white man I could name has found to his cost. Personally, I don't mind taking the risk, of course. But—we've got two women aboard, you know.'

'I know, captain. That makes what you suggest a very terrible thing to contemplate. I wish I could have persuaded Miss Temple to let me undertake this quest alone. But she simply wouldn't hear of it, and—in the circumstances—what was I to do!'

'Quite so. I can understand how you were placed, Mr Faring, and since they're here with us we must make the best of it.'

'But do you think there is likely to be any trouble with the natives?'

Captain Jackson was silent for a few moments. Then—'Between ourselves,' he said, 'I think it would be wise to clear out of this at day-break. I didn't like the look of that old chief much. There was something shifty about his manner, I thought. The way he kept eyeing us, as if he was measuring up our strength, had a peculiar significance to my mind. Then, his sending off those vegetables and what not—'

'Doesn't that seem to indicate a friendly attitude towards us?'

'On the face of it, perhaps. But I noticed that they didn't arrive until close upon sundown, and that the matter of payment was treated with an indifference, amounting almost to contempt, very unusual on such occasions. Further, the total absence of any lights or movement ashore is in itself somewhat remarkable. As I was saying to Mr Carter, only half-an-hour ago, the thing isn't natural. These islands are visited by white men only once in a blue moon, and— Eh? What the devil—'

There was a sudden loud clamour of voices forward, and the sound of bare feet pattering along the deck. A moment later, one of the Kanakas rushed up to them in a state of apparently uncontrollable excitement. 'My word, cap'en—you come quick!' he gasped. 'Black fella he here one time catch 'm this fella ship. We plenty fright—'

'Hell and thunder!' roared Captain Jackson, striding over to the rail.

Faring sprang after him, and together they peered shorewards with anxious, straining eyes. The moon was hidden behind a mass of dark clouds, but by its diffused light they could make out dimly the line of the beach, and what at first sight appeared to be a broad curved shadow advancing slowly across the water towards them. In reality it was a vast fleet of canoes, closing in upon them from three sides. The rapid

swish of the paddles came to them like a harsh whisper out of the night, and here and there a spear-blade flashed ominously.

'Hundreds of the beggars,' groaned the captain. 'We're up against it now. There's not a moment to lose—'

He turned quickly, almost colliding with a man in a white duck suit, who had raced aft from the forward part of the ship.

'My God, sir!' cried the latter. 'D'you think the brutes mean to attack us?'

'Not much doubt about that, Mr Carter,' Captain Jackson answered grimly. 'Five minutes or so'll see hell let loose aboard. Get up the spare rifles, and arm the Kanakas—as far as they'll go. Look slippy, man!' The mate spun round, and dived down the companionway. Captain Jackson glanced at the group of dusky figures huddled round the main-mast. 'You fella Kanaka fight plenty dam' hard! Savvee?' He turned to Faring. 'We'll form a ring round the hatch. That'll give us the width of the deck, and we'll be able to keep together. We're too few to prevent them from getting aboard. Come along, Mr Faring!'

IV.

What happened immediately afterwards Faring could never very clearly remember. He had a hazy recollection of following Captain Jackson down into the saloon; of seeing Iris Temple's face, white and distressed-looking in the light from the hanging oil-lamp; and of exchanging a few hurried words with her which expressed far less than the unspoken message in their eyes. Then he was up again on the moonlit deck, rifle in hand, one of the grimly silent figures standing in a ring about the hatch, waiting for the moment that should bring the first of their savage assailants upon them.

It came suddenly, heralded by a discordant yell, as a score or more of frizzy heads bobbed up on either side of them, and dark lithe bodies swung themselves over the bulwarks on to the deck.

'Now!' Captain Jackson shouted.

The rifles cracked, and spat venomously. Unaccustomed as the Kanakas were to fire-arms, some of the bullets went wide. Nevertheless, at that short range most of them found a billet, and for a moment stopped the rush. But it was only for a moment. Other naked figures, brandishing spears and clubs, leaped on board, followed by others, until it seemed that the little band of defenders must be overwhelmed by sheer weight of numbers.

It was then that Faring, who had emptied the magazine of his rifle, and was about to use the weapon as a club, felt something tapping against the calf of his leg. Glancing down quickly, he saw Iris Temple crouching under the hatch, with two automatic pistols in her hands, and a small box of cartridges on the step

before her. 'Iris!' he cried. 'What are you doing here? Go back, dear—'

She shook her head, smiling at him confidently. 'Take this,' she said, giving him one of the pistols, 'and when it is empty you can have the other while I reload. There are twenty-four—that is—twenty-two cartridges. You understand?'

And Faring, who understood only too well, bowed his head in assent.

There was, in truth, no time for any further words between them. The savages were closing in, and for the most part the conflict had resolved itself into a hand-to-hand struggle, with the odds rapidly mounting against the already diminished few. Faring, Captain Jackson, and Mr Carter still survived, the two officers fighting desperately with clubbed rifles. But six of the Kanakas had fallen, killed or seriously wounded by thrusts from the short keen-bladed spears, and in all human probability the end could not be very far off.

Then, when it seemed that nothing on earth could save them, when Faring had deliberately fired his twenty-second shot, and there only remained the last hard duty to perform, a voice rang out through the night, loud and clear above the din of battle, uttering a stern command in the Boruan tongue. 'Hold! Hold, I say! Who wars against the white man wars against me!'

The effect was magical, instantaneous. As if drawn by some invisible force, the mass of the invaders fell back slowly, with awed faces and fear-dilated eyes, leaving a wide space between themselves and the remnant of those whom but a moment before they had been seeking to destroy. Into this space stepped a tall gray-robed figure, wearing a hood which partially concealed its face. A movement swept through the ranks of cringing savages like that of wind playing over corn. The newcomer flung out his arm in a superb gesture of authority. 'Go!' he commanded. 'Return to Ka-Ka, the chief, and say that for this I will deal with him presently. You hear my words?'

'Ai, Ai!' wailed a hundred voices.

'Then go quickly, lest an evil thing befall you!'

V.

They went with almost incredible swiftness, vanishing over the side like leaves caught up in a gale. Within the space of three minutes, there were left on the deck only the dead and the wounded, the six Kanakas, Captain Jackson, Faring, Mr Carter, and their mysterious rescuer.

'Thank heaven, I was in time,' came a barely audible murmur in English from beneath the cowl-like hood.

Captain Jackson stepped forward, still clutching his rifle by the barrel in one hand, and with

the other outstretched. 'We owe our lives—and the lives of the two women on board—to you, sir,' he said.

The man pushed back the hood with a startled gesture, the moonlight falling clean upon his lean, bearded, strangely white-looking face. 'Good God!' he exclaimed. 'There are women—white women—on board!'

Then, before Captain Jackson could frame an answer, Iris Temple rushed out from the shelter of the hatch, her lips parted in a gasp of breathless astonishment, and her eyes shining with a glad light of recognition. 'Arnold!' she cried, going towards him.

He shrank back, holding out his hands as if to ward her off. 'No—Iris—you mustn't touch me,' he said in a hoarse whisper. 'You do not know—'

The girl halted, staring at him in a dumb-founded way. 'But, Arnold,' she protested, with a ring of dismay in her voice, 'what is this? I have searched for you through two long years, and now—I want to take you back with me. I want you to come home with me, dear.'

'No, no! I cannot come. You don't understand—'

'Yes, I do,' she interposed quickly. 'You are thinking of what happened long ago. But you need have no fear, Arnold. The man did not die after all.'

'I know.'

'Yes?' She looked at him wonderingly, a puzzled frown creasing her brow. 'Then, if you knew, why did you not return!'

'Because the knowledge came to me too late—as you have come, Iris.'

'Too late!' she echoed.

'Even so,' he answered gravely. 'There can be no return for me. My home is here amongst these wild untutored savages, children of the outer darkness, to whom, for the little time that remains to me, such skill as I have may be of some service. And that time is very short now.'

'Arnold! what are you saying? What do you mean?'

Suddenly he bent towards her, the blue gleam of his eyes contrasting sharply with the dead whiteness of his face. 'Iris, look—look!' he cried. 'Don't you see? Oh, my dear, can't you see that I'—his voice sank to a tone of hopeless, absolute finality—'I am that accursed thing, *a leper!*'

For the space of perhaps five seconds there was an intense, heart-gripping silence. Then a pitiful little cry broke from Iris Temple.

Faring caught her in his arms as she fell.

VI.

The schooner lay hove-to off the pinnacled mass of rock rising like a fantastic dream-castle from the sea, her bow dipping gently in the

heavy ground-swell. A couple of miles southward a faint purple blur marked the position of Ka-Ka's island, and to the north a streak of white showed where the breakers foamed against the encircling barrier-reef of a distant atoll. Westward, glittering under the tropical sun, stretched the wide sapphire-blue waters of the Pacific.

Dick Faring and Iris were standing by the accommodation-ladder with Arnold Temple, to whom they were bidding farewell ere he descended to the waiting canoe. It was a sad leave-taking; yet not without some measure of resignation and hopefulness, so far as Iris was concerned. They had talked the matter over long and earnestly the night before, and Temple had convinced his sister and Faring that any change in his present mode of living would be undesirable, if not impossible.

'It is too late to think of that now,' he had said. 'The terrible disease with which I am afflicted is advanced to a stage beyond all hope of cure, or of amelioration. I am reconciled to that, and content to spend the short remainder of my life in this beautiful island on which I have made my home. There is nowhere else I could go where I should be free to live as I do here. No, no! I have my flowers, books, everything that I want; and am even able to be of some small service to those around me. That, for such as I, is a happiness not to be relinquished easily. I could never find it again elsewhere.'

And when Iris had spoken of her desire to be with him, he had answered, with a shake of his head, 'You mustn't think of that, dear. It is quite impossible. Apart from the sacrifice involved—a sacrifice no brother would allow a sister to make—the risk of infection is too great.'

'Yet others take it. Those men of yours——'

'Ah, that is different! The natives on these islands appear to be immune from the disease. I have never known a case during the years I have been here. But for you, my dear, putting all other considerations aside, it is utterly out of the question.'

'Then I—I am never to see you again, Arnold?'

'Well,—and a smile of rare tenderness had lighted up the shrunken face—'as to that, now, perhaps it might be managed—occasionally. Let us suppose that you found it convenient to reside for a time in Borua——' He broke off, with a quick, involuntary glance at Faring. 'Then you might take a little cruise in this direction now and again, and we should be able to see something of one another. Eh?'

'Oh yes! And I could bring you things——'

'Um—perhaps——'

'Of course I shall, Arnold!'

'Provided you don't—er—give anything away, you know.—What do you think, Mr Faring?'

'I think the plan is an excellent one,' came the prompt and very hearty reply.

And so it had been arranged.

Now, therefore, that the moment of parting was come, Iris found herself able to face it more bravely than she could otherwise have done. It was very quickly over.

Temple turned to Faring. 'Good-bye, Mr Faring,' he said. 'I am glad to have known you. Our meeting was a rather strange one, but——'

'A very lucky one for us, Mr Temple. If you hadn't come just when you did——'

'I know. It was indeed fortunate that the wind had prevented my leaving the island. Otherwise—but we must not think of that!' And in a lowered voice: 'You will look after my sister, won't you?'

'Trust me for that,' said Faring, returning steadily the searching gaze bent upon him.

'Ah, yes—I do.' Then, to Iris, 'I leave you in Mr Faring's care, dear. It has been a very great happiness to me to see you again after all these years, and to know that your loving faith in me has never wavered. God bless you for that, Iris, and—good-bye, my dear, good-bye.'

'Good-bye—for the present, Arnold,' she responded, smiling at him bravely through a mist of tears.

They watched the canoe glide shoreward over the heaving water, until it vanished through a narrow opening in the coral-reef. Shortly afterwards, a small gray figure appeared on a rocky ledge running obliquely across the face of the cliff, and stood there waving its hand to them.

It seemed to be giving them to one another.

THE END.

WOODLAND ECHOES.

(Translated from Geibel.)

DEAR Love sat as a nightingale,
Beside the rose—and sang,
And hark! the sweetest melody
Throughout the woodland rang.

And as he sang, a coronal
Of fragrance crowned the air,
And softly whispered rustling leaves,
As zephyrs floated there.

The brooks were silent—from the height,
Low murmuring they fell,
The deer stood still as in a dream,
And listened to the spell.

And clear and ever clearer flowed
The sunbeam's glowing stream,
Whilst flowers, wood, and glen rejoiced
In gold and ruddy gleam.

I also listened to the spell
As soft I passed along . . .
Ah! what within my heart remains
Is but an echo's song.

EDITH C. ADAMS.

Chambers's Journal

SEVENTH SERIES

A ROMANCE OF THE REEL.

By N. M. GUNN.

PART I.

I.

THAT there could be anything uncanny about angling had never before touched the mind of Davie Dunbar, though half a century recorded his devotion to the sport—and the art. Never before had excitement, whipped by exasperation, been held in leash by the fearsome. For it is not that the long black pool in the still hush of a late September evening contained many salmon; it was possessed by them, as, of old, bodies were possessed by spirits. From filmy copper to purest silver they launched themselves into the air, to fall again with resounding splash, in front of him, down the long vista of the pool, above him, by his very waders. And yet to his thunder-and-lightning—no slightest offer.

Covering the leaping fish became a game in excitement that wore thin to an exasperation that quivered—because in this game hope cannot die. His nerves renewed their youth as so many live wires stringing his body to an awful expectancy . . . and then *splash!* behind him, and his heart would be in his mouth. Uncanny! . . . maddening!

Yet Davie Dunbar was normally a mild retiring little man, and his gray eyes looked straightly and simply at you, notwithstanding that most of his life had been spent along the tortuous alley-ways of a dealer in curios and antiques. But then his little shop in an Edinburgh side-street had made him no fortune. For alas! he not only knew old beautiful things when he saw them—he also loved them; so that, even blindfolded, the cool, soft, almost velvety touch of old silver to him spelt a caress unmistakable. Indeed, were it not for old Jamie Forsyth, at once his managing director, accountant, salesman and caretaker, it is at least doubtful whether there would ever have been any fishing expeditions at all. Not but that these expeditions were of the most modest, and for ever winding along the dubious ways of 'free fishing'—except for the rare red-letter windfall that landed a day or two on 'private water.' Ah, private water—how it threaded its dark mesmeric way through his dreams! Some day

to sell out, to retire, to live where the autumn of his days would fall softly and coloured and exquisitely as September leaves on a dark deep-flowing pool—of private water!

And then suddenly he had had this windfall—a few days' salmon fishing on a northern river; a spring river, to be sure, yet with the wise, unfathomable autumn fish there too. The greatest windfall he had ever experienced. The real thing. The dream. Yet here the waning of the first day, and in his basket not a scale; and round him, splashing in silver mockery, a dream, nay, a nightmare of—of the brutes!

He reeled in and examined his thunder-and-lightning. 'Far too dark,' he muttered, though he had but just changed from a dunkeld. 'Ah—this silver doctor—two sizes too big—but—it might mesmerise them—it might exacerbate them!' and his lips shut firmly. He changed the fly accordingly, and then, as he was preparing to get his line out again, his eye ran naturally along the pool, to encounter what it had not encountered that day—a fish no more than breaking the surface in a fine business-like swirl.

Excitement was up again, pure and throbbing, but he strove deliberately to keep it in check. He methodically felt for his gaff. He took a steady glance about him, up to the still sombre pine wood, which persisted so involuntarily in reminding him of that old picture of his, to the opposite bank, down the river. He had the lonely scene to himself.

He fished steadily down, hoping to cover the spot naturally, cunningly. But now the water rose gradually about his waders at each short step. A fear began to grip at him that he might not be able to cover the spot. The floor sloped. The water continued to rise half-inch by half-inch; it was lapping round his waist, a lightness was coming to his feet, the black flood was beginning to suck at his body; once as he half-turned he experienced a very insecure, bobbing sensation, as of a cork. And then Davie Dunbar paused, knowing he had gone as far as he should, as he durst.

He was casting with so much line now that

it caught the water behind him. He tried to 'shoot' a few feet. Yet he was still short, though it could not be by more than a couple of yards. Only, now the off-swirl caught his fly so readily and whisked it away, he got no chance. He began to blame his luck, and the more he blamed the more certain he became that if only he could get his fly over that particular spot in front of the gray stone in the bank-face opposite, he would—he would strike! He would feel that sudden heavy resistance, that momentary incredible pause on the part of man and fish, and then—the music of the reel! He licked his lips. Perhaps he might venture a step or two, very cautiously, yet. He was getting more used to the depth, and for all he knew it might get no deeper. If only he could see bottom! Putting all his weight on his right foot, he began to feel carefully, inch by inch, with his left. But he had to admit he was going deeper. But surely one step more—two steps. . . . Things were becoming insecure. He paled. His eyes rounded a little. He felt his body sway. This was madness—but then he could always return in the attitude he was now in, little by little, side on. He would try him once more.

He reeled in till he got his line under control. Yard by yard he let it out at each cast. Yard by yard the weight of the jerk back and the throw forward was compensated by the swaying body. The line reached the maximum length he could wield. With a final effort, every muscle tense, he sent it shooting for the gray stone. The fly landed, there was a swirl, the fly was stuck, the line taut. . . . Emotion became tumultuous. With left foot he instinctively 'dug in' against the extra weight in this dangerous game of balances. With such small margins the digging in was done the least trifle too impulsively, too heavily. The small round stone under the ball of the left foot slipped, slithered. He pulled himself up, stumbled, thrashed the water, felt himself going. One lucid moment of agonised amazement, and panic rushed the brain.

A mad fight for a moment or so, with an all-engulfing, choking, deadly enemy. He cried out, thin yell on yell, cried and fought—and knew he was done for. He had long known the danger of waders, where the air trapped in the legs assist, in the case of a sudden overturning, to keep the feet up and the head down. His head was now under. The water was choking his throat in great suffocating gulps. He fought to the surface madly, but it was the hectic madness that precedes final exhaustion. Already his brain was giving way, side-slipping into phantasm—for lo! in front of him was not that his picture of the sombre pine wood, and flying from it, hair streaming, the maiden on horseback; that old old picture he had picked up in a sale lot, and that had

interested him because of its somewhat unusual medieval symbolism? Giving way . . . down . . . down . . . and the last flicker dies in a strange comforting quiescence, touched vaguely by a grotesque, fading sensation that he had a salmon on, taking him down . . . down.

II.

If death be a pale shadowy dream of earthly things, then he is dead. This body of his has at last no substance, wavers uncertain as a smoke wisp in a calm. There, apart from him a little, is his own hand knotted on the cork handle of a sixteen-foot rod, and by the rod, silvery and gleaming, the most exquisite of all shapes in the world, of all desires the most beautiful.

A legend this of the land under the waves, where the salmon is all-knowing and all-wise. And even that dark pool which seems to flow below him, this bank, that sombre wood, all this phantasmagoric dry land which wavers so uncertainly—even that dark shadow of something like a centaur coming yonder, two shadows. . . . But all gets blurred, blurred—vanishes as frail smoke.

Out of black nothingness things waver back again. The face of the maid in the picture takes on a glowing, frightful light. The glowing light is sunlight—yet no, it is spirit, it is a burning from within. And she is crouching forward, fleeing the wood. Fear . . . terror. . . . He struggles to dismiss the picture; shuts tight his eyes. But they open in spite of him, and lo! overhead is a great unsearchable whiteness, palely luminous, stretching into remote infinitudes of shadow. Nearer, nearer, it comes; nearer, till his eyes grow dazed, till his eyeballs get oppressed by the intolerable closeness of the focusing. . . . And in a sudden queer amazement, he, Davie Dunbar, realises he is staring at the white-washed ceiling of a real room. Spasmodically his fingers clutch at bed-sheets; his head rolls on a pillow; a dim night-light is burning on a table. . . . Verily, he is alive.

It was enough to go on with. He let himself slip down again into exquisite unconsciousness. He would take things easily. And presently when he returned, he decidedly felt calmer, more real. An utter stillness was about him as his eyes opened and encountered the ceiling. Then suddenly a shadow detached itself from the bed-head and stood over him. It was his landlady, smiling gently.

'You'll be feeling better now?' she asked softly.

'Yes.' He was feeling perfectly all right, though queerly enough his voice was no more than a whisper.

'I have been waiting for you to waken. Now I'll be getting you something to drink,

and then you'll sleep. I won't be a moment!' and she was gone.

She returned with a steaming bowl.

'Tell me,' he whispered, 'how—how——'

'Not a word till you take this and have a long sleep. 'Tis what the doctor ordered. And oh! it's me that's glad to see you as you are. I've been waiting and watching. But now you are well again, and in a day or two you will be fine.' Anxiety and motherliness and relief mingled in word and action. She tenderly lifted his head up, held the bowl to his lips.

'I am so sorry,' he said in a little while, 'to have kept you. Please—I am all right now, and will sleep.'

III.

Daylight was glowing in the yellow blind of the little window in his bedroom when Davie Dunbar awoke to a consciousness of an outside door opening and a half-subdued breezy voice in the passage-way.

'Well, Mrs Fraser, how's our patient this morning?'

'Not awake yet, doctor.'

'Splendid! You'll find he'll be all right—but shaky for a few days, and no more fishing this week.—Ah, that you, Kennie?'

The footsteps receded, but not far enough to render talk inaudible. There was a little laughter.

'Has he been talking, Mrs. Fraser?'

'No, doctor, no; I wouldn't let him. He was going to——'

'I'm sure he was! It must be a bit of a puzzle to him. It was the nearest thing I ever struck—and the pluckiest—ready-witted.'

'From what I've heard, it was surely,' came Kennie's soft Gaelic voice. 'She has enough pluck for many a one. I was saying to the wife just that.'

'The old fellow was game, too. Stuck to that rod and fish of his like grim death. If he hadn't stuck to the rod, of course, it would have been all up.' The doctor gave a chuckle. 'She got hold of the point of the rod, for the current, you see, had sucked him in and across a bit, so that the point walloped the bank. She got hold of it and hauled him in, waders and all, hand over fist. Then she dragged him on to the bank, turned him over on his stomach, and squeezed the water out of him.'

'She had that ambulance during the war,' said Mrs Fraser. 'It came in handy for once.'

The doctor chuckled again. 'But the old chap wouldn't give up the rod—not he. And there at the end of the line, with an odd screech now and then from the reel, was the fish, playing himself beautifully. Eh! I've heard of a man playing a fish when not quite in his sober senses, but never yet of a dead man doing the trick!'

'It wasn't canny nearly,' said Kennie.

'She couldn't get his fingers off the butt, tear at them as she might; so she just pumped the water out of him and left his hands alone. When she could do no more and was coming away for me 't seems she had a sudden queer feeling that—that the fish might pull him in, or something, eh?'

'Just that,' said Kennie.

'Why, now, you don't think it would, really, Kennie?'

'Whoever would be thinking that?' asked Kennie, laughing softly.

'You're a queer lot, all the same, and I do believe that in this sort of thing the Big House and the Black House are but and ben!'

'Nonsense, doctor! And you were saying she landed the fish. . . .'

'Yes, she landed the fish. At least, she stuck the rod up on end and began to reel in. Instead of sulking, the fish, as it happened, had played himself out. No doubt he was mad at the gut being all round his fins; then there was no strain on him after the first rush or two, so that he did not think of leaving his own ground, but thrashed about, trying to break with his tail what there was no longer any strain on.'

'I can see it happening,' said Kennie.

'But the really amazing thing was this. Of course, if we examined the ground we'd probably find an odd little hole in it, or maybe the cleft edge of a bit of rock sticking up, or something like that. Anyway, she says that when she let go the rod to get the gaff, the rod remained standing up, with his hand holding it there!'

'You're not telling me that?'

'I thought that would get you! And it's a fact. Determined, wasn't he, to play his own fish? It must have been a sight for the gods! He deserved to get the fish right enough. In fact, she felt that he had to get the fish. Must get it now. That feeling was stronger even than the commonsense which told her she ought to be rushing for help. And she got him, too. Gaffed him clean. He remained lying close in, exhausted, his white mouth opening and shutting, when she stole on him.'

'It was well done,' said Kennie.

'Wasn't it?' The doctor's tone, for all its half banter, held an undertone of something like enthusiasm. 'That twisted drowned body holding on grimly, lank wisps of gray hair, gaping eyes—it wasn't a bonny sight for a young woman.'

'No, indeed!' said Mrs Fraser. 'No, no!'

'So she laid the fish beside him, leapt on her pony again, and came fast as the beast could carry her.'

'I am wondering,' said Kennie, 'what he would be thinking himself if he had woken

up and found the rod and the fish, and no one beside him at all.'

The doctor chuckled. 'I wonder! I bet, Kennie, you'd have been looking about you for signs of the Last Day.'

'Indeed, now, and there's no saying what one would be looking for at all.'

'Not for Auld Nick, because it wasn't poaching, Kennie; he had permission from the factor in Edinburgh.'

'You will have your joke, doctor!'

'Ah, well! Have a look, Mrs Fraser, to see if he's awake yet. I must be getting on.'

And as Davie Dunbar heard the footsteps coming to his door, he closed his eyes. The door opened quietly, the footsteps came softly to his bedside. He opened his eyes.

'Ah, you are wakening, Mr Dunbar! How are you feeling now?' Her voice was all the tenderest solicitude.

'Very well, thank you,' and he smiled.

'Now, isn't that fine! And here's the doctor himself come to see you.'

The doctor stumped into the room. He eyed his patient shrewdly for a moment. 'What's this I hear you have been attempting at the Dragon Pool, sir, eh?' He stooped and gently caught the pulse in a wrist.

'Oh—I'm afraid—' stammered Davie self-consciously.

'Afraid! I hear that it did not look at all as if you were afraid. I thought such new-fangled ways of catching fish were peculiar to these parts, where they catch them every way—but quite unknown about the Water of Leith!'

Davie smiled.

The doctor nodded. 'Good! You're all

right. Bring in the real medicine, will you, Mrs Fraser, please?'

'Wh-what medicine—'

But her husband was by the door. 'Ach, woman!' cut in his voice, and in the same instant his footsteps were stamping to the kitchen.

The doctor chuckled aloud. 'When it comes to a matter of intuitive intelligence, Mr Dunbar, I am sorry to say that we of the Lowlands haven't a look in. Wait!'

Kennie reappeared, a couple of fingers at the gills supporting the weight of a most beautifully-proportioned eighteen-pounder.

And Davie's smile gradually faded in a strange gleaming increase of light. Another moment, and he was struggling valiantly to get up on one elbow, to stretch out a hand. . . . He collapsed uncertainly.

'Ay, better wait a while! You'll do it before another day is gone. Mr Fraser here says that it is a phenomenally fine specimen for this time of the year.'

'The doctor—' began Kennie, when Davie, gasping mildly, interrupted him in all seriousness: 'Yes, a silver doctor,' he said.

There was an amazed hush for a moment, then the doctor's laugh rang out. 'How's that, Kennie?'

'That's a good one, and no mistake,' replied Kennie.

And Davie, grasping their meaning, blushed.

'Now, you must be wondering how on earth all this happened to you. So I'll leave Mrs Fraser to explain. Between fish and the girls, you have most certainly created history in Glenuel. I'll look in to see you before the night is done.'

(Continued on page 603.)

THE PUZZLE OF THE SWALLOWS.

By MILDRED PERRIN.

THERE is always a certain pleasure in detecting in an occasional error the man who knows everything, and when we find the great Samuel Johnson asserting, with his usual *ex cathedra* manner, that swallows spend the winter under water, we smile our smile of superiority and feel profoundly comfortable. How absurd the words of the great man seem to us now! 'Swallows,' he says, 'certainly sleep all the winter. A number of them conglobulate together, by flying round and round, and then all in a heap throw themselves under water and lie in the bed of a river.' Johnson pronounced this choice bit of natural history in 1768, and he was really only quoting the theory generally accepted at the time by professed naturalists; his error, a serious one, lay in stating it as a proved fact.

The strange notion that swallows hibernated under water prevailed in England for close on a century and a half at least, for it is mentioned in the *Philosophical Transactions and Journal of the Learned* for 1666 and 1667, and crops up at intervals until the close of the eighteenth century.

The annual disappearance of swallows and other migrant birds in the autumn and their reappearance in the spring must have set men speculating from earliest times, wherever the ways of birds were observed, and the ancients seem to have had an inkling of the truth. To the majority of seventeenth and eighteenth-century naturalists, however, the idea that small frail-looking birds like swallows could travel over land and sea to distant countries seemed far more wonderful than that they should hibernate like butterflies and squirrels.

They had observed, too, that in the autumn swallows were wont to collect in numbers near water, and in the evening to disappear among the osier beds, their roosting-ground. The next morning there were none to be seen; hence it was concluded that they had retired to their damp winter-quarters. Some few observers believed in migration, and some thought that both hibernation and migration were practised. For example, in *Nature Displayed*, a work which appeared originally in French, and was translated into English and ran through several editions during the middle years of the eighteenth century, we read the following: 'While some cross the sea, others, in most northern countries, continue in Europe, and conceal themselves in caverns of the Earth, riveted to one another with their Claws and Bills. They flock to places unfrequented by Man and even bury themselves in the Water. The precaution they take to lubricate their Feathers with their own Oil, and to roll themselves up like a Ball, their Head within, and their Back without, preserves them in the Water, and even under the Ice.' This description certainly shows a good deal of imagination, as, of course, no one had ever seen a balled-up swallow.

Gilbert White, writing in the closing years of the eighteenth century, was greatly puzzled by the problem of migration. He could laugh at the Swedish naturalist who, in his *Flora*, 'talks as familiarly of the swallows going under water in the beginning of September, as he would of his poultry going to roost a little before sunset,' but he could not give up the hibernation theory altogether. In one of his letters he says: 'I acquiesce entirely in your opinion—that, although most of the swallow kind may migrate, yet some do stay behind and hide with us during the winter.' He arrived at this conclusion through observing that a few martins were often to be seen on the wing on a mild day in November. It is now generally thought that such loiterers are birds which were either too young or too weakly to join in the autumn migration—but this is one of those matters connected with natural history which are not yet finally proved.

White was honest enough to declare that no case of hibernation had ever been authenticated, though, like other observers, he had sometimes come across birds rendered torpid by a sudden cold spell. Some naturalists, however, gave credence to all kinds of absurd stories about birds remaining torpid for great lengths of time, and some of these stories were current until quite recent times. For example, in a book published in 1890, the writer, a F.R.S., although not committing himself personally to a belief in hibernation, gives several instances of swallows being found torpid 'which have come to our knowledge, on the most respectable authority.'

Some of the instances are likely enough, but among them is this gem: 'Again, about half a dozen swallows were found a few years ago, in a torpid state, in the trunk of a hollow tree, by a countryman, who brought them to a respectable person, by whom they were deposited in a desk, where they remained forgotten till the following spring, when one morning, on hearing a noise, he opened the desk, and found one of them fluttering about; the others also began to show signs of life, and, upon being placed out of doors in the sun, speedily arranged their plumage, took wing, and disappeared.'

We cannot imagine any present-day naturalist having the hardihood to relate stories of this kind as having come to him 'on the most respectable authority,' but it is doubtful whether we have outgrown all our 'strange notions' about migration. One that dies hard is that the larger birds carry smaller ones on their backs. This myth is of respectable antiquity, for a saying of the Tartars that 'each crane carries a corncrake on its back' was referred to as an old legend in 1740. The notion originated from partial observation and from reasoning. It was reasoned that the weaker fliers must be carried somehow, and it was observed that small birds often appeared, as it were from nowhere, immediately after the arrival of the larger species. It is probable that they had travelled in company, and that, being small, they had remained invisible until quite close to the observer. Careful modern observers have sometimes noticed birds dropping from the sky at the time of the spring migration, and it is thought that these were migrants that were flying so high as to be invisible.

Although the fact of bird-migration is indisputably established, there are many problems connected with it which are still unsolved. We have learnt to be humble before the workings of Nature since the days of the great Doctor; even the experts are shy of dogmatizing, and are content, for the most part, to record their patient observations, thus adding to the vast mass of data from which the ultimate truth will be unfolded. We of the laity may have our own theories; we may even cherish some 'strange notions,' but if we are wise we do not reveal them, except perchance, tentatively and apologetically, to some trusted friend.

THE GIFT.

HER faith is the sound of the running stream
And the breath of the child who sleeps.
Her heart is the core of the wide-open moor,
And the glorious light of the steepes.

Her love is the break of the early morn,
And the light to life's sinking day,
Her love is the gift of compassionate God—
For worthiness I pray.

J. P. DAVIES,
Pretoria.

A NATURAL PHENOMENON.

By D. E. STEVENSON, Author of *Peter West*.

I.

THE hot tropical sun beat down upon the barrack-square, turning the dry brittle surface to a pool of dust, blindingly white in the glare. Above the low white buildings the blue sky was cloudless and pitiless. George Anderson stared round him in a bewildered manner—stared from the low-roofed cantonments to the few sickly palm-trees, whose leaves were scorched and withered by the heat and long-continued drought. He had been here before—something was going to happen—but here his memory failed him. Across the square was a door—a red door—blistered and cracked. George knew that he must reach that door. . . .

Suddenly he heard a shout, and saw a huge black horse galloping down upon him. It was harnessed to a high cart, which rocked from side to side. George was held rooted to the spot by a nightmare-feeling of sheer horror. He could not move. The dust rose in a cloud. At last a shout startled him out of his apathy, and with a violent effort he wrenched his mind into action and jumped aside—but the action came too late. He tripped and fell. . . .

The pawing hoofs whirled above his head—the wicked eyes, bloodshot and staring—the huge black body, shiny with sweat. An intolerable pain tore at his body, while the dry dust, rising about him like warm smoke, clogged his lungs and muffled his cries of agony. . . . Then all was dark.

George opened his eyes, to find some one shaking him with no gentle hand. 'For Gawd's sake be quiet, can't ye!' a voice said.

He sat up, rubbing his eyes, and found himself in the familiar barrack-room which he, as a private, shared with fourteen other men.

'You bin dreamin',' the voice continued more amiably.

'Shriekin' somethin' awful,' another voice put in plaintively.

George Anderson shuddered. He had had the ghastly dream before, and each time that he had it he wakened like this, wet with fear, every nerve in his body quivering like taut wires. 'I'm — sorry, boys,' he said between his chattering teeth, so making the 'amende honorable' in the vernacular of his kind. Then, hunching up his brown blanket over his shoulder, he turned over and pretended to go to sleep. For a few moments there were murmurings of annoyance, but these soon subsided into snores, and once more comparative quiet reigned in the big dark room.

There was one man, however, to whom sleep did not come. George Anderson slept no more that night. He lay and watched the moonlight on the floor, and saw the dawn come into being over the big building on the other side of the square, which was the officers' quarters. Although he was fatigued almost beyond endurance by his hard day of physical exercise and by the tumult of his nerves, George fought against sleep with every ounce of strength and will-power that he possessed, for sleep might bring a recurrence of that terrible dream. . . .

The dream had haunted him from his boyhood. Sometimes months would pass without his having it, and then, when he was lulled into security, it would come to him with renewed horror and fear, making his nights a misery of wakefulness and his days a long slow torture of jangled nerves that cried out for the sleep which he denied them.

George never spoke of his sufferings to any one. He bore them, as was his nature, in stoical silence, with a bewildered dour courage which he had inherited from his V.C. father. The place that he dreamed of—the low cantonments, the burning sun and white powdery dust, the queer smell of burning rubbish—was like no place that he had ever seen, for the battalion had finished its tour of tropical service before he joined it four years ago.

When the older men spoke of India, George would listen with mouth agape, but his secret prevented him from wishing to go abroad and see for himself the wonders described by his companions. Most of all he liked to hear about the campaign in Tirah when his father, then a private in the battalion, had won the most coveted distinction in the British service. He had won it for his devotion under fire to his company commander, Captain Logan, and now George, his only son, was servant to that officer's son, and held a unique position in the regiment by reason of his father's prowess.

Captain Logan, junior, was a great favourite in the battalion; he was young and cheerful, and keen as mustard. His company adored him, and would have followed him through fire and water. To his seniors he was always known as 'The Boy,' doubtless on account of his round face and fair curly hair.

George liked being servant to this popular officer, not because he escaped certain parades and fatigues by this favour, but because he took a real pleasure in serving him—polishing up his buttons and boots until they outshone those of any other officer in the battalion. His pride and pleasure were therefore not unmixed with regret when he had learned the

previous day that a decree had gone forth detailing him for the next N.C.O.'s course.

'I mustn't be selfish any longer,' Captain Logan had said, with one of his boyish smiles which had endeared him to everyone, from the C.O. downwards. 'I shall be awfully sorry to part with you, Anderson, but it will only be for a time, and then I shall have you back in "A" company as a lance-corporal.'

George never thought of questioning the decision of his idol, but his eyes strayed regretfully from the shining buttons on Captain Logan's tunic to the perfectly polished field boots. 'Very good, sir,' he said; and then added, 'You'd better have Taylor, then, sir.'

'The Boy' nodded. 'Yes, I'll take Taylor; and the momentous interview was at an end.

II.

The afternoon sun was warm and golden. A cool breeze blew across the barrack-square, flapping George Anderson's kilt against his knees, and at the same time blowing the cobwebs of his miserable night out of his handsome head. He threw his shoulders back and saluted the sentry on duty at the gates with a smart gesture of greeting.

The sentry spat reflectively—there was no officer about. 'Eh my, yon's a terrible hole ye've got, Geordie!' he sighed.

'A hole?' cried the wretched George, glancing down at his braw new hose in consternation.

'Niver heed. Aiblins she'll no' see it.'

'Whaur's it?'

'In yer hairt,' was the grave reply.

Geordie's remarks, much to the point, but scarcely printable, were cut short by the timely appearance of an officer, and he sallied forth into the High Street with a little swagger which became his well set-up figure in its becoming rig-out.

Who wouldn't swagger a little with Geordie's consciousness of good looks and good conduct, with a kilt to swing at his knees and a pretty girl in the offing?

Lily was waiting for him opposite Galloway's, the big draper's shop which had usurped a dozen small holdings in the busiest part of the town. She was very conscious of a new pair of silk stockings and high-heeled shoes. A green jumper in Galloway's window had caught her eye; it was very attractive, and she was wondering in her busy little brain how many times she would have to go without dinner so as to save enough money to buy it. Several men passed and nudged each other, and she glanced at them sideways from beneath her pink hat.

Lily knew that George was coming long before he saw her; *how* it would be difficult to say, for she had never glanced in his direction. Her little squeal of astonishment, when she found him at her elbow, would have deceived a more worldly fellow than our poor soldier boy.

'Whit a stairt ye give me!' she said, raising her eyes to his face with a simper which would have completed her capture of his heart had it not been effected long before. 'I wis jis' lookin' at that jumper,' she added. 'Div ye think it would fit me?'

Thus questioned, George tore his eyes from his captor's face and looked at the garment in question, which was hanging in the window. He turned over the few shillings of his week's pay which remained to him, and looked again. The price-ticket was placed conspicuously, and alas for poor Geordie, whose pay had a habit of melting away like snow in April!

'It's real pretty,' he averred; adding in a shamefaced manner, 'weel, is it tae be the movies, Lily?'

Lily turned away with a little sigh. She had not really expected him to buy it for her—she was finding out that soldiers were generally hard-up. If George had not been so good-looking she would have given him the cold shoulder before this, and taken up with a 'clurk' who had shown her, in a delicate manner, that he was quite ready to walk out with her. But Geordie was very good to look upon—she knew that people gazed after them as they passed.

On this particular afternoon Lily voted for the park, and led her companion past the swing-doors of the 'Grand Picture Palace' with a firm little hand on his arm. She did this partly because she liked to be seen with the big handsome soldier boy, and partly because she knew he wanted to sit beside her in the dark solitude of the picture palace and hold her hand. Thus did Lily punish him for his inability to satisfy her desire for the green silk jumper.

As they walked round the park, listening to the band and watching the people, George unburdened his heart to Lily on the subject of the N.C.O.'s course. 'I dinna want tae leave Captain Logan,' he explained. 'But if I get tae be a N.C.O.—weel, I'm nearer being able tae mairry ye. An' oh, Lily, I'm wantin' ye sae bad.'

Lily was only half-listening. It took her all her time to keep pace with her companion's long-limbed saunter, with the mincing little steps dictated by her tight skirt and high-heeled shoes.

III.

The next day there was much grumbling in the barrack-room, for the C.O. had decreed a route-march of fifteen miles. This necessitated an extra polishing up of arms and equipment until they shone again, and it also entailed—in the case of many of the men—a week's purgatory from blisters and corns. George did not join in the general grouching. He enjoyed marching, loved to step out with the battalion as one man, with his kilt swinging free from his hips and the skirl of the pipes in his ears.

There was a rush to doors and windows as the battalion turned the corner of the High Street and marched up Pollock Street towards the big stone bridge. It was fine to see them. Many a woman brushed the tears from her eyes with her apron as she looked after them with misted gaze; many an old man found a lump rise in his throat.

'Eh, they're fine!' was the general opinion. 'Oor laddies; there's nane tae come up tae them!'

The song of the pipes, wailing and sweet, drew a motley crowd of followers, who kept pace with the soldiers along the congested pavements.

'I wonder if Lily sees us,' thought Geordie with a surge of pride.

Old Mr Watson (late quartermaster-sergeant of the regiment, now retired) was taking a swarm of bees, when he heard the wild music and the tramp of many feet. The sound was as strong drink to the old soldier; he dropped the hive and rushed to the gate. 'Eh, they're braw,' he whispered, his feet marking time to the familiar tune; and he was not far wrong. They came up the street marching as one man, their arms and accoutrements winking a dazzling heliograph in the bright sunshine.

Mr Watson leaned on the gate, wishing that he were twenty years younger; he had quite forgotten the bees, which swarmed out angrily from their overturned hive and flew over the fence in a buzzing cloud. The baker's cart happened to be standing outside Mr Watson's gate, and the bees settled upon the black horse, which was awaiting its master with model patience, and stung it severely. It was more than any horse could stand, and with a neigh of terror the poor creature threw up its heels and bolted down Pollock Street towards the advancing battalion.

'A' Company happened to be leading, and Captain Logan shouted to his men to break ranks and stop the animal before any accident happened. He had hardly done so when the enraged horse was upon them, snorting with pain, and quivering with fear of the unknown enemy which had attacked it. . . .

When George Anderson came to himself he found that he was in a narrow dark close; his knees were knocking together, and he felt physically sick. He had no recollection of what had happened after his first glimpse of the black horse—the incarnation of his ghastly dreams—coming towards him at full gallop. How had he escaped from the battalion? What had happened?

The shock had completely shattered his nerves, which were already on edge from insomnia, and it was some time before he regained control of his trembling limbs. When he could do so he crept to the entrance of the close and gazed up

and down the street in a bewildered manner. The street was deserted . . . no signs of the battalion, no sound of its pipe band. . . . A girl lounged on the door-step of a neighbouring shop, watching him with inquisitive eyes. 'Lily!' he gasped.

She laughed shrilly, and disappeared into the dark little doorway.

IV.

'Pull in your chair to the fire, padre,' said Jack Logan hospitably. 'It's funny how cold it gets at night, even in summer, in this—er—hole.'

'It is the damp,' replied Mr Trevor in his low musical voice. 'The place lies very low, you see, and those flats by the river exhale a thick mist at night.'

'Beastly spot,' agreed Jack Logan laconically. He was pouring some amber liquid into two small glasses as he spoke—it seemed uncommonly precious, judging from the care employed in the process.

The padre stretched out his hand and took one with a smile. 'I never can resist Benedictine.'

'Why should you?' his companion wondered. 'It is the best thing to counteract the evil poisons contained in the mess dinner. Macfarlane is the rottenest mess president we've ever had. He ought to sack that cook. Look here, padre, honestly now, don't you think it's positively—'

'It is, it is,' Mr Trevor said soothingly. 'But, Logan, it isn't the mess dinner that is worrying you, is it?'

'What d'you mean?' The young face was turned to that of the older man in surprise.

'You know quite well what I mean—you're worried about something. I suppose it has got to do with all that talk in mess. Not having the clue, I couldn't make head or tail of it, but I saw they were getting at you about some protégé of yours—'

'Oh Lord!' groaned 'The Boy.' 'Look here, padre, I just must tell somebody about it or I'll burst. You know Anderson, who used to be my servant—'

'Of course; Will Anderson's son.'

'Yes. Well, I recommended him for the next N.C.O.'s course. He didn't want to leave me, but it seemed such a waste—he appeared just the man for an N.C.O.—and then his father's record in the regiment—' The voice trailed off into silence.

'Well?' prompted Mr Trevor after a little silence.

'I was going to give the chap a first-class chit and all—he's a fine specimen; at least I thought he was—but after this morning—'

'What happened?' asked the padre. He was very fond of 'The Boy,' and admired the keen interest which he took in every detail of

the regiment, and the endless trouble expended over the men of his company. George Anderson was also a favourite of the padre's, and he wondered of what 'crime' in the army calendar the man had been guilty.

'You may ask what happened,' replied Logan. 'I almost can't believe it myself, though I saw it with my own eyes—it's like Gilbert and Sullivan; if only it were not such a tragedy I could yell with laughter whenever I think of it. Well, we were marching along Pollock Street about twelve o'clock this morning when a horse ran away. It got stung by some of old Watson's damned bees—pardon, sir!'

'All right, Logan, go on,' said Mr Trevor mildly. Nobody deprecated the use of bad language more than he, but he was wise enough to know that it really meant very little to the men who used it, and that there was as little chance of stopping it as there was of stopping the flow of the river which wound its way through the outskirts of the town.

'Well, the brute came careering down the street with the cart rocking behind it, and the loaves and cookies scattering right and left—you never saw anything so comic. I ordered my company to break ranks, and we stopped it easily—it's a tame creature, and even the bad stings didn't madden it up for long. Anderson didn't wait,' continued 'The Boy' bitterly; 'remembered an important engagement, I suppose! Anyhow, you couldn't see him for dust; he went down Pollock Street like a streak of lightning, and disappeared round the corner. Gad, it was funny!'

'But what was the meaning of it?'

'Funk,' replied the young officer grimly.

'Funk?' echoed Mr Trevor incredulously.

'I can't believe it of Will Anderson's son.'

'I know, it's—it's—— But, padre, I saw his face—sheer panic—you can't mistake the signs, if you've seen it before.'

The padre knew that you couldn't—he had 'seen it before' also. He was silent, and his companion continued with a shamefaced laugh, 'It's beastly infectious; for the moment I felt I wanted to run myself. The men were all laughing.'

'They saw too?'

'Oh, everyone saw—they couldn't have helped it, unless they'd been stone blind.'

'What happened after that?'

'I never saw him. He must have gone straight back to the barracks——'

'Perhaps it was an excuse to escape the route-march.'

'The Boy' laughed scornfully. 'Why, the man's a born foot-slogger—positively revels in a route-march; besides, there's his face. Lord, padre, I can't forget it! He must be having a hellish time now,' added his officer, looking out of the uncurtained window across the square to where the barrack-rooms were situated.

Mr Trevor leaned forward, and knocked out his pipe preparatory to re-filling it. 'Have you spoken to him?' he wanted to know.

'Of course; I sent for him as soon as ever I got back. He stood there with his face as cold and proud as Lucifer——' Mr Trevor followed 'The Boy's' eyes across the room, and seemed to see the young soldier standing on the mat at attention, with that hard defiant look marring his handsome face. 'I asked him if he had any excuse for his extraordinary behaviour.'

'What did he say?'

'“No, sir.”'

'And then?'

'Well, I made him come in, and talked to him a bit about my plans for him—and about his father—and—and all that. When he saw that I was really interested, he told me a long yarn about a dream that he had. It was about a horse that savaged him—a great black horse in an Indian compound——'

'Was it true, do you think?'

'Oh yes! Yes, I'm sure he was speaking the truth; but—— Well, you see, it doesn't make much difference so far as his promotion is concerned. What control is he going to have over the men with a ridiculous story like that attached to him?'

'He might live it down.'

'He might; but ridicule is the worst thing for undermining discipline. And then, supposing he were in a tight corner requiring nerve—N.C.O.s can't afford to indulge in dreams like that! It's a question of *moral*, you see, padre.'

The padre saw. Of course 'The Boy' was right; he had a sure touch for everything connected with the regiment. The padre was also seeing something else. 'A great black horse in an Indian compound'—these words called a memory out of some locked cell in his brain. What was it that the words conjured up? An old memory, faded with the passing of twenty-two years, a memory elusive as a will-o'-the-wisp on an Irish bog; yet with 'The Boy's' words it rose clear out of that wonderful storehouse which is in every man's brain.

'That's—odd,' he said slowly. 'A black horse in an Indian compound, savaging him.' He was thinking aloud, forgetful of his companion, who was looking at him in surprise. 'Did he—does he know of any—any reason why he should have that dream?'

'Reason!' The word was echoed wonderingly. 'There isn't any *reason* for dreams, is there, sir?'

'There is—or might be for this one,' Trevor thought. 'Rather a queer thing,' he went on, sitting forward in his chair and tapping his well-worn briar against his teeth ruminatively; 'rather queer.'

The younger man waited impatiently for Mr Trevor to explain himself, and after a few moments the latter began: 'As you know, I

was out with the battalion at Julapore in nineteen-one. I had just joined up then, and I was very keen and interested in everything. I liked the men, and, of course, I was often round the married quarters seeing the women and children. It's odd how, out there, the married quarters are so like *home*—it's a magic word, Boy!—they used to remind me so of home. I've often wondered why those women take Pollock Street east with them—as it were—and I think now that it is because they *resent* the East. They hate it, you know, all of them—hate it as if it were a living thing (women always hate like that, I think). So they take Pollock Street with them, and put it between four walls, and call it home. Their bits of rugs—rag-rugs I think they call them—and their rep curtains, and oleograph pictures, dreadful things, but just *speaking* of home. I suppose I was a bit homesick and I liked it. I was friends with most of the women, but especially with Mrs Anderson.

'Well, to get on with the story, I was crossing the square one grilling hot afternoon, when I saw an accident happen. Brown had a black waler—an awfully vicious beast. He drove it in a *tum-tum*, and had the greatest difficulty in getting a syce to touch it. On this particular afternoon the creature had broken loose, and I saw it come tearing across the compound with the *tum-tum* rocking behind it. I saw suddenly that there was a woman crossing the square towards the married quarters. She evidently did not see the horse coming until it was almost upon her—the noise of its hoofs was deadened by the thick dust which lay there inches deep. When she did look up she seemed to quiver all over; she stood quite still—hypnotised by fear, I suppose. I ran and shouted—and she must have heard, for she tried to struggle out of the way, but—but it was too late—another second, and she was down in the dust amongst those cruel hoofs. Boy, it was a ghastly thing to see. When I got to her she was unconscious. We sent for the M.O., and she was carried into the nearest house. Can you guess who that woman was, Boy? She was Will Anderson's wife and George's mother. He was born that night.' There was a little silence, and then the speaker added brokenly, 'She—died.'

'Good God!' Logan ejaculated. 'And you mean—that's what he—dreams?'

The two men sat and gazed at the fire, which was sinking into a bed of red-hot cinders. The elder was occupied with visions of the past, the younger—as befitted his calling—with plans for the future. Did this disclosure change the situation? Was Anderson any more fitted for a responsible position because his panic was the result of pre-natal impression rather than sheer cowardice? Had he the moral strength to live down the ridicule of his fellow soldiers?

It will be observed that the regiment was everything to this not very imaginative young officer.

'Should we tell him?' The words were spoken half-aloud, but the padre heard and answered them.

'I think so. You see, he may be imagining all sorts of horrors—that his brain is affected, or something equally unpleasant. It is easier to fight a nightmare if you know that there is a natural cause—better far than struggling in the dark.'

'Yes, I suppose so,' said his companion doubtfully. 'Still, I don't know that I can recommend him for the N.C.O.'s course.'

The padre smiled inwardly. Oh these boys, these mad keen soldiers! Did they ever think for five minutes without coming back to the regiment? His thoughts went suddenly to George Anderson struggling in the black grip of the nightmare which had secreted itself in his unformed brain. 'I think you'll find,' said Mr Trevor, choosing his words carefully—'I think you'll find he will be able to bear that with equanimity in view of your other communication. It is queer that he should never have heard from anyone how his mother died—his father felt it too hardly to be able to mention it, I suppose, and—well, it is wonderful how soon one is forgotten. By the time little George was old enough to understand, the regiment had come home. You must explain to George,' went on the padre, 'that it is not cowardice on his part, and that it is through no fault of his own that he is haunted by this dream—it is merely a natural phenomenon—'

He broke off as a loud knock sounded on the door, and 'The Boy' said 'Come in.'

A man entered clumsily, a heavy-built man with close-cropped black hair, and a face as white as paper, and staring eyes.

'Will you please come at once, sir;' and then suddenly the years of discipline and training dropped from him like a cloak. 'Oh Gawd!' he cried wildly, and covered his face with his sleeve, as if to shut out some dreadful sight.

Captain Logan's chair clattered to the ground as he jumped to his feet. 'Corporal Burke, stand up—attention! Now, tell me at once what is the matter.'

The man stood before his officer, blanched and trembling, with a pitiful attempt at self-control. 'It's Anderson, sir—fell out of the barrack-room window, sir—dying—'

'The Boy' pushed him aside and strode out of the room. They could hear him going down the stone stairs three steps at a time.

'Come now—er—Burke,' the padre said with intentional cruelty. 'Pull yourself together at once. This isn't a girls' school. You must have seen worse things in your time than a man falling out of a window.'

'Yes, sir,' Burke replied with a force of habit; and then, with an unconscious gesture of despair, he threw out his arms. 'But—but this is peace. He did it a-purpose. I saw him do it. If you saw him all crumpled up on the ground——' And then, in a husky murmur, 'We was chipping him. I never thort——'

Mr Trevor shook him by the sleeve. 'Pull yourself together—you're a corporal, aren't you? What kind of an example is this to show the men?' The curt words acted like magic. Burke straightened his shoulders, and the colour came back to his lips. 'Now, follow me,' said Mr Trevor sternly.

The little group on the cobbles beneath the barrack-room window moved aside to make a passage for the padre and his escort. 'The Boy' was on his knees beside the shattered heap of humanity which had so recently been full of youth and beauty. The atmosphere seemed charged with tense emotions, and when some one called out, 'Here's the M.O.,' a murmur of relief went up from the waiting men.

Only Captain Logan gave no sign of relaxed tension; he rose and faced the newcomer gravely. 'We are both too late,' he said.

The padre sensed the agony which underlay these simple words. 'The Boy' was taking it terribly to heart. If only he could help.

He stood aside while the necessary instructions were being given to the orderlies, and wondered a little at the stern, hard voice. When that was done the two friends walked back together across the square in silence. The night was darkening swiftly now, and lights had sprung up all over the big block of buildings which contained the officers' quarters.

Still 'The Boy' spoke no word, and his friend

began to be afraid. 'You couldn't help it. Don't take it to heart, Boy,' he said as comfortingly as he could.

A low even voice replied out of the darkness, 'He was my friend, and I failed him because I did not understand. I—failed him.'

V

Two days later a little cortège passed through the barrack-gates and proceeded down the High Street at the slow march with arms reversed. The sun was shining brightly, and everything looked the same as it had done on that memorable day of the route-march. A little group of officers followed the coffin, which was laid on a gun-carriage and covered by the bright folds of the Union Jack. Captain Logan, with his head erect and a hard expression on his young boyish face, walked alone, for he was chief mourner.

At the corner of Pollock Street a crowd had collected to watch the little procession pass; a motley group, such as might be found at any street corner at any hour of the day with time hanging heavy on its hands. Amongst them was a young girl in a bright green silk jumper; she was hanging on the arm of a young civilian, in a shiny blue suit, with a weak chin and a bowler hat—he was obviously a clerk.

'Come away, do,' he said, pulling her arm in an irritable manner. 'What are ye gazing at noo, Lily?'

'Whose funeral is it?' she wondered idly.

'Well, it's no' mine, anyway,' he replied with the perverted humour of his kind.

The girl in the green jumper laughed shrilly, and followed her witty companion through the swing-doors of the Grand Picture Palace.

SIAMESE SUPERSTITIONS.

By ERNEST YOUNG, B.Sc., M.A., F.R.G.S., Ex-Inspector of Anglo-Vernacular Schools, Siam.

FROM birth to death the native Siamese is enveloped in an atmosphere of superstition. There is no act of his life that is not ruled by some tradition or other that has held authority and power through many ages. The infant is a gift from the gods, and the legendary deities of the parents demand due observance of many customs. As the time of its birth approaches, the mother retires to the seclusion of her own chamber, where she lies on a long flat board in front of a fire. Kindly hands stretch a protective cord all round the exterior of the building, and this is blessed by the priests, and so forms an efficient barrier against all those evil spirits lying in wait to cause trouble. Scarcely has the tiny mite wailed its first feeble note than its nurses make three balls of rice and throw them in three lucky directions. By this means certain bene-

ficent spirits are invoked to be present and to watch over the future of the baby.

Even in these days, when an Education Department is seeking to instil knowledge into the young, there are still thousands of children in Siam who never go to school, and who gain all their ideas about nature from the stories told them by parents and friends. When the big giant in the sky above chases his cantankerous wife and hurls his hammer after her, the sound of his voice and the noise of the falling weapon, as it crashes against the floors of heaven, give rise to the rolling of the thunder; the 'sky cries.' When the long waves of purple lightning flash across the horizon, the angels are amusing themselves by striking fire with bricks. When the mighty crab comes out of its hole in the sea, the tide ebbs, and when this same denizen of the deep

retreats once more to his subaqueous residence, the tide flows again. When too many angels get into the same bath at the same time, the water pours over the side and it rains. And when the earth is wrapped in darkness, and the night winds sigh across the rice-fields and the plains, you can hear in those evening breezes, if you will but listen as you should, the voices of all the little children who have long since gone to their eternal rest.

When the Siamese child wants a fairy-tale with which to while away the hours, nothing so insipid as Cinderella will suit his fancy. His hero is the man who meets single-handed a million foes in a deep ravine. When the assembled hosts laugh at his daring he takes up the mountains in his right hand and his left and, crashing them together, annihilates the opposing forces in the twinkling of an eye.

If a person be travelling far from home he will not mention the word 'alligator' as he passes by the river-bank, or whisper the word 'tiger' as he threads the jungle, for fear the beasts should hear him and answer to their names.

And so the boys grow up to manhood and the girls to womanhood, and, as happens everywhere, they fall in love and seek each other in marriage. Then the parents of the lovers go to the astrologer and state the facts of the case, and the astrologer notes the respective birthdays of the young couple and consults his oracles. For the years run in cycles of twelve, and are ruled over by the rat, the cow, the tiger, and nine other animals. And should the man have been born in the year of the dog and the woman in the year of the cat, there could by no possible means be any happiness in the wedded life of these two. If no inauspicious births have taken place the marriage may be solemnised, and the man will build a house for his bride. But in this house the number of rooms, of doors, of windows, of everything within and without, must be an odd one, for even numbers are unlucky.

No one lies down to sleep with his head pointing to the west, for that is the point where the sun dies his daily death, and so is symbolical of the end of all things. The only safe direction for repose is north and south. On Sunday, if you travel, you must travel to the east, for that will bring you luck. On Monday you may go west; on Tuesday, south; on Wednesday, south-west; on Thursday, north; on Friday, south-east; and on Saturday, north-west.

Again, every day is ruled by some particular planet, and if you wish that planet to bring you success you must dress in the colour of the planet itself. On Sunday, when the Sun is the ruling luminary, dress yourself in red, and wear rubies. The Moon controls Monday and demands

white moonstones; Mars asks for light red and coral on a Tuesday; Mercury requires green and emeralds on a Wednesday; Jupiter looks out for the cat's-eye on a Thursday; Venus is not satisfied unless you wear silver-blue and diamonds on a Friday; while Saturn takes charge of Saturday, and expects dark blue and sapphires.

Get your hair cut on the proper day, or much woe will befall you. Go to the barber on Sunday, and long life and happiness will be your lot; but beware of Monday's tonsorial operations, for they bring disease, sorrow, and unpleasant surprises; Tuesday means peace, prosperity, and success in war; Wednesday brings trouble from your enemies; the angels grant protection to all those who lose their locks on Thursday; Friday is the glutton's day, for all food will be palatable to those who are then shorn; Saturday's haircutting brings success in all deeds and ceremonies performed on the last day of the week.

Wherever credulity flourishes the medicine man reaps a rich reward, and quacks are in great evidence. They combine, in Siam, the double function of healer and destroyer, for they will cure or kill for an adequate financial compensation. If you can afford it, you can, by the help of the doctor, rid yourself of an enemy in the following manner. The wizard will buy a buffalo at your expense, and then say charms over it. As the process of bewitching the animal continues his body decreases in size until the huge beast has dwindled to the size of a pill. Then you arrange for your enemy to swallow this highly condensed extract. No sooner has he partaken of the pill than it begins to swell to its original size. It is scarcely necessary to add details as to the dramatic close of your enemy's career.

At last the time comes to each one to die. There are several methods of disposing of the dead, and one of these is burial. None, however, are buried except those who have died of sudden death, of cholera, or by the executioner's sword. Down in the depths of the subterranean regions there dwells an enormous monster, who sits through all eternity warming his feet in the fire. In order to prevent them from being utterly consumed by the flames it is necessary, from time to time, to pour water over them. This water is brought to him by an army of slaves. The slaves are the spirits of the people who have been buried after death. To get the water they have to travel over perilous bridges, through dark ravines, and across dangerous swamps. Their every step is beset with danger, darkness, and pain. They bring their precious burdens back in sieves, and through endless ages they must perform the same ceaseless, terrible, and hopeless task.

The deceased can be liberated from this cruel existence only if their living relatives are willing to call themselves the relations of the fiend,

and to do homage to him. The method of doing homage does not appear very serious to us, but it is sufficiently efficacious. The earthly relatives bind on neck and wrist a few red and yellow strings, which they can obtain from a priest. Then they make a tiny cart, and put into it a number of clay images, one for each member of the family. With the images they

put offerings of fruit, flowers, and rice, and they deposit the whole gift in an out-of-the-way corner of a field. The wind and the mice soon play havoc with the propitiatory offering, but the demon takes no notice of that, and the minds of the living are satisfied with what they have done in mitigation of the miseries of the departed.

IN THE VALLEY OF DECISION.

CHAPTER VII.—*continued.*

III.

IT was a minute or two before I dared look up and meet Mr Thurlow's eye.

I was aware, when I looked across at him, that he too avoided looking at me. I think we both of us felt that we had been treading on holy ground, and that we ought to have taken our shoes from off our feet.

'Our client,' and Mr Thurlow was speaking in his driest tones, 'would never have allowed us a sight of this letter, had he not been consumed with anxiety about the young lady. His chief idea is to keep her out of the affair altogether; he can't bear that the breath of scandal shall touch her. And so you and I are to devise the means for keeping her name out of it.'

'Mr Thurlow!' I exclaimed with some warmth, 'I will never lift a finger to prevent those two from coming together again. They have been parted; there has been misunderstanding; but the moment the light of truth has shone, she has seen her path of duty quite clearly, and is determined to walk in it; and in my opinion, God bless her, she is doing exactly the right thing.'

'You speak,' said the lawyer, 'as if I were of a contrary opinion; but I have not said so. What I have to consider, however, is the character of the defence which we set up; and the responsibility for this rests upon me.'

'Well,' I queried, 'would not her witness be helpful?'

'That is just the point,' he replied, 'which I have very carefully to weigh. The "pros" and "cons" seem to me to be these. The cause of antagonism leading up to this deadly quarrel was undoubtedly this young lady; but, you see, the more strongly a motive is made to appear—and that I assume is the idea in allowing Miss Weston to give evidence—the more strongly does it appear that our client's act was wilful, and as one might say of 'malice prepense.' And, of course, we don't want to show that: so that is against our putting her in the witness box.'

'On the other hand, when we were before the justices, it became practically impossible,

as you know, to keep her name out of the case altogether. Now, my experience of judges and juries is that they are apt to resent the keeping back of any witness who may seem to them to be material to the case—they become a little bit suspicious. They have, you see, to come to a decision, and they want everything that may contribute to a true verdict to be placed fairly and squarely before them.

'I should say that Miss Weston would probably make a good witness, and would be likely to impress the jury favourably; and even a judge, you know, is not wholly uninfluenced by sentiment and feelings of pity.'

He paused.

'Then, on the whole, you agree with me,' I said, 'that we should let her appear?'

The lawyer's eyes twinkled. 'I doubt if there is much "let" about it,' he remarked; 'we can't hinder it. She has appeared, and she will appear; and what we have to do is to coach her just a little bit as to the dangers of overstatement, in case she gets carried away by her feelings.'

'And what,' I asked, 'are we to say to Carrington about disregarding his wishes?'

'You can leave that to me,' was Mr Thurlow's reply. 'When a doctor of medicine has a patient very sick, and perhaps about to die, he doesn't look to his patient for orders, but gives his own orders. And a prisoner is something like a sick man—he doesn't always know what is best for him.'

IV.

I said 'good-bye' to Mr Thurlow, and as I had missed Vera at his office, I now drove to Lennox Gardens on the chance of seeing her, for I greatly wished to see her, and to speak a word of appreciation and encouragement.

By good luck she was in, and we had a great deal to tell each other.

And then Mrs Chichester came into the room, and I found she had espoused Vera's cause with great enthusiasm. 'I am going to look after Vera,' she said, 'and am only too delighted to do it. There was some talk of Hubert's mother or one of the girls coming up; but that's been vetoed. They would only have made Vera

nervous, and perhaps made themselves ill. No! I am going with her to the law-court myself; so she'll know she has one friend at court anyhow.'

'Many more friends than one,' I declared. 'She has quite won Mr Thurlow's heart already, to say nothing of yours, and mine; and if I were a betting man, Mrs Chichestcr, I'd wager you she will win the case.'

'That's just what my husband says,' she exclaimed; 'in fact, he says so much that I tell Vera I shall be getting quite jealous.'

'He has written such a funny letter to General Weston—you know they are old Indian friends—and he has told him that his old regiment would disown him if they knew he was opposing his daughter in what she was doing; and he strongly advises Sir Thomas to yield with a good grace now, and not to wait till the trial is over, when everybody, however it may end, will cry "Shame on him."'

'Poor, dear old Dad,' said Vera, 'I'm sure he meant what was right; but he so often calls me "my child" that I suppose he still thinks I am one.'

I did not attempt to see Hubert again before the trial. After what Mr Thurlow had said, I thought I would leave him in the lawyer's hands.

But I went down to Wingate for the Sunday, to take the church services, and to see Hubert's mother and Cecilia and Alice, and to tell them how matters stood.

v.

I was back again on Monday, and made my way at once to the Central Criminal Court.

There I found Mr Thurlow, and Vera and Mrs Chichestcr, and, to my great surprise and satisfaction, no less a person than Sir Thomas Weston himself.

'I wasn't going to leave my daughter,' he told me, 'to wander about in these unsavoury purlieus all by herself, so I've come up to look after her; and I only hope we sha'n't be detained here very long.'

'A good deal depends,' Mr Thurlow observed, 'upon when our case will be called. I have ascertained that there are seventy-nine cases down for trial, and over 400 witnesses are in attendance.'

'Good gracious me!' cried the general. 'Why, we may be here a fortnight! But whereabouts do we come in the list?'

'I fear,' said the lawyer, 'that the place in the list won't tell us much. There are three judges trying these cases in different courts, and the proceedings in some of them may be very protracted, while in others the prisoner may plead guilty at once. In that way some of the cases get remitted from one court to another, and the order in the list is quite upset. I shall be able probably to find out pretty early each day whether our case is likely to be taken on that

day, and if it isn't, then you will be free for that day at any rate. But it isn't safe to absent yourself altogether, so I'm afraid it means coming here every day.'

The general looked so disgusted, and so furious, that Mr Thurlow nimbly beat a retreat; while I, with a sense of the ludicrous, could hardly restrain a smile.

But, in all seriousness, if prisoners at the bar have their trials, it may be averred with truth that witnesses have theirs also, and that their trials begin long before they set foot in the witness box and face the jury.

The swarms of witnesses, many of them belonging to the great unwashed; the foetid smell of overcrowded courts; the lack of proper accommodation; the pervading sense of crime, and evil, and unhappiness, and anxiety—all these things in combination make the kicking of one's heels at the Old Bailey anything but a pleasing pastime.

However, it is a long lane that has no turning, and in the afternoon of the second day we were informed that without fail we must all be in attendance in good time on the following morning, as we were almost certain to be called before the Grand Jury.

This sifting of cases by the Grand Jury before they are actually tried in open court is sometimes a mere formality, but not always. For the Judge of Assize, previous to charging the jury, is accustomed to give special attention to such cases as demand consideration. Then, in his opening address to the Grand Jury, he is in a position to advise them as to the actual law obtaining in such cases; and if he has seen that the evidence against the accused is inadequate or contrary to the law, he directs the attention of the Grand Jury to the points in question, and sometimes will advise that an indictment must be ignored. By this means much time is saved, and also a good deal of expense to the country.

vi.

It was not without some thrills of emotion, and a deep sense of anxiety that at last we found ourselves conveyed as witnesses to the very door of the room in which the Grand Jury was sitting; and there we had to wait until such time as we might be called, individually, to give our evidence.

Our little party included Admiral Chapman and three of his servants, and one of the three doctors who had made the post-mortem examination, and Vera and myself.

Mr Mackenzie and Mr Swallowfield, junior, were also in attendance as representatives of the Birmingham firm, although they had been informed that they would not have to appear before the Grand Jury, as the Grand Jury only called witnesses for the prosecution.

In this aspect of the case, as it presented

itself to my mind, there seemed to be such a topsy-turvydom of justice, and such a jumble of proceedings in all that we were required to say and do, that I seriously debated whether, by our own fault, we had been turned into a pack of fools, or whether the law itself was 'a hass.'

For here we were, myself and my fellow-witnesses, who were all wishing to be regarded as for the defence of the prisoner, and yet some of us had been subpoenaed for the prosecution.

Moreover, the prisoner himself, as it turned out, who was presently to appear at the bar, although he was the very man who had given himself up on the plea that he had been guilty of assault, if not of manslaughter, was now about to plead 'Not guilty,' in view of the more serious arraignment by the Crown. How would it all end?

VII.

The end was not far off. First Admiral Chapman was called into the room to give his evidence before the Grand Jury. In about ten minutes he came out again, looking extremely disturbed and ill at ease.

Then came the doctor's turn. And he, too, came out again. And then I went, and at once was sworn to speak the truth, the whole truth, and nothing but the truth.

The examination was very brief, and proceeded upon the lines of evidence given before the

bench of magistrates at Richmond. I said what I wanted to say; and then out I came.

Vera looked at me with anxious and troubled eyes; but the nervous tension added a set look of firmness and almost fierceness to the whole face, as though she had prepared herself to go through fire and water, if need be, for the man she loved.

She was expecting every moment to be the next witness to be called. But we had to wait, and waiting in such circumstances is more than a trial—it becomes a martyrdom.

And then the door once more opened, and a court official came out. 'Are you the witnesses in the Carrington case?' he hurriedly asked in the gruffest and roughest of whispers.

'We are,' I said.

'Well then,' he continued, 'you needn't stay any longer; the Jury has thrown the bill out. They found there was no true bill against the prisoner, and so the case is at an end.'

And as I turned to Vera she just threw herself into my arms and cried like a little child.

Six months afterwards there was a very grand wedding at Bath. Sir Thomas Weston certainly did the thing well. And I did my little best; for I had the privilege of placing Vera's hand in Hubert's, and saying, as I joined their hands together, 'Those whom God hath joined together let no man put asunder.'

THE END.

LONDON GOVERNMENT.

By WILLIAM ABDQUIN.

I.

THROUGH the courtesy of the Deputy Clerk of the London County Council the writer, in company with a body of Overseas engineers and architects, was recently conducted over the new headquarters of London government. The present building on the Surrey side of Westminster Bridge has been erected at a cost of three million pounds. It possesses about nine hundred rooms, and when the northern extension has been completed at the cost of another million, the housing accommodation for the L.C.C.'s tremendous staff will stretch almost half-way from Westminster Bridge to that eye-sore of the Thames, which has a crossing by the name of 'Hungerford.' Much useful information was disclosed, not only in regard to the building, but in connection with many important phases of London government.

The London County Council are the largest landlords in London, their capital expenditure exceeding twelve million pounds. They house nearly a hundred and twenty thousand persons, at an approximate rent-roll of eight hundred thousand pounds. But some of the largest

individual owners are scarcely known. The 116,000 square miles of the administrative area of the county of London are divided amongst 38,200 owners. Lord Northbrook (Eltham) and Dulwich College hold over two square miles each, and the following four persons own more than one and a half square miles: Lord Forster (Lewisham), Mr H. T. B. Barron (Plumstead), Lord St Germans (Blackheath), and Sir Spencer Maryon Wilson (Hampstead and Carlton). The Duke of Westminster is the owner of three-quarters of a square mile of London territory. The Earl of Dartmouth receives rents for over half a square mile of property in St Pancras and Lewisham; Magdalen College, Oxford, owns half a square mile in Wandsworth; and the Prudential Assurance and Mercers' Companies own about the same quantity throughout London.

II.

In connection with the furniture contained in the building there is one fact which is not generally known, and that is, the seating accommodation for members is of oak, some of which is believed to be several thousands

of years old. It was found some thirty-five feet below the level of Villiers Street, Strand, during the process of erection of the Hampstead Tube at Charing Cross Station. The columns and pilasters are monoliths of Veine Dorée, an extremely beautiful marble quarried over five thousand feet above the sea-level in the Italian Alps. 'The heating and ventilation of the chamber,' said the guide, 'are obtained by air which is drawn from alternative positions on the fifth floor, is completely saturated at a predetermined temperature, automatically controlled, and all dust is removed. In the chamber an individual supply is provided for each occupant, and the direction of the current can be regulated by the lever in front of each seat.' The clocks in all the rooms are worked by electricity; there are six boilers in the sub-basement for supplying hot water through thirty miles of pipes to 2150 radiators, 690 basins, &c., and the staff refreshment-rooms and kitchens, which are designed to supply two thousand luncheons a day. When completed there will be four miles of corridors; four million floor blocks will have been used in the work; the total area paved will be about eighteen acres; and hundreds of miles of electrical wire will be required.

One of the most interesting disclosures made concerned public health and the disposal of sewage. It appeared that formerly the drainage was carried off in open watercourses, which was unsatisfactory. Afterwards, main sewers, running approximately at right angles to the Thames, discharged their contents at different points within the London area. The great innovation, however, was the construction at different levels of sewers running from west to east, which intercepted the sewage and conveyed it mainly by gravitation to outfalls well below London—at Barking on the north and Crossness on the south side of the river, five pumping stations being erected to assist the flow of the sewage. When the sewage reaches the outfalls it is run into reservoirs. The solid matter, or sludge, is then precipitated, and the effluent, or clarified liquid, after chemical treatment, flows into the Thames. The sludge is deposited by special vessels in the black deep, twelve miles off the coast of Essex. One hundred million gallons of sewage and two million tons of sludge are dealt with every year, the length of the sewers running to three hundred and seventy miles. In addition there are two thousand miles of local sewers controlled by the authorities. The total cost of maintenance in 1922-1923 was £617,000.

III.

The L.C.C. have a million children in their schools and some 160,000 students in their evening institutes. Their new education officer, Brigadier-General G. H. Gater (who is only

thirty-nine years of age), joined the army at the outbreak of war as a private soldier.

The ages of the students in the evening classes range from fourteen to seventy-eight. The curriculum includes all subjects which are calculated to equip one for a professional, a literary, or a commercial career. Laboratories and workshops are distinct from class-room education, in which technical and scientific instruction is given right from the elementary to the most advanced stages, thereby releasing at the polytechnics and technical institute rooms for development along technological lines. Law is taught by lawyers, hygiene by medical experts, journalism by journalists, banking and the like by specialists who are well versed in their subjects, and, what is equally important, know how to teach them. At the same time 'it links up all the different grades of institutions by numerous scholarships, which enable boys and girls to pass through every grade of education from the lowest to the highest without payment of fees, and with the assistance of maintenance grants. Every London home has the chance offered to it for the clever boy or girl to pass right through from the elementary school to the university, and there win the highest academic honours that the country can bestow.'

When excavations were commenced on the site of the building, for the purpose of laying the foundation of it, an old Roman boat was discovered, which has been presented to the British Museum. The coins and rounded stones found in it have enabled students of antiquity to form the conclusion that before the upper and lower marshes (which are situate not far from the structure) were converted into arable land, the occupants were fisher-folk, who inhabited rough hovels on adjacent territory. It may incidentally be remarked that in the days of Roman London the site of Westminster Abbey was known as the 'Isle of Thorney,' and historians state that it was the centre of a busy trade. Merchants would ferry across the river and essay to negotiate the crossings of the marsh, which were precarious, expansive and swampy, and often resulted in the loss of valuable merchandise. The site of the present building was known in bygone years as 'Pedler's Corner,' a notorious resort of river thieves of the period.

SEPTEMBER.

NIGHTS full of beauty; calm and gracious days
That lay cool hands on Summer's fervid hours;
Fruit ripening fast in quiet country-ways;
The garden-beds ablaze with gorgeous flowers.

So comes September in a regal dress,
With vine-leaves crowned and golden harvest moon.

O who amid this Autumn loveliness
Could sigh for Spring, or miss a vanished June?

E. MATHESON.

Chambers's Journal

SEVENTH SERIES

CLAY IN THE HANDS.

By EUSTACE AINSWORTH.

I.

TO say that man is the creature of circumstance may be true enough, provided that Circumstance is admitted to be of the female sex. Circumstance must be, of course, for she will not be gainsaid. John Storrs discovered that fact at the mature age of forty-two, but he will be dead and in another life before he realises how inevitable was his defeat.

For close on twenty-five years John Storrs had concentrated his whole energy upon the upbuilding and extension of Wilberforce, Storrs, and Wakefield, at the head of which he now stood. Wakefield had died very early in the venture, and Wilberforce had become so alarmed at John's ambitious notions that he had suffered himself to be bought out at a large profit, and spent the rest of his years accusing John of having swindled him out of the business. John did not mind that because it was not true, but as time passed and nothing came to him but wealth, and work that brought more wealth, John began to speculate upon the saying that it is not good for man to live alone. There was something so isolating about great success. It cooled a man's old friendships, as one by one comrades of early days found the pace too warm and dropped behind, and hung one up, so to speak, between the everyday working crowd, from which John had sprung, and Society with a capital initial, which—so far as John could detect—consisted largely of the grandchildren of such men as himself. And it was in this vein that Storrs, after much careful thought, decided to marry.

Unfortunately he knew that his choice of a wife would be limited. He had gone far enough to let go the hands of one set without reaching the feet of the layer above, and the only young woman he could think of as a possibility was Wilberforce's daughter Vic. Wilberforce was a fool, or he would not have lost his nerve and sold out when he did, but he was sound, and from what John remembered of Mrs Wilberforce, Victoria should be well-bred in the only way that John Storrs understood that much-abused phrase. Then again Victoria was distinctly pretty, and would make a splendid hostess at Holly Bank. Of course Vic might

No. 769.—Vol. XV.

[All Rights Reserved.]

AUGUST 22, 1925.

have other ideas, and her father's constant grievance against Storrs might have prejudiced John in her eyes. But you never could tell.

So, to pass over a period rather sordidly uninteresting, John Storrs, aged forty, was married, with as much pomp as money could buy, to Victoria, aged twenty-six, only child of Robert Wilberforce, widower, of Myrtle Grove; and the happy couple left for a fortnight in Cornwall, subsequently taking up their abode at Holly Bank.

Victoria had a free hand to take up, or be taken up by, whom she wished, and on those occasions when entertainments came out of working hours, John was a complete success either as guest or as host. His simple directness and modesty made friends on all sides, and the fact that he was completely at ease himself in any company assisted Victoria's social success.

'Must I know the people at the office?' she asked one day.

'Not unless you choose. I'm the only link between this house and the business.'

'Dad thinks I should. He says it's snobbery not to be friendly with the other directors' wives.'

'Rubbish. The snobbery is on their side. I don't know them myself.'

'Dad says it's their only chance of getting onto the Assembly list—'

'That's not my department,' John replied. 'Do as you wish. Personally, if I were you, I would not. But it's all the same to me.'

'Then I won't,' she said, with a feeling of relief.

II.

The months passed, and John found that, as usual, he had made no mistake. Vic was charming, slight in figure, quick, and clever enough to conceal more intelligence than she displayed. Her manner, while apparently deferential, was fearless and unhesitating, till from small venturesome beginnings she succeeded eventually in ruling John and his household as that gentleman had never been ruled before.

Strictly speaking, it had not been a love match, of course; that is to say, it had not begun with any passionate or sentimental feelings on either side; but perhaps for that very reason it

passed the more quickly into that lasting stage of liking, confidence, and respect which, after all, is the shape into which successful marriages merge. In fact, if anything, the liking between husband and wife increased rather than dulled, until John could hardly imagine any request that Vic was likely to make with which he would not at once agree.

And Vic was wise. On the return from their honeymoon she had cast one shuddering look upon the furniture and decorations of Holly Bank, had said nothing at all, but had spent the next six months entrenching herself safely in John's heart. Once there, and a suitable opportunity arising, she had proposed a move into another neighbourhood, the purchase of a modernised old house, and refurnishing throughout. John had asked what it would cost, and eventually had left the whole thing in her hands.

He liked the new house better than the old, noticed the very few articles of furniture and decoration that Vic had preserved from Holly Bank, and noticed also that in every case they were things which had belonged to his grandfather when that gentleman was a tenant-farmer some seventy years ago. He was fully aware that Vic knew nothing of their history, and so began his first lesson in taste.

III.

John never talked 'shop' to Vic, but once or twice a month old Wilberforce would drive over for dinner and critically discuss the doings of Wilberforce, Storrs, & Wakefield before the servants, in a way that John did not like; nor did it mend matters when he more than hinted that he had been legally—oh quite legally, of course—jockeyed out of his share. Like many another, Wilberforce, living on an assured income of some fifteen hundred pounds a year, felt it deeply unjust that John, once his junior partner, should be making at least ten times that amount. John was very patient over this treatment, because, whenever Wilberforce said anything particularly galling, John knew that Vic was looking at him, and either said nothing or smoothed the point over with a soft reply. Vic's eyes, he sometimes thought, would be worth a million pounds if they could be put to their full use.

Unfortunately, too, John had discovered that his father-in-law, not content with annoying him, was actually borrowing money from Vic. So one day he told her that he had doubled her very ample allowance, and suggested that she should drop her father a hint that he had better draw in his horns.

'I can't think what he wants to spend so much money for,' he said kindly. 'Now I hear he's buying another car.'

Vic looked across the cosy study where a reading-lamp fell on John's copy of *The Times*, and said, 'I've often wondered why God was

so good as to give me you for a husband, John.'

'What's that!' John gasped. 'I say, you shouldn't say things like that!'

'Why, I hadn't a chance,' Vic went on, unheeding, 'and now, just look!'

'Well, look!' he agreed, 'and what d'you see? A man that can make money and can do nowt else'—John's rare emotion had swung him back twenty years—'and a woman that he shouldn't have dared to touch!'

Vic shook her head. 'A man's opinion of a woman, John—'

'Don't you make any mistake,' he interrupted, 'I haven't got no "opinion" about you, my lass. Opinions are things that haven't been proved!'

Vic laughed. 'You are certainly the best flatterer I ever met.'

'Flatterer!' he exclaimed indignantly.

'Of course. There are two kinds of flattery, John—that which a woman likes to hear, but which she knows is not true and is not meant to be true either; and the more rare kind which she still knows is not true, but which she also knows is honestly believed by the flatterer. That is the sweetest of all. But seriously, what are we going to do about Dad?'

'I've doubled your allowance, and if there's anything else you can suggest—'

'There is, though I hardly like to suggest it.'

'Go on.'

'Well, you know what's wrong with him—he has no work, no place in the world. He sees Wilberforce, Storrs, & Wakefield on every signboard through the land, and yet he knows that he's out of the concern. That's what makes him extravagant.'

'An odd reason,' John ventured.

'Not as odd as it seems. Dad is vain. He wants acknowledgment by other men, he wants to be looked on as Somebody. Did you see what a newspaper called him the other day?'

'No; but what matter? What do they call me?'

'They call you John Storrs, and every time the printer puts your name in type he raises his hat.'

'You certainly know something about flattery,' he remarked with a smile; 'but what did they call the old man?'

'They called Dad "Mr Robert Wilberforce, father-in-law of Mr John Storrs."'

John laughed quietly and looked into the fire.

'And you see that just makes Dad mad, and he goes out and buys a car, or does some other foolish thing, simply to attract attention to himself. Of course his view is all wrong, but it is his view all the same.'

'Well, we're not responsible for his views,' John said; 'if it's just a matter of money, up to a certain point—' But as he looked across at his wife an extra brightness in Vic's eyes nearly stopped his heart.

'Couldn't he go on the Board?' she suggested, after suffering a long scrutiny from John's troubled gaze.

IV.

This was something entirely new. Never since their marriage had Vic asked for anything for old Wilberforce, and never had she attempted to interfere with the Firm's affairs. And not only was Vic attempting this astounding thing, but, unless he was much mistaken, she was on the point of tears.

Of course he could shelve the matter, as Wilberforce himself always did when a disagreeable question arose, but it was not in the character of John Storrs to take that line. On the other hand, suppose Vic were to lose her tense control for a moment and positively cry! It was a terrible predicament, and took John's mind back to the first week of the war when his accountant had told him, with a white face, that strictly speaking the Firm was insolvent; and John had sacked him there and then.

Wilberforce on the Board would be impossible. John's directors were heads of departments only, who spoke, each in turn, on their own specialised subjects and then held their peace. The policy of the Firm was in one pair of hands, and there it must stay. Yet supposing Vic should cry!

'Couldn't you arrange that he had no real authority, signed cheques or something like that, as lots of other directors do who don't really direct?'

'The cheques are signed by the cashier,' John replied.

'Then they could be countersigned by Dad; that makes it easier still. You once said that the only things Dad could do were to keep books and buy broadcloth, whatever that may be.'

'You don't understand, Vic,' he replied, the unusual use of her name showing that he was distressed. 'My directors are merely heads of departments. Sykes, for instance, is cashier, and runs the financial side; Ellison is buyer; Murgatroyd has charge of sales, and so on; and at Board Meetings these fellows just speak on their own particular subjects. The "directing," as you call it, is done by me.'

There was such a tone of finality in John's voice, so complete a refusal, as though the thing asked for were entirely out of his power to give, that Vic turned away to the fire. He watched her adjust one piece of coal after the other with the tongs, her face still averted, and then sat in torture as she went quietly out of the room.

V.

It was the biggest thing John Storrs had ever done. He cast his mind back to every seeming disaster that had loomed up before his path or chased him wildly through weeks of tight money and bad debts in early days, back to the time when even his bank had for the

moment lost confidence in John Storrs's ability and had shut down on the Firm in the middle of a big deal; but none of these things had shaken his nerve in the same way.

Yet what could he do? Not that the presence of Wilberforce on the Board, with limited power, could do much harm, but the cardinal principle of deciding every such thing from an absolutely hard and fast test of increased efficiency ruled it out. What would the secretary, or Sykes, Ellison, or Murgatroyd think of his wisdom if he brought that old fool back onto the Board? There could only be one opinion amongst them, that John Storrs was losing his grip, that his judgment had ceased to be infallible; and there was no room for opinions such as that.

The house was deadly quiet. Suppose Vic were actually crying now. She would do it in complete silence. She would never show her disappointment, for fear it should cause him grief. Then John remembered that she had not said 'Good night.' There could only be one explanation of that fact; she dare not trust herself to speak. But Wilberforce must not come on the Board.

John sat up late, the paper still lying untidily on the floor, and then went quietly up to his dressing-room, where he crept into a seldom used bed and lay awake all night.

VI.

During the next ten days no stranger would have noticed anything but the most cordial comradeship between husband and wife, because neither had any intention of expressing what lay at the back of their mind. That John, for instance, had occupied the dressing-room for the first time, and still occupied it from sheer reluctance to open up the difference that lay between them, passed without comment; whilst Vic had only changed, if at all, in a greater attention to John's comfort in little details, which, of course, merely increased the tension that hung in the air.

John went out of his way to refer kindly to Mr Wilberforce on several occasions, and Vic looked gratefully at him while venturing the opinion that the old man was very comfortably fixed and much better off than he deserved. She even volunteered that her father had nothing whatever to complain of any more than had she. To which John countered, 'Still, he's your father, and for that reason I shall always be in his debt.' In fact, things could hardly have been worse.

Then came the fortnightly Board Meeting, and John, bravely reminding Vic of the fact, warned her that he might be late home.

To John the world, as he was beginning to love it, had come to an end. In business, if one disagreed with a man, well, one disagreed and talked about the disagreement so openly that in the end it often formed the basis of a friendship

that lasted through life; but with women it was different. Women were so set on having their own way—in fact you could not stop them. But he had stopped Vic. That was the awful part of it. Women should never be stopped, he felt sure of that, and yet he had done it. He sometimes wondered whether he were different from everyone else, whether, as Napoleon had said of himself, he was not a 'man' but a 'thing.' In business, yes. Business and private life, money and affection, were divorced as the poles. He had defied his wife, and made both her and himself miserable. It would last for the rest of their lives. He began to wonder whether it was worth while. Suppose he sold out and went to live in the country—let old Wilberforce onto the Board? No, that would not mend matters. The new Board would turn the old fool out and the trouble would begin all over again. Well, it could not be helped. Apparently Fate took a swipe at a man every now and then, and the man just had to grin.

The secretary coughed and looked at his watch.

'I beg your pardon,' John said; 'go ahead.'

VII.

John listened to the reading of the minutes, signed them, and thereafter for three-quarters of an hour tried to pay attention to reports and suggestions read out by the others round the Board. He wondered whether he would ever again succeed in keeping his home affairs separate from his business. In time, of course, he would get hardened, he supposed. Vic would become just an obliging lady-housekeeper and entertainer of his friends, while he would spend more time at his club. The mischief of it was that this was the ideal with which he had started off married life. It had only been lately, for the last six months perhaps, that his home had become a joy to him such as he had never expected could exist.

'I beg your pardon, Mr Sykes?' John was punctiliously polite at a meeting of the Board.

'I was saying, Mr Storrs, that it might be better if the Firm's cheques were signed by another director after being countersigned by me.'

'What for?' John snapped. There was a flavour of repetition about that suggestion. It was what Vic had proposed. He remembered now.

'It is customary,' Sykes went on rather uneasily, 'and as a matter of fact the bank would prefer the arrangement from their own point of view.'

'There's no one here who has time to do that properly,' John replied, looking round the Board. 'We're all stretched to capacity, and what use would it be for one of us to sign as a matter of form?'

'None, Mr Storrs,' Sykes agreed. 'What I suggest, with all deference, is that another director be found, part of whose work would be to keep track of finance. This business is very large and growing fast—'

'Another director!' John gasped. 'But who?'

Apparently no one cared to reply at the moment, so Mr Ellison, who was buyer to the Firm, chipped in.

'That gives me an opportunity, Mr Storrs, of pointing out a weak spot in my department, which Mr Sykes's suggestion might help to remedy. In the early days, when we were mostly concerned with broadcloths, Mr Wilberforce was of the greatest assistance, having been more or less brought up to that particular business. But now the variety of purchase is so large that it would add to the efficiency of my department if some assistance could be given, say twice a month, in that particular direction.'

'Wilberforce!' John exclaimed, gazing from one to the other of his faithful servants.

'It was more or less of Mr Wilberforce that I was thinking,' Sykes remarked. 'If you will remember, sir, Mr Wilberforce, though a little limited perhaps in vision, was a most reliable man at books.'

VIII.

John Storrs pushed the clean blotting-pad along the shiny table and sat far back in his chair. This was a most astounding thing. And then like a flash there came to him, as it had come many a time before, a feeling that Fate was on his side after all. Over and over again in a busy life he seemed to have rescued a project from wreck by clinging to some fragment of luck, and convincing himself that that showed the way if he had but nerve to follow; and over and over again his luck and courage had carried him through.

Wilberforce lay between him and happiness. The heads of departments would think him crazy if he put the old man on the Board; worse even than that was the fact that Vic had interfered with business, had tried to cloud hard facts with sentiment, and that could not be done. And now the Board themselves were asking for the very same thing, not from any sentiment, but as a matter of pure business. He saw it at once. Sykes was right, so was the bank, and Ellison, usually a most reliable man. They had talked it over, of course, as business men should, and had decided that Wilberforce was the best man. Why? Because he was a good bookkeeper and could judge broadcloth as few others could. Quite sound.

So, 'Why Wilberforce?' he asked.

'Easy man to handle,' came from the secretary, a pencil still between his teeth. 'I should do it, Mr John.'

The secretary was the only man who still spoke of 'Mr John,' and then only when he

particularly wished to impress Storrs with his earnestness and to recall with a single word the years of devotion that he had given to the Firm.

'You would?' John said slowly, but with an air of relief. 'All right, then we'll agree on that. Any other business?'

'I think not, Mr John,' the secretary replied; and as the Board filed out of the room John was astounded to notice that each man turned at the door and made him an uncomfortable, almost shamefaced, little bow.

'What's the matter with those fellows?' he asked the secretary, who was collecting his books. 'There seems something unusual in the air.'

'Times change, Mr John,' the other replied casually, 'and influences are set to work. But you're making no mistake. Leave Wilberforce to me.'

'I'm afraid of him interfering——' John began.

'I know. Leave him to me.'

'Well, I hope it will turn out all right. I can't do with him near my room——'

'Leave him to me, Mr John, and you won't know he's here.'

'There are times,' said John to his old secretary as they left the room together, 'when I feel, as you said just now, that there are influences at work——'

'Good ones, Mr John, good ones.'

'No doubt; and yet it gives one an uncomfortable feeling to be swept off one's feet.'

'It's momentary,' the other replied, helping John into his ulster. 'Just once in a while influences may conspire against a man, and he's drowned; and at other times, why, they just sweep him right up onto the shore!'

IX.

'I've got some news for you,' John remarked, after Vic and he had settled down by a blazing fire.

Vic looked up with a smile. 'It's good news, too,' she said happily.

'How d' you know?'

'How should I not know?' she replied. 'I saw it written all over your face when you came in.'

'Yes, it's good news,' he agreed. 'Your father's to go on the Board.'

Vic put down her empty coffee-cup and crossed to the other side of the hearth, sitting down by John's side on a deep settee.

'But are you sure it's wise?' she asked anxiously.

'It's necessary,' her husband corrected.

'John,' said Vic, slipping an arm round his neck, 'you don't deceive me the least bit! You're just a great big, transparent, darling bear, and there isn't another woman in all the world with a man to her name one half as good!'

'Well, well,' he said, taking gentle possession of her hand, 'maybe there were influences at

work, who can tell, but it'll be all right! It'll work out all right, you'll see!'

Of course, he ought really to have told her that he was half driven to it by his own Board; but then John Storrs was wise. Vic was getting what she wished and John was getting the credit for it, which he certainly required. A true recital of the facts could do no good and would positively do harm. So, 'Well, well,' he repeated slyly, 'maybe there were influences at work; who can tell?'

But the curious part of it all never came to John's knowledge, namely, that the wives of John's trusty directors were all added to Vic's social list and helped gently up to the heights of their several ambitions, including the Assembly balls.

After all it had been quite simple. Here was the great John Storrs driven to abject misery by a slip of a woman like herself; was it too much to assume that his directors were in some manner under like distress? The secretary had, of course, been the man to tackle. He had known her as a child. And the secretary, while non-committal as regards himself, he being a bachelor, had been of opinion that under the circumstances the heads of departments would probably agree that Mr Wilberforce was the man required. The rest was easy.

On the other hand it would have been foolish of Vic to explain to John just how the thing had been brought about. That would deprive John of his comfortable feeling of satisfaction and could do no good at all. So she nodded in sage silence and returned the pressure of John's hand.

As for Mr Wilberforce, he spent the very short remainder of his life explaining to casual acquaintances how Storrs had tried to run the concern himself, and had been obliged to bring him in at the end to keep the great Firm on its feet.

So that in that way everyone was pleased.

TRAMPING SONG.

O ROUGH the way,
And steep the brier,
But light the heart I carry;
For I've no care,
No grief to bear,
No cause to turn or tarry.

I trudge along
With idle song,
And never look behind me.
To-day's the day,
And this the way—
The past holds naught to bind me.

I love the trees,
I love the breeze,
I love the world around me.
No tears I weep,
And sound's my sleep,
For happiness has found me.

C. ETHEL EVANS.

CABLE-LAYING ACHIEVEMENTS.

AN EPIC OF THE SEA.

By J. and S. HARRISON.

I.

EMPIRE rests on communications. The Romans, with the menace of the barbarian ever at their frontiers, were able to maintain their boundaries, only because they were careful to construct fine military roads wherever they ruled. The earlier far-flung empire of Alexander the Great had fallen to pieces very soon after his death; for, in the absence of any consolidation, any welding together of subject territories by means of a network of communications, it was easily possible for a tributary monarch or governor to rebel successfully against a central government.

In comparatively recent times, in 1815, after the first phase of colonial expansion, the British Empire consisted mostly of insecure trading outposts and penal settlements. In a world of uncertain and difficult travel it seemed that the Empire was incapable of any real development. Two factors were, however, presently to enter the lives of men, which seemed to cause the world suddenly to become smaller. The steam-engine and the electric telegraph solved, in the course of a few decades, two of the chief problems which faced Britain. The railway made the unification of India and the development of Canada possible, and the steamship provided a means of transport and a weapon of defence of a potency hitherto undreamed of.

It was the electric telegraph, however, which swept away the age-long difficulty of administering over extensive sparsely-inhabited territories. Because of it the British Empire has become, in the course of only a century, a consolidated group of nations capable of infinite development. And the United States of America is an economic unit with an electric nervous system linking up all the centres of her activities.

But the civilised world is now become one wherein the oceans are the highways, and the spanning of the length and breadth of those highways with the electric cable is one of Britain's proudest achievements. In these days, when three hundred and twenty-five thousand miles of cable have been laid, and the industry is capitalised to the extent of sixty million pounds, it is hard to realise that only eighty years have elapsed since the first submarine telegraph lay on the bed of the sea.

II.

On 23rd July 1845, the brothers Jacob and John Watkins Brett addressed themselves to Sir Robert Peel (Prime Minister and First Lord

of the Treasury) with a proposal to establish a general telegraph system, including a cross-Channel cable. They were referred to the Admiralty and the Foreign Office, and, as is usual with government departments, months were wasted in futile correspondence. Eventually a concession was obtained from the French and British Governments authorising the brothers to lay a line from Dover to Calais. The cable, which was a single strand of copper wire covered with gutta-percha half an inch thick, had weights fastened to it at a hundred yard intervals. The line lived long enough to deliver a few incoherent words and a complimentary sentence to Louis Napoleon Bonaparte. It transpired that a Boulogne fisherman had hooked the cable in his trawl, and, thinking it to be a new kind of seaweed, had cut a sample out of it. But his ignorance was far more forgivable than that of the critic of those days who was of the belief that one pulled the cable after the manner of mechanical house-bells, and who gravely pointed out that the bed of the Channel was too rough for the submarine cable ever to be a success.

The message fortunately had the effect of saving the concession, which was renewed by the French Government in 1850. The failure had made investors shy, and until some few weeks before the expiration of the renewal new capital was not forthcoming. The undertaking was saved by the energy and talent of Mr T. R. Crompton, an eminent railway engineer, who raised the necessary fifteen thousand pounds, of which he himself subscribed half.

Crompton's cable consisted of four copper conducting wires, each covered with gutta-percha, the bundle being wrapped in Russian hemp. The outer cover was composed of thick galvanised iron wire to protect the insulation from chafing. This cable was the true forerunner of the modern type; it proved to be a lasting success, for it was worked until the beginning of the present century.

III.

In 1857 certain bold spirits embarked on an attempt to lay an Atlantic cable. They did so in the face of popular prejudice and scientific ignorance. The Astronomer-Royal announced that 'it was a mathematical impossibility to submerge a cable in safety at so great a depth,' and that 'if it were possible, no signals could be transmitted through so great a length.' Owing to the impossibility of finding a ship sufficiently large, the cable was carried in two

steamers. One started from the Irish coast, and the other was to meet her and join up in mid-Atlantic. When three hundred and eighty miles had been paid out the cable was broken, owing to the misjudgment of the brakeman. Besides losing a year of time and three hundred and thirty-five miles of cable, the expedition cost a hundred thousand pounds.

The many errors of the first attempt led to more care being taken with the second, and in the following year the fleet made a series of experiments in the Bay of Biscay before proceeding to actual operations. This 1858 attempt would doubtless have succeeded had not one of the cable ships, the *Agamemnon*, struck a particularly violent storm. The occasion was one of enormous hardships, for the steamer, a warship, was unsuitable for her task. The crew worked with the utmost heroism in the endeavour to keep the appointment in mid-Atlantic, the arrangement being that the two boats should splice the cable in the ocean and then proceed, one to Ireland, and the other to America. So badly was the *Agamemnon* buffeted that of her crew of two hundred, forty-five were in the sick-bay suffering from the effects of injuries and exhaustion. One had a broken leg, another a fractured arm, and a third had his fingers crushed off in holding to what he thought was a ledge in the planks. Unfortunately it was the beams straining apart, and when the ship righted herself they closed up together. One of the crew was driven out of his mind with terror.

The *Agamemnon* and the *Niagara*, however, kept their tryst and, after splicing the cable-ends, started on their journeys, only to return within a few hours because of a breakage. Again they started . . .

It was only after a return to port and an entirely fresh beginning that the cable was completed, and on 16th August 1858 England transmitted the following message to the U.S.A.: 'England and America are united by telegraphy. Glory to God in the highest, on earth peace, goodwill towards men!'

Unfortunately for the life of the cable the electrical engineer of the Atlantic Telegraph Company believed in very high-tension currents for signalling, and the line breathed its last on 20th October. It had, however, proved its usefulness in transmitting messages to Canada announcing the quelling of the Indian Mutiny and cancelling an order for troops to return to England.

iv.

A considerable feeling of disappointment reigned everywhere. There was much difficulty in obtaining capital for another venture, though the American Civil War stimulated capitalists to further efforts. Mr Cyrus Field, as a special inducement to his fellow-countrymen, preached the doctrine in the U.S.A. that a cable would

be a means of helping America to capture the grain market which was so largely held by France. His mission had the warm support of John Bright and other free-traders. What success he had may be gathered from the following letter written by his brother:

'The summer of the year (1862) Mr Field spent in America, where he applied himself vigorously to raising capital for the new enterprise. To this end he visited Boston, Providence, Philadelphia, Albany, and Buffalo, to address meetings of merchants and others. He used to amuse us with the account of his visit to the first city, where he was honoured with the attendance of a large array of 'the solid men of Boston,' who listened with an attention that was most flattering to the pride of the speaker addressing such an assemblage in the capital of his native state. There was no mistaking the interest they felt in the subject. They went still further; they passed a series of resolutions in which they applauded the projected telegraph across the ocean as one of the grandest enterprises ever undertaken by man, which they proudly commended to the confidence and support of the American public. After this they went home feeling that they had done the generous thing in bestowing upon it such a mark of their approbation. *But not a man subscribed a dollar.*'

The fact must be recorded that the enterprise, like all the previous ones, was entirely British, the work of British brains, British capital, and British labour, stubbornly fighting against unprecedented difficulties.

v.

In 1865 enough money had been subscribed for a new attempt. The single cable-laying ship for this venture was the *Great Eastern*, the conception of Isambard Kingdom Brunel. It is a pity that she was not available at the time of the laying of the first cable. She was in advance of her time; for nearly ten years previous to her use by the telegraph company she had suffered three different ownerships and had, for the most part, lain idle.

On 23rd July 1865 she left Valentia. When forty-eight miles of cable had been paid out a fault was indicated, and the ship had to pick up and examine ten and a half miles of cable before it could be discovered and rectified. This happened again at seven hundred and sixteen miles and at eleven hundred and eighty-six miles, when, after a series of accidents in which the lifting tackle was lost, the *Great Eastern* returned unsuccessful.

She had, however, indicated unsuspected possibilities, and money was found for the 1866 expedition, largely through the faith and determination of Mr (afterwards Sir John) Pender. The giant steamer left Valentia on the *thirteenth* of July, and during a successful

voyage of only fourteen days laid her cable, once more joining the two continents.

On 9th August she again put to sea, and recovered the 1865 cable six hundred and five miles from Newfoundland. After repeated failures the cable was hooked, and on 2nd September the steamer was in communication with Valentia. Six days later she completed the line, thereby making two cables to join England and America within three months.

There followed upon these achievements a boom in submarine telegraph enterprises, and in 1872 Sir John Pender amalgamated the various short-length cables between England and India and formed the Eastern Telegraph Company. Within a few years his concerns were operating lines as far as New Zealand and Shanghai, southward to the Cape, and across the Atlantic to South America.

I'll put a girdle round about the earth
In forty minutes,

wrote the author of *A Midsummer Night's Dream*, little suspecting, no doubt, that science would so far outvie magic as to girdle the earth in eighty seconds. But His Majesty the King, when he opened the British Empire Exhibition, sent a message right round the world and back to Wembley in this amazingly short space of time. 'I have this moment opened the British Empire Exhibition' was flashed from Wembley to Penzance, and thence *via* Fayal, Halifax, Montreal, Vancouver, Bamfield, Fanning, Suva, Auckland, Sydney, Adelaide, Perth, Cocos, Rodriguez, Durban, Cape Town, St Helena, Ascension, St Vincent, and Madeira back to Wembley; also from Sydney *via* Singapore, Madras, Bombay, Aden, Suez, Alexandria, Malta, and Gibraltar.

VI.

The advances in laying and transmission have resulted in an enormous reduction in rates. The pioneer Atlantic Telegraph Company began with a minimum of twenty pounds for twenty words, with one pound for each additional word. By stages it dropped to thirty shillings for ten words of five letters each, and now it is possible during a week-end or in the night-time to send telegrams *via* Imperial or Western Union from door to door, from London to certain towns on the Atlantic seaboard of the U.S.A., for five shillings for twenty words and threepence per additional word. (The ordinary rate is a shilling per word.)

The war service of the cable companies is a proud one. The call from the Motherland reached the outposts of the Empire almost immediately after the declaration of war. In international diplomacy the cable proved itself invaluable. Without it, decisions made within a few hours, and arrangements completed in a

few days, would have taken many months. Throughout the time of hostilities much special work was undertaken in laying and repairing cables all over the world. The most remarkable of the war-time expeditions was the laying of a telegraph from Peterhead (in Aberdeenshire) to Alexandrovsk, by the ship *Colonia* under the supervision of the Post Office. This was performed in 1915 in the cold and darkness of an Arctic winter.

Within four hours of the outbreak of war, Germany was entirely devoid of cable connection with the U.S.A. One line was taken in at Penzance and another was diverted from New York to Nova Scotia. A third was captured by the French at Brest. A year later the crew of a German cruiser landed at Fanning Island and cut the All-British Pacific cable there. The notorious German raider, *Emden*, met her fate after cutting the Eastern Telegraph Company's line at Keeling-Cocos. She succeeded only after the superintendent had sent out the alarm signal which led to the *Emden's* ultimate destruction by the cruiser *Sydney*.

Twenty thousand miles of German cable was captured during the war, for these lines mostly passed through the English Channel.

VII

In the period after the war the cable companies, in common with the rest of mankind, have had manifold difficulties to contend with. During the time of fighting no cables excepting Government ones were put down, and repairs became overdue. The traffic had nearly doubled, and the result was serious congestion. In spite of the competition of wireless, however, the submarine telegraph systems continue to grow; one company alone spent three million pounds on new cables recently. Where secret and reliable transmission is essential the cable holds undisputed sway, for it is not affected by atmospherics, and its messages cannot be picked up by any ingenious schoolboy.

Among recent scientific improvements is the use of automatic relays, wherein the human element is entirely eliminated. Men are necessary only to see that the machines are working properly, and to feed the tape that has been punched out by the receiving machine into the transmitter to the new cable. When one remembers how many times the King's message at the opening of the Exhibition was relayed, it is possible to realise the immense advantage arising out of the freedom from human error that the use of the machine ensures. Carefully compiled statistics by the Eastern Telegraph Company show that the percentage of error in manual working is 1.90 per cent, and with machine relaying 0.37 per cent.

An innovation for use on duplicated cables (and all cables are now duplicated) is one which enables two messages to be transmitted simul-

taneously in one direction while another is being transmitted in the opposite one—three messages on two wires. Hence local calls can come through without interfering with long-distance telegrams.

Last year the greatest of the cables to date was completed. It extends from Weston-super-Mare to Far Rockaway, Long Island. It is capable of transmitting twelve hundred letters per minute—six hundred from each end simul-

taneously, a capacity nearly twice that of any other long-distance cable. The slender strands continue to reach out along the bed of the oceans, and the electric network is drawn more closely over the world; though through the ether spread the messages of the new wonder. Each has its sphere of usefulness, and such compelling agencies mould our civilisations, though most men are ignorant, or shut their minds to a knowledge, of their achievements.

HOW ABOUT WATER?

THIRTY years ago this was the oft-repeated question on the gold-fields of Western Australia. It was the all-important query put by the men who met on their travels in opposite directions. Each was anxious to know what were his chances of finding water on the track that lay ahead of him—for upon water life depended.

When in 1891-92 Bayley and Ford rode the 120 miles from Southern Cross and discovered Coolgardie, they 'blazed' the track for thousands of their fellows. In making the journey they took a great risk, for they would meet no one who could tell them where water might be found. They could go for two or three days on the water they carried, but if, before that time expired, they failed to find other water they must return, or die on the track. In their particular case the season favoured them. Rain had fallen not long before and here and there rock-holes had been filled. Also, there was young green herbage for their horses. But rainy seasons were rare in that part of the state, and the men who followed Bayley and Ford did not meet with equal good fortune in finding water—or gold, for that matter!

A marked feature of the country lying between Southern Cross and the eastern gold-fields is the presence of immense dome-shaped masses of granite. These rise, dark and sombre, above the surrounding forest and scrub, and, in area, may cover many acres. For the most part their surface has been worn smooth by weathering, and very little vegetation grows upon them. Here and there on these domes may be found holes worn by some process of attrition perhaps, and in these water may frequently be found. The natives named them 'gnamma' holes, but I do not know the precise meaning of the term. The capacity varies from a few gallons in the greater number of holes up to hundreds of gallons in a few. The water is fouled with the dead bodies of birds, mice, and lizards; but famished men are not faddy, and it was found that after the more solid 'remains' had been picked out, and the water boiled for tea, no harm came to the drinker.

But larger and more permanent supplies were necessary to provision the thousands of men

who tramped along the track to the wonderful gold-fields. The immediate demand was met for a time by the discovery of what were called 'soaks.' The water, shed year by year from the granite masses, disappeared in the soil at their bases. And men, urged by dire necessity, dug for it. They found it, not perfect in quality because of the presence of salt, magnesia, and other minerals in solution. But it was water, and drinkable, and that was what was wanted. Very soon, however, this supply was found too small to meet the demand. The soaks quickly drained, and the cry still was, 'Give me water!'

Wells were sunk deeper, and large supplies of water were met with at no great depth—but salt and bitter! Very much more salt than seawater, and heavy with dissolved minerals. But the men were not to be beaten by drawbacks such as these. They built condensers, and from the bitter liquid produced an absolutely pure water. It was tasteless and insipid—but it was water on which life could be maintained.

The condenser-plants were primitive, but effective. The ordinary 400-gallon iron malt-tanks were brought into use. They were usually placed tandem-fashion in pairs, with a connecting pipe. One edge of the tanks rested on a rough masonry sill, and masonry—stones and mud—was built around and upward to the edge of the tank. The end elevation was diamond-shaped. The masonry formed a flue through which the heat of a wood fire circulated freely. When once the water was brought to the boil a small fire kept it under steam. The steam passed from the boilers along hundreds of feet of piping, and was condensed into water by the air and stored in tanks. The solids in the water fell to the lowest angle of the tanks, and could be removed through an opening as required.

The sinking of wells and the erection of condensers were pushed on vigorously, and at intervals of not more than twelve miles they bordered the road to the fields. They made the journey safe for man and beast. But, as a rule, the man had to pay sixpence a gallon, and at first the price was higher. It cost money to water a team of horses, but the

teamster passed it on to his customers, and it was they who had to pay.

At these watering-places there usually were one or two eating-houses, built of house canvas and galvanised iron. Here, in addition to food, customers could get a wash; but they were cautioned not to throw away the dirty water. This had to be emptied into a near-by tub. Thence it passed back to the condenser, and again came forth as pure drinking water. The idea was not pleasant!

Then some man—name unrecorded—who was possessed of a fine stock of common-sense, deplored the loss of good water that during rains ran to waste from the granite domes. Acting on his suggestion, the Government caused deep gutters to be cut round the bases of the domes, and tanks to be excavated in the earth at the lowest point. And this simple scheme saved many million gallons of water from being wasted. Whenever these tanks were filled the condenser-men were thrown out of business for the time, and they would curse the Government heartily. But, being practical as well as profane, they set to work to overhaul and repair the condenser-plants, ready for the day on which the tanks would be dry and useless. Seeing that the average annual rainfall in that part of the state is about nine inches, they never had long to wait.

But the cry was still 'More water!'

The supplies that had so far been obtained sufficed only for the most urgent needs of the people, and were also very dear. There were few people who could afford to buy water for a decent bath; a sponge-down from a two-gallon bucket of water at long intervals was a luxury, and not within the means of everybody.

The gold-mines also were calling for water, and wanted it by hundreds of thousands of gallons per day. At first the supplies of salt water met with in shaft-sinking sufficed, and for ore treatment the salt water was not harmful, but it could not be used in boilers to raise steam. For this purpose condensing had to be resorted to, but the results were meagre in face of requirements, and very expensive. The cost amounted to a minimum of twenty-five shillings and a maximum of seventy-five shillings per thousand gallons. Strict economy was practised, and no exhaust steam was allowed to blow to waste; it was carefully condensed, and the water returned to be again used. This system still obtains, and no feathery plume of waste steam is to be seen anywhere floating in the air.

For the energetic and thorough development of the mining industry it became an urgent necessity to bring water to the mine in great quantities and at the lowest possible cost to the consumers.

This was brought about, ultimately, by means

of a scheme initiated by the late Mr C. Y. O'Connor on behalf of the Government. A weir was to be formed at Mundaring, in the Darling Ranges near the coast, and from there water was to be pumped to Coolgardie and Kalgoorlie. The estimated cost of the scheme was three million pounds, and the daily supply of water to be 5,600,000 gallons. The length of the pipe-line was 351½ miles, and the maximum height of lift 1290 feet. Eight pumping stations were provided at various points along the line until, from the highest point, Bullabulling, thirty-two miles from Coolgardie, the water was able to gravitate to Kalgoorlie.

The foundations of the Mundaring weir were begun in May 1898, and the charging of the great main was started in April 1902. This water reached Coolgardie, at 328 miles, just before Christmas 1902, and Kalgoorlie in January of the year following. It was a great work well carried out, and has stood the test of time. Moreover, it reduced the price of water to five shillings and seven shillings per thousand gallons.

Not only did it serve the needs of the gold-mine—it saved the railway great expense in hauling water for the locomotives; and as time passed districts adjacent to the pipe-line demanded water, and were supplied by branch pipe-lines. Farmers drew upon it for their needs, and here and there on the gold-fields beautiful gardens came into being and glorified places which previously had been the abomination of desolation.

The pioneers of the track had carried their meagre supply of water in canvas bags or in canteens, on foot or by horse and camel. To-day the traveller on the railway follows the same old track, and the great pipe-line is in evidence the whole way.

But farther back, beyond the reach of the Mundaring supply, the travellers along the bush tracks still ask the men they meet, 'How about Water?'
E. D. C.

THE LIKENESS.

YOU, whom I asked for a portrait,
You, who bade me 'forget'!
Who would bury the jewels of Passion in the
grave-cold sands of Regret;
What of the night-wind's whisper, sweet and
faint as your sighs?
What of the blue of the heavens—the fathom-
less blue of your eyes?
What of the cornlands that borrowed the glorious
gold of your hair?
What of the lark's high ecstasy?—the thrill of
your voice is there;
What of the poppies that matched your lips, when
we gathered them dew-wet?
You, whom I asked for a portrait,
You, who bade me 'forget'!

A ROMANCE OF THE REEL.

PART II.

IV.

MRS FRASER had not much to explain to her visitor that he had not already overheard, though he paid most careful and properly astonished attention.

'And who—who is this young lady, Mrs Fraser?'

'She is Miss Sheena of the Lodge.

'Miss Sheena Cattanach?'

'Yes.'

'Ah!'

'Perhaps you know—' suggested Mrs Fraser.

'No. Only, it was a big enough obligation to be under for the fishing; but when it comes to getting your life saved as well, it—it embarrasses, Mrs Fraser.'

'Indeed, no!' she vouchsafed. 'Miss Sheena herself would just enjoy it. She'll be round to see you this afternoon for certain.'

'You see, I got the two or three days from Mr Robertson, the factor in Edinburgh, for whom I did a little commission. It seems Mr Cattanach has an interest in antiques.'

'They say he would just sell his soul for a bit old picture, and as for the gallery of pictures he has—there's no end to it. Some of the things that queer-looking and foreign, the keeper was telling Kennie that he wouldn't be seen taking them away in a barrow for nothing.'

Davie ventured his timid smile, but no comment.

'He doesn't fish much himself nowadays, except maybe an odd time. But there are friends who come for spells now and then. The last of them is that dark, foreign-looking man—and he's just going. The fishing is really over now, but in the spring—'

'Yes, in the spring,' said Davie Dunbar. 'I can understand.' And his eyes became contemplative.

And when Mrs Fraser thereupon retired to make him something, he dreamed of the great annual spring run and the swift, strong bodies cleaner than new silver. . . . Till slowly, imperceptibly, there crept over his dreams a shadowy film, the dark pool gripping at his deathly experience became darker, the leaping fish more uncanny, more symbolic of the fear-some. He tried to shake it off as a man strives to shake off a horrible imputation on the thing he loves. And he knew it was not altogether mere fear engendered by the physical mishap as a mishap. It was something elusive, sinister, like—like that picture of his, which had so strangely been at once illusion and reality when he had been going down—down. 'Just sick fancies,' he mumbled. And after Mrs Fraser

had ministered to his needs he felt decidedly more able to cope with all shadowy things. 'And that picture—after all, it's a mere surface fancy o' a mad painter, who must aye twist every clear, sweet feeling into something contorted and unchancy.'

He shook himself. He tried to feel better, to get a grip of the philosophic imperturbability that winds with the doric. 'Ah weel, tae a richt mind the mischance was no-but the kitchen tae the triumph; an', Gudesakes, is he no' eichteen pun'? What wad Jamie say tae that!' But the picture remained, the shadow haunted. 'Mistress Fraser!'

'Yes! Yes!' She came quickly.

'I was jalousin' mebbe that as muckle speerits as wad gang i' a thim'le—'

She looked at him, vainly striving to follow.

He pulled himself up, coloured a trifle. 'I thought perhaps a spoonful of whisky—'

'How stupid of me—' And just then there came a knocking. 'Now I'm not thinking but that will be Miss Sheena herself come to see you;' and the good lady bustled to the front door.

Mrs Fraser's expectation proved to be correct, and presently Davie Dunbar saw his door open and a young woman enter, bringing with her a fresh cool swirl of air that fanned his face, his senses, with fragrance of the wide out-of-doors.

'Mr Dunbar! How glad I am to hear you are little the worse of—of—'

'Ma dookin'' were the words that rose impulsively to his lips, wildly, and that he only just managed to choke down. For the light that he thought he had visioned on her face was there naturally. His heart began to beat unreasonably. And she finished her sentence not with words but with a smile where humour blended perfectly in a soft-welling sympathy.

'No, I—I am none the worse. Thanks—thanks indeed to you!'

'That was nothing—nothing at all;' and she sat down on the chair by his bed. 'Though I take not a little credit, perhaps, for having acted the gillie so well!'

(Exit Mrs Fraser, with a mumbled reference to a 'message'.)

'It was the first time ever—ever I had a gillie,' said Davie; 'and—and,' concluded Davie in a rush, 'it was worth having gone without one for. I mean—'

Her eyes danced. Her colour rose a shade. 'It is kind of you just to mean that,' she said.

And suddenly looking into her eyes, he smiled. She was so plainly no-but a bit lassie herself. A sudden warmth whirled about his heart. 'You saved the life of a poor old man—'

'Who was fighting like ten young ones!' Plainly she was going to take no thanks. 'How stubbornly you refused to give me that rod!'

'So they have been telling me. But I had tried so hard to get into him, was it any wonder?'

As eyes met smiling eyes a perfect accord seemed to be established.

'And then—' she began, as on a sudden impulse, and paused.

He noticed the hesitation, the slight instant sobering of her expression; but in a moment it had passed.

'Tell me,' she said cheerfully, 'did you see me coming?'

And for an instant there was a slight sobering of Davie Dunbar's expression also. 'Well, yes—' he hesitated.

She looked at him.

It came in a rush. 'To tell you the truth, I saw you and yet I didn't see you.' He forced a doubtful smile.

'You mean it was just a glimpse?'

'No, it was a picture,' he said; 'but it just shows you how the mind gets all mixed up at such a moment. I have a picture in my shop in Edinburgh—and it was that picture that seemed to rise before my eyes. It sort of fitted in—and it was that I thought I saw. But really, it is foolish of me mentioning it at all. Actually I did see you, of course.'

'How interesting! And what is your picture like, really?'

'Oh, a foolish old-fashioned picture!' Drat the picture! There was no need to have mentioned it at all.

'But now you have roused my curiosity! You must tell me. You say it "fitted in."'

'Well, that's just what it didn't do in a way.'

'In what way?'

He twisted in his bed a trifle. She laughed. 'Surely the picture is not so bad as all that?'

He gave in. After all, it was foolish to pretend there was anything in it. By holding back he was merely creating the wrong sort of mysteriousness.

'Well, you see, the picture has a great sombre pine wood in it. I don't mean your pine wood holds any of the darkness. A pine wood, and out of it a woman is escaping on horseback. That's all. It did fit in a little as a picture, didn't it?'

She nodded, but a queer intangible uncertainty had been created. 'Escaping, you say?' she asked.

'Yes, yes. One of those old symbolic things, you understand. Virtue flying before the darkness, and all that. Merely a silly hallucination of mine at such a moment!'

'That's queer,' she said quietly.

He looked at her. 'How could it be queer?' he asked with a sudden gentleness.

'Well, I can imagine how heavy is the

feeling of debt one has to carry when some one else has saved one's life. I can understand that, believe me. And I have thought it might lighten and make glad the burden—if, if at the same time some compensating great service had been done that some one else.'

His eyes watched her invitingly, waited.

She suddenly looked at him impulsively. 'You did me a service, too, by—by diverting me. Before I saw you I was not flying from that pine-wood with fear in my face. I was going into it, to an appointment, with black misgiving, yet somehow mesmerised, knowing I shouldn't, yet going—desire, fear. . . . Oh, I can't explain, but to-day—I know that I—escaped.'

There was a listening silence of revelation between them for a moment, then his hand came out and caught hers. 'You saved a poor old man's life, and now how deeply happy you have made that old man's heart in the saving! To have waited for that was worth my whole life.'

The white flame of earnestness, fear, that had touched her face, gradually receded before returning colour, a softening in the eyes. 'You said that about the gillie, you know!'

He smiled, and there was a brightness upon his face. 'But what I will say to my own heart will be known only to myself—and no one else shall hear a mystic word of it.'

v.

The year dies and the year is born. And the rebirth, according to the poets, is accompanied by many signs and wonders from the fancies of a young man to the red on a robin's breast. Yet to Davie Dunbar the poets missed the subtlest wonder of all, for the fancy and the feather, the flower and the sap—these, like the blessed poor, we have always with us. There are other things.

He moved about the shop restlessly. Twice he went through to the back-place, where, away from Jamie's measuring eye, he could behold the picture that hung above his own little desk. The amount of diplomacy, of tact, he had had to exercise in order to get it removed from the immediate purview of Jamie's salesmanship! How lame the excuse that he 'thocht he wad keep it by him a wee'! The removal of the sale ticket with its cryptic lettering that, being translated, signified £3, 3s.—Jamie's price, argued out on the basic value of the frame! He had not looked at Jamie, and putting as bold a front on it as possible, had simply walked away ben with the picture, feeling the while Jamie's eye like a shaft in the small of the back.

Not that he had dared absolutely to forbid its sale. But who, beyond a deluded and gambling Yankee, would ever offer five shillings? In its possession he felt perfectly secure.

And in the little universe of it, the picture signified much to Davie. Already time was

lending its enchantment, smoothing over the physical harshnesses of a past misadventure, of a past Adventure, leaving only the subtle meanings, the deep significances, the strange wonder. A little universe wherein he had acted the principal part—even if too literally he had blundered into acting it. It was something to have lived for. And how exquisitely kind and just Fate had been to him, even in that matter of the salmon. Ah, that was a matter! Yes, the picture was a magical picture, even with its shadow, with its still undissolved film of the uncertain.

Not that that shadow had anything any longer to do with a dark pool and leaping fish. It stood for the life of a young woman, who had wavered within the edge of it. And that life now? Davie gazed at the fleeing figure, the fear on the bright face, till his gray eyes softened.

He turned away from it again, came through to where Jamie, with emphatic niceness, was polishing the silver on a great cairngorm brooch. Jamie did not pause in his rubbing, paid no attention to the figure that moved about restlessly, yet every rub indicated that he was enigmatically privy to much.

Davie wandered to the door, looked abroad, and found the air of a fine thin blueness tempered by an enlivening suspicion of frost. It was early afternoon, very still, and full of a sort of listening reverie. He sniffed the air. The coolness ran along his veins. No, it wasn't reverie, it was an awakening. It was spring. The time the poets speak of so inadequately. On a sudden impulse he turned to the only figure near him, and 'They will be running noo, Jamie!' he said softly.

Silence hung portentously, till there was the sound of the brooch being laid on the top of the glass case with a metallic deliberateness.

'I wad hae thocht,' said Jamie, 'ye'd 'a' been cured o' that; cured o' a' that, by now!'

Colouring a little, Davie laughed uncertainly. 'Hoots, man, it's the best winter season we've ever had! We're gettin' rich!'

'Yes, I'm no' denyin' the season; an' for the first time oor stock hes reached pre-war heicht—if no' a little ayont.' And thereupon the brooch was taken in hand again.

'Weel, then—I dinna see—'

Jamie waited ruthlessly, but apparently Davie had thought better of it.

'P'raps ye dinna,' agreed Jamie at last. 'P'raps ye dinna.'

A position of the most delicate; losing none of its difficulty because Davie knew in his heart that Jamie's concern was not altogether for the business. Had he not sternly refused to let Davie work in Davie's shop for a full week after the return from Glenuel, because he, Davie, was alleged to 'hev a colour on him that micht weel frichten a decent customer'? Of the most delicate—yet to be faced—yet how?

His dilemma was resolved in a manner that appeared to him little short of the miraculous, though, when regarded calmly, there was possibly nothing out of the way in the fact that Mr and Miss Cattanach of Glenuel should elect, as usual, to break their long northern journey from London at Edinburgh. Yet he most indubitably glared upon them as they advanced, in the body, to his very doorstep.

'Ah, Mr Dunbar!' It was her voice, her face with the clear light on it. Her hand came out quickly. It took him yet a moment to respond, and even then his handshake was half-mechanical. She laughed. 'I have brought dad with me. Besides, I think he was a little intrigued over the perfectly lovely silver!'

That did it! Davie had sent, privily, one or two exquisite pieces of old Tudor silver by way of acknowledgement of the Adventure. The pieces were, of course, his own, and, everything considered, there was no need of running the gauntlet of any salesman's comment, verbal or silent. 'Nothing, nothing at all!' he hastened to say, and turning immediately to her father, 'How do you do, sir?'

Mr Cattanach acknowledged. 'My daughter has often spoken of you.'

In build the two men were not unlike, and the blue eyes of the owner of Glenuel Lodge had much of that dreamy quality which not infrequently lay like a mist of reverie in the gray eyes of the dealer in antiques.

'And,' said Miss Cattanach, 'this is Mr Graeme.'

Then Davie looked upon the third member of the party, who proved to be a young man of a hand-grip in which there was the friendliest lack of indecision.

'Welcome, welcome, indeed!' said Davie, half recovered, the other half still overcome.

'And now we are going to look at all the queer things you have. May we?' Her understanding was subtle. Davie as host came to himself in a moment.

He ushered them into the shop. He introduced Mr James Forsyth, and thereupon, without apology for store or stock, he indicated such treasures and curios as he possessed. He had really a rather fine collection of old Georgian silver, over which he was inclined to linger. But as he warmed to his task in front of such obvious interest, he even unearthed an unusual knowledge of the homely cairngorm—and its foreign birthplace.

In the end they reached the back-shop, where the more choice items were kept. He preceded his visitors, and then, turning to welcome them in, suddenly interrupted a little action that in its instinctive nature told him something more surely than would the most intimate words.

The light from a side window shone right across the rather small room on to the face of

his picture, lighting it up with an arresting glow. Sheena Cattanach saw it on the instant of entry, caught her breath, paled, and before the instant had fled had gripped instinctively at the arm of the young man by her side. So plain was it that she sought shelter there, protection, from some suddenly resurrected nightmare of the past, sought it naturally, spontaneously, that Davie Dunbar's eyes shifted to the face of young Graeme with a sudden benign understanding. He saw the young man's face quicken, a fine face, as he instinctively pressed the arm that caught at his and looked from the frightened face to—the frightened face on the canvas! Then the young man laughed, the tolerant laugh of the young male who is lording it protectively over life's beatitudes. 'You look nearly as scared yourself!' he said.

But Mr Cattanach had also seen the picture. 'Ah, I think this is a little more in my line, Mr Dunbar. Allow me.' He went up to the picture.

'Tell me—why did it scare you?' asked young Graeme quietly, still smiling.

'Oh, nothing!' she replied, the blood stealing back as she removed her arm. 'Nothing!'

He looked at her a trifle curiously, if still smiling. She felt the scrutiny; could not help showing confusion, discomfort. Then Davie intervened. 'I'll tell you,' he vouchsafed. 'Did Miss Cattanach ever relate to you how she once saved an old man from drowning?'

'Perhaps, from other sources—I have heard—something —'

'Well,' said Davie, 'there's the pool, there's the lady herself coming headlong, and I have the honour of being the old man who was rescued.'

'Well, by the horn spoon of my forefathers——' began young Graeme; when Mr Cattanach, doubling up his pocket lens, quietly observed, 'If it's agreeable to you, Mr Dunbar, I should like to make an offer for this picture.'

And in a sudden, stark moment Davie, overwhelmed, turned his gaze blankly on the speaker. 'An—an offer?' he stuttered.

Mr Cattanach smiled. 'Yes. Your price?'

'But—but,' searched Davie desperately, 'it isn't—it isn't worth buying.'

'Possibly, to be frank, you're right; but still, as it is, I should like to buy it. We have our whims, Mr Dunbar.'

There was a little hollow of silence.

'Perhaps, dad, Mr Dunbar does not care to sell.'

Her father paid her not the slightest attention. Indeed, he ventured equably, 'Would ten pounds meet you?'

Davie's lips twitched a little. 'It's really not worth——' he began, and failed.

'Well, let us say twenty,' pursued Mr Cattanach.

There was a hollow of silence this time large enough to include them all, to include the whole shop. Davie heard his heart beating in it. Sheena gazed at her father as though she had never seen him before, gazed for the first time on the smooth, gentle, but deadly inscrutability of the sale-room. The tension had to be broken. Something must be said. It was said, however, after such a fashion that Davie nearly jumped.

From the doorway leading to the front-shop, Jamie coughed. At twenty pounds the picture changed hands.

(Continued on page 620.)

CHOUNANE—ONE OF LIVINGSTONE'S AFRICAN HOMES.

By DUNCAN MACKENZIE MACRAE, M.A., M.D.

I.

SINCE my first visit to the Bechuanaland Protectorate, some sixteen years ago, I had often heard, from old government officials, that Dr Livingstone's first missionary settlement among the Bakwenas—of which Sechele was chief—was not far from my present station, Gaberones, a place which, since this territory came under the protection of the Crown, has been the seat of a magistracy, as well as the chief centre for the police and medical establishments for the Southern Protectorate. I had, however, never met any one who had been on the spot, or who could give me any more precise information as to its actual locality than that it was 'somewhere in the Transvaal—not very far from here.'

Gaberones Camp is situated on the northern

bank of the Notwani River, a periodical stream which, with the neighbouring Marico and other watercourses, gives its annual tribute to the beautiful Limpopo, or Crocodile River. It even receives honourable mention from Gordon-Cumming, who, as he tells us, sometimes gazed with delight upon its crystal waters. It is only, however, after very heavy rains that it ever approaches to the tint ascribed to it by the great hunter; for, during the summer season, with the exception of a few pools, it is a dry watershed.

Men who knew Livingstone and Gordon-Cumming I have met and conversed with, notably Chiefs Khama and Gaberones. The latter (at the moment of writing) is still living in this village, hale and hearty, at an age not far short of a century. A native missionary still lives at Molepolole, the present seat of the Bakwena tribe, some thirty-seven miles distant

from Gaberones, who saw Livingstone at Kolobeng in 1848 or thereabouts. In the same village lives one white man, the son of an old elephant-hunter of Kolobeng—Lottering by name—who saw him about the same time. All this, however, by the way.

I had read in a South African paper, in 1913, that the site of Livingstone's house at Chounane had been enclosed by a fence, under the direction of the National Bible, or the London Missionary, Society, I forget which. As my duties invariably confined me within the limits of this territory, I had all but despaired of ever being able to see a place which I very much wished to see, if for no better reason than that it was once the home of one who, possessing no assets beyond that immortal energy and lofty idealism which have raised the Anglo-Saxon race to its present position of supremacy in the world, has carved his name deep in the hearts of his fellow-men. My wish was at last gratified in quite an unexpected way.

II.

One morning, in August 1922, I received an urgent message to go at once to a farm in the neighbourhood at Ramoutsa, a little railway siding distant eighteen miles from my station here. I got into my car—motoring is a comparatively recent innovation here—and started on my journey in a drizzling rain, which, by wetting the hot sandy road, made travelling quite delightful. Here I may say that, as most of the roads in the Southern Protectorate follow the tracks of the old hunters, some of them for considerable distances are admirably suited for motoring.

On my arrival at Ramoutsa, I was told that the farm at which my services were required was still about fourteen miles distant, right across in the Transvaal.

Taking for my guide and companion a weather-beaten Scot, who had spent thirty years of his life as a trader in this part of the Protectorate, I turned away sharply to the left, passed through part of the village (or *stad*) which gives its name to the railway siding already mentioned, and crossed over into the Transvaal, where I found myself on a road made and kept in excellent condition by the Union Government. After proceeding for less than a mile on this road, I again turned off to the left along a somewhat rougher road. After little more than half-an-hour's easy driving, I found myself at a comfortable-looking farmhouse, which, on inquiry, proved to be my place of destination.

As soon as I had attended to the farmer's wife and children, the inevitable cup of coffee, which the traditional hospitality of the Dutch South African almost religiously prescribes for the stranger within his gates, was handed to myself and my companion. During the oppor-

tunity for general conversation afforded by this gracious custom, I asked my kind host, *inter alia*, what the name of his farm was. He replied that it was called 'Sechele's Old Stad.' The name Sechele set me thinking, and I again asked him if the Bakwena tribe had, at any time, lived here. He replied that they had lived here before they went to Kolobeng; that Dr Livingstone had also lived here with them; that the remains of his house were about a mile distant; and that, if I cared to see it, he would be very pleased to show me the way along a good road which he had made to his cattle-dip. I was not slow to accept his offer, and, in a few minutes, I found myself at the ruins of Livingstone's house.

Here I may state that the wooden fence which was erected to protect it a few years ago is now level with the ground. The larger corner-posts alone remain; for the smaller posts have been eaten by white ants. I could not help thinking it a pity that nothing more durable than a wooden fence should enclose a spot sacred to the memory of Livingstone. For, though it may be truly said of empire-builders such as he, '*Si monumentum queris, circumspice*,' yet, something more worthy of his fame might have been erected here at very little cost. If the Scottish churches would be willing to do anything in the matter, it would give me great pleasure to carry out their wishes. The English, and even the Irish, have already done something in the way of preserving the sites of some of his African homes.

III.

It was not without emotion that I first beheld the ruins of a house in which, nearly eighty years ago, one of the greatest men of the nineteenth century, with his heroic wife, braved the solitude and dangers of the African wilderness. The place is not, by any means, beautiful, and the cloudy skies under which I first saw it quite obscured whatever attractions it might possess under the brilliant African sun. It stands quite close to a long low range of hills, below which winds the dry bed of a large periodical stream, or *spruit*, at which the Bakwena tribe once watered their flocks and herds. The cattle-dip referred to occupies the site of the original well which supplied the settlement with water, while, not far away, on a barren, stony slope, may still be seen a slight trace of the old native village.

The mound of earth which represents all that is now left of Livingstone's house is roughly about 120 feet long, by about 30 feet wide. It was evidently built of raw brick, as may be proved by a careful inspection of the foundations. To this place Livingstone came from Mabotsa, a spot which lies farther south, where he had his all but fatal encounter with a lion. The house at Chounane was the second he had built

with his own hands; that at Kolobeng was the last in sub-tropical Africa.

The physical aspect of the country here has not, I should say, greatly changed since Livingstone's time. More trees there may have been, for it was then virgin forest; but I doubt if it was even then a heavily-timbered country. The present trees are of a stunted kind, consisting mostly of low scrub and bush, as well as the ubiquitous mimosa. Eighty years ago, however, this part of the Marico valley had much of the fascination which might well 'lend to loneliness delight,' for it was practically alive with innumerable species of wild animal—lions, elephants, buffaloes, and even that now rarest of big game, the white rhinoceros, as well as buck of almost every variety and size. To-day, beyond the small species of buck called the 'duiker' and the 'steenbok,' or an occasional covey of guinea-fowl or Francolin partridge, there is little to attract the sportsman. On his moving from here to Kolobeng, Livingstone tells us that the lions became so bold that they walked up to the house, much to the alarm of his wife and servants, who were afraid to go out of doors after evenfall. What a change indeed 'twixt then and now!

Here Livingstone was visited by Gordon-Cumming and Oswell, and here also, if I mistake not, he did some kindness to Mr Webb of Newstead Abbey, which the latter right royally returned on Livingstone's first visit to England.

Before leaving the place on my first visit I promised to return some day to get a photograph of it. A year later, with my wife and two children—recently arrived from England—I again paid homage at this all-but-forgotten home of one who was an honour, not only to the medical profession, but to the human race. We remained on the spot until nearly sunset, and the glory of the African sun alone redeemed it from the appearance of desolation which struck me on my first visit to it in a drizzling rain. While I tarried, musing on the paltriness of the lives of so many of us, by comparison with that of this great altruist, the evening shadows, shrouding in purple splendour those hills which he knew so well, warned me that I had still before me a journey of thirty-two miles. I left the place with a feeling of sadness, the immortal words of Thucydides sounding in my ears during my homeward drive: '*Andrōn gar epiphānōn pasa Gē Taphos*' ('For of illustrious men the whole earth is the sepulchre').

INDIAN TRICKS AND THE CAMERA.

A SUBSCRIBER writes *à propos* the article on 'Collective Hypnotism' published in a recent issue of *Chambers's Journal*:

When I was travelling with a friend in India, a few years ago, we came one day upon one of the Indian jugglers, who was just going to perform the famous mango trick. He was squatting upon an absolutely bare piece of ground with no one near him. His apparatus consisted of a flower-pot, in which he put some earth. In this he planted something that he said was a mango seed. He waved his hands over the pot, and in a few minutes we saw a green shoot appearing through the earth. This grew and grew while we were watching, until a tall, full-grown mango plant appeared before us.

My friend was rather keen on photography, and always carried a small pocket camera about with him, and I thought this would be a good opportunity to use it. 'People at home have often heard of the trick with the mango plant,' I said, 'and I am sure it would interest them to see a photograph of it.'

My friend assented, and immediately took a snap-shot of the scene. Later on, the film was developed and proved to be an excellent photograph. The people round about came out most clearly; so did the juggler, and so did the flower-pot; but—there was no mango plant!

My second story describes an episode that is the exact antithesis of the last. It was told to

me by a young friend of mine who was an assistant physician at a large lunatic asylum. He told me that one of the patients suffered from the uncomfortable delusion that he was always being followed, and he kept constantly looking over his shoulder with a terrified expression.

Every means that could be thought of was resorted to, to prove to him that he was mistaken, but in vain. At last, the chief physician told his assistant that he had thought of a plan that might be successful. When the patient was walking in the grounds, the young doctor was to take a photograph of him, without letting him know that he was being watched. Although the patient would not believe their assurances that there was nobody near him, he would surely be convinced when he saw a photograph of his own solitary figure.

Accordingly, one day the young doctor hid behind some trees, and, waiting till the patient slowly passed, managed to get a snap-shot as the poor man was jerking his head to look over his shoulder.

The doctor hurried to the house, well pleased with himself, to develop the plate. The photograph came out most satisfactorily, and provided a good portrait of the patient, but—it never was shown to him, for close behind him was an indescribably horrible face that seemed to be just peeping over his shoulder.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

THE railway centenary has been celebrated prematurely, mainly for the convenience of some foreign visitors, for this is a world affair; but our own country, with a prideful sense of invention and leadership, specialises in the event. We made and maintain as relics the first locomotives, and a certain honour and distinction are associated with the highly industrial town of Stockton-on-Tees in the north of England, as little beautiful as such places must inevitably be, a concentration of blast furnaces, engineering shops, and the like, which appropriately indicate the roaring, ugly development of the mechanical and industrial age to which the railways gave a start. For it was on the 27th of September 1825 that the first railway passenger train made its first journey, starting from Darlington amidst much whistle-blowing, and proceeding to Stockton at the rate of about six miles an hour, preceded by a man on horse-back. Contemporary pictures of the occasion show George Stephenson and his assistants standing by the boiler or on the tender, this being also occupied by a man with a flag. Many small wagons, making up what in those days must have been considered a grandiose train, were coupled to 'Locomotion I,' that being the name given at its baptism of utility to the prime ancestor of the 'Pacific' type of engine, and the other heroes of the steam-speed of our time. The first six of these wagons, it appears, were loaded up with coal and flour, an odd and somewhat incongruous combination, yet accidentally representing two of the chief elements of human life and existence as no others could have so fairly symbolised. Some passengers sat upon the coal and the flour as if to mark the point, though innocent of such intention. An 'elegant covered coach,' as it was described, being the body of a road coach of the period set upon flanged wheels, came next, and it was occupied inside and out by the proprietors of this new 'Rail-Way' in all their pride and pomposity. Twenty-one wagons equipped with seats for passengers followed, and in the first of them was a brass band and a banner with the motto 'Periculum Privatum Utilitas Publica.' Then more coal, six wagons of it completing the train. The locomotive

weighed six and a half tons, and made an average speed with its train on that famous journey of about five miles an hour, attaining at one thrilling, ecstatic period as much as fifteen. The invaluable contemporary chronicler tells us that the fields and lanes through which the railway ran were thronged with elegantly-dressed females, and that nothing could exceed the beauty and grandeur of the scene. Yet even then doubts existed in the public mind as to whether this new-fangled contrivance would displace, as a means of transport, the admirable horse, which would always 'go,' and had been relied upon from the time of the Hittites, some twelve centuries before the opening of the Christian era. At one stage of this initial journey a stage-coach drawn by horses in the usual manner bravely challenged the train, and amid great cheering from lovers of the old order, drew level and passed it. Then it was that 'Locomotion I.' disdainfully drew upon its reserves, spurted to its fifteen miles an hour, and administered a shock to the prestige of the horse that was repeated with crushing effect a generation back from now when the automobiles came upon the roads, and left the racecourse as almost the only remaining field of distinction for the superbest quadrupeds evolved through blood and time. When the train arrived at Stockton a salute of guns was fired. Yet the victory of steam and rails over horse-flesh and the plain country roads with their pleasant hostleries at intervals was not complete. The 'romance of the railways,' of which now we often speak and write, was not established, not begun; and even when long after we came to perceive and wonder at it, was not this romance after all of that order so cold and dry, of mechanics and industrialism, permeated with the materialistic spirit? Steam was by that time hissing through the world; but let us respect and not censure our dear grandfathers for some hesitation they displayed in adopting the steam railway for their occasional transitions. The sense and romance of the road were within them; something noble abided in their resisting conservatism. Surely they felt in their more pious moments that horses and roads were things of God, while steam and rails were just the toys of man. So the horses galloped along

the roads, the horns were blown, the stage-coaches rattled up to the sign of the White Lion as of yore, and the Turpinian spirit was still maintained. Let us bless their memories for it.

* * *

Steam has been like a high priest of the god of Progress; but in these days we probe into the old religions, and some pertinently ask if the world be truly better and happier for the steam and the Progress—and the wars which they assist—and likewise if we should have sensed the need of such had we never known them. Railways have been the mainspring of all the fierce industrial and mechanical progress of this age, and now we have reached a trembling point of doubt and fear. A thesis might well be developed at a Union debate at one of the universities, where primary problems are treated by the students with a fresh and vigorous regard for essential causes, on the question, 'Have the railways been an unmixed blessing to our modern civilisation?' The young orator would argue plausibly upon the strife of industrialism, the rapid expansion of populations through the increase of speed and the extension of the world, accompanied by its virtual shortening of distances, and he would discuss the greater necessities created by these results, the ferocity of competition fomented by political jealousy, and so with good logic would he reach his climax, that had there been no railways there would have been no Great War as we so sadly knew it—other wars certainly, but not like that—and the world would not have contained the suffering and the dread with which it is permeated now. The speakers in opposition would assuredly reply with great force of argument and evidence, maintaining that railways had brought immeasurable happiness to humanity, and had assisted towards the refinement of human life. In the end the voting would be in favour of these defenders, and the railways would gain the official blessings of these wise young men. They are now as the basis and the beginning of every form of industrial effort and world expansion of every kind. Let us suppose a new piece of country is being claimed for the white men from its savage possessors. Then three things happen in usual order: the flag of the pioneering nation is planted in the soil; a number of the demurring natives are slain; and the construction of the first railway is begun. Nothing in this affair of railways could be more impressive than the fact—to which, for some political reasons, less than the utmost publicity is given—that a network of quite excellent railways is being laid over the Sahara Desert and the rest of French central and west Africa. Myself I have travelled on them whole days in the desert, with only a rare oasis to relieve the terrible monotony of these vast sandy plains, and in such circum-

stances time and opportunity have been afforded for hard thinking, and also temptations towards some uneasy ruminations. For the main purpose of these railways is the tapping of a source of ten million black troops and making quick transport facilities to bring them north when needed. Now we may be less disposed to cast scorn upon our great-grandparents for such hesitation as they showed in adopting railways when they were first presented. Superficially they had doubts upon efficiency and speed; deep within them I think their instincts were subtly touched with formless fears upon the consequences of such a gigantic disturbance in the prevailing order. And, to those who had known nothing better, nor conceived any future chance of it, ten-miles-an-hour on the main roads behind good horses, in a coach to carry fifteen, was good travelling; and if a wheel were shed and a gentleman atop were pitched into the ditch, it was taken as a common part of life in a frequently irritating world—as missing a connection in a journey of changes through the lateness of our first train, or the bursting of a tire of our automobile is now. Ten miles an hour was the best that could be done; often the pace was less. It is in the records that a man who left Sheffield at three o'clock arrived in London thirty-six hours later, though the distance is only 165 miles. Yet he probably grumbled less than would an Edinburgh gentleman who, leaving Waverley before eleven o'clock at night, and sleeping all the time, reached London at only forty minutes past seven in the morning—or twenty minutes late, after fifty miles an hour. Again, I imagine that they regarded the world, the scheme of things and the degree of progress that had been achieved, with less discontent than do we now. Education, scientific discovery, invention, and industrialism, while supplying them with many pleasures and conveniences, had not whirled them dizzily into a state of existence where, panting and uncontrollable, they could only ask for more of these drugs that had captured them. Did not many of us living now, so much possessed by the delirium of progress, feel when we were very young, a peculiar sympathy, even an attraction, for the old mail coach that we read about, though even then we were travelling forty or fifty miles an hour on the railway?

* * *

Most of those now in the section of elders have keen memories of certain scenes of their childhood that may have had a thrilling interest for them at the time or, in the opposite, have been of no interest or importance, having caught upon remembrance in that capricious manner which makes diversion for our personal human records. The eye of my memory has retained many of these visions, old and dear friends peopling them in love and kindness; but the other senses have been less diligent and exact

in their perpetuations. The palate has kept perhaps one odd trophy from its youth, the ears the same, touching can produce nothing from the past, but no scene is more vivid to me now than are certain odours that in those early days seemed to strike upon the nasal sense with a magic exhilaration. They were strangely diverse, and all were not sweet so much as pungent. Remembrance of the scent of hawthorn blossoms in the lanes when so lightly we loitered there, is common to us all, and the smell of the hayfields too. Malt and hops were heartening odours. Many scents, some of which have never since been smelled, can be remembered, but chief of them is the peculiar penetrating smell exuding from a railway steam engine in certain circumstances, most commonly when it is at rest, and, maybe, engaged in 'blowing off steam.' This smell seems made from a mixture of special locomotive steam, some smoke, and a breath from the hills and valleys from which the engine has come, for distance and travel are plainly suggested in it. It is not produced in any other way. Fixed boilers and engines and those belonging to ships cannot prepare it, and it is good that the most modern engines with all their wonderful contrivances do not seem less efficient in the production of travel scent of steam. Each of you knows the smell; it cannot be described. Such perfume, as I think of it, is one of the most vivid remembrances of my childhood. I think I can fix upon the occasion and circumstances of my first knowing it, and probably others who once were boys or girls remember it the same. And was not a tiny railway train of tin among the first of their toys? Things of travel and wonder were at work among the early instincts. Though this magic of the railway engine, the 'Puffing Billy' as we called it, worked upon our youthful spirits, wafting a seduction from the future back to us, yet the instincts of the fathers and grandfathers, the love of a good horse, the sense of the road, the colour and variety were also strong. As little boys did we not often feel that it would be fine to return to school after holidays in the way that Tom Brown went to Rugby, by the coach? So it happened that our ancestors, in their conservatism, refused to accept immediately the railway trains as masters of the situation, and neither abandoned the coaches and horses nor showed less inclination to patronise them. The railway steam engine at the time of its beginning was not reliable. 'Locomotion I.' was always giving trouble, and the company controlling the Stockton and Darlington railway were so much provoked that at one time they seriously considered whether they should not abandon the engine entirely and use only horses for haulage. Observe that at this crisis the railway, that is, the way of metal rails for reducing the friction of haulage, was of the essence

of the change, and not the locomotive. They might have had what we call a traction engine plodding upon the roads, or horses pulling a train along the railway. Two alternatives there, and which the better to our own mind and imagination? The Stockton and Darlington company, feeling uncertain upon the combination of steam engines and iron lines, positively used horses to draw single coaches on their railway for some time after its opening, employing the engines for the transportation of coal, which after all was their main business. These horse-rail-coaches moved along at about the same speed as the road coaches, but, of course, in this way the horses were able to pull heavier loads. Stephenson was worried; many discouragements were piled against him.

* * *

George Stephenson was not really a brilliant man of fine imagination. No hero-worship need be exerted at this moment, for only in a small degree is Stephenson to be credited with the invention of railways as we, like passengers, think of them. He was an applier and an adapter rather than an inventor; but he was an excellent engineer, with a delicate comprehension of the issue from the union of steam and wheels, and he was a hard-headed Northumbrian, gifted with unrelaxing courage and perseverance. Railways existed before the Stockton and Darlington. At about 1805, a railway was constructed from Wandsworth near London to Merstham, following the direction of what is now the Brighton road. A double track was made, and the rails were laid on stone sleepers. Some of these old stones, it is said, are now used in these same parts for kerbs. But this railway was meant for horses and not locomotives, and was a success in its way for a full generation. Horses, like engines, can do better with rails than roads, and we hear of one animal drawing forty or fifty tons at a time on this railway, which served a number of mills, and lasted until the Brighton steam locomotive railway took it over. Then Richard Trevithick, an eminent engineer of Cornwall, might have started the era of the locomotive earlier than it happened, could he have found men with money to back his ideas, for he was certainly ahead of Stephenson in some respects. He, a mining engineer, worked assiduously at improvements on the steam engine, and so early as 1796 presented the high-pressure principle, and exhibited models of steam locomotives, while it seems that about 1802 he made a real one, and two years later constructed an engine which hauled wagons on a rail-road at Merthyr. But five miles an hour was the speed limit of this affair, and so long as steam in the matter of speed was no more than one-horse power, as we might say, it had no chance. Stephenson watched, adapted, improved, and kept his mind on the

essentials of reliability and speed. An engine of his, christened 'Blücher,' was tried at a colliery in 1814, and other public experiments were made before the Stockton and Darlington achievement in 1825. He, more fortunate than Trevithick, found an enthusiastic believer to finance him. Edward Pease, a Quaker manufacturer, was the man, and honour is due to him as much as to Stephenson, for he too struggled against discouragement, and spent vast sums of money in laying the rail-road, manufacturing the rolling-stock, and securing the necessary parliamentary powers. Yet, as said, the Stockton and Darlington was a doubtful venture as a locomotive railway, and we can imagine the little sneers, in the manner common to human nature at such times, of those who were being drawn along the high-ways by spanking bays, laughing that it would still be a good long time ere they were called upon to transport themselves by means of any of these new contraptions. At one moment the management of the company hesitated, and nearly abandoned the locomotives; but at a critical moment, Hackworth, manager to Stephenson, made a better sort of thing which he called the 'Royal George,' whose main feature was six coupled wheels. That was in 1827, and it staved off the horse again, though the noble and galloping quadruped was not yet defeated. Stephenson braced himself for a master-stroke. A Liverpool and Manchester Railway Company existed, and the management held a competition for locomotives not heavier than six tons. For that competition Stephenson produced the 'Rocket' with its tubular boiler, and a maximum speed of twenty-four miles an hour. The prize was his, and the future was determined. Nothing could have prevented its being settled in this way very soon. Steam, the engine, and rails were presented; the grand evolution from them was a quick certainty in spite of prejudices and failures. It would have come long before Victoria reigned, even though Stephenson had never been born. Hundreds of engineers would have swarmed to the idea. Yet, with these reservations, our thanks and praise are due to the memory of this resolute Northumbrian, who strove without ceasing, and never lost his faith.

* * *

The 'Rocket' later did better than in its competition trials. Thirty miles an hour was a speed that it often attained, and some said that once it fairly flew at fifty-two, which those who have gazed upon the 'Rocket' can only think of as an empty legend. But the main point was that the new Manchester to Liverpool railway soon began to pay as a steam-engine passenger-traffic concern. A family of 'Rockets' settled down to covering the thirty-one miles separating these cities, which were at the front

of the new industrial movement, in an hour and an half, and the receipts in the first year, estimated in advance at £10,000, amounted to £102,000! Then it was railways, railways everywhere. The country, yes and the whole civilised world, leaped to the new idea. In 1842 Queen Victoria first travelled by a train from Windsor to Paddington. Even by that time, and with all the constructive enthusiasm, railways were not familiar to the multitude, and old customs still hung upon the day. I like the idea of the queen's fussy old coachman in his powdered wig and scarlet finery pompously insisting that, steam or no steam, only he could drive Her Majesty, and thereupon mounting the engine and pretending that it was he who made it go. Even up to that moment a few grand old irreconcilables, refusing in the die-hard manner to accept facts though they loomed like mountains, had ignored the railways and declined to travel on them. The Duke of Wellington was at the head of this staunch brigade; but, hearing of the queen's journey, loyalty and sense compelled him to admit that the new day had dawned and the light would spread. Britain then was at her best. Keen and energetic, not bothering about hours and profits so much as loving her labour and her enterprise, she was setting the example to the admiring and copying world. It is curious and significant to see with what varying quickness the nations followed her in this matter. America was first in 1829, and she bought her engines in Britain. France nibbled at the idea in 1833, but the first German railway was opened in 1835. The fact in this historic series at which I wonder most is that Russia started the construction of a railway as soon as 1835; but she was not trusting everybody, especially the neighbours on her west, and so she adopted a gauge of her own, as did Spain, thinking of France, when she started a line laggardly in 1848. Austria hesitated, and Italy came in very late; but what did it matter? All of them knew that the end of one old world had come.

* * *

Strange that at this very centenary that seems to come upon us warningly, ominously, we should have reached such a crisis with our railways as they have not known since the time of their father, Stephenson; and even as the future and the good of Britain were then at stake, no less certainly is that the case to-day. Nay, we may lose more now than ever we could then have lost. We may be as proud of our railways now as then. They have serious faults, no doubt, of which in the manner of our people we ceaselessly complain; but as one who has travelled much on the railways of many countries, I am not sure that on a balance of points we are not still well the first. Only France, Germany, and America are in our class, and I give our-

selves the best. The Americans do strange things in a lurching speed over vast distances. Huddled in our green-curtained sleeping-bunk with a nigger for our attendant in the car, hearing that strange melancholy clang of the engine bell, the low sonorous tone of its occasional siren, we may feel, when forging through the middle-west and on the edge of dreams, something of the power of America as in no other way. The railways made America as they made no other country so thoroughly, and our cousins and creditors are right, apart from considerations of advantage and convenience, to build their railway stations in a grand and solemn style, suggesting cathedrals of industrialism. The first time I boarded a German train I was impressed with a sense of its material quality and efficiency. Through many railway experiences I have captured each of the special and elusive two that make completion: that is to say, I have been provided with a special train at a foreign government's command, and from a partly demolished train have been carried out to hospital after a smash upon a continental line. But of all experiences there is one, happily recurrent, which is the most emotional, and that is the immense spiritual delight that is felt by the traveller coming home after a long absence when he makes the two hours' journey from Dover to London. Doubtless the homecoming of its abstract self accounts for much of this joyous tension. The sweet, the lovely placidity of the smooth fields and gardens of Kent sings to us, with the clicking rhythm of the wheels, of the beauty and well-ordered goodness of our native land. Yet a point in this pleasant case is the quality, the comfort, and the neatness, with the politeness of the service, on our British trains. It seems better to the returning traveller than at any other time, and perhaps an effort is made to be nice to the homing vagrant. Anyhow, the clear impression exists.

* * *

At this railway centenary we smile upon the earliest locomotive, in appearance a confused apparatus whose main feature was the long, thin chimney stuck out from its front like the neck of an ostrich, while upon its back was a cage-like formation of iron rods and other engineering tackle. Power was surely here, yet not a noble suggestion of it, and we do not wonder that some of the ribald spectators of 1825 were inclined to make fun of 't' iron 'oss.' But regard the modern flyer, its hundred years' descendant, and the British strain, the handsomest locomotive of them all. By evolution that ungainly chimney has now been bred almost completely out, appearing only like a little knob to make balance at one end of a finely harmonious mechanical whole. The long, unencumbered boiler poised high is awesome and magnificent; and when at the starting a sound

and sign of force are exploded from the little chimney, and the giant wheel makes a fast slipping turn upon the rail, we take as good a sense of the pride of man as is to be gathered in the contemplation of any other thing. In time there will be no locomotives; they will die out. Much do I doubt if in another hundred years there will be railways anywhere save in some lonely parts that are distant from all new movements. Mount high in an aeroplane and, looking down upon our lovely landscapes with the fields squared out so clearly and so smoothly and in such dainty colourings as though they were a toy world for the children, see the small white smoke mark of the moving train. Thus observing it from high, free air, wondering if it moves or not, sorry that this poor slow thing should be chained down to earth like that, our instinct determines that the railways' years, many though they yet may be, are numbered. Yet flying posterity shall admire the nobility and majesty of these our modern locomotives. They seem, too, like a good sign of Britain, and there is pathos in the sign. We led the world in railways; no better symbol stands of the energy and greatness by which we strove to power. But at the very time of this centenary the will and the way to work and trade seem fading from us, these railways are drooping, and the money stock that represents their value is falling as none has ever known it fall before. The case is frightening. Britain clearly is not being true to herself as once she was. So this may be one of two things: it may be the tragic centenary, the dating of the fall, or we may take up again the sign of the noble railway engine, so strong and willing, docile, and seize the wonder of the world again.

IN SUMMERS LONG AGO.

WHAT master's pencil caught a grace
So delicate and fair?
Who flung that too-bewitching face
Upon the canvas there?
What girl was this whose budding charms
(For fancy feigns it so),
In many a breast woke loud alarms,
In summers long ago?

Did life fulfil her hopes, or cheat?
And was she wooed and wed?
What fate was hers—this daughter sweet
Of generations dead?
Divine who can; guess on; suppose;
And this is all we know:
She breathed—a fair and human rose,
In summers long ago.

Like dream, maybe, she passed away;
Too soon, perhaps, she died!
How many ardent hearts, and gay,
Have perished in their pride?
And still, to make the old heart well,
And kindly eyes to glow,
Her pictured brow preserves the spell
Of summers long ago!

D. R. ROSS.

MICHAL, DAUGHTER OF SAUL

By GEOFFREY BRADLEY.

CHAPTER I.

I.

LANE led to cart-track. Cart-track gave way again to lane. A nick across country here. A few hundred yards of main road there. And still more lanes.

What metalling there was was inches deep in winter mire. High hedges shut the darkness in and turned the lane into a gloomy tunnel, down which poured wind and rain; a lashing, drenching rain, merciless in its desire to soak through every crevice to the bone of man and horse.

As I trudged on, head down, hands under arm-pits, a bridle-length before the mare, the very tautness of the reins seemed full of protest. I told her I was sorry for my share in the unhappy business, but reminded her the fault was not all mine. 'How was I to know you'd choose to-night to lose a shoe, my girl?'

She seemed to understand. Sometimes I think horses do. The strain upon the bridle ceased. A few quick steps and she was lipping my shoulder, as if to say, 'Let's go on talking. I like to hear you talk; it breaks the loneliness.'

I rubbed her steaming muzzle with my glove. 'We were a couple of fools to leave that little pub, weren't we, old lady?' She tossed her head in most complete agreement.

The advertisement of a hunting-box had tempted me into a strange country. It seemed the very thing I wanted, and the owner had courteously suggested seeing hounds and house together. Unhappily the day was being just as bad as any day could be. A succession of blank coverts; eventually a hunt of sorts, patchy and in a chopping wind; finally to lose the fox on the edge of the country remote from my temporary home. The few stalwarts who had stayed with hounds until the end had gone their ways. None of their ways seemed to be my way, and I was left with many miles to make upon a tired horse, across a country quite unknown. Some execrable brandy and a six-inch Ordnance map upon the parlour wall had conspired to send me from the only inn that came into our line. And now? . . . John Jorrocks on a by-day was never in worse case.

Suddenly the mare began to take an interest in things. The dragging walk ceased; the drooping head was raised to bring ears and nostrils into better play. Another twenty yards and a cut-flint wall broke the monotony of hedgerow. I blessed the sight of it, not caring if it surrounded cottage or castle. Human habitation meant direction to the nearest inn at worst, and it might mean shelter for the night.

A gate appeared—an ample carriage-gate

between twin lichen-covered posts of brick. I stopped and considered. When it comes to the point, unless the case be one of real necessity, one hesitates to worry strangers at half-past nine at night. But the mare had her opinion. She made towards the gate, and her snuffing whinny clearly said, 'You surely can't be such a fool as to pass by what might mean corn and comfort!'

I pushed through the gate, agreeing. Some thirty yards of carriage-drive and we were in the shadow of a brick Georgian pile with—oh, joy!—light streaming from a shell-shaped fanlight. I found a sword-handled bell-pull and wondered if it were the rectory.

The maid had hardly heard my prologue when a door opened somewhere inside, and a voice said, 'Who is it, Martha? Mr Smith?'

'No, sir. A huntsman lost his way.'

Servant fell back, giving place to master. The glare of the hall-lamp made vision difficult, but, even in that fleeting first impression, the charm of the man's face took hold of me. His eyes were soft and strangely full of sadness. I noticed a short gray beard, well trimmed into a point. His black evening waistcoat was covered by a dark brown velvet coat; and oh, he looked so very dry!

I murmured an apology and named my destination. Would he kindly put me on my road? Or perhaps . . . as my horse had lost a shoe . . . ?

At this his face lit up. 'Of course, my dear sir. Appleford? You can't make Appleford to-night. Why, how it rains! Upon my word, I hadn't noticed it.' He turned about. 'Come, Martha! Bustle up. Run out to Tom and bid him come round for the horse. What a night it is! Appleford indeed!' He rubbed his hands in hospitable contentment. 'You mustn't dream of going on. What a blessing you didn't pass. Cator my name is—Saul Cator. Where can that Tom be?'

I mumbled what thanks he gave me time for, and added, 'My name is Guye. They call me "Major".'

Came Tom, as anxious for the welfare of the mare as his master was for mine.

'Now, come in, Major. Come in.'

That kindly Fate that watches over hunters was in good mood to-night.

II.

Ten minutes of steam-clouded joy and my mind began to move again. Here was I, wrapped in a stranger's bath-gown, having just used his bath-room as my own, sitting before the newly-kindled fire in what was, for to-night,

my bedroom. No stitch of clothing was left to me but the borrowed bath-gown. Well; I was content. The house was clearly the house of a wifeless man. Be he bachelor or widower, he was the very High Priest of hosts.

The struggling fire needed coaxing. It may be that the clatter of the poker drowned a knock; perhaps no knock was given. I faced about, and there was Martha looking down upon my limbs. Her arms were full of garments and her face was full of smiles. I felt like an infant in its bath beneath the gaze of an admiring aunt.

'Lord bless your scarlet cheeks!' she said. 'Don't you mind me, sir. I'm old enough to be your mother. Master's sent you these.' Unblushingly she wreathed a chair in underclothes and tossed a dressing-gown upon the bed. 'Not that they're *my* idea of body-linen for the dead o' winter,' she chattered on. 'But master won't put on what isn't silk, and yours are wringing still. They'll be small, too; you're such a fine one. Master's making the salad.'

The salad! I suddenly remembered I was hungry; before, it had been merely emptiness. Prospect of food and drink on top of unexpected comfort brought me near to the awful indiscretion of hugging the only person in reach.

'Martha,' I said, 'yours is the most comfortable house in England, and quite the kindest.'

She should have smiled. Instead, she slowly shook her head. 'Ay, sir. 'Tis a good house and a kind, for all its sadness.'

I tried again. 'What do you suppose I've done to deserve hot baths and salads—I, a benighted fox-hunter on a limping horse?'

Again the answer was a strange one. 'You'll have your chance to deserve it by-and-by.' She made towards the door, but turned with the handle in her hand. 'You're a bachelor, now, I'll be bound? All you huntsmen are bachelors.'

'Yes, Martha, I'm a bachelor. Otherwise I shouldn't have got lost.'

She looked me up and down as though I were a show-horse in the ring. 'I'm glad you're still a bachelor,' she said, and closed the door behind her.

Thoughtfully I donned the silken 'body-linen.' What a strange old girl she was! By Jove, though, she was right about the garments being small. As I endeavoured not to split them, I tried to sort the impressions of the last half-hour.

Why should this old servant talk of sadness in the midst of all her jollity? And what was it to her if I were bachelor or bigamist?

And, now that I thought of it, her master had left much the same impression. He too was bursting with good nature, yet his face was lined with the marks of care and sorrow. I wrapped the dressing-gown around me. After all, it must be devilish lonely living miles away from everywhere. He didn't hunt, either. No wonder the poor chap looked sad.

His knock came at the door. 'Now, sir, what about some food? May I come in? Why, you look splendid! Can you get into the slippers? It's a good thing they haven't any heels!' He led me down a shallow oaken stairway, and shouted as we reached the hall, 'We're ready, Mrs Mitchell. Mrs Mit-chell!'

'All right, sir. All right!' came cheerfully out of the distance. I found myself hoping Mrs Mitchell was the cook.

By now I was getting broke to comfort, but the sight of the room he took me into was a new sensation.

'We use this room a good deal in the winter,' said my host. 'The dining-room is bad to warm.'

No glaring electrics broke the softness. Firelight played upon the moulded ceiling; and on a polished table, naped with a single strip of lace-edged linen, two brown wax candles burned.

My host put me into a carving chair at one end of the cloth and busied himself behind me at a sideboard. I was content to listen. 'There's more harm done by that little sentence "take the chill off" than any other in the English tongue,' I heard. Reverently he brought a decanter to the fire. 'Now, where's that Mrs Mitchell? A minute and a half and it will be ready for drinking. Longer will sap the flavour.'

At the end of a minute Mrs Mitchell came. In a restaurant it would be called 'mixed grill.' I have no words for it except that it was grilled perfection. The burgundy was even better than the grill. As the last mushroom went its way, my host brought galantine and tongue. 'You help yourself,' I was instructed. 'Ah! that foolish Martha has given us steel to eat the salad with. Sacrilege! Sacrilege!' Silver was rummaged for and found.

I remembered that the salad was of his making, and stopped my simple carving to watch the service. He handled it reverently, leaf by leaf, as gardeners prepare their wonders for a show. Clearly he was to be numbered among the noble few to whom the making of a salad is an art. The chasm between bowl and salad-plate was crossed at last. I smiled for very joy to see his pride. 'There, sir!' He straightened his back. 'The dressing *should* be oil of walnuts, but Fortnum is out of it, and I never go to Paris till the spring. Still, this red-wine vinegar goes pretty well?'

I sought appropriate adjectives, mixing them freely with questions on his art. Had he been discussing theology with a pontiff he could not have given the subject greater reverence.

'Of course, it's *not* the same as in the spring.' He spoke as one convinced. 'Glass is all very well. Without glass one could never struggle through the winter. But there's something missing in the glass-raised leaves. A lack of

crispness, is it? Or something in the flavour? I've never satisfied myself.'

III.

When I had convinced him I could eat no more, he rang a bell. Came Martha smiling, and was bidden take away the broken meats.

I would willingly have kept my unlovely legs beneath the table. But there was no chance. I was put into a leather reading-chair and the protecting table wheeled away.

My host produced cigars. I expected more ritual. But now that the salad had been eaten, a load seemed lifted from his mind. He was no smoker. Tobacco leaf was clearly weed, not to be grown in the same continent as endive.

And then the thing happened. The door opened slowly and a woman came into the room. Her dress was black. Plain black, falling in graceful lines about her perfect figure. Her neck and arms were bare, and from her shoulders fell a pure white Spanish shawl, its edges drooping to below her knees. I have never seen a more beautiful effect—but then I have never seen a more beautiful woman.

You must not think I noticed all this at the moment of her coming in. Indeed, her coming completely demoralised me. I sprang up and hissed a command that my host should, for the love of mercy, hide me.

A shadow passed across the old man's face, a shadow of accustomed pain. 'Don't worry, friend,' he said. 'Your clothing does not matter.' And there was something in the way he said it which calmed my panic.

The girl walked to him, and laid a hand upon his chair-back. He was his genial self again, and embarked on formal introductions.

'My darling, this is Major Guye.—My daughter, Major.'

I took the hand—and then I saw my clothing did not matter. Her voice was just as sweet as her expression.

'How good the smoke smells!' Then, 'You are creating chaos in this house, Major Guye.'

I was. But there were dimples round her mouth.

'Since your coming, my maid no longer obeys me: I have to obey her. That is why I am here now.'

'Martha?' I asked.

'Yes, Martha. You have made a great impression. She refused to stir hand or foot until I consented to spend the evening with "the huntsman," as she calls you.'

'Well done, Martha!' I wished I *had* hugged her now.

After a while Mr Cator took his daughter's hand and patted it. 'Do you know what we should like?' he said coaxingly.

She was sitting on the arm of his chair, swinging a silken leg in and out of the massive edges of the Spanish shawl. She kissed the

top of his head. 'I know what *you* would like; but how do you know what Major Guye would?'

I was enlightened, and my entreaty added.

At one end of the room there was a heavy leather curtain shutting off an alcove. I had noticed it during my meal. A lovely thing, stamped, and with scalloped edges, like those one sees in Spanish and Italian churches.

The girl stood erect for a moment, wheeled, and walked straight to the curtain. There was a rattle of rings, a dexterous sweep of the shawl, and she was sitting at a boudoir grand. The glow of the fire and the light of the two candles hardly reached her. Only her face and the beautiful white of her neck and arms were visible. The Spanish shawl lay negligently across the top of the piano, where she had thrown it.

She played the moderns: chiefly Debussy. I felt my conservative love for the older schools melting into complete conversion. Her eyes were fixed high above our heads, but she *never* played a wrong note, and her whole soul was in the music. Such playing is seldom heard outside the concert hall.

When she had done her father said, 'Thank you, Michal.'

There was a pause; then something said, 'Michal, daughter of Saul.' It was my voice, but I was unconscious of having spoken.

I stammered a profuse desire to be forgiven. 'Really, Miss Cator, it was your playing dragged it out of me. Though I am guiltless, I apologise most humbly for my rudeness.'

She laughed away the little episode. 'Aren't they absurd old names! We might be creatures of the Bible.'

CHAPTER II.

I.

I TOOK that hunting-box, and moved my horses down as soon as possible. The season was still young, and hounds were often on that side of the country where the Cators lived. If we ran within three miles of Owlsrattle—by which strange name their house was known—I shamelessly forsook the Field and called.

As I got to know them better, I called more often. They seemed willing to throw off the veil of shyness which hid them from the rest of the county. If we were due to meet at a place nearer to their house than mine, I received a courteous invitation from Papa Cator to sleep at Owlsrattle. 'It will save your using inns,' he was wont to write. I did not mention that in these days of motor covert-hacks the need to 'lie out overnight' has disappeared.

They led a lonely life, these two. It shocked me when I discovered that I was *practically* the only visitor they had. People *had* called.

Neighbours had sent invitations. But circumstances made them naturally reserved, and the callers dropped away. He became 'old Mr Cator,' and she 'that poor girl.'

They seemed to exist solely for their hobbies. The old man had his garden. A beautiful old garden, prolific of flowers as well as of everything that goes towards the making of a salad. Michal loved her music. Sometimes a well-known pianist would be called down at great expense to give her his ideas. And once a year she would go up to town to hear some great exponent. Otherwise the house and gardens were convent and cloisters to her.

I did my best to alter it. To me it seemed all wrong that this sweet girl should have no friends; no company at all but Martha and her father. But she would not hear me. 'It is so difficult. I cannot go to other houses. I only know my way about our own. And if people come here they are uncomfortable.' I tried to persuade her it was not so. Then she would smile and say, 'Oh, but it is so. I know it is. We "see" a lot, you know.' And I would go back to my side of the county and fall to wondering if she would treat all my dreams like that.

II.

The season came to an end, as seasons must. I managed to secure a lease of the hunting-box. The country suited me, and I had made other friends besides the Cators. Thus do we justify our weaknesses!

Came a day when Cator Papa went off to Oxford. He was a man of learning and attended conferences where men discuss strange theories.

He bade me see to it that his daughter was not lonely.

The day was a fine one, and I arrived early in the afternoon.

Michal and I had often taken walks together in the gardens, but always with Martha or her father for pilot. To-day I begged her let me be the pilot. She hesitated; then put her arm in mine. 'And if you pilot me into the lily pond I'll never, never speak to you again.'

Said Martha, 'There's no need to hold her so tight, sir. She isn't going to run away.' The dear old thing pinched Michal's cheek. 'God bless you both,' she muttered; 'now I can get on with my sewing.'

It was wonderful how the girl knew her way about. She would stop in the middle of a thirty-yard path. 'We'll steal some of Hunt's violets, shall we? He's good at violets.' And there was the frame at my hand. She knew just where the seedlings were, and wanted a report on all of them. In the melon-house she astounded me by going straight to each fruit to feel how it was growing.

When we turned back I contrived to choose a way that took us through the stable-yard. My car was in a corner. I had driven the big

one over in the hope of interesting her in it. I put her into the deep back seat.

'It is shamelessly comfortable for a thing that runs about the roads,' she said. 'Now show me your seat.'

'No,' I said, 'never mind my seat. My seat is full of wheels and levers. I'll show you your seat.'

I took my place at the wheel and shut her in beside me.

How often had I driven her in my imagination! Surely it would give her pleasure to feel the wind playing through her hair as the spring sunshine was playing through it now. I put it to her.

'But isn't there a lot of noise?' she asked.

'I'll show you. Don't be frightened.'

I pressed the self-starter, and the six cylinders gently purred. After a while she said, 'How wonderful! To see a different picture every time the road bends!'

III.

We had tea in her boudoir; a tiny room, but exquisite in every detail. She knew her way about it as a cat knows her basket.

In course of time a contented Martha came to take away the tea-things. When she had gone we sat down on a deep sofa facing the dying sunset.

Talk drifted to some neighbours—the M'Gills.

'Yes, Laura M'Gill is going to be married,' Michal said. 'Her man's a sailor. A Commander Somebody. He's brave. Laura has been an invalid for years, father says.'

'But she walks about. I saw her at the Point-to-Point.'

'Oh yes, she goes about. But she is very ill, you know; that's why they go to Switzerland so often.'

'Then if she's ill she has the greater need of a Commander,' I said firmly. Michal was silent. 'And her Commander isn't brave at all; he's lucky.'

'Is Laura so attractive?'

'No; but she will need him. She will be dependent on him, and there can be no greater joy than to be needed by the woman one loves.' I was warming to my subject; it had suddenly become a most congenial one. 'If Miss M'Gill were well, her man would have nothing more to do than just to make her happy. As she is ill he'll have a hundred opportunities of being useful too. When they are married he will take care of her, and for every little thing she wants she'll look to him. And if a steam-roller ran over Miss M'Gill to-morrow and left her absolutely helpless, with nothing but her mind to fight life with, I tell you her Commander would be still luckier. People would say, "Poor man, he cannot marry her now. She can't stir hand or foot." And he, if he is a *man* and loves her, would marry her

to-morrow, and by doing so reach happiness undreamed of.'

She heard me out and said, 'You think like that?'

'I do indeed,' I answered hotly.

She spoke so softly I could hardly hear her: 'Then you must never come again.'

'Not come again?'

'I am afraid not.'

Somehow a crisis had arisen. A ghastly, nameless fear had hold of me. It had become my second nature to obey her. Supposing she should mean that I must never come again!

I bent to look at her, for she had turned away. Great tears were falling down her face. Seeing her like this drove fear and caution from me, and left me at the mercy of my passion. I took her in my arms and pressed my cheek to hers. She alone knows what I said; the form it took has left my memory. I only know my soul went out of me to her. I told her of the love I had been mastering for all these weeks. I told her that my only thought was for her to be my wife. I tried to tell her all the little plans I had for making her life different from the caged affair it had been up to now.

I could see that she was suffering. 'You do not know,' she cried; 'you do not understand.'

We cannot love what we cannot see. It is a law of nature.'

Then suddenly she struggled free and took my face between her hands. With her poor sightless eyes she gazed at me, and in that gaze was concentrated every particle of will-power she could muster. I heard her almost wail, 'My man, my man! If only I could see you!' And then some awful physical reaction took control of her. I think it is called 'rigor.'

She shook and sobbed as a waking child does after nightmare. A terrible spasm of pain twisted her; her cheeks paled, and she lost consciousness.

Perhaps I should have called for Martha. Most certainly I should have been afraid. Instead, I took her on my lap, as though she were a little child, and watched her heavy breathing. For I had seen that which filled me with hope undreamed of—hope which, in a moment, turned to happiness. Not ordinary happiness—ecstasy.

She opened her eyes, and covered them with her hand. Then she raised her head, and a hand went straight to my pocket, and drew out a green silk handkerchief.

She held it out to me and, with the calmness of complete exhaustion, said, 'Do bind my eyes, dear. The light is so very very strong.'

DEMOLITION OF A FAMOUS RUSSIAN CATHEDRAL AT WARSAW.

By 'AILSA.'

IN a country which has so much unemployment and labour unrest as Poland it seems a short-sighted policy to employ people to destroy, and yet that is just what is being done in Warsaw to-day. At the mere mention of Warsaw anyone who is familiar with the city will at once visualise in all its beauty the magnificent Russian cathedral standing in the Saxon Square, and this is the church which is now being demolished by order of the Polish Government. No matter what the beauty of the building; no matter what its purpose—it was Russian, and therefore unloved by the Poles. And one can almost imagine, if the question of its existence or destruction were put to the masses, the cry would be, as of old, 'Let it be destroyed!' There has been talk of demolition since 1920, and the building has been barricaded for years, but now its demolition is almost *un fait accompli*. It was in a state of great disrepair, and the powers-that-be said they were not disposed to spend money on reparation. Some truth in that, and yet . . . could they not let such a building venerably decay? Whatever the reason, however, one must not inquire too closely into the whys and wherefores of

continental policies; there are too many wheels within wheels. The fact remains that the cathedral will soon be no more, and one hears that the Saxon Square is in future to be used as a drill-ground for soldiers.

Since the war the capital of Poland has worn such a forlorn and dilapidated appearance that the few beautiful buildings which there are in the city have been somehow forgotten—shades of a bygone splendour, too much overshadowed by the grim reality of recent years and the drab present day. But even such beauties as did exist were swept into insignificance by the almost insolent majesty of the Russian church, built in the very heart of the capital. Situated in the centre of the immense Saxon Square, once the courtyards of the Palace Royal where lived the former rulers of Poland, Augustus II. and Augustus III., it was an imposing monument, with its one-time golden domes flashing in the sunlight. Indeed, one can hardly imagine a prettier sight than that of the cathedral seen on a summer day through the arches of the entrance to the Saski Ogród (Saxon Park), which faced the cathedral—the foreground a carpet of brilliant flowers surrounding an artistic fountain; beyond,

the simple arches, with the straight line of the bridged pillars above, giving a somewhat stern look, which contrasted vividly with the softening contours of the cupolas of the cathedral towering above, and made an effective framework for the exquisite mosaic-work which decorated the entrance. The Saxon Square itself is surrounded on three sides by uninspiring and dreary-looking stone houses, but these emphasized in an almost startling manner the isolated grandeur of the Russian church.

This immense Russian Sobor (Russian Cathedral) was erected at great expense by the Russians between 1890 and 1910, and since 1915 and until recently was used as the Catholic Garrison Church. The building was designed to give the Saxon Square a Byzantine appearance, and to dwarf the importance of other buildings in the vicinity, which was no difficult task. Later a campanile seventy metres in height was built near the Sobor in the same style of architecture. This was intended to be a lasting monument to the victory of the Russians over the Poles. Alas for the intentions of the Russians, however, for the Poles demolished the belfry tower in 1921.

The Byzantine domes—of which there were five, one at each corner and a larger central one—were originally covered with copper-gilt, but it is alleged that the Germans, during their occupation of the capital, removed all valuable metal from the church and belfry roofs. They are also said to have carried away the immense bells, the chandeliers, and even to have torn off the bronze metal plates covering the heating apparatus. Quite a different rumour was also rife, however, to the effect that it was not the Germans but the Russians themselves who removed the copper and gold, ikons, &c., before they evacuated Poland; when they did so they simply painted the domes with gilt paint. This version of the happenings goes on to say that, when the Germans arrived, they got ladders and men to work in the hope of removing the copper-gilt from the cupolas, &c., only to find to their dismay that all is not gold that glitters! Which story is true is a matter of controversy, but latterly the domes were covered only with slate-coloured tiles. Obviously whoever was responsible for the re-roofing of the domes, when the original covering was removed, cared nothing for the sacredness of the building or for the works of art within, for the repairs were carried out in such a careless manner that the roof was no longer water-tight, with the consequence that the wall and ceiling paintings of the interior were much disfigured through the constant dripping of rain-water or melted snow. Indeed, so much damage was done that that was the reason put forward for the demolition of the building.

The exterior walls of this square, massive building were of white stone, and were notice-

ably lacking in ornamentation, this perfect simplicity accentuating the richness of the mosaics which adorned the three principal and side entrances, throwing into greater relief the crowning glory of the golden cupolas.

The interior, however, contained so much to admire that it needed more than one brief visit to appreciate it all. The vaulted ceiling was supported by gigantic granite pillars, and all the walls were adorned with oil paintings depicting biblical scenes. It was a veritable gallery of Russian art, revealing the true Russian spirit. The entire ceilings, the domes, and the walls of the church, including the choir, side chapels, and vestibule, were covered with immense paintings, which combined Byzantine and modern influences in a curious fashion. The scenes represented phases from the life of our Lord, the characters sometimes being portrayed in quaint and ancient Russian peasant costumes. These paintings were mainly the work of three famous Russian artists, Rajlan, Machowski, and Sudkowski, and it is more than a pity that these gems of art should be for ever lost. One cannot dwell at length on the beauty which characterised each painting, but there was one which will remain for ever impressed upon the minds of those who have visited the cathedral. This work—which occupied the whole of the ceiling of the central dome—was a many times larger than life-sized reproduction of the head of Christ wearing the Crown of Thorns. It can be imagined what rare talent, skill, and patience must have been required to carry out such an immense painting on the concave surface of the dome. As one stepped from the sordid street into the shadowy sanctuary of the cathedral one's attention was at once arrested, and one was held spell-bound by this superb portrayal of the suffering Christ. . . . And when one dwelt on the horrors and hardships of recent years, the present uncertainty with all its attendant evils, one felt that there was an intangible significance in that Crowned Head—looking down with strangely mingled sorrow and aloofness.

TWILIGHT.

THE day is slowly trembling into night;
The winds are still; within a silken sea,
That mirrors back the sunset's last glory,
Enchanted islands dream. No sail's in sight;
No sound of oar disturbs the deep quiet;
Only the crying of a sheep is heard,
'Mong the gray corries, where the light airs shred
And piece again the bracken's lace; and, wet
With dew, wild thyme and myrtle fill the air
With fragrance sweet.—Anon, the west grows
gray;

From loch and pool the rose light slips away;
And in the ever deep'ning silence, clear,
Behind the purple hill-top, once again
The 'still small voice' of twilight speaks to men.

MARY C. CHRISTIE.

A ROMANCE OF THE REEL

PART III.

VI.

THE only thing that Davie regretted, when he had had a day or two to reflect on the transaction, was the price. It had been exorbitant. It had been iniquitous. He should have made a present of the picture. That troubled him. In the awful first blush of the business the selling of the picture had been like the selling of his Adventure. And certainly (he now assured himself—privily) not to anyone else on earth would he have parted with it—nay, verily, though Jamie had had a complete fit of the whooping-cough. However, it had served his purpose. If shadow of the uncanny remained at all to gloom his Adventure it merely remained on the surface of the canvas. It was perhaps a great pity it should remain even there, considering its destination. Ay, the great pity . . .

He moved towards the front door, the late afternoon of a spring night never failing to send its mystic call. He sniffed the air.

Suddenly a voice from within, 'Ye nicht as weel gang, an' be done wi't!'

A whimsical smile came to Davie's face. 'Ay, I'd be off this very meenit, Jamie, gin I knew where to gang.'

'Ay, nae doot it's some early for the reservoir in the Pentlands!'

'Ah, I'm afeerd, Jamie, that never again will a' the reservoirs an' burns 'tween this an' Cape Wrath hae the same appeal. Man, they're runnin' noo, Jamie, the clean silver bodies o' them, in the private waters that are as weel guardit as was the Gairden itsel' i' the Beginnin'. . . . An' if this is no' Maister Cattanach! Gudesakes!'

It was Mr Cattanach. He came and greeted Davie. They agreed on the beauty of the evening. They drifted into the shop. They eventually reached the back room.

'About that picture you may remember I bought the other evening?' ultimately said Mr Cattanach.

Davie remembered.

'I have good reason to believe—in fact,' and Mr Cattanach's voice cracked the least trifle, 'in fact, it may be taken as proven to the last twist of the monogram that it is a genuine Vermeer!'

Plainly Davie doubted if he had heard aright. 'Van der Meer of Delft?' he whispered.

'The same.'

Eyes looked into eyes for a long moment; then Davie's hand came out. 'Mr Cattanach—how glad I am!'

It took Mr Cattanach a little while to realise the gesture, to appreciate its overwhelming

genuineness. 'My daughter assured me of as much,' he muttered, taking advantage of the chair beside him.

For a little there was silence. Then Davie's visitor gave a preparatory little cough and faced him. 'Now, Mr Dunbar, we are only too well aware of what this means. My risk at £20 was insignificant compared with my reward, which was altogether beyond all dreams of worth. I should not care to say, frankly, how far I should have been willing to go had authenticity, in the first instance, been guaranteed. I readily admit that. However, my daughter, sir, has seen fit to discuss this matter with me. Possibly I see fit to defer to her in most affairs, but, as I assured her, in a matter of this sort she is—ah—incompetent; that is, she does not appreciate, understand. The matter, so to speak, is outwith her province. In other words—er—'

'Sir,' said Davie, 'you will permit me to understand you to the uttermost. Yours the risk, yours the gain. It's the law; and I myself live by the law. I congratulate you, sir, and, may I say, if there was anything on your mind of the nature of—of reparation, then, sir, in a word, I should feel black affrontit!'

Mr Cattanach was up from his chair, eyes shining. 'Thank you,' he said. And presently, on a softer note, he continued, 'Possibly we all have our dreams, Mr Dunbar, and this realises for me a double dream: first, that I should become the possessor of a Vermeer; but second—second, sir, that for the first time in my life—for the first time in my life—' he took occasion to clear a huskiness of the voice—'that, sir, for the first time in my life I have had the collector's exquisite pleasure of discovering an unknown masterpiece and—and buying it for an old song.'

To which Davie, not without a certain simplicity of dignity, 'I understand so well that I may account it something to myself even to have been the innocent instrument of your dreams' fulfilment.'

'Thank you. Thank you. Such understanding, considering your position in the matter, is, believe me, rarer than an old master.'

After which complimentary and genuine passages Mr Cattanach added in a sudden, almost sprightly manner, 'By the way, I hope you'll forgive my thoughtlessness in making no reference to the fishing on my last visit. I had fully intended, but really—the picture—'

'And I had intended to thank you—'

'My dear sir—the most trivial matter! However, I am anxious for my own sake, I may

say, to mark this occasion in some small way. It requires it, you'll agree. Now, I felt that a mere verbal invitation to you would not—life is uncertain at the best—would not— In short, I have requested my factor, Mr Robertson, to have prepared an instrument which gives you legal permission during your lifetime to fish any and all of the waters of the Glenuel Estate at any and every season of the year—barring, eh? the close season!’

And for the first time that evening Davie Dunbar failed to respond. His hand gripped at the top bar of the chair till the knuckles stood out white and taut, while he gazed at his visitor almost vacantly.

‘Yes, the salmon are running now—the spring run, you know. Mr Graeme is a capital fisher, and would introduce you everywhere, if you could spare a few days just now. My daughter would be delighted, and wishes me to impress the invitation. Meantime, if you'll allow me,

I wish to make some tangible acknowledgment to Mr Forsyth, to whose delicate interference the other night I was possibly not deaf!’

And he left Davie still standing by the chair in the back-shop.

Presently, like a man in a dream, Davie found himself by the front-door, with his visitor about to take his leave.

‘You know, you have not yet asked me about the Vermeer, eh? It was the light on the face that drew me, the quality of it. It was the only genuine thing visible on the whole canvas, as the experts have revealed. And I am not a little proud, perhaps, that so little was yet enough! The rest, including even the horror twist to the features, is all superimposed. Marvellously cleverly, I admit. But, like a dark shadow, it is being wholly removed—to leave beneath a beauty that will be imperishable.’

THE END.

THE MONTH: SCIENCE AND ARTS.

AN IMPROVED GAS-COOKER.

MANY improved gas-cookers have been brought out during the last few years, several of which have been described in these pages. A new model was placed on the market not long ago, which, while presenting no startling departures from previous types, possesses one or two special features that are worthy of mention. In general the design is similar to that of other gas-cookers. There are two boiling burners near the back of the hot-plate, each of which is fed by two distinct gas-supplies from one tap. These give respectively a full flame, or a reduced one for simmering. Each has its own adjustable air inlet, with the result that very perfect Bunsen flames are obtained. The tap has three positions: ‘off,’ ‘full on,’ and ‘simmering.’ Each burner consists of two simple loose parts which can be picked out of a socket for cleaning, this operation being very easy, because the gas holes become open notches when the two parts are separated. A commendable feature of these cookers is the enamelling or nickel-plating of all parts, which therefore look smart and are easily cleaned. Another advantage is that all parts except the hot-plate and the framing are of sheet steel; this is light, and gives a smooth surface when enamelled. The hot-plate is a very light, brown-enamelled iron casting, which lifts off. Over the burners are fitted circular bright-steel covers, and these are removable for saucepans if desired. At the back of the hot-plate is a white-enamelled wall-plate, which carries a combined plate-rack and warming-shelf. The oven is built up of white-enamelled steel sheets.

The back is single, and has openings to let out the burnt gases. Removable linings with ledges for shelves are fitted to the sides, leaving air spaces which minimise the escape of heat. A white-enamelled drip-tray is also removable, so that the oven can be completely cleared for cleaning, leaving smooth enamelled surfaces. Double doors are fitted to the oven, each having double walls with asbestos between them. These gas-cookers are made in various types and sizes, and in one pattern the modern plan of mounting the oven by the side of the hot-plate, high enough up to avoid any need for stooping, is adopted.

WIND DYNAMOS.

In our issue for December 1921, what was called a ‘wind dynamo’ was described, consisting of a small dynamo with a two-bladed wind-mill like an aeroplane propeller, mounted on its spindle. This machine gave about 40 watts, and by itself was not powerful enough to do much in the way of lighting. But five of these little generators mounted on a crossbar give quite a respectable amount of current, which is enough to keep the lighting battery charged in a small country house. Two new uses have been found recently for wind dynamos. One is for charging accumulators for listening-in sets; the other, to provide illuminated advertisement signs on motor-cars or motor-lorries. For charging accumulators for wireless sets the apparatus is very simple. The wind dynamo, which weighs only 10 lb., is mounted on the end of a pole with a swivelling head, the machine having a tail to keep it pointing into the wind. To transmit the current without.

twisting up the wires, it is led to insulated metal rings at the swivelling joint, and picked up by brushes connected to fixed wires on the pole. This pole, with the wind dynamo on the top, can be carried on the shoulder and placed in a socket in the ground when charging is to be done. The dynamo begins to charge with the wind at from twelve to fourteen miles an hour, being connected to the battery, so soon as the speed is high enough, by an automatic device, which breaks the circuit again when the wind drops. No attention whatever is required, and the machine keeps on charging day and night when there is enough wind. For advertising purposes, a wind dynamo is mounted on a car, a lorry, or a van, and is worked by the wind due to the speed of the vehicle through the air. It is fitted with a tail which is illuminated by the current generated. In this case no automatic device is fitted, the dynamo being always connected to the battery. With a speed of twelve miles an hour or over, the dynamo charges the battery which maintains the lights. When the vehicle is slowed down, the current runs back through the dynamo and runs it as a motor, so that the windmill is always rotating. The device may be fixed in front of the radiator, on a pole at the side, or on the roof of a covered van. But wherever it is located, it never fails to draw universal attention to any advertisement set forth on the tail.

THE LARGEST CARILLONS IN THE WORLD.

Very few carillons exist in this country, the best known being that in the Royal Exchange, London. In Holland and Belgium they are common, and several carillon players are noted men. Carillons have recently come into favour in the United States and in Canada. One of fifty-three bells, which has recently been completed, is the largest in the world. It is for the Park Avenue Baptist Church of New York, the authorities of which were able to purchase this carillon owing to a munificent donation from Mr J. D. Rockefeller, jun., in memory of his mother. The total weight of the bells is 50 tons, the largest weighing $9\frac{1}{4}$ tons, and the smallest only 15 pounds. With the steel framing and fittings, the total weight is about 80 tons. Forty-five of the bells are fixed in three frames, one above the other, in the beautiful Gothic tower of the church, which was designed by the famous American architect, Mr H. C. Pelton. But the eight largest bells are to be hung in a campanile, built specially for the purpose up to the level of the existing tower. These carillons are played by means of keyboards, which closely resemble those for organs, but with wooden levers instead of ivory keys; the larger bells are rung with the help of pedals. Wires and bell-cranks connect the levers and the pedals with the clappers which strike the inside of the bells.

The clappers do not move with a big swing, but have only a short stroke of from two to three inches. A sister carillon is to be installed in the memorial tower which is being erected on Parliament Hill at Ottawa. Both, together with many smaller ones, have been or are being made by Messrs Gillett & Johnston, the noted clock-makers and bell-founders of Croydon. At Ottawa a clock with four sixteen-foot faces is also being installed in the tower, and mechanism will be provided for striking the hours and chiming the quarters on the carillon. Provision has been made for adding at some future time an automatic machine which will play tunes at certain hours in the day. These bells will, of course, provide an interesting attraction for the public, who will be taken up the tower in a lift. To increase the attraction, the works of the clock, with the striking mechanism, are to be visible through glass sides to the case.

A PORTABLE HAMMOCK STAND.

For enabling one to take a peaceful rest in the open air a hammock is not easily excelled. But to sling it, two trees or two posts are required at the correct distance apart. In either case the position of the hammock is fixed. A hammock stand is now obtainable which, while being strong and stable, can be moved about by one person—even by a child. In principle the contrivance is not unlike a deck-chair, the two chief components of the frame forming a horizontally-extended X. The upper ends of these components, however, overhang the lower; hence an A-frame at each side, pivoted to the ends of the X members, rises at an outward slant. The hammock is hooked on at the apex of one A-frame at the 'head-end,' and a few inches lower down at the other, so as to give a fall towards the feet. All the joints are connected by zinc-coated bolts which pass from one side of the frame to the other. Where the X members cross each other, slots are provided for the bolt. This allows of adjusting the slant of the A-frames, giving any length between the hammock hooks of from 9 feet to 12 feet. A short upper portion is pivoted to the apex of each A-frame for the suspension of an awning, and is adjustable to awnings of various lengths, the awnings themselves being steadied by guys to the hammock frame. A slightly-modified stand is made for a camp-bed; this type is also convertible into a sun-chair or a hammock-chair. A valuable feature of these hammock stands is that all the components are the same length, and will fold up together into a flat package for transit without the frame having to be taken to pieces. If the bolts are removed—the work of ten minutes—the stand resolves into eight lengths of timber and a small bundle of bolts. The frames may be left in the open all the summer. Should rain

threaten. the hammock and the awning can be detached in a few seconds, and brought indoors. The frames are made in solignumed Oregon pine; in the same wood stained and varnished; in oiled oak; or in oiled teak.

MIXING THE 'GAS' FROM THE CARBURETTER.

It is a well-known fact that some of the 'gas' supplied by the carburetter of a motor reaches the cylinders in liquid form, instead of being suspended in the air, with which it is supposed to be mixed. Any contrivance which will break up the gas into numerous separate streams would aid the mixing. This is exactly what is done by a device which can be fixed on any motor between the carburetter flange and that of the induction pipe. It is made from a short length of thin brass tube. One end is nicked for a quarter of an inch at frequent intervals all round, leaving a number of teeth that can be bent out at a right angle. The result is a flange which can be clipped between the carburetter and induction-pipe flanges. From the other end deep cuts are made which divide the tube into fingers. Alternate fingers are cut to about half the length of their neighbours. These short fingers are bent over towards each other until they almost meet in the middle. The long fingers are also bent over towards the middle, and each is twisted. This device effectively mixes the air and petrol which are drawn swiftly through it; hence much less petrol is wasted, the saving claimed by the makers being from 20 to 30 per cent. Another effect is the reduction of carbon deposits in the cylinders, due to the more complete combustion.

FILTERING THE PETROL.

It is now generally agreed among motorists that a fine gauze strainer does not exclude all impurities and water from the petrol-tank of a car, and that some sort of filter is desirable through which to pass the petrol on its way to the carburetter. An effective petrol-filter was described in these pages in December 1923; another has been brought out lately in which the filtering medium is chamois leather. The body of the device is a thick, toughened glass cup. In one model, that for fixing in the bonnet, the body is mounted on a tubular spindle between a metal cap with inlet and outlet sockets, and a nut at the bottom. A coned gauze ring in the upper part of the body is covered with chamois leather, while the inside is in communication with the outlet to the carburetter. Entering at the top of the spindle, the petrol from the tank passes through cross holes into the body below the filter, where it has to rise through the chamois leather to reach the outlet. Impurities are removed by unscrewing a plug at the bottom. In another model, especially designed for direct

connection to carburetters, the glass body is flanged at the top and clamped to the cap by a ring. There is no central spindle, and the chamois leather is stretched over a plain gauze cone. Sediment and water are left behind in the bottom of the cup, where they can be drained off by a needle valve which is opened by a knurled plug on the top of the filter. In other respects it closely resembles the previously-described model. A metal guard is supplied with this type if desired. These filters are substantially made, and the metal parts are nickel-plated.

POWER FROM WOOD FOR FOREST REGIONS.

Gas-producers must have been seen, even if their method of working has not been understood, by all readers of *Chambers's Journal*. These devices make gas for engines from coal, coke, wood, or charcoal, at a far lower cost than that supplied by gas companies or local authorities; but they have some drawbacks. One is the consumption of water for cooling and cleaning the gas; another is the difficulty of getting rid of the foul water or effluent, this being so offensive that many town authorities prohibit its discharge into their sewers, while it would destroy the fish if turned into a river. A producer has been brought out lately which requires no water for its operation, and from which, therefore, there is no offensive effluent to be got rid of. It has been especially designed to facilitate the burning of wood fuel, coco-nut shell, or other tropical vegetable matter. Gas-producers are very similar to slow combustion stoves, but with a still further reduced air-supply, producing just enough combustion and heat to carbonise the fuel and drive off the gas. In many, a certain amount of steam is mixed with the air-supply to the grate; in all, except the one we are about to describe, water is also used for cleaning and cooling the gas, and for removing the tar, which would otherwise clog up the engine. The new producer is in two parts. One is a cylindrical chamber in the centre; the other, an annular chamber surrounding it. Both have grates at the bottom, that for the central part being coned downwards. The gas is drawn off from below the central grate and passes into the lower part of a gas-filter, whence it rises through steel shavings, gravel, or some other non-combustible material to the outlet, and thence to the engine. An ordinary petrol motor will work on the gas produced, which it draws from the filter on the suction strokes, thus creating a degree of draught through the apparatus according to the position of the throttle. To start the producer, a fire of wood is lit in both the inner and outer chambers, a damper leading to a short chimney is opened, and air is admitted at the bottom. With natural draught the producer will become hot enough to work in about forty-five minutes, but

the process can be hastened by a hand blower. When the producer is ready for work, the damper is closed, and a few turns of the engine draw the gas through the filter. Alternatively the engine can be started on petrol. Now we come to the novel and essential feature of this producer, which is that air is admitted to the annular grate and rises upwards through the fuel. At the top the resulting gas is drawn downwards through the glowing fire in the central part, which consumes the tar. With the compression increased to that customary in gas engines, a petrol motor running on this gas develops 75 per cent. of the power it would develop with petrol, or nearly as much as it would with paraffin. The consumption of wood fuel is from 2 to 2½ lb. per horse-power per hour, according to the size of the plant. Coconut shell gives off a rich gas which furnishes an amount of power nearly equal to that from petrol. These producers should prove invaluable abroad where wood is the only fuel available, especially as they are eminently suitable, in conjunction with marine motors, for river craft. Steam is the only alternative, but it needs from four to six times the weight of fuel, according to the size of the plant, for a given power, while the boiler is much bigger and heavier than a producer of equal power. Moreover, the producers can be taken to pieces for transport up country by native carriers or mules. One for a 5 h.-p. engine weighs only 50 lb.

A GAS FIRE-LIGHTER.

There is something to be said for the portable gas-burner as a means for lighting coal fires. It saves the cost and the trouble of 'laying' a fire with sticks and paper, while one that has died down can be quickly restored to a cheerfully-blazing condition. A recent gas-burner for this purpose is of the Bunsen type with the usual air adjustment, and has a flattened snout which gives a fan-shaped blue flame. A wooden handle through which the gas passes on its way to the burner terminates in a spigot for the attachment of flexible tubing connecting it with the gas tap. A grate filled with coal without any paper or wood can be lit in a few minutes with this burner, while the danger of flying sparks from burning wood is avoided.

A NEW FORM OF LAMP SHADE.

A new form of lamp shade of which we have recently made careful inspection possesses a distinctly novel and ingenious feature which should commend it alike to the artistic housewife and to the up-to-date shopkeeper. Made in a variety of sizes and designs, it is provided with patent hinge-flaps which enable the glass panels forming the essential portion of the shades to be easily and quickly removed for cleaning purposes, or for other panels to be put in their places. All that is needed is to

press back a small knob, when the panel is instantly released, and can be at once removed without the necessity of taking the shade from the lampholder. As the glass panels can be obtained in any colour, either plain or artistically decorated, the housewife of artistic leanings can readily change the colour of the artificial light in a room to suit her individual taste and the prevailing scheme of decoration. For advertising purposes these shades are unique in the advantages they offer, for not only can panels be obtained already provided with suitable wording, but stencilled or written advertisements can be readily prepared by the advertiser himself, and effectively displayed on plain panels. The shopkeeper is thus enabled to vary his advertisements at will, and to draw special attention at any time to particular features of his business or portion of his wares. It should be added that no extra fittings or wiring are required for hanging shades, as they fit on ordinary shade-carrying holders.

AN EFFECTIVE FLOOR-POLISHER.

Any effective device for the saving of unnecessary labour in the home is always welcomed by the busy housewife. Such a device is a floor-polisher which we have recently had the opportunity of testing. The polishing surface is naturally of bristles. These are fitted into a wooden head of a large size and oblong in shape, and sufficiently weighted to give the necessary pressure. But so well is the weight distributed that the exertion involved in the use of the polisher is reduced to a minimum. Round the wooden part of the head goes a strong, resilient leather pad, thus obviating the possibility of damage to wainscoting or furniture while the polisher is being used. The head is secured to a long handle by means of a patented universal joint, which permits of easy movement in any direction, and thus greatly facilitates the accomplishment of the task. By means of this 'all-British' appliance an ideal polish is rapidly given to a polished or parquetry floor, or to one covered with linoleum, without the necessity for stooping or kneeling.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (a) a reply post-card, or (b) a stamped and addressed envelope or post-card, be sent to the Editor, *Chambers's Journal*, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

*. TO CONTRIBUTORS.

All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.' For its return in case of ineligibility, a stamped and directed envelope (or postage-stamps) should accompany every manuscript.

To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them in FULL.

Chambers's Journal

SEVENTH SERIES

THE FIRST SCOT.

By Lieutenant-Colonel GORDON CASSERLY, F.R.G.S.,
Author of *The Elephant God*, *The Jungle Girl*, *The Red Marshal*, *Algeria Today*, &c.

PART I.

I.

THE sea boiled with fury before the wild south-easterly gale; and the uprooted tree, drifting through the seething water, was hidden by the flying spume blown by the fierce breath of the storm. Again and again the waves broke over it in fountains of foam that spouted high above the longest leafy branches rising up from the angry sea. Sometimes the trunk, tossed about in the heaving water, rolled heavily as if going to turn over; but the weight of the submerged roots and boughs kept it from doing so—fortunately for the scared, strange being that clung to it in a desperate struggle for life.

An ugly hairy ape it seemed, low-browed, heavy-jowled, chinless, the wet fur of its body plastered to its yellow skin. Yet the long hair streaming from its scalp in the wind, the hands clenched in desperation on the rough-barked branches, proved it a human being. A woman! A woman of a very far-off age, yet an ancestress of the humans of to-day—humiliating thought! But more than a million years have passed since she drifted before the gale out into the Atlantic Ocean, since the convulsion of nature that drove the tidal wave against the west coast of Europe and swept away the great tree in which this strange creature had made her home. And the storm was blowing her and it through a raging sea that rolled a hundred fathoms above England; for a subsidence of this portion of the earth's surface had buried deep beneath the ocean the Britain that formerly had been a vast land joined to the continent of Europe from Denmark to Spain. Of it nothing remained but a few scattered islands, which before the cataclysm had been the summits of the highest Scottish, English, Welsh, and Irish mountains.

The wretched waif clinging desperately, half-drowned, smothering, blinded by the flying spume, was just an ordinary specimen of mankind of that early pre-Eolithic Age, of almost the most helpless carnivorous animals that then existed, more guileless than many of the harmless beasts on which they preyed, much inferior in strength, power, and daring to the terrible brutes

that preyed on them. The neighbouring continent from which she had been swept was being peopled for the first time in the world's history by human beings. Immigrants from east and south were pushing up northward as the ice of the Glacial Epoch retreated again towards the Arctic Circle. And with them was coming a varied, a countless, host of strange animals; so that monster straight-tusked elephants and woolly rhinoceroses filled the forest of France, and giant lions and sabre-toothed tigers chased the elk and wild horses over her grassy plains. The hairy ape-like human beings disputed the tree-tops with the monkeys and the birds; for they feared to encounter the terrible beasts of prey that roamed the ground below. Their rude weapons—stones snatched up at random, or clubs that were only broken-off branches—were poor defence against grizzly bears that would dwarf the largest specimens of their species in modern America, or cave-lions far bigger than their African representatives to-day.

Who that saw this miserable creature clinging to the tree would believe that in her kind glimmered feebly the spark of intelligence that was in ages unborn to make their descendants masters of all created things, of sea and air, of Time and Space? She was so utterly helpless, powerless to make any effort to save herself. But for the fact that she was wedged in among the tangled branches she would have been torn from her refuge a hundred times by the hungry waves. Soaked, chilled to the bone, despairing, life in her battered body was at its lowest ebb. Her hardy frame could not have endured another day of this misery. But luckily the gale had reached its climax and was beginning to blow itself out—to subside almost as swiftly as it had arisen.

II.

Suddenly the flying clouds parted, to let a ray of sunlight stream down on the troubled sea; and the woman looked up hopefully as a strip of blue sky appeared and gradually widened. Before long the almost tropical sun was warming her chilled body.

But as its fierce heat made itself felt, there
SEPTEMBER 5, 1925.

was a movement in the branches; and through the tangle a big animal forced its way out into the welcome sunshine. It was a giant, cat-like brute with barred yellow face and bristling whiskers, a thick white ruff, and an orange hide striped with black; and the two glistening fangs, six inches long, curving down on each side, from the upper jaw to well below the lower one, showed it to be the most dreaded beast of prey that the continent of Europe then knew. It was a sabre-toothed tiger, far bigger and more terrible than any tiger that roams the jungles of India to-day.

The shuddering woman crouched lower as it revealed itself. She had all along known of its presence; but in the perils of the storm it had seemed negligible, and indeed had been too terrified to be dangerous. But now that it had apparently recovered its courage, she feared that hunger would drive it to attack her.

But the animal ignored her. With muzzle pointing in the direction of their course, and head thrown up, it was sniffing the air as though it scented something; and presently, as the mirk over the sea thinned and vanished, the woman's straining eyes saw straight ahead a conical island that seemed to rise by magic from the whitened waters. A lofty peak clad with forest almost to the jagged summit, it towered above the sea, which on that blustering day was lashing its rocky base, but now is far from it indeed.

For that island is to-day Ben Nevis, the highest mountain of a historic land; and it and the similar isles that were gradually revealed as the sea-fog lifted were all that then existed of what is now Scotland.

To the poor wretch the land ahead meant salvation, life—if only the wind that had been her foe, and now might prove her best friend, would last long enough to blow her tree ashore.

It was falling rapidly; and the tiger whined impatiently at their slow progress. Hours passed, but still the land seemed no nearer. The waves dulled down to a sullen swell, the heaving surface only rippled by the falling breeze. Here and there it was broken by the rounded back of some enormous whale-like marine creature, or the gambols of a shoal of big fish resembling porpoises. Half a mile from the slowly-drifting tree a fearsome dragon head with curving horns and an immense mouth studded with sharp teeth was thrust out of the water to a height of twenty feet, the goggle eyes scanning the sea, which for fifty yards behind the scaly neck boiled with the writhing of the innumerable coils of the serpent body.

The woman shuddered as she looked at it. But the tiger paid no attention to the creatures of the sea, and, whimpering petulantly, fixed its gaze on the distant land. All too slowly they drifted towards it. At last, when it was but a mile or so away, the yellow beast lost patience

and, to the woman's relief, plunged into the water and began to swim to the shore.

But it had hardly gone twenty yards before there was a sudden flurry in the water around it. Uttering a wild scream of pain and terror, the tiger splashed furiously as it snapped at a shoal of thin-scaled, swimming reptiles, like elongated porpoises with paddle-fins and snake-like loose jaws studded with long curved teeth, which rushed at it from all sides, leaping over each other's silvery bodies in their savage eagerness to attack the hapless beast. The sea reddened as, despite its struggle, the tiger was pulled under and literally torn to pieces in a minute; and the trembling woman, watching, tried to drag herself higher up among the branches away from the crimson-tinged water lapping against the tree-trunk.

Or the scent or sight of the blood brought other monsters to the dread feast. As the ravenous sea-reptiles fought over their prey, the shining shapes of hungry sharks shot up through the green depths of the sea to dispute it with them; and the horny backs of big marine crocodiles rose to the discoloured surface, their enormous jaws clashing like gigantic traps as they snapped at the scared reptiles, which scattered and eluded them by swift movements.

III.

As the woman clambered affrightedly out of reach of these terrible enemies, and got as high as she could above the sea, a loud and measured beat of wings made her look up—only to see a new danger approaching her through another element. Flapping swiftly towards her from the land came a horrible creature such as even she, who lived in an age of nightmare horrors, had never dreamed of.

Was it monster bird or flying reptile? It looked like a giant lizard with the leathery wings of a bat twenty feet from tip to tip; wings that were thick membranes stretched between the fore and hind legs, which ended in claws, those of the former shaped somewhat like deformed human hands. But the fifth finger of each forehand was elongated to make the upper edge of the immense wing.

The brute's furry body tapered suddenly into a long serpent-like tail ending in a rudder-shaped flat tip. But its head! Its head was hideous, terrible. Half-bird's, half-reptile's, it had pointed, beak-like, long bony jaws studded with gapped teeth like a crocodile's, and dull goggle eyes, which the wretched woman could see, even at that distance, were fixed menacingly on her.

She was in despair, and for a moment the new danger paralysed her. But as the hideous monster—men name it nowadays a pterodactyl—neared her and poised on fluttering wings to stoop like a hawk, she scrambled back hurriedly

into a tangle of stout branches that guarded her like a fence. The bat-lizard checked in its swoop, for its beak and claws could not reach her through the screening boughs. Then with a discordant cry it swept up high into air again; and the woman breathed more freely as the danger passed.

But only to be succeeded by a worse peril. She had climbed down again almost to the half-submerged trunk, about which the sea-monsters still lingered, while the slayers of the tiger swam around farther out. To her horror she saw a crocodile lay its broad snout on the floating tree and, seeming to scent her, begin to climb out of the water onto the lurching stem and drag its unwieldy body towards her.

It was an immense brute, thirty feet in length at least; and its great jaws were garnished with long teeth set irregularly. But, unlike most of its fellows floating on the surface around, it was soft-skinned, while they had on head and back the horny armour-plating that all their modern descendants possess.

The woman gave herself up for lost. As the monster crawled slowly out of the sea she began to scramble up a thick bough that pointed to the sky, but stopped in despair when a glance upward showed the horrible bat-lizard hovering overhead and ready to swoop again. She dared not emerge from the protecting tangle of branches lest the pterodactyl's claws should seize her, yet if she remained low down the jaws of the sea-monster would grip her as surely and drag her into the water to be torn to shreds like the tiger. Death clutched at her above and below.

The crocodile, clasping the trunk with its short limbs tipped with blunt-nailed claws, pulled itself clear of the water and drew nearer to the woman, until its snout almost touched her feet. The horrible stench of its fetid breath reached her. An uncanny fascination seemed to drag her down towards the open jaws. All hope was gone.

But suddenly, dropping like a stone, a heavy mass fell from the sky, and the great bird-beast's beak was driven like a pick into the sea-creature's skull, piercing to the brain and killing the crocodile instantly. Notwithstanding the slayer's efforts to hold it on the tree, which sank lower under their combined weight, the huge carcass began to slip back into the water, where a score of hungry monsters awaited it. Their jaws gripped it as it slid and dragged it into the sea, despite the upward lift of the flapping wings of the pterodactyl, which strove to hold it back while it pecked savagely at the crocodiles. Even when the dead brute's body slipped off the trunk, the bat-lizard, clutching it with clenched claws, disputed the prey fiercely, until an immense shark, turning over as it rose like a trout to a fly, seized the fluttering tail-tip of the air-reptile, which was dragged down back-

wards into the sea. The wildly-flapping wings churned the water into foam, until they and the body to which they belonged were torn to fragments by the snapping jaws that closed on them.

IV.

A sudden squall drove the tree and its passenger away from the blood-dyed water where the cannibal crocodiles were feasting on their fellow and its slayer, while the sharks and porpoises hovered around for the scraps.

As she was borne towards the land the woman, with fresh hope kindling in her eyes, looked eagerly at it. The coast was varied. In places rocky cliffs bounded it; elsewhere the shore was flat—here a sandy beach, there a stretch of marshy ground clothed with long reeds and vivid green herbage. But bordering it, and occasionally thrusting down nearly to the water's edge, were dense forests which, as the ground rose up into steep hills, clothed them almost to their jagged peaks.

The floating tree was drifting towards a point where high rocks met a mangrove swamp. As the woman's eyes ranged anxiously over the swamp, the tangled bushes and noisome mud of which would prevent her getting to land should she be blown against them, a strange and gigantic animal heaved into view out of the vegetation. It looked like an enormous lizard; but it lifted erect into the air the weird skull that crowned its long neck until it was forty feet above the bushes, and it gazed nervously around as if, despite its great size, it had enemies to fear. Apparently reassured, it lowered its head and plodded heavily to the shore; and the staring woman gasped as it dragged itself out on to the rocks and was fully revealed.

For it was a hundred feet in length! Its skull was comparatively small, with large stupid eyes, diminutive ears, a big mouth filled with blunt teeth, and nostrils placed high up near the top of the head, so that the amphibious monster could breathe when almost completely submerged. The neck was long and slender; the body short, thick, and lower at the shoulders than behind, ending in an extremely elongated tapering tail. Four powerful legs, with small, five-toed clawed feet, supported the massive smooth-skinned frame, which stood twenty feet at the hindquarters. It was a Sauropod, one of the varied families of the Dinosaurs or Terrible Lizards, as they were named long after they had all vanished from the face of the earth. Many of its kindred well deserved the name; but, despite its dreadful appearance, it was a harmless vegetable-feeder.

To the woman it was a nightmare terror, a fitting comrade on the land of the horrors that she had seen in the sea. Dragging its huge bulk over the rocks, the monstrous creature crossed the beach to a broad marshy patch, where it began to feed on the rank vegetation,

much to the surprise of the watcher, who could not believe that so terrible a reptile would be content with a vegetarian diet.

When the tree eventually drifted against the rocks she scrambled on to them with the agility of a cat, raced over them and the shingle behind towards the edge of the forest, sprang up the nearest tall tree like a monkey, and never stopped until she reached the highest branch that would support her weight. And there she clung panting, her bosom heaving, her heart thumping, exhaustion, suffering forgotten in the joy of feeling, for the moment at least, safe.

And thus the first human being that had ever set foot on Scottish soil came to the land!

v.

As she hung outlined against the sky, it was difficult to believe that from her and such as she would, in the fullness of time, come beautiful women to inspire painters and handsome men whom sculptors would model. Easier far to lend credence to the scientists' theory that she had sprung—and not sprung far—from the monkeys and even the less human-like lemurs. Up in the tree she looked more like an ape than ever. With a low-browed skull abnormally thick, her sloping forehead, retreating chin, and flat nose with gaping nostrils emphasised the forward thrust of her thick-lipped mouth set with sharp yellow fangs, the upper and lower canine teeth interlocking and long enough to serve her as a weapon, like a wild beast's. The brutish jaws resembled an ape's. Over her small eyes were prominent bony ridges. Her yellow skin was covered with short fur, her only clothing; but the wet, matted locks of her scalp were true human hair. Her short legs were bowed, so that she walked on the outer edges of the soles of her feet, while her hairy hands reached to the level of her knees.

Such was Woman untold centuries ago—woman of a cycle anterior to the Stone Age.

Now, the fear of death past, this creature miraculously saved from the storm was suddenly tormented by hitherto-forgotten hunger and thirst, the latter the more urgent. Her lips, her parched mouth, were caked with salt; and her

first need was fresh water. So, moving agilely through the branches, she climbed along the leafy ways high above the ground, keeping near the edge of the forest, until she reached a spot where the trees drew back from the coast, to leave an open green space through which a stream flowed to the shore.

The sight of the clear water aggravated her burning thirst. She longed to drop to earth and rush to it; but to her horror she saw the goggle-eyed, foolish head of the great Sauropod rise up out of the marsh near the outlet of the rivulet into the sea. And on the open, grazing on the reeds and low vegetation, were the weirdly-shaped bulks of a dozen other monsters even stranger and more terrifying to look at. They all belonged to the race of Terrible Lizards, were all Dinosaurs, but differed in species and in appearance.

Some were great reptiles, long-necked, longer-tailed, four-legged and ostrich-footed, with large narrow heads and immense jaws ending in toothless beaks. To the watcher's astonishment, when something startled them they rose on hind legs and ran or hopped in long leaps like giant kangaroos. When they stopped she saw that their fore limbs were small, with five-fingered hands and slender shoulders. Standing erect they were fifteen feet high, while their length from beak to tip of tail was twenty-five or thirty. They were Iguanodons, or Bird-footed Lizards.

More terrific in appearance were huge armoured quadrupeds, having large ugly heads with horns on snout and forehead, the bone of the skulls running back in a wide, outspreading carapace or ruff to cover the neck; while a continuous bony shield studded with bosses protected the hip region, and long sharp spikes ran down the backbone and the elongated tail. Their jaws, filled with flat grinding teeth, ended in parrot-like beaks. Their bulky bodies were twelve or fourteen feet long. Frightful as they looked, these Stegosaur, or Plated Lizards, were, like the others, pacific vegetable-feeders, although their spiked armour and formidable pointed horns made them dangerous foes if attacked.

(Continued on page 650.)

RIO DE JANEIRO UP-TO-DATE.

By GRACE L. MORROW.

I.

BEFORE the present century has ended will the centres of civilisation have shifted to the newer world 'Down Under'? Visiting in the last few years the great cities of the southern hemisphere, I have often wondered. Melbourne, Sydney, Johannesburg, Buenos Aires, or Rio de Janeiro—will they ever become what New

York, London, and Paris are—or think they are!—the hub of the civilised world?

Modern Brazilians have shown an amazing energy in making their beautiful capital one of the wonder-cities of the world. Formerly noted only for the beauty of the harbour and for deadly yellow fever, Rio de Janeiro is now one of the healthiest cities in South America.

The credit for this is given to Dr Oswaldo

Cruz, who died in 1917 while still a young man. His work is carried on by the Oswaldo Cruz Institute, and 'Yellow Jack' in Rio is completely vanquished. But the authorities still take precautions. A house-to-house inspection is maintained—very annoying to housewives, as wash-tubs, saucepans, even flower-vases, are inspected for stagnant water, the possible breeding-place of the germ-carrying mosquito. Water-cisterns are papered over, sealed with the Government seal; if the paper gets broken the authorities must be notified. By law all sugar must be kept covered. Lump-sugar is sold with every lump wrapped in paper! And table-napkins in hoteis, restaurants, or tea-shops must be served in a sealed band to show that they are fresh from the laundry.

For gorgeous colouring and beauty of setting this metropolis of the South is unsurpassed. The city nestles in the folds of the Tijuca mountains, and like a gay kaleidoscope shimmers in the sun. Broad tree-lined boulevards have superseded the narrow hot streets of old Rio, and smooth macadamised roads lead out to mountain or ocean-side suburbs. The old Portuguese 'Carioca Aqueduct,' which formerly brought cool mountain water to the fever-ridden town, is now utilised as a bridge to carry electric cars across to the mountain suburb of Santa Thereza.

From those heights behind the city entrancing views of the harbour are obtained. Blue as a sapphire, and studded with emerald islands, the water stretches fifteen miles from where a conical rock, Pão de Assucar, 1300 feet high, guards the entrance. History does not agree as to the discoverer of this land-locked haven. On 1st January 1531, a Portuguese captain, Affonso de Souza, entered the bay, and, thinking it the mouth of a river, called it Rio de Janeiro, that is, January River. In 1565 Esatacio de Sá landed at the foot of the 'Sugar-Loaf,' and by him Rio de Janeiro was founded. His tomb was found on 'Castle Hill,' but as that hill with two others has been *completely removed by hydraulic power*, because they interfered with projected improvements to the city, the remains of Esatacio de Sá were transferred to the cathedral.

The soil and rocks from these hills were used to fill up the foreshore and further extend it five-mile-long boulevard, with its wall of white marble, broad tessellated side-walks, and palm-planted gardens, which now encircles the bay. Along this boulevard at night is seen an amazing stream of motor-cars. Tunnels through granite mountains lead out to Atlantic-shore suburbs, where a casino which opens at midnight is busy till dawn. Perhaps it is this traffic which makes Rio roosters crow all night! Every newcomer remarks on this strange peculiarity of Brazilian poultry. Or it may be the blazing lights.

For Rio is the most brilliantly illuminated city in the world, 'tis said. Her reflected halo can be seen for sixty miles at sea. To go to the Sugar-Loaf and cross to the summit on the fearsome cable-car, swinging across a deep abyss, is a favourite excursion at sunset. The sun sinks behind fantastic granite peaks, which emerge from dense green jungle. Then quickly comes the soft blackness of the tropic night. But suddenly, by the turning of a lever, the city blazes forth. Lights appear on higher roads, on the summits of the mountains, and, like a brilliant coronet, round Botofogo Bay.

When moonlight floods the harbour, gilding the waving palms, music of stately Argentine Tango or of rollicking Brazilian Maxiche floats from the marble terrace of some great hotel. Then, indeed, is this city of the south more like fairyland than solid earth.

II.

Rio, like all semi-tropical cities, seems slumbrous from noon until the heat of the day is waning. By five o'clock Avenida Rio Branca, the Piccadilly of the town, is crowded with promenaders. Etiquette in Brazilian society is still very strict. Even married women do not walk anywhere alone. This is not so difficult to understand when one has seen the sailor-hatted men, who stand three deep on the edge of those tessellated side-walks, making audible comments on the 'points' of the Brazilian belles as they pass with their chaperones.

Shopping in Rio is an amusing if expensive pastime. In the Rua do Ouvidor, a narrow street where wheeled traffic is forbidden, are the best shops for Brazilian jewels. Diamonds, sapphires, aquamarines are here in gorgeous profusion. Never except in the Rue de la Paix had we seen such enormous stones. Brazilians give their wives thousands of pounds worth of jewels, and regard it as an investment, or sort of 'Dot.' They are still very Turk-like with regard to womenkind. Nothing impresses them so much as the independence of English women, and the comradeship of our elderly married couples. An elderly woman in Brazil 'knows her place,' and that, in the opinion of her male relatives, is *always at home!*

Brazilian men are not seen to kiss each other, as do so many of the Latin races, but they always lay an affectionate arm round the shoulders in greeting a fellow man.

Parisian models are to be seen in the shop-windows, with all the latest styles, which come out in January to be tried for the coming summer in the northern world. A story is told in Rio, that these garments were once displayed on wax models, but that the too susceptible men of the south became so enamoured of their waxen charms that they had to be removed from the windows!

III.

In South America there is no 'colour-bar,' in sharp contrast to the United States. In Brazil many of the effete Portuguese nobles took wives from the native Indian tribes when Dom Pedro, Isabella, and Portuguese royalty were sent home again. Some authorities say it is to this new virile blood the modern Brazilians owe their energy.

No negroes have been imported since 1860, but the slave blood has left its mark on the population in a curiously livid blue-black complexion. We saw full-blooded negroes bathing among white women at the bathing beaches in Rio.

Lotteries play an important part in the daily life of the people; tickets for the drawings can be bought in many places in the city. But for some reason the 'Bicho,' in which the betting is on animals, not on colours or numbers, is illegal.

Horses seem obsolete in Rio, but on mountain paths we met mules laden with wicker panniers full of live chickens. The traffic is enormous, and is made up entirely of motor traction. Brand-new American cars can be hired for the modest sum of fifteen milreis per hour (about seven shillings and sixpence) for city or suburbs. For mountain excursions more is demanded.

Up those steep gradients you can soar in a powerful car, through forests where the taller trees are literally choked with lianas and parasitic growth. Orchids with sprays of bloom two feet long hang from the forked branches, and have seeded themselves even on the overhead cable of the electric cars. Scarlet-winged birds and gorgeous blue butterflies fly among the feathery paineiras trees and shadowy palms.

No description of Rio de Janeiro is complete without mention of the Royal Palms. When Portuguese royalty fled from Napoleonic despotism to set up a Court in Brazil, Dom João VI. imported many trees from Portugal's far-flung colonies—among them the Royal Palm. For many years the carefully guarded 'Mother Palm,' 112 feet high, was nursed and tended in the Botanic Gardens. Free seeds were given to the people. Now everywhere in suburbs and city are magnificent avenues of palms.

In the city 'plazas' are many fountains and bronze statues half-smothered in flowers, while, seventy-five feet overhead, the plumed heads of Royal Palms cast quivering shadows on gleaming marble pavement.

Splashing fountains, the heavy scent of tropic flowers, the aroma of roasting coffee, remain haunting memories of this rainbow-tinted city of the South.

IN THE VALLEY OF DECISION.

(2) MARY'S WEDDING-DAY.

By ASHLEY L. BARNES-LAWRENCE, Author of *Jacob Bateman's Ladder*.

PART I.

I.

THE banns had been published three times upon the three previous Sundays, and Wednesday was to be the wedding-day. And the young lady who was to be wed on that day was Mary Massinder.

Just a few words about her before I describe what took place on that particular day.

I had always liked Mary from the time when she came home from domestic service to take charge of her widowed mother, who was in poor health and poor circumstances, and did her best to maintain the home by taking in sewing and doing a bit of dressmaking.

This went on for some two years, and then her mother died; and Mary continued to occupy the cottage and to maintain herself. She was at this time about twenty-six years old. She was always busy with her needle whenever I made time to look in upon her; and no girl in the parish seemed to me to lead a more hum-drum and uneventful life.

It was, therefore, rather a surprise to me when

she appeared at the rectory one evening and asked me to publish her banns of marriage on the following Sunday, and gave me the necessary particulars about herself and her young man. I instructed her that he must have his banns published simultaneously at the parish church in the parish where he lived, and be sure to bring a certificate to that effect when he presented himself on the wedding-day. I also expressed my regret that he had not himself come to see me, and to put in the banns; and, in Mary's own interests, I put to her some leading questions as to his character and position in life.

It appeared that John Williams—for that was his name—lived about forty miles away, in the town of M—, where Mary had been in service and had made his acquaintance. During the past twelve months he had come over to see her some three or four times, and as it was rather a long journey for him to take merely to put in the banns, she, as a matter of economy, had come to see me in his stead.

His business was that of a butcher on his

own account and on a small scale, and he was some five years older than herself. I elicited that he was careless about religious observances, and that although she had never known him to be the worse for drink, he was certainly rather fond of a glass of beer or spirits.

'But I don't fear for that,' said Mary, 'and I'm sure when we're married I shall be able to keep him straight, and he'll settle down all right.'

'Well, Mary, I don't wish to say a word against your friend, for I know nothing about him except what you tell me; but it is so often the case that girls think they can keep a sort of upper hand upon their husbands, that I venture to utter a word of warning. Judging from what I know about the marriage of young men and maidens, let me say that unless the love expressed before marriage is based upon mutual confidence and trust in one another, marriage is too much like a lottery. Husbands either become poor henpecked creatures, or else they ignore the wishes of their wives and go their own selfish way.'

She laughed; and then a tear stole down her cheek. 'I wish very much,' she said, 'that I had my mother to consult with.'

'Let me tell you,' I said presently, 'a curious little story, and a perfectly true one. It was in my first parish in Yorkshire, where we had some large factories. One night a factory girl about twenty years of age—and a very pretty girl she was—came to see me about putting in the banns. I took down the particulars, and she was about to depart, when she turned round and with a great deal of emphasis said: "And I shall be very much obliged to you if, when we comes to stand up afore you in church, you will give my young man a real good dressing down, for he's a ramshackling young man, he is."

"But, my dear girl," I said, "if he is such a ramshackling young man as all that, do you think it wise of you to shackle on to him at all?"

"Well," she said, "I thought perhaps he'd listen to you a bit, for he takes no heed of what I says to him."

"If that is so, don't you really think that you had better postpone this publication of banns for a while," I advised, "until you see whether you can exercise a good influence over him before you get wedded to him for life?"

"No," she said after a little pause; "I think I'll marry him, and it will be queer if I can't manage him when once we get married."

'And so they were wed; and three months afterwards he had left her, and she never heard of him again.'

I glanced at Mary Massinder. It was no part of my duty to set her against her man, but while I knew nothing of him personally, I came to the conclusion that she did not know him so

thoroughly as to be quite sure of his character and habits before uniting herself to him in the bonds of holy matrimony. But I had uttered my caution; and now it only remained to express my great interest in her well-being, and my best wishes for her happiness.

II.

The wedding-day arrived, and the ceremony was to take place at half-past twelve.

Early in the day I sent a note to tell Miss Massinder that, to my great regret, I was ill in bed, and that the doctor would not allow me to come out, but that my assistant curate would take the service.

My curate was a very nice young fellow, but not at that time a man of much experience or perspicuity. However, as with many other things in life, we will let that pass. He was to come up to see me after the service and tell me how all went off.

At half-past twelve I pictured the arrival of the wedding-party, and prayed for a blessing on the happy pair. At one o'clock the curate failed to appear at the rectory. At half-past one, still no curate. A few minutes later he was announced and came up to my bedroom, and I saw at once that he was very perturbed.

What had happened was that the prospective bridegroom had failed to turn up at the appointed time, and they all had waited an hour at the church for him, and still he had not put in an appearance. And at the present moment poor Miss Massinder was sitting in the vestry, in tears, and in a state of nerves approaching collapse. She could not face again the party of friends who had assembled in the church, nor the driving in solitary state back to her own cottage. What was to be done?

'Scuttle down to the church as fast as you can,' I said, 'and bring the poor girl with you to the rectory, and I'll see her. And she must stay and have some luncheon here, and so must you. Perhaps the wretched man may turn up after all; and then we can still proceed with the marriage up to the legal limit of three o'clock. I wonder if he missed his train, or what has happened?'

A quarter of an hour later my curate returned to tell me that Miss Massinder much preferred to be alone and to remain in the vestry, and had asked him to beg those who still remained in church to go home.

Another half-hour was gone when a message was brought to the rectory asking the curate to come at once to the church to proceed with the service. As it was now half-past two, I felt much relieved by the thought that there was still ample time left in which to tie the knot; and that 'all's well that ends well.'

My colleague promised to come back after the wedding and tell me all about it, and to explain the delay.

In due course he came, but obviously he was in a very excited state. 'Yes,' he said; 'the wedding has taken place, but look here!' and he handed to me the marriage register.

And, to my amazement, there, surely enough, were the signatures of the two persons just married, and there was the signature of the old parish clerk as witness, but the name of the bridegroom was not John Williams at all, but quite plainly John Hillyers. 'What on earth is the meaning of this?' I asked. 'And I see that you have not filled in the names of the parties, nor their places of residence, and so forth.'

'No,' he said. 'They were in a great hurry to get away by motor-car, as it was so late in the day; and so I simply got them to sign their own names, and said I would fill in the particulars afterwards. And it was only when they had gone, and I was about to complete the entry, that I found that the name in the register did not tally with the name on the certificate issued by the vicar of the parish where the young man comes from.'

'That certificate,' I interrupted, 'was sent to me by post on Monday by John Williams, and I handed it to you this morning.'

'Yes! here it is,' he said. We both gazed intently at what was written thereon, and indubitably the name written was John Williams. I also recalled the fact that Mary Massinder in speaking of him had called him by that name. To suppose that a woman like Mary had been imposed upon, and didn't know what she was doing, and had married the wrong man, was too preposterous.

I turned rather angrily upon my curate. 'You really must give me some explanation of this. You had the name John Williams on the certificate, and in the course of the marriage service you have to address the man by name. Can't you remember exactly what took place? For instance, you had to tell the man to say these words after you: "I, John, take thee, Mary, to be my wedded wife," and so on.'

'Yes,' my colleague replied; 'but you see this man John Hillyers is also a John, and he repeated the words after me all right.'

'That's true,' I said; 'but what about the sentence which comes afterwards? I suppose you said "forasmuch as John Williams and Mary Massinder have consented together in holy wedlock——"?''

'Well, you see, rector, the man and the woman are not called upon there to say anything, and in any case the name Hillyers has a sound something like Williams. But I'm not certain that I mentioned their surnames at all. It is quite possible I may merely have said "John" and "Mary."'

A thought occurred to me. 'You had the clerk there as witness. Were there any other persons present?'

'No! I had told them previously it was Miss Massinder's wish they should all go away.'

'Well! Who gave the woman away when you asked, "Who giveth this woman to be married to this man?"'?

'Oh, the old clerk stepped forward, and made us a bow.'

'But when you discovered the change of name afterwards, I suppose you said something to the clerk about the matter, didn't you?'

'Of course I did, but I must say he seemed to me to be half-daft, as if he were stupid with drink, and I could get very little out of him. But he did say that he knew this John Hillyers, and knew nothing at all about John Williams.'

'The mystery deepens,' I exclaimed; 'but you must get hold of old Ben at once, and I'll question him. If he knows this John Hillyers, perhaps he will be able to explain how these two Johns can possibly be one and the same person.'

III.

Before another five minutes had elapsed we were to be further enlightened; or, perhaps more accurately I might say, plunged into a deeper mystery than ever. There was a violent ringing at the front-door bell, and we then heard some one speaking in loud tones to the servant who had admitted him.

'Do go down, my dear man,' I said, 'and see who has come, and what it's all about. I feel sure it has to do with this wedding.'

And so it had. In a few moments up rushed the curate again. 'This is truly awful,' he ejaculated. 'It is Mr John Williams himself from M——. He says he missed his train. He says he has been to the church, but there was no one there; and then he rushed off to Miss Massinder's house, but there was no one there either. And now he is here; and as it is barely three o'clock he wants me to hurry up and get through the marriage service as soon as I can. He expected to find his young lady here, or at a neighbour's house.'

'Have you told him the state of the case?'

No, he hadn't. He evidently had funk'd the fearful disclosure.

'Here,' I cried; 'help me into this dressing-gown. I must go down and see this man myself, and you can come with me.'

I did not like the look of Mr John Williams when I set eyes on him; but of course one had to make allowance for the position in which he was placed. He was in an angry and peremptory mood.

I piloted him into my study, and decided as I did so that if I showed too soft a side to him he probably would trample upon me, and more particularly upon my unfortunate curate for any share he had had in depriving him of his bride-elect. I really felt very sorry for him, but was

not altogether sorry that Mary Massinder was not at that very moment Mrs Williams.

'I don't know how it was,' said Mr Williams, 'but I expect I fell asleep in the train, and so got carried on past the station; and I've made tremendous efforts to get here, I can assure you. Now, if you'd be so good, sir, as to turn a blind eye to the clock——'

I pulled out my watch. 'It's quite impossible for your marriage to take place to-day; it's already past the legal time.'

'Surely,' he said, 'you could stretch a point or two in my favour if you wished?'

'Quite impossible,' I replied; 'you must dismiss all idea of it.'

'Then what about to-morrow?' he asked.

'Sit down on that chair, Mr Williams. Now I've got a very painful communication to make to you. Miss Massinder came to the church this morning at the appointed hour, and this gentleman was there to take the service, and there was quite a nice little assembly of Miss Massinder's friends and neighbours; and you may imagine how very much crushed and humiliated she felt before them all when you never appeared, although she waited more than an hour for you.'

'Oh, well, I'll soon put all that right with her,' he cried; 'she's a good sensible girl——'

'Stop!' I said; 'it's my duty to inform you that she then and there made up her mind that she would never have anything more to do with you.'

This was a blow that evidently staggered him. 'If only I could get a word with her,' he stammered. 'May I ask,' he added suspiciously, 'if you happen to have got her stowed away in this house?'

'I think I had better tell you all I know,' was my answer, 'because you are sure to hear of it in the parish; and it is a hard thing for you to bear. Miss Massinder is not only not here in this house, but she has gone right away out of the parish. And, more than that, she has gone away as a bride; my curate here took the service, and she is married to a Mr Hillyers. Our parish clerk will be able to tell you more about it than I can, as I wasn't there. I have been confined to the house by illness.'

Poor Williams glared at each of us in speechless amazement. 'Married!' he exclaimed at last; 'and who was this Hillyers you say who married her? Do you know him?' he asked, turning furiously towards the curate.

'No, I don't,' he faltered; 'I thought all along it was yourself.'

'And where have they gone to?' he shouted. 'By G—— I'll tear the liver out of him—and out of anyone who plays hocus-pocus with my young lady in this kind of way.'

'You had better go and see the clerk,' I repeated.

'Ay! trust me,' he cried. 'I'll go and see

him fast enough. I'll raise hell over this business; and if I catch this Hillyers I'll slit his gizzard for him to a nicety. Here, let me get away.'

He rushed out of the room, and out of the house, and in another minute we heard the sound of a motor-bike being put into action. My curate seemed to have his suspicions as to what was taking place, for he hurried to the front door, where he had left his own motor-bike, and was only just in time to see Mr Williams mounted upon it and careering down the long drive at a terrific pace. 'Oh, my poor bike!' he lamented.

'Yes,' I said; 'but there's worse than that in it; this man is a butcher by trade, and he has rushed off bent on slaughtering somebody. I do earnestly hope he won't catch them.'

IV.

We speedily learned that Williams, without loss of time had questioned two or three of the parishioners, and had ascertained that the motor-car conveying Hillyers and his bride after they had left the church had been seen proceeding at a rapid pace on the great high-road leading to York; and at once he had started in hot pursuit.

'I'm afraid,' I said to my companion, 'you've dragged me as well as other people into a veritable slough of despond by this carelessness. It is evident you did not sufficiently identify the man you married this morning with the man specified in the certificate.'

'Is that quite fair to me, rector, to put it in that way? Was it likely that I should feel the least suspicion, when the young lady herself treated the man Hillyers as her accepted lover?'

'Anyhow,' I replied, 'it looks as if it may become a case of murder, or of law proceedings, and it is bound to create great scandal, and necessitate a report to the bishop. You see, you have been guilty of an illegal act.'

'How is that, rector?'

'Because you are forbidden to marry without due publication of banns.'

'I don't think,' he remarked, 'the married couple are likely to prosecute me for that.'

'Perhaps not; but this other man Williams is not likely to spare you.'

'He can't invalidate the marriage in any case,' he urged, 'so it's not likely he will try to do anything to upset it. There was nothing omitted; a ring was produced, and there was the joining of hands, and I solemnly declared them to be man and wife in the name of God.'

'All of it, my friend, utterly illegal, and therefore invalid.'

'Do you mean to say, then, that these two, who have gone off together in the belief they were married, are not married——?'

'That is so.'

My good curate looked very much scandalised,

as well he might. 'You mean to say,' he urged, 'that all that I said and did was no good?'

'No good at all,' I said, 'except as giving good ground for a prosecution for committing a very serious offence against the laws of this country. But we mustn't stay here talking—we must do what we can. Do you remember the certificated number on your motor-bike?'

'Yes; it is JX 9035.'

'Well, I will write out a telegram to the Chief Inspector of Police at York, and you must get it sent off instantly, and then find old

Ben Toovey, the clerk, and bring him here to me.'

The telegram was as follows: 'Watch all roads approaching York from here, and take in charge and lock up a man named John Williams for stealing motor-bike No. JX 9035 and riding off on it just now from my house. Also intercept Mr and Mrs John Hillyers proceeding now by motor-car from here to York, and warn them that their form of marriage was illegal, and that they are not yet married.'

B——, Rector of A——.'

(Continued on page 643.)

REED-BEDS.

BEDS of reeds fringe the lower reaches of several of our east coast rivers, and occupy large areas in various creeks, inlets, and meres. Not only have they a distinct kind of beauty in themselves, but they are the home of several birds not often seen far from these and similar places. They are also frequented at times by a few interesting mammals; and other more or less special forms of animal life, appealing to entomologists and others, are to be found there.

What goes on in the hidden depths of the big reed-beds is to a great extent shrouded in mystery. The possibilities which present themselves to the imagination of a naturalist invest these forests of reeds and bulrushes¹ with a peculiar charm and attraction. Their various inhabitants are effectually hidden from the sight of most of their enemies, and are not to be approached without some amount of difficulty. It is the concealment they afford more than anything else which makes these places such valuable retreats or asylums for bird and beast. A dog can, indeed, force his way through the close array of stiff stems without much trouble, and to the flexible snake-like body of a stoat they present but a trifling obstacle; but in spite of this liability to occasional perils, the value and importance of these sanctuaries to animal life is unquestionable. With what an air of relief and satisfaction does a frightened coot or waterhen take advantage of the sheltering reed-bed, and promptly disappear into its obscure interior!

These places no doubt had formerly a more abundant and varied population. Otters were more numerous; polecats often paid them a visit; and the solitary bittern sat silently among the reeds awaiting the evening twilight—his 'opening day'—before going out to search for food. Shy retiring birds like the water-rail and the less abundant spotted crane could here dispense with their extreme watchfulness, and search in comparative security the wet mud and

small pools left by the ebbing tide for leeches, water-snails, and other dainties.

Those who spend much time by the river-side fishing, sketching, &c., soon become familiar with the ordinary sounds which come from the thick beds of reeds—from the faint whispering of the feathery tops, as a gentle breeze springs up after a sultry summer's day, to the loud rustling noise caused by countless waving stems and blades swayed by a strong wind. But now and then other mysterious sounds are heard, which are not always easily accounted for, and therefore raise many a conjecture as to their origin. Sometimes there is a loud crashing noise (intensified probably by the prevailing silence) as of some creature of considerable size stirring about; or perhaps the sharp and unfamiliar cry of some bird reaches the ear. Occasionally, too, one is startled by a squeal or a scream, betokening some such tragedy as the capture of a rat or a water-vole by a stoat. The tremulous rumbling voice of this usually silent animal is another noise heard now and then coming from these sequestered, little-frequented places. There is, however, one sound which above all others belongs to the reed-beds, and this is the quaint little song of the sedge-warbler and of its near relative the reed-warbler—both regular summer visitors to these places. These restless nimble little birds seldom show themselves for many seconds together, and have a provoking habit of diving into their sheltering covert just as one is on the point of determining satisfactorily to which species they belong. But, though hidden from sight, their movements can be followed by closely watching the reeds, and noting the slight tremor imparted to those stems on which the birds alight for a moment as they pass from place to place.

Compared with the notes of the blackbird, robin, or linnet, those of the sedge-warbler have a somewhat harsh quality. However, like the loud 'crank' or 'frank' of the heron, the cawing of rooks, and many other natural sounds,

¹ Great Reed-mace, *Typha latifolia*.

they accord well with the character of the scenes among which they are heard. In the present instance, indeed, they seem to have some actual affinity with the grating rustling sound made by the reeds themselves when set in motion by a breeze.

The more uniform colour of the upper parts, and the absence of the light mark above the eye (so conspicuous in the sedge-warbler) make it fairly easy to distinguish the reed-warbler when the bird keeps still long enough to allow of a clear view.

The nest of the reed-warbler is deeper than that of most birds, and is, as a rule, firmly fixed to a few stems of reed or some other tall aquatic plant, its extra depth serving, as Yarrell points out, to prevent the eggs or young birds from falling out when the supporting stems are swayed about by the wind.

In late autumn and winter one sometimes meets with a solitary blue tit or a wren hunting for food among the reeds.

The beautiful reed-tit or bearded tit was formerly, in all probability, a fairly common bird about the reedy margins of many east coast rivers, as well as the larger reed-beds, though now, alas! seldom seen far from its main stronghold—the Norfolk Broads. As recently, however, as the early seventies of last century, this little bird was often to be seen in a large reed-bed covering several acres near the Suffolk coast, and here the writer, in November 1873, had the pleasure of falling in with three separate flocks or families at the same time, each of which consisted of about eight or nine individuals. A bird-lover could hardly imagine a more pleasing sight than a troop of these pretty little creatures, so unlike any other British bird, flying low over the reeds, and alighting from time to time to feed on their seeds or on those semi-aquatic snails (*Succinea*) which often ascend the stems and blades. While thus occupied the tits keep uttering from time to time their musical note, which has been well compared to the sound of a tiny bell.

The bearded tit or 'reed-pheasant' is one of those birds which, like the kite, chough, and some others, have been brought perilously near extermination by the greed and selfishness of certain collectors. Posing as *naturalists*, they are in reality enemies and *destroyers of nature*, setting apparently no value whatever on the *life* of a bird. So far from rejoicing in the knowledge of its being alive and enjoying itself in its natural haunts, or from feeling any anxiety for its safety and protection, they are intent only on compassing its *death*; or (to make use of the orthodox formula), 'on "obtaining," "securing," or "acquiring" the specimen for *preservation*.' To this end tempting bribes are, as is well known, offered in defiance of the Wild Bird Protection Act

to those best able to obtain what is wanted, whether it be the bird itself or its eggs.

The Norfolk Broads are believed to be almost the only remaining breeding-place of the bearded tit in England; yet, up to only a few years ago, the reed-cutters there were receiving a high price for the eggs of these birds, in consequence of which nests were eagerly sought for and robbed; but whether anything of the kind still goes on I am not aware. It must be very difficult to suppress or even to detect this pernicious practice. During the last few years, however, both this little bird and the bittern appear to have been better looked after, and the booming of the latter may now be heard, it is said, almost every spring in some of the Broads.

A familiar bird among the reed-beds is the prettily marked reed-bunting or reed-sparrow, the latter name originating no doubt in a fancied resemblance of the male, as regards the arrangement of its colours, to an ordinary cock sparrow. The plumage of the bunting is, however, much the handsomer of the two. His black, white, and tawny brown colouring has a very pleasing appearance as he flits along just above the reeds. It is impossible not to admire the perfect ease and unconcern with which he keeps his balance as he drops down upon some yielding pliant young stem of reed or tall reed-like grass that bends with his weight (insignificant as it is) almost to the ground. His mate, though without the black head and throat and white neck-patch, is nevertheless a pretty little bird, with plumage showing a pleasing arrangement of warm browns of different degrees of depth. This is the smallest of our resident British buntings, as well as the gayest and most sprightly. Its cheery manner and attractive appearance make it a favourite with most visitors to its haunts. Like the chaffinch this bird sometimes gives chase to insects on the wing.

In October a sudden increase in the number of moorhens is generally observable, and the reed-beds seem suddenly to become full of them; but whether the fresh arrivals have crossed the North Sea, or are British-bred birds journeying southward to escape the rigour of a more northern climate, it is impossible to say. Considering the number of moorhens' eggs taken every year by boys, or devoured by stoats, rats, &c., and the many dangers to which the newly hatched young are exposed, it is difficult to see how, without re-inforcement of some kind, this bird could manage to keep up its numbers. It is interesting to see the mother bird warily leading out her little black chicks from the protecting reeds and bulrushes into open water, but ready at the least suspicion of danger to call them back to cover. Besides her loud sharp alarm note, there is a low clucking sound with which she talks to her young ones.

The reed-beds are made great use of by certain small birds as roosting-places. Immense flocks of starlings pass the night among the large tracts of reeds in some of the creeks, meres, &c., near the coast. The graceful evolutions which these enormous flocks go through before settling down for the night, though often described, cannot fail to excite wonder and admiration when seen for the first time. But it is the precision with which these various movements are performed that strikes one more than anything else. A company of birds numbering perhaps several thousands seems to be controlled and directed by a single dominant will. Every bird appears to know exactly what to do, and there is neither hesitation nor confusion.

Towards nightfall companies of starlings begin to arrive from different directions, till, in a short time, an immense number of birds are gathered together. So dense does the flock become that it almost darkens the sky, and the sound of the myriad wings passing overhead is like the roar of a waterfall.

Suddenly, but in perfect order, and without the slightest hesitation, the flock divides into

two or more detachments, which go off to perform for a while separately, afterwards perhaps reforming into one body. After wheeling about and executing various manoeuvres and changes of form, the vast cloud of starlings sweeps down into the reed-bed; the deafening chatter of their voices gradually dies away, and silence at last reigns.

The smaller patches bordering the rivers are in certain places made use of for the same purpose by large gatherings of swallows, house-martins, and sand-martins; the last-mentioned bird, flying almost incessantly backwards and forwards over the water and the reed-beds in search of insects, occasionally takes a short rest on the broken-down stems during the day.

Flocks of pied wagtails, sometimes joined by a few of the yellow species, *Motacilla ragi*, also sometimes roost in these places. Towards dusk they begin to assemble near their accustomed rendezvous. Before finally settling down, however, they flit restlessly over the reeds from place to place, making many a feint of alighting and again rising into the air—perhaps to make sure that all is safe and no enemy lurking near.

THE AUCTION SALE.

By CATHERINE MACLAURIN.

I.

AT the auctioneer's door the Misses Isabella and Josephine Fanshawe descended shakily from the cab. They were very much bewildered, and would have gone away without paying the driver, only he reminded them—not at all nicely, they thought; but then the lower classes are so bold nowadays! The crowd round the entrance to the auction rooms was not at all nice, either, and they had difficulty in pushing their way through. Were all these people going to the sale of father's furniture? The two old ladies felt flattered, and yet vaguely alarmed. Father was such a gentleman, while these people. . . .

It was dark inside the auction rooms after the glaring August sun outside. One stumbled over chairs and couches, piled in mournful heaps. Marble statues loomed up in corners, marble-topped wash-stands stood neglected by walls. Tables there were, piled with the spoils of many a household; and massive wardrobes, built to conceal a legion of robbers, seemed to overhang and dominate the entire room.

The two sisters gazed round the dusty room for their own furniture, familiar to them since childhood, and now alas! to be sacrificed. The precious things were not even placed together. Far over in one corner was the desk at which mother used to write her prim early Victorian epistles; at the opposite end of the room

Alexander and Bucephalus pranced in bronze as in the days of their youth. Then there was father's old arm-chair, from which he would thunder forth his opinions on Mr Gladstone's disastrous policy. They had all sat in awed silence when father spoke from the depths of that chair, forty years ago—all except William, who, even at the age of fifteen, had had no proper respect for these august pronouncements.

The chair seemed melancholy in that crowded room. It was an ugly thing, with its stiff leather back, all shiny where father's head used to rest on it. The sisters had always thought it a fine piece of furniture, but now it suddenly looked old and shabby. It didn't seem so very long since father had sat in that chair and William had contradicted him; yet father had been dead for thirty-five years, and it was forty years since they had seen their perverse brother.

'I wonder where William is now,' said Miss Isabella suddenly, as they looked at the chair, standing there so deserted.

'I was just thinking the very same thing,' replied Miss Josephine. 'Poor William! If he had not contradicted father so he might have come to something.' Then, as she felt the tears welling up into her eyes, 'I seem to have caught a cold.'

'So have I, Josephine. These cabs are so draughty.'

II.

Prospective buyers strolled around the room, examining the goods with critical eyes. They weighed the silver in their hands, whispering. They stroked the surfaces of the tables, and looked at the bottoms of cups. There was a little Jew among them, who peered with short-sighted eyes, like a scared hen. Beside him a huge creature, with multitudinous chins, padded ponderously from table to table, and after each would snort, 'Early Victorian!' like the refrain of a song. But his keen eyes noted every detail, and his alleged contempt was belied by his careful notes.

Opposite father's chair he paused. His pudgy hand, heavy with cheap rings, wandered over its back, while with little eyes sunk deep in flabby cheeks, he scanned its features.

'Just fancy him buying father's chair,' whispered Miss Isabella. 'Oh Josephine, just think of it!'

'I could bear most things,' said her sister emphatically, 'but *not* a publican. And I'm sure he's one.'

'Early Victorian,' muttered the fat man, as he passed on. The Misses Fanshawe oscillated between anger that father's chair should have been so despised, and relief that the monster had not been tempted.

'Horrid wretch,' said Miss Isabella, glaring at his massive back. It was the strongest expression she knew.

'But I don't think he wants *it*,' Miss Josephine said earnestly. 'Just think, if he were to come in, all beery, and sit in it.'

'Oh, Josephine,' said Isabella, obviously shocked at such coarseness; but her sister said wisely, 'Well, you never know, nowadays.'

The crowd in the room was growing larger, and, to the sisters' critical eyes, more and more hopelessly plebeian and undesirable. 'And not a relation among them,' said Miss Josephine bitterly. 'One would have thought that with all those brothers and sisters, *one* would have come to buy father's things, even if they have got some of their own.'

'If only Henry had lived, he would have come. But that widow of his doesn't care.'

The flight of time had never been wont to distress the sisters, but now they felt on a sudden very old and out of date. No one cared. The children of their brothers and sisters didn't care about a grandfather dead thirty-five years ago, and *their* children hardly knew that such a great-grandfather had ever existed. In vain they scanned the crowd for a familiar face. Nobody they knew was there—not Robert, from London; not nephew Richard, from Manchester ('So like poor father, Josephine'); not Helen, the deceased Henry's daughter; certainly not any of that irresponsible crowd of great-nieces and nephews that had

grown up around them while they believed themselves still young. And yet everybody had been told about the sale. People were so hard and unsentimental nowadays.

III.

Outside in the street it had begun to drizzle, and the patch of sunlight from the solitary high window no longer illumined the dancing clouds of dust in the air. A settled gloom hung over all that abandoned furniture round which the crowd surged, rustled, incessantly moved. One could hardly see into the corners where the massive chiffoniers loomed up. Only a marble Venus stood out, naked, against a gilt-edged mirror.

At the other end of the room the auctioneer was mounting his box, and the two old ladies realised sadly that he was not going to begin with their poor little collection, though it had seemed to them much the most imposing feature of the sale. The crowd swayed towards the place where superannuated alarm-clocks and electroplate butter-dishes were offered to tempt them. But the Misses Fanshawe remained where they were, on a mahogany sofa, upholstered in green velvet, which stood quite close to father's chair. They did not themselves know why that chair seemed to them more important than their other furniture. Was it perhaps because it symbolised for them the dignity, the comfort, of their childhood's home, broken up long since, and never reproduced by another? So they sat beside father's chair, and waited, sniffing. There was no doubt that one caught cold in cabs.

IV.

The auctioneer had just finished his melancholy table of sundries, when some one pushed by the two old ladies on the green velvet sofa. It was one of those modern young women, and she shoved her way to the very front of the crowd, as though used all her life to auction sales. She was a young person of bizarre appearance, heavily rouged; her frizzled hair was pulled over her ears and eyes, a jaunty hat adorned her pert head. From beneath the satin skirt protruded solid calves, encased in thin silk stockings. 'Common little thing!' thought the two sisters simultaneously. How little reserve these modern girls have!

Their attention was diverted from this young person by the movements of the auctioneer, who was walking towards them, with the crowd at his heels. He was really coming to father's chair at last, and in a flutter of excitement the Misses Isabella and Josephine wondered who among that plebeian gathering was destined to be its owner. They felt a sick tremor as they noticed the fat man prominently placed among the buyers. He and his Hebrew friend had affected boredom during the first part of the

sale; not for them such small fry as alarm-clocks. But now they came forward and stood at the auctioneer's right hand, horribly close.

'But it may be another piece of furniture he wants,' whispered Miss Isabella. 'He did say it was Early Victorian, you know.'

'I'm sure he keeps a hotel,' said the other in a trembling voice.

v.

'Lot sixty-one!' shouted the auctioneer, as though they were all on a distant hilltop. 'Fine old mahogany arm-chair, leather seat and back, in an excellent state of preservation.'

'Thirty shillings,' came an oily, muffled voice from the front. The fat man indeed had spoken, and the two sisters exchanged despairing glances. And what an offer! Thirty shillings for father's chair! Fortunately the auctioneer also seemed sensible of the affront.

'Thirty shillings, gentlemen? For a fine old mahogany arm-chair, leather seat and back, in an excellent state of preservation? Not a penny under five pounds, gentlemen. Any advance on five pounds?'

There was a moment's silence; then a shrill cockney voice exclaimed, 'Five guineas!' It was the common girl; and the crowd scuffled and peered at her, standing there so self-assured: The Misses Fanshawe, too, craned their necks as far as was ladylike, to look at the bold young creature.

'But I hope she gets it, and not that odious publican,' murmured Miss Josephine, when their necks were restored to a normal position.

'Publicans are so rich, Josephine,' replied the other in a despondent tone.

'Five pounds ten,' came from the fat man, in an accent even oilier and more muffled than before. In marked contrast was the 'Five pounds fifteen' of the determined young woman in the front row. At the next bid the man did not speak at all, but merely raised his repulsive hand.

'Six pounds offered,' roared the auctioneer, and the two old ladies shivered.

'Oh dear, Isabella, I'm afraid I shall have to go out. I feel certain the monster will win.'

But before her sister could reply, the girl had spoken again. Seven, eight, nine, ten, the pounds mounted up. The Fanshawes clutched one another as the duel went on; she was an ordinary little thing, no doubt, but oh! so much better than that odious man, falling asleep in a drunken slumber after supper—in father's chair, when father never would allow so much as a glass of wine at his table.

The rivals were up to twelve pounds now. The offensive person was merely indicating his bids with a wave of the hand, but the girl's voice seemed to grow shriller as her excitement grew. At last, when she had squeaked 'Fifteen pounds,' there was no reply. A moment's

hesitation, and the fat man, with a little shrug, moved heavily away. Father's chair was saved.

vi.

The sudden relief made even such elderly maidens as the Fanshawes giggle weakly to each other. Isabella grew quite gay.

'Come, Josephine! Let's go and speak to her, and tell her how glad we are she bought it.'

'Yes, and let's make her promise to take care of it properly,' fluttered the other.

Together they marched to the auctioneer's desk, where the girl stood giving her address to the fresh-faced young assistant—and prolonging the transaction as much as possible.

'My dear,' said Miss Isabella gently, 'we feel we must tell you how glad we are that you, and not that man, bought the chair.'

'You see,' went on Josephine, 'it belonged to our father when we were little girls, and it is very precious to us.'

A queer look came over the girl's face as she heard these words; then, to the surprise of the timid old ladies before her, she burst into a flood of eloquence, in her curious, half-Cockney voice.

'So you're the aunts dad told me to look out for! Well I'm blessed. I'd imagined somebody fat, like dad. "Wilhelmina," he says to me this morning, "I can't go to the sale, 'count of business, but just you go and see if you can't buy back your granddad's arm-chair, and don't spare any expense. And if you see your Aunt Isabella or Josephine, tell them that their long-lost brother William from Australia is coming to see them, soon as he's had time to look round." I'm *that* glad to see you!' she continued, seizing Miss Josephine's hand, oblivious of the look of distress and dismay that had come over the good lady's face.

Fully half a minute passed before Miss Isabella found a faint voice.

'You're William Fanshawe's daughter?' she faltered. 'That hat! A niece of theirs! A Fanshawe!'

'You bet I am,' said the young person genially. 'Why, everyone at home says dad and me's as like as two peas. Don't you see the resemblance?' And she turned so that the light fell full on her face, making the rouged cheeks, the carmined lips, more painfully apparent than ever.

It was hard for the Fanshawe pride. 'People are always imagining resemblances,' said Miss Josephine, with a nervous laugh. 'You may really be like your mother, you know.'

But the sting in the tail of this remark passed unheeded.

'Why, ma's just lovely,' said the girl modestly. 'You'll see her some day soon. Dad's just longing to see you after all these years.'

'We were wondering only this morning what had become of our brother William,' said Isabella, trying hard to control the tremor in her voice. 'And so he went to Australia when he ran away from home—and never so much as wrote us a line in forty years?'

'No, not even when father died,' put in Josephine.

For a few moments the girl looked at them with a half-quizzical, half-pitying expression. Then she leaned forward and said confidentially, 'Dad told me not to tell you why he never wrote home. But I believe I just will. It was because he thought you wouldn't like the idea of his keeping a hotel. That's all.'

SOME QUEER MADAGASCAR SPIDERS.

By JAMES SIBREE, D.D., F.R.G.S.

WE don't admire spiders much here in England, at least in our houses, and we usually dispose of them and their webs with a brush or a broom. And yet in our fields and woods there are some pretty little spiders, and they have curious habits and ways. But in tropical countries like Madagascar spiders are much more in evidence. Some of them are beautifully coloured, others are most curiously shaped, and many of their doings are well worthy of study.

Take a walk in a garden, or in a mango-tree orchard in the interior of the great island, and you will immediately see scores of large spiders (*Nephila* sp.) nearly two inches long, and with their legs spreading over six to eight inches. They are very conspicuous in the centre of their great geometric nets, which stretch from tree to tree. Spaces of twenty feet across are often spanned by the main lines or 'guys' of the net, so that the Malagasy call this spider *Mampitahady*, or 'fosse crosser.' The lines are of strong yellow silk, so that it requires quite an effort to break them.

These spiders are beautifully marked with silvery and golden tints, as well as red and black. The male insect is only about a quarter of the size of the female; and, sad to say, unless he is uncommonly active he runs great risk, after mating, of being killed and eaten by his amiable spouse! Mr E. F. Knight, correspondent of the *Times*, in travelling from the south-east coast, wrote that in a Tanosy village, 'the mazes of cobwebs that link house to house, and hang across the paths, were full of large spiders.'

Because of the strength of the lines spun by these spiders the French have made silken fabrics with them, excellent in appearance; but it is not at all probable that such material will become any rival to that made from the produce of the silk-worm moth, since cocoons are much more reliable than living spiders, which are of uncertain temper and difficult to handle.

But other spiders besides this great *Nephila* are also very numerous; and on many bushes we shall notice three or four different kinds. Here is one with a bright green coat spotted with red, probably a case of 'protective resem-

blance,' to resemble the foliage all around. Certainly it is the same with another species, which is pure white, and lives in the corolla of a large white flower. You can hardly detect him or her, unless you look quite closely, or the creature happens to move. Here are some spiders (*Gasteracantha*) which are broader than long, each side being prolonged into a large and sharp spike, which would be a most unpleasant morsel for any bird to swallow. Another allied kind has several small spikes around its body, also a very awkward mouthful for any enemy.

Still another kind of spider (*Thomisus fôka*) is provided with crab-like claws, and this is one of three or four species whose bite is very poisonous, and, unless remedies are quickly applied, is said to be fatal in its effects. This result is also said to be caused by the bite of another spider, which resembles a large shining black marble, with a small red spot on its abdomen. I remember that when one of my bearers brought a specimen for me to examine, he carefully got it on the end of a long stick, and kept as far from it as possible. The bite from the *fôka* spider is followed by swelling, which spreads from the wounded part throughout the whole body.

In our houses in Antananarivo we often see a rather large kind of spider, light brown in colour, but its peculiarity is that it is extremely thin and flat—a case almost of extension without thickness. It is hardly thicker than a piece of stout paper, and so is enabled to wait for its prey hidden in narrow and almost imperceptible cracks. It is a hunting spider, and apparently makes no net or web, and it is amusing to see the adroit way in which it will cautiously approach the edge of a crack in the floor-boarding and sweep off an unwary fly.

There is another curious species, which has a very small body, hardly larger than a big pin's head, but it has extraordinarily long thread-like legs, covering a very wide area when compared with its minute body.

Mason-wasps have been known for a long time past to all naturalists, but it is only of recent years that I have become acquainted with the fact that we have in Madagascar a *Mason-spider*. This spider's nest is very like

in shape to some sea-shells that I have seen many a time on the eastern shores of the island; its builder is a mason, and constructs an elegantly-shaped home for itself in the form of a cornucopia, or 'horn of plenty.' This is made of small fragments of quartz rock, cemented together with clay, all of which material must have been brought by its builder in minute pellets or parcels one by one; and so she gradually builds up her house. But the most curious fact about it is, that this nest is not built on the ground, or in the corner of a wall, or on a tree trunk, but hanging in the air, for it is suspended by a stout and strong cord from the stalks of a rice-plant or a tall grass. It is not easy to imagine how this is accomplished.

The nest, which is about an inch and a half long, is suspended with the open end of the horn downwards; and the place for the little spiders, when hatched, is in the curved upper part, the mother occupying the lower and wider part of the nest; thus she guards her dwelling. The whole interior is lined with silken cloth, so that it is water-tight and safe for the family.

Some species of spider have the habit of drawing in their legs together, and consequently appear more like a little lump of earth in the middle of the net than a living creature. Others, I have observed, often put their net into a violent state of vibration, so that one can hardly see the spider in the centre. Both these habits must certainly be resorted to for protection; for spiders are the frequent victims of the solitary wasps, which dart down upon them and carry them to their nests, where they are stung into insensibility, while an egg is deposited in the captive spider as food for the pupæ of the wasp when the eggs are hatched.

But Madagascar spiders have still other means of protection. I was standing one day examining the curious nest of a species of ant, which lives under the bark of large trees, and happened to take hold of a piece, as I supposed, of the bark. This I let drop to the ground. But I was startled to see that this bit of bark presently developed four pair of legs, and scuttled away as fast as possible to a place of safety!

'Trap-door spiders' have been observed in many tropical countries, and we have one or more kinds of these in Madagascar. These clever little creatures line their burrows with a silky web, and the round door, about as large as a sixpence, has a hinge of silk like a strong spring, so that it shuts of itself when its owner goes in or out. The outside of the door is covered with roughish clay, and it is impossible to see it when closed, so exactly does it resemble the ground around it.

A very peculiar looking spider (*Epeira coque-relli*) consists of three cones impaled one over the other, the largest nearest the thorax, and the three ending below in a sharp point. Its colours

are almost entirely black and white, so that it is very conspicuous.

But the most extraordinary looking of all the Madagascar spiders is one which, at first sight, would be taken for some curious shell, or an equally abnormal and small crustacean, for it is as unlike our ideas of a spider as anything can be. It is difficult to convey any clear idea of its appearance without three or four drawings. As it crouches, fixed to a branch or twig, whether it is viewed from above, or its back, or front, or side is examined, it is equally 'uncanny' in its looks. (It is called *Epeira mitralis*.)

On a cool morning, in the dry season in the interior, one sees thousands of little webs scattered over the bare moory downs. Some of these are beautiful geometric nets, but the larger number are a fine gauzy web, from six inches to a foot in diameter, spread horizontally over the blades of grass. In the centre of each is a funnel-shaped tube, and if you look down this tube you will see a little brown spider waiting for any insect that may come her way. But the curious thing is this, that when you return home in the middle of the day not a net or web is to be seen! They are still all there, for it was only the dew resting on them that made them visible, and as soon as the sun's rays got warmer the dew dried off, and they were perfectly unseen.

In the first paragraph of this paper mention was made of the distances which are passed over by spiders' webs and cords. How are these distances reached? I remember one afternoon seeing a deep valley, about a quarter of a mile broad, in which the air seemed filled with floating spiders' lines or gossamer—only made visible by the sun shining on them at a particular angle. This appeared to give the key to the problem.

I have not said all that might be said about the Arachnidæ of Madagascar. Many other species no doubt will still be discovered by naturalists, either travellers or residents in different provinces. Much has yet to be done before all the wonders of animal life have been described as existing in 'the great African island.'

A MYSTIC REVERIE.

By a lone shore, in mystic reverie,
I soared beyond my reason's finite reach;
Methought, as pools that gather on the beach
Are still a portion of their native sea,
So is my ego, everlastingly,
A part of God; and fain would I beseech
Th' Eternal Wisdom graciously to teach
The nature of my soul's immensity.

And, even as the tides that ebb and flow
Merge, in their motion, every shallow pool
Into the ocean's bosom, so I know
That there are laws, inscrutable, that rule
The Spirit's tides—that one day I shall be
At home in God's illimitable sea.

SEVENTH SERIES

SOME STUART RELICS IN ROME.

I.

EACH nation has its own sights in Rome.

It is the boast of the Roman Church that in Rome there is a church for every nation—St Thomas for the English, St Andrew for the Scots, St Louis for the French, and so on. And as there are sights for every other nation, so there are sights of special interest for Scotsmen. There are—to take a handful—Bramante's house in the Via della Mercede, where Sir Walter Scott stayed in 1831, and where he penned the last entry in his *Journal*; the relics of St Margaret of Scotland, and the tombs of many Jacobites in the church of St Andrew of the Scots; the grave of R. M. Ballantyne, which should not be missed in a visit to the Protestant cemetery; the huge font of Aberdeen granite in the Vatican library; the roof fresco by Gavin Hamilton in the Borghese Galleries; and the statue of St Cecilia by Mr Macbride in the largest catacombs of Rome—the catacombs of St Calixtus.

All these are on the beaten track. But in the by-paths of Rome no Scottish name is so familiar as that of the exiled House of Stuart. The Old Pretender lived for fifty years in Rome as a reigning monarch; Prince Charlie was born and died there; and Henry Benedict was for sixty years a cardinal, and was a Roman all his life. Living with much display, the Stuarts have left many traces; in Frascati alone there are said to be twenty-seven mural tablets in memory of the Cardinal.

II.

The first step in a Stuart pilgrimage should be to visit the Palazzo Savorelli, or Muti, as it is called. It stands in a small oblong square at the foot of the Quirinal hill, and within a stone's throw of the hub of modern Rome—the Corso, Mussolini's headquarters in the Palazzo Chigi, Trajan's Forum, and the grave of the Italian Unknown Warrior. The square is flanked by a palace of the great Roman family—the Colonna—and a church, the Church of the Holy Apostles. But had you visited that square in 1740, your attention would at once have been riveted, not on those buildings, but on a rather shabby entrance alongside them, for through this doorway it was then treason for any Englishman to pass. A royal British coat-of-arms surmounted the doorway, and it led to the

Savorelli Palace, for fifty years the centre of the Stuart Court in Rome. You may still read from an inscription on the wall, that 'this palace was the residence of the Cardinal Duke Henry of York, son of James III. of England. He took the title Henry IX., and with him, in 1807, the line of Stuart ended.' The Romans, in commemorating the Stuarts' residence in the palace, have characteristically made no reference to any other member of the family than the Cardinal, who was their favourite. But for fifty years before it became the Cardinal's, the palace was the residence of the Pretender. Here in 1720, the glad news was proclaimed of the birth of a son to Queen Clementina of England. 'The cannon of St Angelo thundered in his honour. A new star was said to appear in the heavens that night to hail him. The Pope provided the baby-linen to the value of six thousand scudi.'¹ The Hanoverian ministers must have heard with dismay the news that came that day from the Palazzo Savorelli, for the baby was Prince Charlie.

Here Charles and Henry were brought up, and they were a source of much curiosity to Englishmen in Rome. It was treason to be received in audience by the Old Pretender, but travellers were sometimes furtively presented to the young princes. The Pincian hill, the pleasure-ground of modern Rome, was where the princes played as boys. The poet Gray wrote home in 1740 that he had 'seen the two boys in the gardens of the Villa Borghese, where they go a-shooting almost every day.'²

The Palazzo Savorelli, besides being the centre of the Stuart family-life, was, in 1744, the starting-point of a most romantic expedition. On a cold January night of that year you might have seen two horsemen mounting their steeds in the square in front of the palace. An attendant awaits orders. We may imagine the words that passed. 'Tell the Prince Henry when he wakes,' says the one rider, whose face is so muffled up as to be scarcely distinguishable, 'that we have set out early for the boar-hunt at Albano, and that we shall await him there to-morrow.' Then they ride off into the night, and, skirting the Coliseum, emerge from Rome by the Gate of St John Lateran, and make

¹ *Dublin Review*: quoted by Hare, *Walks in Rome*, i. 67.

² *Letters of Thomas Gray*, 2nd April 1740.

southwards for Albano. But once clear of the town, the rider who has spoken, Prince Charlie, leaves his henchman—Lord Dunbar—to go on alone to Albano, and he turns northwards across the Campagna. Next morning Prince Henry rides out to meet his brother at Albano, to be met by Dunbar instead, with the story that Charles has sprained his ankle, and is delayed. The real fact is, Prince Charlie is far on the way to Genoa, to raise the Forty-Five.¹

III.

Charles's secret departure alarmed the Pope, who could not allow his Stuart protégés to incur the opposition of Britain, and tried to make sure that the Old Pretender would remain inactive. In 1747, after his brother's tragic failure, Henry was offered a cardinal's hat. From this time the youthful Cardinal began such an accumulation of papal offices as is almost unrivalled, at least in modern days; the result being that most of the Stuart remains are ecclesiastical in nature. At twenty-two, Henry was Cardinal; at twenty-six, Archpriest or Dean of St Peter's; at thirty-three, Chamberlain; at thirty-six, Cardinal-Bishop of Frascati; at thirty-eight, Vice-Chancellor of the Papal States; finally Bishop of Ostia and Velletri and Dean of the Sacred College. Associations with him cling round many buildings in Rome. Behind St Peter's you may see the house, now occupied by Cardinal Merry del Val, which was Henry's as archpriest. His bust stands in the sacristy of St Peter's, and there you may also see a chalice adorned with his mother's, the Sobieski, jewels. The Stuart arms are also to be seen in the Church of Sta. Maria in Trastevere, perhaps the third most beautiful church in Rome, and built on the site where, according to legend, a fountain of oil sprang up on the night of the Nativity. But most interesting of all is the Church of Sta. Maria in Campitelli, in a squalid corner of the ghetto; this was Henry's titular church, and here he spent his time rehearsing his favourite masses, for he was fond of music. Henry was the patron of Baldassaro Galuppi, whose toccata is the subject of Browning's poem:²

Oh Galuppi, Baldassaro, this is very sad to find.
I can hardly misconceive you: it would prove me
deaf and blind:
And although I take your meaning, 'tis with such a
heavy mind.

In a fit of piety, the Old Pretender founded masses in this church for the conversion of Britain, and to this day, if you enter Sta. Maria at eleven o'clock on any Saturday forenoon, you will hear these masses founded by the Old Pretender. Another building associated with Henry is the Palazzo Cancellaria, the most perfect Renaissance palace in Rome, and now the only piece of papal territory outside the

Vatican precincts. This is the papal chancery, and was the palace of Henry in his capacity as Vice-Chancellor. From here, during a vacancy in the papal chair, Henry issued the papal money stamped with his own head.

IV.

Round the Scots College hang memories of Prince Charlie. For the ten years following the Forty-Five, Charles was in hiding. He never saw his father again during the twenty years that elapsed before James's death. But during that time a figure might have been seen flitting about the shadowy streets of Rome. It was Prince Charlie in disguise, now dressed as a monk, now as a peasant. The British Government set its ambassador at Florence to dog his movements. And at last he gets a clue: 'One of my intelligencers,' writes Sir Horace Mann, 'went so far as to say that he saw him in the streets the 4th instant (January 1753), but so disguised as to make it extremely difficult to know him, having painted his face with red and coloured his eyebrows with the deepest black . . . that he followed him and saw him go into the Scots College.'¹

Charles did not return to Rome till his father's death, and then it was in the vain hope of getting the Pope to recognise him as king; but the Pope refused to Charles the recognition he had given to James. James died in 1766, in the sixty-fifth year of his reign. Had you been in Rome that year you might have seen the unfamiliar sight of a British monarch lying in state for five days in the Church of the Holy Apostles. Then James was buried with royal dignity in St Peter's, and that was the last time the popes conceded to the Stuarts the privileges of royalty. Charles continued to live in the Palazzo Savorelli as Count of Albany; and, when he married Louise of Stolberg, she was given by the Romans the picturesque name of 'Regina Apostolorum' on account of the position of the palace on the Piazza S.S. Apostoli. Part of Charles's time was spent also at Albano, where he fished and hunted, and made fatuous attempts to cure the king's evil.

V.

Henry's last years, on the other hand, were spent at Frascati. Frascati is the loveliest of the Alban towns. It lies on the slopes beneath ancient Tusculum, now a summer resort for Rome, then a mere cluster of villas and a pretentious cathedral. In modern Frascati there are many traces of Henry's work, and, till a generation ago, personal recollections of him lingered. Here he took up the work of a provincial bishop, and threw himself into the life of the place with such a zest that at his death there was universal mourning among the

peasants of the Alban hills. Here Henry gave his brother the royal burial that the Pope denied him in Rome. You may see a tablet placed to Prince Charlie's memory in the cathedral, and the Royal British coat-of-arms at the foot of the bronze candlesticks before the high altar and on the magnificent vestments in the sacristy. You may also see a room in the episcopal palace with a window opening out on a magnificent view of the Eternal City—the room where in 1807 the last of the Stuarts died.

In the Frascati Seminary, which was Henry's chief interest, and from which he produced men like Consalvi, the papal representative at the Congress of Vienna, Henry established a library, into which he put the last books treasured up by the Stuart family. The most valuable of the collection is a Book of Hours of the sixteenth century, written for Catherine of Medici, and given by her to Mary, Queen of Scots. Henry prepared a manuscript catalogue of the library subscribed with his autograph: 'Henricus Cardinalis Episcopus Tusculanensis Dono Dei.' Below this autograph you will now find other signatures: 'George R.I. May 11th 1923' and 'Mary R.' These signatures were placed there

by King George and Queen Mary on their visit to Rome two years ago.

Within a few miles of Frascati is to be found a last trace of the Stuarts and one remarkable for its situation. On the top of Monte Cavo—the Alban Mount—there stood a temple of Jupiter, which Cardinal Henry pulled down, to put a Passionist monastery in its place. It was an act of desecration, but one can understand his desire for the site. The monastery has been superseded by an inn, and the ruins are without interest. But from the site there unfolds a glorious view. Beneath are the Lakes of Albano and Nemi—the very cradle of Rome; beyond is the Campagna, with St Peter's dome rising through the haze, and beyond all the sea at Ostia. The site dominates one of the most historic panoramas in the world.

In St Peter's the bodies of the last Stuarts rest. The monument by Canova is the one vestige of the Stuarts which no one fails to see. But Canova's monument is a cenotaph, and it is in the Crypt, in simple urns bearing the names 'James III.,' 'Charles III.,' and 'Henry IX.,' that the last of the Stuarts are buried.

J. R. P.

IN THE VALLEY OF DECISION.

PART II.

v.

MEANTIME, while waiting for developments, I closely questioned Ben Toovey, and by putting together what I learned from him, with further details which I subsequently elicited from Mary Massinder herself, what really happened at the church may very well be told at this point in the narrative.

It appeared that John Hillyers was an old flame of Mary's before she took up with John Williams, and matters had advanced so far between them that they would have married but for the necessity of maintaining Mary's mother in the old home. Hillyers was a builder's mason, lived in a neighbouring village about three miles away, and was a man of respectable character and a good workman; and when old Mrs Massinder died, he promptly bought a wedding-ring, showed it to Mary, and pressed his suit.

But she by this time had become involved with John Williams, with whom she had walked out a good deal when she was in service at M—— where he lived. Williams, as I have stated previously, was a butcher and small shopkeeper on his own account, and probably appeared to Mary to offer better prospects in life than her more humble admirer.

Be that as it may, the faithful Hillyers pocketed the gold wedding-ring which he had

designed should embrace Mary's finger, and told her he would keep it always in the pocket of his best coat against the day that she might change her mind. 'For I sha'n't change,' he said to her. 'You be the young lady, and the only one I shall ever want to be my wife, and I sha'n't believe my chance is gone till with my own eyes I see you wed in church to another man.'

And so that was how it came to pass that on the day appointed John Hillyers, dressed in his Sunday best, came and sat down in a far corner of the church to hug his misery, and to see the last that he ever expected to see of the girl whom he had loved for the past five years or more.

And now ensued all that dreary waiting for the bridegroom who never came; and then Mary's retreat to the vestry; and finally the dispersal of the congregation when Mary had commissioned the officiating clergyman to tell them there would be no wedding that day.

The clergyman proceeded, as we know, to the rectory, and the clerk went outside, still dimly expecting the arrival of Mr John Williams; and then—I will let Mary tell her own tale.

'I was waiting in the vestry,' she said, 'and felt too weak and low to go home, with all the neighbours to watch me go by along the street. I thought I would wait till dark, and wished I were dead. I determined that nothing John

Williams might say now would ever make me like him again. And then I thought of John Hillyers, and how he would never have treated me in that way. And I wondered what he would think about it all. Perhaps he would say, "Serve her right." But I didn't think he would, for he was always the same to me—so kind and forbearing. I was a fool to say "No" to him.

'And just then the vestry door creaked a bit, and who should I see peeping in but just him I was thinking of! I cried out, "Oh, John!" and then started crying. And he said, "Oh, Mary, my poor love!" and in another moment there he was kneeling at my side, and holding my hands in his; and the tears were running down his cheeks, and we both cried together.

"I be still true to thee, Mary," he kept on saying; "only say the word, and we'll be wed. I won't desert thee like this other chap have done. This was bound to be, else it would never have happened so. Now do 'ee say yes?"

'And then we kissed each other. And so then he pulls the gold wedding-ring out of his pocket, he did indeed; and he tried it on my finger. And then, all of a sudden, he starts up and he says, "This is your wedding-day, Mary, and wed you shall be. Here be you and here be I; and here's the ring, and all we now want is the parson. He must be got back again, and there'll be no one in the church but the old clerk."

"Oh! but," I said, "he knows you, John."

"Ay," he said; "but I'll show him this golden sovereign, and tell him all he's got to do is to keep his mouth shut, except to say 'Amen' at the right times in the service."

"But what will the clergyman think?"

"Why!" said John, "he'll think nothing at all about it. He's the new curate and don't know me, and the rector be ill in bed; and one John I reckon be as good as another."

"Yes," I said to him, "and some Johns be a deal better than other Johns to my way of thinking."

'And I had no sooner said so than he rushes out of church like I don't know what; and when he comes back he could hardly get his breath for speaking. But he told me he had squared the clerk, who had gone back to fetch the parson. And he had been to the "Red Lion" nigh the church and ordered a motor-car to be got ready at once, and we were to pick up my box at the cottage and to go straight away to York, and next day to Scarborough. And he had bare time to tell me this, when the clerk and the curate came in, very hurried like, and the service began at once. I was real glad to have a veil over my face.'

Such was Mary's simple recital; and readers of this story already know how in the hurry of the proceedings and to enable the happy pair to get away quickly, the register, at the clerk's

instigation, was signed by the bridegroom and bride, and himself as witness, leaving the curate to enter further particulars at his leisure.

VI.

It only remains to tell what became of the pursued and their pursuer, as the result of my telegram to the Chief Superintendent of Police at York. As a matter of fact the sending of this telegram was precautionary, and in my opinion justified by the circumstances, but it did not effect all that I intended.

Mr Williams, as I learned by a communication from the police next day, never arrived at York, but they had taken prompt steps to find him.

The motor-bicycle was discovered at a wayside inn some miles from York, and was uninjured. And the innkeeper's statement was to the effect that the gentleman, Mr Williams, had dismounted there, because his petrol had run short, and he was in a somewhat exhausted condition himself. He had refreshed himself, however, by copious libations of whisky, and had talked very volubly about his grievances and about what he was going to do with the runaways.

In these circumstances the landlord of the 'Cat and Fiddle' Inn took great credit to himself that he had failed to find any more petrol for JX 9035, and had allowed his guest to slumber peacefully in his private parlour, and two hours later had persuaded him to return to his native town at M——, and forget all about a young lady who seemed to be not worth thinking about, still less pursuing.

I need hardly add that the charge of stealing was withdrawn.

As for John Hillyers and Mary Massinder, the York police could only report that they had neither seen nor heard anything of them.

As a matter of fact they were very happy together at Scarborough for one whole week, but the following week they were very unhappy when I got into communication with them, and wrote and told them what their position was.

They took immediate steps to set themselves right in the eye of the law, and were married as soon as they could be at a registry office. I suggested another service in church, but they said they were quite satisfied with what had already been said and done in my church. And they hoped my curate's earnest prayers at that time for their happiness and welfare would be heard, and that anything wrong might be forgiven. And for everybody's sake I hope so too.

I dealt faithfully, or at any rate tried to, with my old friend, Ben Toovey. But he was prompt to carry the war into my camp and to turn the tables on me.

'It warn't me as married 'em,' he said, with some show of indignation in voice and attitude; 'it were the curate. And it warn't for me to

be telling other folks their business; I had my own duties to attend to. And as for that other chap as what calls hisself Williams, I never sot eyes on him till he comes to me and says, "Be you the Parish clerk?"

'And I says, "Yes, I is."

'And he comes at me very fierce like and he says, "If I be not to do you a injury, just tell me what you've done with my young lady, Miss Mary Massinder."

'And I sticks up to 'im, and I says, "You 'm better keep a civil tongue, young man. I'se never sot eyes on you, so far as I know, all my born days, and I doant want to do so now. And I doant know nothing about no young lady as belongs to you, and if I does I pities 'er."

Old Ben must have seen a twinkle in my eye, for his old eyes sparkled as he said, "I'll tell you what it is, rector—you ought to have been in the church, instead of in bed, and then nought of all this would have happened."

'You never said a truer word, Ben. But let

me say to you in all seriousness that you are too much given to saying "Amen" to anything, whether it be good or bad.'

'Well, sir,' said the old man, 'they say in the parish as I earns my living by saying "Amen," so there's some good seemingly in it anyway.'

We looked at each other.

'Ben, do you know the meaning of "Amen"?'

'Sir,' he replied, 'I'se over seventy year of age this very month two year ago, and I'se been clerk of this parish for nigh forty year, and I learned the meaning of "Amen" out of church catechism in the church school when I were but seven year old. And it tells us that "Amen" means "So be it."'

'My good friend,' I said, 'you are perfectly right.'

'So you see, rector,' he concluded, 'there be worse words very often spoke than "Amen." And if this be my last word, I says "Amen, so be it." Let the matter bide as it be.'

THE END.

LEAVES FROM A CENTRAL ASIAN NOTEBOOK.

By Lieut.-Colonel P. T. ETHERTON, late H.M. Consul-General and Political Resident in Turkestan.

I.

TO most people the interior of Asia is a sealed book. To a certain extent the Far East and Siberia, Afghanistan, Persia, and Trans-Caucasia are known to the world at large, and now Tibet has grown somewhat more familiar in recent years since the British expedition to Lhasa revealed a few of the secrets of that country, which for so long baffled many intrepid explorers. But Chinese Turkestan, the land of ancient Tartary, and the Roof of the World, to the north of the Himalayas, wedged in between the frontiers of Russian Central Asia and our Indian empire, are a shadowy sort of territory of vast extent, into which but few men have penetrated.

The Roof of the World comprises the Pamir steppes, a lofty plateau region with an average elevation of 13,000 feet, forming the nucleus of the Central Asian highland system, uniting the Himalayas and the Thian Shan mountains with the Hindu Kush and the Karakoram ranges. This region has been fitly termed the Roof of the World, and from a political and sporting standpoint has attracted considerable attention, more especially some years ago when Russian movements in the direction of India gave rise to anxiety there. The Taghdumbash Pamir lying within the boundaries of the Chinese republic is the only one now open to travellers and sportsmen, since the Russian Pamirs were closed some years ago, a rule that has been rigorously enforced. Moreover, with the rise of Bolshevism, and the spread of

anarchy and disaffection throughout Russian Central Asia, the areas there have since become still more of a *terra incognita*.

The people inhabiting this desolate region are the nomad Kirghiz, a tribe distributed over Central Asia, whose origin rests somewhat in obscurity. These hardy nomads gain a scanty subsistence by herding their flocks on the bleak uplands, and during the winter, when the snow and intense cold render life on the higher ground of the Pamirs impossible, they retire to the valleys, though some of them migrate to the Afghan Pamirs, where the high wind sweeps the pasturages bare of snow, affording a meagre grazing. Their habitations are called *khirga*, constructed of felt on a wooden framework, with an opening at the top to let out the smoke from the fire lighted in the centre of the *khirga*.

The people live mostly on milk and mutton, and their chief beast of burden is the yak, that denizen of high Asia which can live only at great altitudes and endure intense cold, but dies in the heat.

In so far as the sportsman is concerned the chief object attaching to the Pamirs is the *Ovis Poli*, the largest of the wild sheep, named after the celebrated traveller Marco Polo, who traversed the Pamirs more than six hundred years ago on his journey to the court of Kublai Khan at Peking, then the most luxurious and famous of the Mongol kings, whose conquests in Asia have filled so many pages of history.

II.

It will be asked how one reaches the Roof of the World, since, as the name implies, it is

not easy of access. The route most generally followed is that from Kashmir through Gilgit and Hunza, northwards from the Himalayas. Hunza is a mountain state which was added to the British Empire in 1892, and we must traverse it to reach the Pamirs, a by no means easy task when one considers the precipices, the ravines, and the many rushing torrents to be negotiated. From Hunza we pass on to the Pamirs by the Mintaka, or 'Pass of a Thousand Ibex,' an appropriate name, but perhaps not so well deserved as formerly, since the Kirghiz have caused havoc amongst the poli and the ibex from their hunting expeditions, which are carried out with the help of dogs that round up the quarry and endeavour to force them into deep snow drifts, where they fall an easy prey to the guns.

Wolves are the chief enemy of the wild sheep, and in their hunting tactics they display remarkable cunning, working on a plan of campaign which is almost human in its detail and the craft and circumspection with which it is carried out. A herd of wild sheep is marked down by the wolves, which then proceed to encircle it. When a cordon is drawn round the sheep the wolves set up a prolonged howling, with the object of getting the herd to bunch together and so force it more or less to concentrate. The ring is gradually tightened, and all possible avenues of escape are closed, the herd being then shouldered off to where the snow lies in drifts. It is difficult for the poli to get through these drifts, and they are easily pulled down.

Amongst these jovial nomads one meets with many forms of sport, but none is more popular than hawking and the game of 'baiga,' in which the carcass of a sheep or a goat is the object of contention, the players being mounted on strong and agile ponies, and striving for possession of the carcass in what is nothing less than a whirlwind mêlée. It is a great game, and frequently as many as fifty players will take part. They form up into line, and one of their number, taking the carcass, dashes out into the open with a yell that sounds like the crack of doom, careers madly along, and when he hurls the sheep to the ground all the other players move off at a mad gallop, and then the fun begins. It is a scene of the wildest confusion; a player will gain possession of the sheep, but it is only a temporary ownership, for others are after him, and he may have a dozen men hanging on to his coat, his saddle, the trappings of his horse, even the mane and tail of his mount. All is fair in the game of 'baiga'; there is no such thing as off-side, or fouls; and by fair means or otherwise any player may unhorse another. Yet, despite the dangers of this fast and furious game, the writer, although he has seen many of them, has never known an accident, nor seen any of the players thrown, which speaks well for the Kirghiz powers of horsemanship.

III.

Let us now leave the Pamirs and pass on to the plains of Chinese Turkestan, calling on the way at Tashkurgan, where in pre-war days the Russians had an outpost of Cossacks as the outward and visible sign of the might of the Great White Czar, albeit Tashkurgan is in Chinese territory. Well does the writer remember calling on the captain commanding the Cossack detachment, and how that officer courteously returned the civility, attired for the purpose in his best uniform. At the time the circumstance impressed the writer, but it may perhaps have been due to the fact that his visitor's sartorial stock was limited. When some years ago the members of a British boundary commission met the Czar's representatives, they were informed that a Russian officer's outfit usually embraced one presentable tunic at a time. With epaulettes attached it signified full dress; with those embellishments removed it served for undress; and when it had attained the shabby stage it came in useful as a night-dress.

In traversing Chinese Central Asia for the first time the writer went *via* Yarkand, a city full of ancient associations and once the capital of old Tartary. There the Chinese governor gave a banquet in his honour of a quality and quantity proportionate to the great man's dignity. The menu of that dinner was varied and extensive, including sharks' fins, bamboo shoots, pigeons' eggs preserved in chalk, stags' tendons, lotus seeds, sea slugs with as many legs as a centipede, and a host of other weird comestibles. Some strange tricks were played at this repast, one of them being to hand round a lighted match stuck in a match-box, and the unfortunate guest in whose hand the match went out had to quaff more brandy, the result in some cases being highly exciting.

Discriminating and jocund souls are not lacking in Turkestan amongst those celestial functionaries who regard service on the western confines of the republic as a form of exile, and a place where money should be made as rapidly as possible to enable them to get out and regain the fleshpots of China proper. Withal the officials are wide-awake to business, as is the manner of their gifted nation, and though the troops at their disposal are none too efficiently armed or organised, they keep a keen eye on expanding commercial and political opportunities. One trait they share in common with most alien commentators on British enterprise. They cannot for the life or them understand how anyone can travel and brave many dangers and many egregious discomforts merely for the sake of sport. That is a conundrum baffling many students of complex human nature, and it is refreshing to reflect that even a Chinaman cannot solve it.

The writer recalls a Chinese military officer

of high rank who once inspected his sporting guns, and held much diverting converse thereon. He had been in Peking during the Boxer troubles, and though officially deprecating indulgence in looting, so far convivially unbent as to show how it was done by rushing round the room and stuffing his pockets with everything portable he could lay hands on. It was an exciting reminiscence, and as he considerably restored the impounded articles, he explained that in his opinion the British, American, and Japanese were the best behaved contingents he had seen.

IV.

They are quaint people, the courtly but credulous officials in these primitive celestial parts, and they indulge in a good deal of extravagant language. Withal, Chinese rule is acceptable to the people since they are allowed to go very much their own way, and the Chinese do not interfere with them so long as they abstain from anything in the nature of a political move, or what might be construed into an attempt on the sovereign rights of China.

Most of the native inhabitants retain customs whose origin may be sought away back in the mists of antiquity. For instance, the Kalmuks, another of the nomad tribes of Chinese Turkestan, do not bury their dead in the orthodox fashion. On the contrary, the body is put out on a knoll or low hill in the vicinity of the camp, and there left to the tender mercies of dogs and birds of prey. A Kalmuk hunter with the writer told him that should the corpse not be disposed of within the course of a few days the departed is deemed to have led a wicked and wayward life, since even the dogs are shocked and refuse to taste him. The sequel to the discovery is the chastisement of the members of the deceased's family with the object of saving them from a similar fate; the sins of the father visited upon the children indeed! Thus do the Kalmuks expose their dead, as Parsees still do with more attention to refinement, and as their rough prehistoric ancestors did without any at all.

Weddings, all the world over, are occasions for hilarity and expense. But the Kalmuks treasure the romantic theory of the bride being forcibly abducted from her father's tent, and they cling to tradition in the unwritten code which permits of the young lady in question, when pressed by a superfluity of admirers, adroitly confiding herself to the care of the one she favours best.

The Kalmuks drink copiously and often of kumiss—fermented mare's milk—from leathern bottles, in exactly the same way as did the Jewish patriarchs or their nomadic forebears a thousand years before them. The Kalmuks never wash unless under the sternest compul-

sion of necessity, and their general demeanour, if mild, hardly compensates for more prevailing traits which render them at times interesting objects to avoid. The Kalmuks are great hunters, and poachers too, yet with all their faults they are a gallant race, and the writer always feels that it is something to have made and preserved their friendship.

V.

The Kazaks are another race of nomadic origin, and the writer remembers how a Kazak once rode up to him, when on tour, saluted by taking off his cap, and inquired if it was a Russian he was addressing. On being answered in the negative he pressed the question, apparently to make sure that it was really an Englishman he was talking to, and then manifested his unfeigned delight by shaking hands vigorously, saying that he had in wanderings through Central Asia heard of the might and power of the British, and had always felt a desire to meet one of them.

In much the same way a Mongol chief was divided between ignorance and admiration of our mighty empire and its island centre. He inquired as to how many days' journey it would be to England, if one went on horseback, a question which was somewhat of a poser, but which was answered by the reply that it would take at least one hundred, which astonished the chief considerably. The Chief put further questions as to the wealth and worldly position of his guest, and expressed great surprise on hearing that the visitor possessed no sheep or cattle, and failed to comprehend how one could possibly exist in this universe without a strong contingent of lambs and kine.

Life in Central Asia is full of incident and excitement, as it might well be in lands but little known, lands which are likely in the future to loom large when the awakening of China shall have become an accomplished fact. At the various trading outposts in Turkestan one comes in touch with a semblance of civilisation. Here and there are signs of the awakening that has commenced since certain great events in the Far East. But they are not general, and one sees much corruption—of troops armed with dusty, dirt-begrimed weapons which it would be dangerous to fire; of police who spend their time in gambling, or who try to frighten away criminals by sounding watchmen's rattles, rather than attempt to catch them.

Central Asia is a storehouse of strange experiences, and the life of the official beyond the frontier affords opportunities for the study of strange and fascinating tribes of nomads, and brings him into contact with countries which through ancient associations have been invested with a halo of romance, and have, more particularly in recent years, given rise to questions of deep political import.

THE RED HUNTER.

By W. GILHESPY.

I.

THE weasel came to the door of his lair and looked forth on a hard and bitter world—hard and cold and bitter in every sense. A profound silence hovered over the land, such a silence as comes at the close of a short day in mid-winter when the cold is intense—a brooding, despairing silence. Even the gentle whisper of the woods, which seldom ceases, was no longer heard; not a leaf stirred, not a living thing moved.

The little hunter turned his head slowly from side to side, while his sensitive nostrils winnowed the air for any message it might bring. The movement exposed his white throat and chest, which contrasted well with the rich deep chestnut of back and flanks. His low, lithe body gave little indication of the restless energy, the enormous reserve of power and endurance, that lay in that small frame, nor would the alert-looking triangular head have told the casual observer of the innate savagery, the cruel, crafty, indomitable tenacity of purpose that characterises the tribe.

A robin alighted on a branch near him, caught the gleam of the baleful red eyes, and, with a jerk of his tail, flew away. The weasel followed along the hedge—not with the slightest hope of making a capture, but because his bitter hunger spurred him to action. For three nights he had hunted fields and woods and hedgerows without finding a morsel to satisfy his savage craving for food—a craving that grew more intense as each hour passed, a craving that was agonising in its gripping intensity. He hunted along the hedgerow, crossed a footpath, and stopped. Sound travels far in the deep stillness of severe frost, and from a great distance he heard the patter of childish feet. Motionless behind a boulder he waited till a little maiden, carrying a can of milk, passed on her way to her cottage home. Swiftly, silently, he returned to the path, and, ravenous hunger urging him to attack, ran parallel with the child, only the bare leafless hedge between him and the tender limbs, the soft, plump, round, young throat. But, though he had never known fear in his wicked little life, fear held him back now—a new, instinctive fear that seemed to paralyse his will and fill him with insensate fury, just because it was new and strange.

Once, at a bend in the path, only a tuft of withered grass was between him and the dimpled bare knees, rosy with the flush of exercise. Mingled with the scent of warm living flesh was that of the new-drawn milk

she was carrying, and the hunger fire burned bright in the cruel little eyes. Then, as the little one turned a corner, a woman came to meet her and a big rollicking puppy greeted her with joyous bark. The weasel stopped, and suddenly it seemed to him that the cruel cold became even more intense.

II.

Dusk fell, deepened, and still he hunted. A rim of silver showed above the horizon, and the rising moon looked down on his vain search for food—for something—anything—that might satisfy his mad craving.

That bitter winter is still spoken of by a few very old men as 'The Year of the Great Frost.' Brilliant sunshine in summer and a genial autumn had allowed an early harvest, followed by early ploughing. The scattered grain, that helps to feed wild bird and beast, had been covered in. Then November was ushered in by storms, followed by such severe and long-continued frosts as few men could remember. The ponds, lakes, and marshes, with their insect life, had been held in an icy grip for nearly three months, so the birds had migrated—or perished. The short grass was as cold and tasteless as icicles, and when the rabbits began to bark trees and hedges they were ruthlessly destroyed. With their natural prey no longer available, the stoats, weasels, and foxes were unable to find food, and few survived that bitter time.

Hour after hour the red hunter searched the ditches and hedgerows. He found the discarded wing-case of a beetle. It was as dry and hard as a twig and about as nutritious, but he ate it greedily and looked for more. In a dry ditch he picked up the fresh trail of a field-mouse, and bounded along on the warm scent till he came to the burrow. There he scratched with savage energy, but the frost-bound earth was hard as iron, and he laboured in vain. He hunted through a huge rabbit-warren, one which he explored regularly every night, though he knew it had been tenantless for weeks. With hunger driving him to ceaseless endeavour he could not afford to let a single chance of finding food escape, and it was always possible that some wounded or starving creature had crawled in there to die.

A few nights previously he had fought a victorious fight with a strange weasel that had hunted over his territory—an unpardonable sin among the kindred of the wild, especially the carnivora. The red hunter had killed and eaten the intruder, but he carried the scars of the conflict still.

The intense cold bit into his raw wounds as acid eats into metal, but still he hunted. The full moon, riding high in a cloudless, star-studded sky, saw him questing the hedgerows with energy unabated—and unrewarded. As he hunted through some tall withered rushes a shadow flitted over him, and he glanced up as a small owl, that had also been vainly hunting, hovered above him. She saw her error just in time, and her broad, soft, but powerful pinions lifted her clear of the flashing death below as the weasel, with muscles like steel springs suddenly released, shot upwards. He was the merest fraction of a second too late, but he plucked a couple of tail feathers, and, furious with hunger and thwarted desire, he tore and chewed them into a pulp.

III.

The church clock chimed the midnight hour. It was far away, but on the still, frosty air the sound floated sweetly and clearly over hill and dale, and he glanced up with a soundless snarl. Then he sped forward on his ceaseless search, keen nose questing the calm air, bold little head held high. Suddenly he stopped and turned back, sniffed the ground once, then bounded eagerly forward, the blood coursing madly through his veins, for he had struck the warm, fresh trail of a hare.

With renewed vigour he sped forward. When a weasel strikes that track, death for the quarry is certain. He followed her apparently aimless wanderings across the field, from one clump of withered grass to another, where she had searched for a tender blade. Through the hedge and across the next field he trailed her with steady bounds, turning where she had turned, never halting for a second. Then his lips upcurled in a snarl as he learned that her stride had lengthened. She had sought fresh feeding-grounds, and the chase would be a long one.

Along the headlands, over frozen stubble, up a hard sheep track and across the barren uplands, with scarcely a turn, she had made her way, and the grim hunter followed. His long, lithe, little body, with its short slim legs, travelled at a speed which seemed marvellous for such a tiny creature. Over the rocky heights, down the shingly slope, he sped with grim, relentless patience. Then once more his fangs were bared in eager anticipation as he came to a sheltered hollow and the scent told him that the hare had stopped to feed. She had tarried there but a short while and gone further afield, and still he followed, steadily—implacable as death itself.

She was nibbling at the frozen herbage near the gate of a pasture when he saw her. With a startled bound she fled down the field and was soon out of sight. The red hunter neither paused nor quickened his pace. Steadily, ruthlessly, untiringly, he bounded along on the warm trail, as confidently as though his quarry's

speed was not many times greater than his own. At the end of a ploughed field he saw her again. She had paused to watch and listen till the pursuer came in sight again; then, across the headland, through the hedge, and across the frozen lea she went with long easy stride. Still the steady inexorable chase continued, slow, but fatally sure.

As she bounded out of one of her 'forms' he was within twenty yards of her. When he sighted her twice within the next ten minutes he ceased to follow the scent—the need for that had passed. He knew that the foolish quarry, her scanty wits paralysed by fear—the fear his fiendish tenacity of purpose had aroused—would run in erratic circles until her nerveless limbs would refuse to carry her further.

He saw her close to the hedge, and as he drew near she ran to and fro in aimless fashion. A few more foolish bounds, a few more frantic rushes, then, with a despairing cry that told of her agony of terror, she squatted motionless, helplessly waiting for the oncoming doom.

Swiftly it came. With eager bounds, his wicked little eyes glowing red with the blood lust, the hunter covered the remaining distance—just as the prize was snatched away. For other ears had heard the doomed hare voice her terror and despair. A poacher, stealing along beyond the hedge, had scarcely time to whisper a command ere his lurcher had jumped the low stone wall and seized the hapless victim. A moment later his master stuffed her into his capacious pocket as the red hunter, his wicked little eyes gleaming with rage, torturing hunger driving the last vestige of caution from his fiery little brain, scrambled in and out of the dry ditch and over the wall. Well it was for him that his climbing had given the despoilers time to get well on their way home.

IV.

Once more he settled down to his quest. Vain, incessant hunting had not improved his temper, but his tenacity and courage were unshaken. Weak with hunger, the merciless cold stabbing the raw wounds on neck and flank, he held to his purpose with grim, unfaltering resolution. Thousands of the wild kindred had crawled into their lairs to die during that awful winter. Death, if it came to him, should find him still hunting.

Dawn was not very far away when he struck a trail that promised a warm, satisfying meal. A wounded partridge had crossed a field to find a few seeds or grains the day before, and something in her erratic wanderings had raised the hunter's hopes. A bird that trails a broken wing is always worth following.

The scent was cold, but his bitter need sharpened the weasel's senses, and he followed fast. The partridge had returned to the headland, followed the hedge for a few yards, and

taken refuge in a hollow under the bank, as the wild folk will when wounded. His pace increased; he could smell the quarry now, and the scent roused him to a fury of anticipation. He plunged into the hollow and saw scattered feathers lying around, and a stoat nosing among them to see if there was a morsel he had overlooked.

Stoats and weasels seldom fight each other or among themselves—the issues are too grave. Each knows the grim battle power, the implacable spirit, and the deathless courage of the other too well to court combat. But, though the

stoat is twice the size of the weasel, the red hunter's temper was too high, his need too great, and his disappointment too keen to give him time to think of consequences. The stoat's head was turned away from the entrance and slightly to the right, giving the weasel the chance to dart in and get the grip he always sought when about to glut his thirst for blood—just where his sharp fangs would meet in the jugular vein. Even as he delivered the death-stroke the other turned, and his fangs gripped his assailant's flank. A lightning shift, and they had pierced the dauntless little heart.

THE FIRST SCOT.

PART II.

VI.

PARALYSED with terror and dismay, the woman in the tree-tops stared at the monsters. In her native land she had seen most of the terrible mammals that waged war on man—cave-lions and giant bears, rhinoceroses and straight-tusked elephants sixteen feet at the shoulder, sabre-toothed tigers and cowardly hyenas. But never, even in the delirium of the fever that sometimes attacked her, had she imagined such awful horrors. What could they be? What was this strange land which harboured them?

She did not know that the storm had blown her, not merely over a few hundred miles of ocean, but back into a past age of the universe. For Scotland, isolated from neighbouring Europe, had not shared in the progress that the world had made elsewhere. The Mesozoic period of creation, the cycle in which giant reptiles held the earth before humanity began, still flourished in these scattered islands lost in the Atlantic when it had passed away hundreds of thousands of years before in the great continents where primitive man and the mammals had taken the place of the reptiles. But this poor stray from Europe had been flung back into an age—a universe—of which she had no conception.

She clung mechanically to the swaying branches and stared stupidly at the monstrous forms on the ground below. Gradually her senses returned. She looked around her. Nothing was familiar but the sea. Even the plants, the trees, were strange. On a beetling cliff across a little bay she saw the hideous shapes of great bat-lizards like the one that had assailed her and killed the crocodile.

But suddenly her heart leaped; for through the heated air a flock of sea-fowl of a kind well-known to her flew over the water, and two flamingoes alighted on the banks of the stream. These birds at least were of her epoch; for Scotland was not inaccessible from Europe to the creatures that had wings.

The sight of them cheered her; they showed her that she had not been transported to another world. Again, forgotten for the moment, her thirst returned, more tormenting than ever; and, mocked by the tantalising vision of the water so near, yet so impossible to reach, she gazed helplessly at the dinosaurs, a dull anger burning in her against them as they showed no signs of moving away.

But all at once there was a commotion among them. Several of the iguanodons stood up on their hind legs and looked anxiously in every direction. The Plated Lizards nearest the forest threw back their ugly heads and sniffed the air; while the gigantic amphibian in the marsh reared up like a kangaroo. From its superior height it was apparently the first to see some danger approaching; and, lowering itself on all fours again, it waddled swiftly into the sea and disappeared under water.

As, alarmed by its departure, the land dinosaurs began to flee, some in terrified leaps, the others lumbering heavily but speedily across the open, there burst out of the forest a monster more horrible than all the rest. Bounding on its hind-legs, it sprang on an unwary young iguanodon which had unwisely lingered for one last mouthful, and, gripping the body with the sharp claws of its short fore limbs, it sank its fangs deep into the back of the neck, biting clean through the spine and bringing its prey with a crash lifeless to the ground. Then, standing over its victim with the blood dripping from its jaws, it looked after the others as if debating whether to pursue them or not.

The woman saw that it was in shape not unlike the dead iguanodon, but far bigger and more powerfully built, having a head four feet long armed with a pointed horn on the nose like a rhinoceros, but possessing more formidable weapons in the curved, knife-like teeth that studded its immense jaws. It measured forty-five feet from nose to the tip of the thick tail, which helped to prop the brute up when

it rose on its hind legs. Their great size, strength, powers of offence and fierceness made this reptile and its kind the most terrible beings in the age of horrors to which they belonged, an age happily past in most parts of the globe, and lingering only in a few isolated spots like the Scotland of the period. Well did these bloodthirsty monsters—unlike most other dinosaurs they were carnivorous—deserve the name that men gave them in later times, the King Tyrant-Lizards.

As, with its sharp claws sunk into its victim, it tore at the still quivering flesh, four or five far smaller carnivorous beasts hopped timidly out from various points of the fringe of the forest and sat up on their hind legs at a safe and respectful distance from the great killer. The sky above the clearing was suddenly darkened; and, looking up, the woman saw that the immense-winged pterodactyls from the cliffs were flapping heavily overhead in circles with harsh and discordant cries. First one, then another, swooped down towards the carcass, rocketing up again into the sky, as the great lizard snapped viciously at it or, standing up on its hind legs, struck with its fore-claws, jealously defending its prey.

VII.

The appearance of the pterodactyls on the scene terrified the woman more than the presence of the dinosaurs; for the latter could not reach her in the tree-tops as the great flying reptiles could. So she climbed stealthily away through the branches deeper and deeper into the forest, until the silence that encompassed her told her that she was safe. Coming to a stream flowing among the trees, she climbed down with infinite precaution and at last satisfied her thirst. A movement in the grasses fringing the stream caught her eye. Picking up a stone, she threw it with quick aim at something wriggling into the water and, flinging herself down at full length, grasped a salamander two feet long, its spine broken by her lucky shot. Killing it by knocking its head against a rock, she sprang rapidly up a tree with it, and at a safe height ate her first meal for days. Then, her hunger and thirst satisfied, she fixed herself in the fork of a big bough and slept the sleep of utter exhaustion.

In that early age of the world even more than to-day human nature readily accustomed itself to changed conditions of existence, and self-preservation was as ever the first law. This woman had been torn violently from her accustomed surroundings—one cannot call 'home' the platform of sticks on which she slept on a high branch in some forest of France. When the catastrophe occurred her mate and the elder of her two children had been absent hunting; and the younger was drowned when the tree was hurled into the sea. The parting

from her man she only regretted because she was deprived of her food-getter; but the loss of her children was a bitter blow. Maternal affection was the only love that human beings then knew.

However, she was aware of the fact that in a few months she would be a mother again. So she settled down to lead a new life in a new setting, but in the old way. High in a tree over a stream, near a spot where the forest reached the seashore, she built a dwelling for herself and her coming babe, just a platform of sticks, a form of habitation that humans probably learned from simian ancestors to make. She did not trouble to roof it with leafy boughs, for she was as indifferent to the weather as wild animals are.

As the days passed she wondered that she never saw apes or men when she wandered through the green lanes in the tree-tops. She did not know that she was the sole representative of the race of mammals in this isolated land of Scotland.

The need of hunting for food forced her to conquer her fears of the terrible beasts inhabiting the small island. She had armed herself with the only weapons then known to men—stones to throw and a club made of a broken-off branch, useless against the dinosaurs, she realised, but serving to kill the giant toads, newts, salamanders, and small reptiles on which she fed. She supplemented these by oysters and other shell-fish, and eggs taken from the nests of birds so unused to being molested that they let her approach them and catch them in her hands, and add them to her food-supply.

And thus she lived until the coming of her child—the first human being ever born on Scottish soil.

The First Scot!

VIII.

A true Highlander this queer, yellow, hairy little morsel of humanity could claim to be, since he was born on Scotland's highest mountain. From the outset he was as hardy, strong, and active as a Highlander should be; and at an age when children to-day are crawling on all fours he could climb through the branches like a monkey. He grew up fearless and daring. The great reptiles that cumbered the earth below his world—the breezy world of the tree-tops—had no terrors for him; but his mother could never overcome her dread of them, although she was not often in danger from them, as she passed most of her life high up out of their reach.

When sometimes the silence of the forest was broken by the sounds of a titanic combat between two or more of the great monsters, she clung trembling to her perch in the tree in uncalled-for terror. But the daring boy, despite her entreaties, would leap away through the

branches until he reached the scene of the battle, and there, high over the combatants, would watch with keen interest a desperate duel between two King Tyrant-Lizards, or a fight for life by a Stegosaur against one of the murderous beasts.

The existence led by mother and son was simple. They woke at dawn on their platform and, brushing the sleep from their eyes, set out through the tree-tops to look for nests or for birds confiding enough to let themselves be approached and seized or clubbed. But the feathered tribe were beginning to fear and to fly from these strange beings that invaded their special realm. So the two had often to descend to earth and, every sense on the alert against possible enemies, kill some reptiles, toads and frogs, and catch fresh-water turtles in the streams, all of which lower forms of life have come down almost unchanged through the ages. As the boy grew he became more daring and skilful as a hunter.

The language that the mother taught her son was rudimentary and extraordinarily simple, the first articulate tongue spoken by human beings. It sufficed for her, but not for him; for he was of an inquiring disposition, and his small head seemed to hold a bigger brain than she or their contemporaries in other lands possessed. There was much that puzzled the speculative child—light, darkness, the sun, the moon, the stars, the tides; but his mother could not explain these mysteries. Many of his questions remained unanswered; but among other things he gleaned some idea of the land from which she had come, and its difference from that in which he was born.

IX.

Before he was out of his teens, the lad—Vo, the woman called him; it meant 'New,' for he was the new thing to her—showed mental powers in advance of the age in which he lived. Since the days of the first man that had learned to use a weapon other than his natural ones of hands and teeth, human beings had been content with the weapons that he had employed, stones and sticks, the latter wielded as clubs. But no one had ever thought of making tools.

It happened that Vo one day had hurt the palm of his hand by a splinter in the mace that he was holding. It occurred to him to use a sharp-edged stone to scrape the wood until it was smooth to his grip. As he swung the club over his head it was caught by the branches of a tree; and this annoyed him and made him wonder if he could not devise a better weapon. It seemed to him that a pointed stick would give him a longer reach if he thrust at a prey with it, instead of striking a downward blow which might be arrested by some obstacle, as the club had been. It resulted in his sharpening one end of a long straight pole with his

stone and making the first spear ever used by man.

He learned to look for large pebbles that by chance fracture had acquired a sharp edge, in order to employ them as scrapers for trimming sticks as lance-shafts. Once, when idly hammering two unbroken flints together, he knocked flakes off one and found that by doing this he could get the required edge. Thus he discovered the art of chipping flints that for so many centuries was to be the limit of human progress in the making of implements and weapons.

He soon realised the value of his discovery, and made good use of it. From these useful stones thus treated he fashioned knives to skin and cut up the small animals and reptiles that he killed, scrape and trim wood, and open oysters and other bivalves that he and his mother gathered on the seashore. By notching a long and slender flint he contrived a rude saw, and with a pointed flint he made a tool to bore holes with. Crude and clumsy these implements were, rude his contrivances, yet they were marvellous and epoch-making; for they were the first proofs of man's awaking intelligence and reasoning power, the first definite sign that marked his upward progress from the level of the unthinking brute. Hitherto he had achieved nothing more than the apes had.

But almost the greatest triumph of Vo was the improvement of his weapons. For by it mankind benefited almost down to the Age of Bronze, and was enabled to wage successful war against the beasts of prey that threatened to exterminate the human race—and might have done so had it not been for this invention. Vo was dissatisfied with his spear, the wooden point of which lacked penetrative power and was easily blunted. After long thinking he split one end of the shaft and inserted in it a long flaked flint, and fixed it firmly by tightly binding the split ends with strips of hide. He had now a sharp and deadly spear-head.

His club, too, was unsatisfactory, as its knobbed top was liable to break and did not always deal a sufficiently hard blow; so he fixed a pointed flint in it, like a spike, and made it much more formidable. This gave him a fresh idea. Cutting a longitudinal hole near one end of a stout baton, he wedged a sharp-edged triangular flint in it—and thus made the first axe. Hundreds of thousands of years have passed since he proudly brandished this new weapon and tool, but the model of the implement remains the same to-day, although the workmanship has improved and steel takes the place of flint in the axe-head.

The lad had undoubtedly something of the inventive powers, original ideas, and mechanical aptitude of the nation that in the course of time was to follow him in this land when it grew larger than he ever knew it, the nation that was

to send to the ends of the earth as pioneers, colonists, engineers, its sons, better favoured but not more ingenious than this ape-like youth. When he sat at work with his strange tools, his mother squatted near him on their platform up in the tree, watching him in wonder that became awed admiration when she saw the marvellous results of his toil.

X.

Their airy shelter, too, demanded his attention. As the only dangers against which they had to guard when in it were from flying reptiles or climbing snakes, he roofed it with stout timbers, and shut it in, around and below, by walls and flooring of woven branches through which no serpent could penetrate. And he contrived for this aerial abode the first door ever made, a door that could be securely fastened from inside.

These defensive precautions were not wasted. Not long after the building of this, the first hut for human habitation, a pterodactyl winging its way over the forest saw the strange mass in the tree-tops, and, slowly planing down, settled on the roof, which it probably took for a giant nest. Sensing the terrified pair within, it plucked at the timbers with its iron beak. It had torn away two or three, when with a harsh scream of pain, it shot up towards the sky on wildly-flapping wings, the blood spouting from a gaping wound in its breast where the sharp flint-headed spear, thrust up through the gap, had been plunged deep by Vo's muscular arm. The pterodactyl struggled back through the air towards its haunt on the cliffs, but was forced to come down in the open, where a score of its cannibal companions fell on it and devoured it.

Not long afterwards the breezy dwelling and its occupants were nearly involved in common ruin. A big iguanodon, feeding in the forest, came to their tree and, rising on hind legs, gripped the trunk with its forepaws, and began to browse on the leaves of the lower branches. Suddenly two Tyrant-Lizards leaped towards it from opposite directions; and, before the startled reptile could make up its mind which way to bolt, they sprang on it simultaneously, and, clutching its body with extended claws, buried their sharp teeth in its flesh. The three huge bodies fell against the tree, their combined weight all but uprooting it; and the thick trunk bent almost to breaking. The mother and son were hurled across the dwelling by the shock of the impact, and clung to the rough flooring as the hut heeled over. But, just as they expected to crash to the earth, the stricken iguanodon relaxed its hold on the stem and sank on the ground, where its slayers fell on the quivering carcass before life had left and began to devour it. When they had satisfied their hunger they departed, much to the relief of the scared watchers above, who, as soon as it was safe, climbed down to search for any scraps that might have been overlooked.

Latterly the island seemed to swarm with these carnivorous dinosaurs, and the herbivorous ones were being exterminated by them. One surprised and chased Vo in the open one day; and only his fleetness of foot and the nearness of the forest saved him. He climbed swiftly up into a tree, which the King Lizard in blind rage tried to uproot. But the youth leapt from it into the branches of another and still another, until the bloodthirsty great reptile lost sight of him and went off in dudgeon.

(Continued on page 666.)

FILLING THE FLESHPOTS.

I.

WHAT the merits or demerits of a vegetable diet may be, the writer has no intention of discussing: but our advocates of a meatless race seem to forget or ignore the fact that, in all ages and in all climes, an inexpugnable craving for some form of flesh-food has been one of the most potent attributes of the human race. It is admitted that we have here and there a few sects and castes who regard with well-simulated horror the eating of flesh. Such abstinence, however, is seldom based on natural inclination, but is rather the outcome of religious creeds or doctrines, and is no more normal than the gyrations of the Dervish devotee, or the celibacy of a priesthood.

In the frozen North, those hardy tribes who brave the inclement winter on floe and ice-field

have no choice in the matter, but are forced—willy-nilly—to accept an animal diet or perish. On the other hand, along the tropic belts, where nature with lavish prodigality has spread her stores of fruits and foods, cereal and vegetal, in infinite variety, the craving for flesh is practically universal; and in the great million-peopled plains of India, Africa, China, and South America, it is no exaggeration to say that the meat menu of these races comprises everything from ants to elephants.

I think that, so far as size is concerned, we touch the bottom of the scale in Nyassaland. There, at times—during the rainy season—great clouds of tiny gnat-like flies are blown across Lake Nyassa and are caught and eaten with great relish by the Wa'Nkondi. As soon as they appear on the horizon—rolling low across the surface of the water like dun-coloured

smoke-clouds—the cry rings from village to village ‘Kungu! Kungu!’ and the natives prepare for their arrival. As the insects in millions roll landward, men, women, and children, provided with baskets of all kinds and sizes, plunge into the humming cloud and, dexterously waving their utensils to and fro, collect masses of flies in a few minutes; pausing only at intervals to pat them down into a heterogeneous pulp, which, pressed into cakes and fried in oil, is said to make quite a toothsome dish. What it tastes like I do not know, as I never had the pluck to sample it.

In the Shiré highlands caterpillars are collected in the early morning, dried in the sun, and after being toasted on skewers before a fire are considered rather a delicacy. Ants are eaten in nearly all tropical countries. At certain seasons nature sets about ‘thinning out’ the ant community, and for this purpose adopts an emigration scheme with ‘assisted passages,’ older than man’s. Each newly-hatched ant is the recipient—for a brief hour only—of a set of transient wings, and, issuing from the ant-hill in thousands in a hissing, humming stream, they are captured by simply inverting a basket over the opening until sufficient are collected. They are then mixed with flour, kneaded into a sort of meat biscuit, and roasted.

Locusts, although not exactly popular, are nevertheless much eaten in some localities, especially Central Africa, Northern Rhodesia, India, and Mongolia, where the usual method is to gather them in the early morning as they cluster in thousands on the tree-trunks in a sort of comatose condition. After being deprived of their long ‘jumping’ legs they are mixed up in a heap of dead leaves and grasses and set alight. The swift passage of the flame just serves to scorch without incinerating them, and they are then eaten out of hand, like shrimps. In these same latitudes slug snails, butterflies, fresh-water crabs, lizards, rats, and snakes add variety to an otherwise monotonous diet of maize, manioc, and yams.

II.

The feathered kingdom contributes largely to the domestic fleshpots, and in most tropical countries nothing is too small or insignificant for augmentation of the family menu. On the upper Amazon humming-birds are netted in hundreds, as are also a diminutive species of sparrow in China. In both cases, being too tiny for much dissecting or cleaning, they are simply stripped of their feathers and boiled whole, arriving on the table, head, beak, and claws complete! In Africa, India, Borneo, and many of the South Sea islands, the larger birds are brought down by light arrows which, being tipped with a button-like foil, kill or stun, but do not lacerate, the victims.

The catapult and the boomerang contribute

no inconsiderable quota to the universal larder, but by far the most common agent in use in this connection is the snare. Not only birds, but the smaller animals of almost every species are trapped in millions annually, by devices so manifold in ingenuity and variety that their merest summary would require more time and space than is at our present disposal. But it is not only with the snare that the Equatorian takes toll of the smaller creatures. Through the long centuries he—like his civilised contemporaries—has called to his aid and trained to his service innumerable auxiliaries, of which dogs, ferrets, cheetas, the mongoose, the cormorant, and the falcon are but a few.

But if the snare is universal, I think we can confidently aver that the ‘pit’ is far and away the most ancient method of trapping practised by man. All the evidence from the dim æons of unwritten history goes to show that primitive man was a hunter of no mean prowess. With his rudely-shaped clubs, flint-headed axes, and a few other weapons as crude and barbarous as the age in which he lived, he faced, fought, and slew the fierce up-towering cave-bear and sabretoothed tiger; and even the monstrous mammoth went down before his cunning and courage, leaving only its calcined bones to tell the tale in grass-grown barrow or stalactited caves. It is very probable that the frequent embogging in swamp and quagmire, or the occasional falling into pits or waterholes of some of his contemporary monsters, first suggested to palæolithic man the idea of the pit-trap, since the killing in fair fight of any of those gigantic creatures—so fearfully equipped for slaughter—must have meant a casualty list from which even our semi-animal ancestors might well shrink. Be that as it may, the pit has always been—and is to-day—the most common device for the capture of big game among the almost weaponless tribes in equatorial countries.

In Central Africa it is usually dug in the form of an acute V from six to eight feet deep, and about twenty feet in length, and is excavated in some spot where there are signs of a much-trodden ‘run,’ and artfully concealed by branches, grass-tufts, and sand. Though the wild things of the jungle are not easily deceived, it seldom happens that a pit is long empty. The denizens of the forest love not beaten paths—only using them, indeed, when emergency demands speed, or when no other avenue is available; and thus, as often happens, a herd of buck, fleeing from the ‘wind’ of a lion or a leopard, come thundering along in the line of the trap, and before the startled leader—suddenly sensing danger—can stay or turn, he is hurled, by the sheer weight and impact of his followers, headlong into the pit. The struggles of the terrified animal serve only to wedge him tighter in the cleft, until at last he becomes totally incapable of movement, and his doom is sealed.

The news of the 'catch' soon spreads, and if the pit is in the vicinity of a village, the whole population turns out to witness the 'kill.' A well-aimed blow with a heavy club, a single skilful spear-thrust, and the carcass is carried off in triumph amid delirious rejoicings.

I have on occasion seen two wart-hogs and a hyena in one of these holes: the hogs were dead and badly mauled, and the hyena had incautiously worked himself down into the sharp angle of the 'V' until only his head was capable of movement. A 'stabbing' spear through the spine put an end to his troubles, and what was left of the hogs was soon on its way to the pot. On rare occasions—especially in the great plains between the Zambesi Valley and Lake Chad—an elephant or a rhinoceros crashes into one of these game-pits, and amid hysterical rejoicing is done to death, making possible one of those flesh-eating orgies that haunt the day-dreams of the African bushman.

III.

In 1903, while camped in the Luapula Valley, my boys informed me that a local chief had 'pitted' an elephant and was about to kill it. I went to view the affair, and for about five minutes watched the bludgeoning and stabbing of the creature as it trumpeted and screamed in pain and terror, until, sick and disgusted, I sent for my rifle and put the animal out of its misery.

A common form of trap widely used in Africa, India, and Amazonia, is the noose. From between two pliant young trees a wide noose is suspended in the centre of a 'run' or the well-beaten approach to some water-hole. The trees are bent down with considerable force and held by an ingenious arrangement of pegs and pins; the wide loop is so adjusted that anything entering its circle liberates the restraining trigger, and in the fraction of a second the victim is caught and held, the recoil of the trees jerking it clear off the ground, or holding it so 'tip-toed' in suspension that escape is impossible.

Passing through Midima en route for 'Mlange in 1900, I had the unique experience of seeing a lion—a real full-grown king of the forest—which had been noosed by the hind legs in this type of trap, and hoisted off the ground until he almost stood on his head. A jeering crowd of natives surrounded the fallen—or shall we say 'up-ended'?—monarch, and with uproarious enjoyment told the creature what they thought of it, and described its ancestors in lurid detail, for nearly an hour before despatching it.

In this same district I saw, for the first time, snake poison used as a medium for filling the village pot. A pole about the size and weight of a tent-prop, pointed with a poisoned arrow-head, is hung from a branch in such a manner as to fall on any animal passing beneath; the descending barb entering, or even scratching,

the body of the unlucky creature, is sufficient to ensure its speedy end. Among these tribes it has long been common knowledge that the fluids secreted in the stomach render snake poisons innocuous, and in consequence they merely take the precaution of cutting away the flesh round the actual wound, eating the rest of the carcass.

IV.

One of the most interesting incidents of my stay in Zambesia was my participation in the capture and killing of a hippo north of Chiloma. About a mile below the village the river forms a deep and sluggish backwater between some small islands and the shore—an ideal feeding-ground for hippopotami. Word was brought to me that the local chief was going hippo-hunting on the morrow, and if I cared to join in he would take it as an honour.

At dawn, accompanied by my 'capitao,' I reached the river-bank and found everything in readiness for the expedition. The canoe allotted to me was in charge of the chief's son, Kampetè, a brown-skinned Apollo, who, his father informed me, feared not death. While this quality might be very commendable in his son, it was, to my mind, rather embarrassing as an attribute of the commander of our canoe. We had a fleet of seven craft all told. A heap of native rope specially made for such occasions lay coiled in the bow of each canoe, and attached thereto was a wicked-looking short-shafted harpoon, which could be fixed temporarily into a twelve-foot length of bamboo to give the necessary leverage when driving home the barb into the body of the hippo. Our crew numbered four: Kampetè in the bow, his harpoon socketed ready for action, my capitao and a tribesman roping, while I nursed my rifle astern.

About a quarter of a mile above the pool we ceased to paddle, and the canoes dropped downstream about twenty yards apart, floating slowly across the feeding-ground. Here and there a huge head broke the surface and with a great wheezing gasp sank out of sight again in a swirling eddy of muddy brown water, but none near enough to justify attacking, although our leading canoe was now well across the pool.

The first bit of luck came to the craft immediately ahead of us. In a surging upheaval of muddy water the great head of an old bull hippo—looking monstrous at such close quarters—rose within six feet of the dug-out, but their harpooner, in thrusting, slipped his barb prematurely, and the hippo slonged slowly forward in our direction, submerging. And now we, too, were in action! A vigorous sweep or two of the paddles brought us almost over the great beast as he sank slowly beneath the surface, and Kampetè—with the whole weight of his lithe, sinewy body behind it—launched his barb: a great thrust that sent the razor-edged harpoon

deep into the body of our quarry. Then, rapidly paying out our line, we swept well clear of the spot, and lay-to discreetly near the shore.

Our hippo had dived, but was soon up again—the centre of a foaming vortex of blood-flecked water, and it was plainly evident that the harpoon had unsettled his temper. The first object of his wrath was another member of his company three or four yards away, who met his onslaught open-mouthed. Then, turning suddenly in our direction, he gave us—or myself at least—one hair-raising moment as he came at us, his little eyes blazing with fury, and his great jaws snapping and clashing. Again changing his tactics, he did what all hippos do when sorely wounded or badly scared—dived, and headed up-stream.

We were after him directly, our rowers sending the light canoe flying parallel with his course, and paying out plenty of slack as we went. At the first bend of the river our quarry halted, as though for a 'breather,' and I soon found that everything was working out according to plan, and the action of our hippo must have followed the lines of many of his predecessors in the past. A canoe, which had evidently been in waiting, ranged alongside of us, towing a fair-sized tree trunk. This was made fast to our harpoon rope and cast clear, and once again we were paddling frantically out of the danger zone.

The log drifted slowly down-stream until the tautened line tugged tensely on the harpoon—then things began to look lively. The hippo rose, and with a bellow of anger turned, charging right and left—wheeling and spinning with an agility that seemed marvellous in so huge a creature—then, making straight for the floating log, he attacked it furiously. Evidently finding this an unsatisfactory performance, he headed up-stream once more, only to wheel time and again and vent his wrath on the relentless float that dragged with agonising insistence on the gaping wound that was slowly bleeding him to death.

In the shallows—about a mile above the village—the end came! Advancing knee-deep on the exhausted hippo—now halted, blown and gasping—our hunters prepared to hamstring and butcher their quarry, but my request to be allowed to shoot it being agreed to, I brought the hunt to a finish with my '450 at close range.

V.

In this treatise I have no intention of dealing with the universal use of fish as a food, but while on the subject of amphibians, it may be of interest to note that the crocodile—a difficult and dangerous 'kill,' and, therefore, seldom molested by the almost weaponless tribes in those regions which are the natural habitat of the saurian—is none the less an acceptable article of diet when the fates are

kind enough to deliver one into their hands. Though the young 'croclings' are regarded as quite a passable dish in the Zambesi Valley, the average 'bush' hunter invariably considers a charge of powder and ball as much too precious to be thrown away on an almost invulnerable target, not to mention the probability of losing a mortally wounded croc by its promptly sinking into the muddy depths beyond recovery.

Near Matope on the upper Shiré river, I came one morning on a group of Ngoni digging close to the edge of the bank, and on inquiring, was informed that they were raiding the 'larder' of an old crocodile that haunted the locality. Further questioning elicited the information that all crocodiles, on making a big 'kill,' eat to repletion and then 'cache' the remains of the carcass in a shelving hole scooped out of the river-bank below the water level, presumably for future consumption. Whether the assertion is based on fact, or whether the diggers were rewarded for their toil, I cannot say.

Like the lion and the leopard, the crocodile, when proved guilty of man-eating, is often assiduously hunted, killed, and eaten by the relatives of the unfortunate deceased as a sort of conscientious duty, in some hazy belief that by this action the body of the victim is rescued from being totally incorporated into the lower animal kingdom.

Mention of this—what one might call 'cannibalism by proxy'—brings to the mind of the writer an experience related by a well-known missionary while exploring the region west of Bangweolo Land. He had been struck by the fact that many of the huts boasted two well-holes, one of which invariably had a circle of small pegs driven into the ground near the margin. From these pegs pieces of cord led down into the bottom of the well. Curious to know their purpose, he pulled one up, and received the shock of his life on finding that his haul consisted of a human hand and arm in a state of pickle!

The practice of eating human flesh, however, is seldom the outcome of an inordinate craving for meat, but, as investigation has shown, has more often a ceremonial basis, even among tribes where cannibalism is common.

It must be understood, of course, that the foregoing form only a very small proportion of the items that go to swell the menu of those races who—though existing in an environment which suggests that a vegetable diet would be not only the ideal, but their practical rule of life—nevertheless show by their desire for flesh-food, in one form or another, how deep-seated and ineradicable is the omnivorous instinct in man, and that, so far as humanity in general is concerned, the day of universal vegetarianism is not yet.

Chambers's Journal

SEVENTH SERIES

THE SENIOR PARTNER'S WRATH.

By E. R. PUNSHON, Author of *Promise of Dawn*, *Old Fighting Days*, &c.

PART I.

I.

IN the prosperous and important firm of Maynard & Co. there were three partners. The senior was Mr Maynard himself, tall, portly, imposing, of so striking and authoritative a demeanour, indeed, that it was said he could overawe an office-boy with a single glance. Probably this was an exaggeration, but undoubtedly he possessed an imposing presence. The second partner was Mr Manners, who was middle-aged, of middle size, and mild of manner, and who was reputed to be the keenest man at a bargain in the whole city of London. The third partner was Mr Price, who was thin and elderly and absolutely bald, so that the subtle saying ran in city circles that when Mr Price of Maynard & Co. gave anything away he gave a lock of his hair with it.

With three such partners as these, it is not to be wondered at that the firm prospered mightily.

But on this particular morning it seemed that something had gone wrong, for Mr Maynard had just entered—or burst or exploded into—the private room of Mr Manners, and his face was crimson and his eyes were aflame, and one thought that his gesticulating hands strove, though but vainly, to express what tongue and lips could only utter in a stammering ‘Never—never—in all my life—never—’

Much alarmed, Mr Manners rose to his feet. ‘What is the matter?’ he gasped, as visions of war, murder, revolution, a panic on ‘Change, swept horribly through his mind.

And still Mr Maynard seemed unable to utter the swelling thoughts that apparently possessed him. It was a dreadful thing to watch the efforts that he made.

Awestruck, Mr Manners murmured, ‘My dear fellow, calm yourself.’

‘Ass,’ snapped Mr Maynard with unexpected force and lucidity. ‘I am calm,’ he asserted, with a glare that seemed to hurl Mr Manners back into his chair almost as effectively as a straight left from Carpentier could have done. ‘But I confess,’ he added, ‘that I am—annoyed.’

‘Indeed?’ murmured Mr Manners, remembering the maxim ‘safety first,’ and thinking this remark involved little danger.

Mr Maynard began to gesticulate again. His hand went up and down like a hammer, as it was wont to do when he crushed into the dust the unfortunate shareholder who at a general meeting should presume to ask a question. From the incoherent and disconnected remarks that accompanied this gesture, Mr Manners disentangled the two names of Price and of Ellison.

His bewilderment increased. What had the junior partner done? Committed suicide? Absconded? Joined the Labour Party? What? As for Ellison, that he recognised as the name of a firm owing them about twelve hundred pounds, and, if current rumours were correct, not too likely to pay. Possibly they had defaulted, but if so, that, though annoying, was nothing to make the heavens fall—as apparently, from the senior partner’s behaviour, must have recently happened. ‘I am afraid I don’t quite understand,’ Mr Manners murmured, putting all the emphasis on the ‘quite.’

‘You wouldn’t,’ retorted Mr Maynard, with an injustice the other felt acutely; ‘but perhaps you know that Ellison’s owe us twelve hundred, and that Price said he would call round and see them about it?’

‘Hasn’t he been?’ asked Mr Manners, still at a loss, since he could not for the life of him see that it mattered much whether Price had been or not.

‘He has,’ said Mr Maynard terribly, and paused still more terribly. ‘Apparently he told Ellison,’ he continued, striving to be calm, ‘that it did not matter.’

‘What?’ almost shouted Mr Manners.

This cry, so heart-felt, so full of amazement, incredulity, and indignation, was to Mr Maynard’s wounded feelings as balm in Gilead. ‘Told them it didn’t matter,’ he repeated, his tone almost genial now.

‘Preposterous!’ declared Mr Manners heatedly.

‘The only thing I can suppose,’ said Mr Maynard, ‘is that Price is suffering from softening of the brain.’

This was a malady symptoms of which Mr Maynard often thought he perceived among his fellow-creatures.

'Where is Price?' demanded Mr Manners, no longer mild; fierce indeed, as only your mild man can be when thoroughly roused.

'Gone home,' said Mr Maynard, with a lingering regret. 'Apparently he came straight back from Ellison's, left this—this—he searched for *le mot juste*, and, finding it not, continued inadequately—'this message for me, and then told them in the office that he was feeling queer and was going home for the day.'

'Well, I don't understand it,' murmured Mr Manners helplessly. 'It's not so much the actual money—'

'It's the principle of the thing,' proclaimed Mr Maynard.

'Our reputation, too,' exclaimed Mr Manners, almost tearful.

'No one will pay anybody anything,' declared Mr Maynard comprehensively, 'if they're to be told it—doesn't—matter.'

'In all my experience of the city,' said Mr Manners solemnly, 'I never heard of such a thing.'

'If it becomes common,' asserted Mr Maynard, 'business will be made impossible.'

Motionless and horror-stricken, they gazed at each other in silence, dreadfully contemplating a world in which business had been made impossible.

But the very terror of the prospect stirred Mr Manners to action, and he reached firmly for his hat. 'I,' he said simply, 'will go and see Ellison's myself.'

Mr Maynard wrung his hand. 'Thank you,' he said, not without emotion

II.

It was in a happier mood that Mr Maynard returned to his own room. The conduct of Price had shaken his faith in human nature to the depths, but Manners had re-established it. He almost began to feel sorry for Ellison's. Manners was clearly roused, and when Manners was roused—well, all the city knew what that meant. Of course, Maynard & Co. were never hard on their debtors—strictly business-like, no doubt, which means getting every penny due, and more if possible, but always within the rules of the game, and certainly never vindictive about it, or reluctant to accept any proper business-like scheme that might be put forward. But Manners, Mr Maynard felt instinctively, would be severe to-day. There would be no 'it doesn't matter' foolery about him. No. Ellison's would have to come to time. Yes, or—the necessary steps would be taken. Oh, Manners was mild, no doubt, but this time that unlucky phrase 'it doesn't matter' had roused him as it had roused the senior partner himself.

Yes, on the whole he was almost sorry for Ellison's with the mild but roused Manners on their track, and he began to feel unusually sympathetic towards all the rest of the world.

'We mustn't be hard on them; I daresay they are doing their best,' he remarked concerning another firm to his son Johnny, who had come to ask how their request for more time was to be answered.

Johnny was a little surprised, but quite agreed.

'One doesn't mind so much when chaps are really trying,' he remarked; 'it's the "don't care, doesn't matter" brigade I can't stick.'

'Quite right, Johnny,' agreed his parent, approvingly, surveying with a certain pride this stalwart soldier son of his who, on leaving the army, had entered the office, and was already showing considerable business aptitude; 'you remember that, my boy.'

'I'll try to, sir,' said Johnny, and withdrew.

Mr Maynard, looking at his watch, was wondering how Manners had got on, and thinking of lunch, when the chief clerk made his appearance.

'Mr Manners on the 'phone, sir,' he explained. 'He says he feels very seedy and is going home for the day.'

'Seedy! Manners?' repeated Mr Maynard, very much surprised. 'Why, he seemed perfectly well . . .'

'Yes, sir,' agreed the chief clerk; 'must have been very sudden. I hope it isn't the influenza,' he added, shaking his head; 'it's just the way that comes on sometimes.'

Mr Maynard felt very much bewildered, and a thought came to him that Price also . . . but that, of course, was a mere coincidence. He heard the chief clerk adding that Mr Manners had asked him to inform Mr Maynard that he had arranged for Ellison's to have a further credit for a thousand pounds.

'What?' said Mr Maynard; 'what was that? I don't think I can have heard . . .'

'Mr Manners said I was to tell you,' repeated the chief clerk, himself a little surprised but supposing that it was all right, 'that he had arranged with Ellison's for them to have a further credit to the amount of one thousand pounds.'

Mr Maynard said nothing at all. There are some situations which are beyond all words. This was one of them. He heard a voice he knew was his own murmur, 'Thank you; that's all, I think.' He heard the chief clerk retire. He perceived that he was alone.

Feebly he looked around the room. 'Could this thing be true?' he asked himself. And he had to answer to himself that apparently it was. At any rate, it was certain he was awake, so it could not merely be a nightmare of a peculiarly revolting description. Neither was he drunk. That also was certain. And

it was certain also that his head was aching badly. This was unusual, for indeed he despised headache, which he felt to be a feeble and feminine ailment; but he supposed that after two such blows as first Price and then Manners, any one's head would ache.

'It's . . . it's . . . it's . . .' he began aloud, and then paused, because after all he simply had not the least idea what it was.

But he remembered with gratitude that there was some brandy in the bookcase cupboard, and he went with an unsteady step and helped himself liberally, and felt on the whole a little better, but even more bewildered than before.

Could Manners have gone suddenly mad? That seemed much the most probable explanation. . . . Only, then there was Price. . . . Surely the two of them together could not simultaneously . . . ? Or was he mad himself? . . . He hoped not, but almost feared it. . . . With sudden decision he grabbed his hat, that wondrous topper, of almost supernatural glossiness, of which the gleam as it shimmered down Cheapside seemed to radiate confidence and prosperity all around.

'I,' he said terribly—'I will see Ellison's myself.'

Striding into the outer office, he informed them there of his decision, as one of the old gods of Olympus might have announced his intention of visiting a city that had of late much neglected his worship.

'He doesn't approve of this new credit to Ellison's,' thought the chief clerk, 'and I don't call it business-like myself.'

Mr Maynard put his head in again.

'I will call at Rushworth's, too,' he said; 'we promised to let them know by to-day, didn't we?'

'We did, sir,' agreed the chief clerk; and Mr Maynard passed on his way to Ellison's.

III.

It was nearly lunch-time by now, though Mr Maynard's indignation had not permitted him to remember the fact, and Ellison's appeared deserted. His first authoritative knock produced no reply, and thereupon he flung wide the door and entered in.

'Any one there?' called a voice from behind. 'Please come through, if there is.'

Mr Maynard frowned. He was not accustomed to be called 'any one'—he was emphatically 'some one.' Neither was he accustomed to 'come through.' However, no better was to be expected from an Ellison's, and he was too anxious to get to grips to waste time. He proceeded therefore, as they say in the navy, across the outer office, and, finding presently a door marked 'private,' flung it wide and once more entered in.

His first impression was that the place was

empty. It was a big room, and there was a big book-case and a big card-index cabinet and a big safe and a big arm-chair and an exceedingly big roll-top desk, so that there's no wonder that amidst so much bigness the very small person seated at the very big roll-top desk almost escaped observation.

Indeed, little more was visible than a mass of fair curls, so fair as to be almost golden, and a pair of very bright large blue eyes, of a blue so intense as to be almost violet, gazing over the top of the very big roll-top desk.

Mr Maynard felt his wrath increase. Blue eyes like these were quite uncalled for in business, and fair curls, so fair as to be almost golden, appeared to him unnecessary in a city office. Like an offended Jove he spoke and said, 'Where is Mr Ellison?'

There was no answer. More wrathful even than before, Mr Maynard was about once again to thunder forth his question, when a strange thing happened, if quotation be permissible for once. Into those bright blue eyes, just visible over the top of the very big roll-top desk, there came a change, a disconcerting change. Their brightness grew dim and soft. Something appeared in them, a tear, and then another. They overflowed, and in the extraordinary silence of the room Mr Maynard was certain that he distinctly heard a splash on the polished surface of the roll-top desk.

'Upon my soul,' said Mr Maynard, feeling that this was indeed the climax of all that he had suffered upon this eventful day.

But then he had always known what would come of this modern craze for bringing women into the city.

Though, after all, what were tears to him or he to tears? Tears are things quite irrelevant to business, and he continued as though they had not been shed or he had not seen them: 'I wish to see Mr Ellison—at once. Where is he?'

'He was my father, and he died two months ago,' she answered.

To say that Mr Maynard was annoyed is to put it mildly. He was, in fact, exasperated. He felt that an unfair advantage had been taken of him. How was he to know the man was dead? Most likely it had been done on purpose. He had merely asked a most ordinary question, and there was she weeping behind her big roll-top desk. Hysterics next, he supposed. He perceived gloomily that the situation was one from which it would be difficult to withdraw with dignity. He told himself passionately that Manners might have told him—warned him—of the trap.

A small voice from behind the roll-top desk said, 'Please excuse me—I'm not generally so silly. Only, you asked so suddenly—and then people have been very kind to me to-day, and that's upset me, I suppose.'

Mr Maynard did not answer. The utter futility and the extraordinary lack of logic shown in weeping because people had been kind were only too apparent, but he supposed it would be useless to point this out.

The small voice continued: 'Please sit down.' A tiny hand appeared and waved towards the big arm-chair, and the small voice became business-like, with an effect as incongruous as if a nightingale were suddenly to give up its song to pretend to be a hawk. 'What can I do for you?' it inquired.

Mechanically Mr Maynard sank into the big arm-chair and tried bravely to rally. Extraneous circumstances, such as blue eyes and tears and a recently dead father, had absolutely nothing, he reminded himself, to do with Business—nothing. He perceived now that the blue eyes in question were fixed upon him with a somewhat odd expression—or at least not on him but on his head, over his head, on his hat, that resplendent topper which he had quite forgotten to remove.

With a somewhat hurried gesture he took it off. What followed was incredible—appalling. She made him a little stiff bow of acknowledgment—exactly as though he offered an apology and she accepted it. To think of the senior partner in Maynard & Co. being apparently placed in the position of offering an apology to this wretched child!

It was too much, and his voice boomed out impressively as it was wont to boom when at some company meeting or at a directors' consultation he found it necessary to silence foolish opposition to his suggestions.

'I regret to hear what you tell me,' he said, 'though I had not the pleasure of the late Mr Ellison's acquaintance. May I ask who is now in charge of the business?'

'It's me,' she said.

Deplorable grammar. A deplorable affair altogether. Nevertheless he continued with the same dignity and impressiveness: 'Indeed. Somewhat young, apparently, for so responsible a position. I am Mr Maynard of Maynard & Co., and—'

He paused as he made this announcement, rather expecting the miserable girl to faint or something of the sort, but instead she leaped from her chair and rushed towards him. For one awful moment he almost feared she was about to kiss him. Fortunately, the worst did not happen. Bad enough, though—she had his hand clasped in both hers and was shaking it warmly.

'I am so glad,' she said. 'Of course, I might have known. It is good of you—awfully good.' Her blue eyes were raised to his with an expression almost adoring in their gratitude. 'Mr Manners said you might—I never dared hope you would. . . .'

And the indignant Mr Maynard perceived

only too clearly that the unspeakable Manners had not only deliberately not warned him of the—er—trap, but had even left it invitingly open for him to enter.

IV.

To Mr Maynard's relief she left off shaking his hand at last, and, standing before him, began to talk quickly and eagerly. Undoubtedly her appearance with her flushed face and eager eyes was distinctly—well, not unattractive. Neat, too. But for the unfortunate eyes and the regrettable curls—and for these she was no doubt hardly responsible—she might, indeed, have looked almost business-like, with her neat, trim attire, and her subtle air of efficiency.

Apparently she was telling him all about the business and her position and her struggles. This seemed to him most unnecessary, and he decided to stop her at once—instantly—but her voice was not unpleasant, and her statement of her affairs seemed peculiarly clear and brief and to the point—admirably lucid, in fact.

'Mr Manners said you would wish to understand,' she concluded.

So it was Manners he had to thank for this also. 'Very well,' he thought grimly; 'very well.'

'You put it very clearly,' he said aloud.

'It's such a comfort to tell some one like you all about it,' she answered. 'You see, your help will make all the difference. I didn't feel as if I could possibly pull through—but your allowing me this extra credit will make just the difference. I daresay I ought to have managed better, but when poor father died I had to do the best I could, or else it would all have gone to pieces. The last thing he asked me was to try . . . for mother and the boys.'

'You have brothers, then?' Mr Maynard found himself inquiring.

'Two,' she confided to him with the air of imparting some specially delightful secret—'such darlings. They are both at school now.'

'While you try to carry on the business?' said Mr Maynard; 'very creditable, too. You find yourself able to manage?'

'I shall now,' she asserted, 'thanks to your help.'

Unblushingly he accepted her gratitude, just as though he deserved it.

'And how do you like being in business?' he inquired.

'Oh, I hate it,' she answered promptly and emphatically.

'Hate it?' he repeated, astonished, shocked indeed.

The fair curls nodded with greater emphasis even than before.

'All this money-making,' she said—'it all seems so—so paltry.'

Mr Maynard gasped. Was there to be no end then to the blows rained down upon his

head this day? Money-making paltry . . . paltry. . . . What a word. . . . What an idea. . . . What a girl!

His smile was a ghastly thing as he murmured, 'Indeed! Most people think it sufficiently important. What would you prefer to money-making, then, I wonder?'

The blue eyes grew thoughtful.

'I should like to live in the country, I think,' she answered slowly, 'and have a garden . . . a great big lovely garden . . . with roses . . . and ask people with babies to come and stay with me. . . . I do adore babies; don't you?'

Mr Maynard rose feebly to his feet. He felt he could endure no more. Had it come to this, then, that he, senior partner in Maynard & Co., respected and known all through the city, was being asked in the very heart of the sacred square mile itself if he did not adore babies . . . babies . . . brats . . . squalls. . . . It was too much; he felt all broken up.

'I must be going,' he said hurriedly. He had a positive yearning to be again in dear Cheapside or thronged Threadneedle Street, where babies are not . . . adored—and money is not . . . paltry. 'I must be going,' he

repeated; 'but if at any time you require any help, my firm will be very pleased. Our Mr Manners,' he added viciously, 'shall come in to see you whenever you like.'

She thanked him very prettily and very gratefully, and at last he found himself again in the street, shaken indeed, pulverised in fact, but safe once more, though he really hardly felt it till he had reached and entered his favourite restaurant, one that only city magnates such as himself patronised—a fact duly noted on the bill.

'Mr John Maynard looked in a moment or two ago to inquire for you, sir,' the head waiter informed him.

'Did he?' murmured Mr Maynard, who still felt weak. 'No matter—a whisky and soda, please. The weather's very trying to-day, isn't it?'

'Very trying indeed, sir,' agreed the head waiter, and wondered in secret if things were going wrong in the city with 'the old geeser,' or if he were beginning to break up; and outside, Johnny Maynard, who had missed his father by only a minute or two, wondered what to do next.

(Continued on page 684.)

THE DIVINING-ROD.

By F. McDERMOTT.

THE divining-rod of modern days is a simple forked twig of hazel wood. With this twig in their hands, certain individuals are able to locate the presence of underground water. Persons with this power are to be met with in almost every country of the world, without distinction of age, sex, or race. They are alike only in the possession of this faculty, and their ability to use it depends in every case on the presence of the twig. It is the twig, in fact, that by fierce twitchings and contortions indicates the presence of the hidden water. And in consequence for many centuries the power was supposed to reside in the twig. But the twig is useless in the hands of the majority of people. To-day, therefore, the view generally held is that the person using the divining-rod is the real source of power, and that the movements of the twig are merely the indication of some action taking place within the living mechanism of the holder.

Nothing could be simpler than the outward appearance of an experiment with the twig. The water-finder—or 'dowser' as he is usually called in these islands—walks slowly over the ground where the presence of underground water is suspected. He holds an end of the fork in each hand, and his arms are tightly pressed to his sides. Suddenly the twig will start to jerk and twitch in a convulsive manner. 'I can

only,' runs a typical account, 'describe the antics of that twig as a pitched battle between itself and the dowser. It twisted, it knocked about, it contracted and contorted the muscles of his hands and arms, it wriggled and fought and kicked until it snapped in two. . . .' While the rod is behaving in this erratic manner the holder of the rod is not immune from peculiar sensations. Since the power of locating the water lies in him rather than in the rod, it is not surprising to learn that the 'dowser' likens his experience to the passage of a current of electricity through his whole body. There is a tingling of the fingers usually present, and very often a sensation in the pit of the stomach like that experienced on the downward movement of a swing.

Science, unable to explain these manifestations, has labelled them quackery. Belief in the rod has declined in consequence, and is to-day confined to the more unsophisticated parts. In these islands the regular employment of the rod will be met with only in rural neighbourhoods. Occasionally, as in the experiments last century in connection with the Richmond water supply, the unbelieving town-dweller will call in a dowser. But only in the country are men able to earn a living by the employment of this peculiar faculty. The West Country of England is particularly faithful to the

old belief. Dowisers are regularly employed by private individuals and even by public companies, while a modern Western university—that of Bristol—employs a dowser in connection with its researches in the Mendip Hills.

It is fitting that this part of the British Isles should be so tenacious of its faith in the rod, for it was here that it was first implanted. Miners from Germany introduced the use of the rod into the mines of Cornwall in the sixteenth century. They probably came from the Hartz Mountains, where, a century before, the divining rod was employed for the first time to our modern knowledge. Attempts have been made to put a very much greater antiquity on the rod. Rods with magical powers are, in fact, associated with the earliest religions; but their use seems to have been confined to the telling of auguries and to the protection of their holders from evil. It cannot be traced that they were ever employed for the discovery of hidden water, and there are no grounds for establishing any connection between the ancient rods and wands and the modern water-finding twig. To this view Andrew Lang lends the weight of his authority in an essay on the divining-rod published in his book, *Custom and Myth*. He points out particularly that Pliny, an author ever ready to record marvels of any sort, makes no mention of the use of the divining-rod, even when dealing with the subject of the finding of wells of water.

To the use of the divining-rod as we know it the obscure writings of a Benedictine monk, Basil Valentin, furnish the earliest reference. For this we have the authority of M. Chevreuil of Paris, who published an important work on the subject in 1854. Valentin flourished in the fifteenth century. In the next century the rod was in general use. Not only were water and minerals sought with its aid, but it was even used to track down criminals! Andrew Lang, in the essay already mentioned, describes how a well-known French diviner, Jacques Aymar, was employed to discover the murderers of a married couple of Lyons in the year 1692. This practice was wholly fraudulent, and soon disappeared under the pressure of ecclesiastical law. The more legitimate use of the rod, however, grew in popularity. It excited great interest, particularly in France, where its merits became the playing-ground for philosophers and scientists of all shades of opinion.

The scientist Boyle put the matter of the rod before the Royal Society of this country in 1666, but without obtaining any definite expression of opinion. Learned societies of various kinds toyed with the question in the succeeding years. Scientists generally regarded it as beneath notice, and it was not, in fact, until the close of the nineteenth century that an attempt was made to pronounce definitely on the merits of the divining-rod from a scientific point of view.

At the request of the Society of Physical Research a most thorough investigation of the whole problem was carried out by Professor W. F. Barret, holder of the chair of Experimental Physics in the Royal College of Science of Ireland. His conclusions are contained in Vols. 13 and 15 of the Proceedings of that society. Professor Barret accumulated a very large number of reports from all over the world. Each one he investigated carefully, allowing for every factor that might have influenced the success of the diviner. His conclusions therefore bear authoritative weight. He acquits the diviner of the charge of trickery. 'Certainly no voluntary effort,' he says of the twitchings of the rod, 'without long and laborious practice at legerdemain could produce an effect corresponding in kind or degree to that which actually takes place. . . . The movement of the rod is not due to trickery nor any conscious voluntary effort, but is a more or less violent automatic action that occurs under certain conditions in certain individuals.' He fully supports the conclusion of a smaller and earlier report to the society on the same subject: 'The evidence for the success of "dowsing" as a practical art is very strong, and there seems to be an unexplained residuum when all possible deductions have been made.' To this he adds his personal testimony: 'Had I,' he says, 'to sink a well, I should prefer to have a precise spot selected by a good dowser rather than general advice given by a geologist, *provided* that the depth of the well did not exceed, say 50 ft., and the quantity of water required was for a private and not for a public supply.' Finally, in the *Times* of January 1908, he proved that ten years had not altered the nature of his convictions. 'Making a liberal allowance for failures of which I have not heard, I have no hesitation in saying that where fissure water exists and the discovery of underground water sufficient for a domestic supply is a matter of utmost difficulty, the chances of success with a good dowser far exceed mere lucky hits or the success obtained by the most skilful observer even with full knowledge of local geology.'

The reports of Professor Barret are practically the last word on the subject. They do little more than give an authoritative sanction to the faith in the rod. We are still without an explanation of its success. There is little doubt, however, that it is one of those manifestations of the hidden chamber of the brain into which science has only just started to probe. The subconscious mind is the unknown factor of human personality. The conquest of its secret is the great task that confronts Science. When that task is completed it is more than likely that along with other puzzling appearances of the subconscious world there will be laid bare the secret of the diviner and his divining-rod.

AFRICAN SILHOUETTES.

I.—KOSKI THE HERD.

By C. M. M. PATERSON.

I.

IF one possesses a keen sense of humour, and an interest in the mentality of savage races now in the birth throes of our so-called civilisation, life on an isolated Central African farm is not the dreary existence it might prove to be were these attributes lacking.

The daily round, the common task, becomes less arduous when the employees chat to you, as they would to their own father, and often by expression of their crude, extraordinary ideas give one an enjoyment in life which is lacking when one's environment is the conventional and sophisticated hordes of humanity.

The African natives' outlook on life is so fresh and simple, such an essentially contented and happy one—I speak, of course, of the real savage, not of the spoilt product of European enterprise—that one begins to wonder whether the whole of what is termed progress and enlightenment is not a ghastly mistake. There is more squalor, more human misery in ten acres of London or Glasgow than in ten million acres of pagan Africa. Yet, before one jumps to a conclusion which will be condemned by many who have not had the advantage of personally comparing the happiness of these primitive men with the dreary, sordid lives of those of our own lower class, it is wise to remember that the struggle for existence has never been such a potent force in the tropics as it is in our cold northern clime. The sun and the primeval forests provide all that is necessary for warmth; clothing, except for a few hides soaked in castor-oil, as a protection in the rainy season, is superfluous; and the kindly earth has only to be scratched, a few handfuls of grain thrown thereon, to make it bring forth a hundredfold. Nevertheless, it is a phenomenon which gives food for much thought—the content and extraordinary happiness of these people compared with that of the average human among civilised nations.

II.

If anyone believes that the ordinary African native appreciates the tranquillity, the cessation of tribal strife and constant raids, which the advent of the British Sarkali¹ has brought, let him at once shed this illusion.

Koski—or, to give him his full name, Kip Koski Arap Kerich—the head cattle herd dispelled mine for me. He is elderly, and can remember the good old times before the British

government put an embargo on the whole pleasures of man—those halcyon days when a man could prove himself a man, in bloody fights, and swift moonlight raids, and the acquisition of much loot in the shape of women and cattle.

Koski is a great character, content in the evening of his life to sit from year's end to year's end, in sunshine and in rain, watching, while they graze on the luscious grass, his master's cattle—which he loves. His quick eye can pick out the ailing calf, or the mother about to add her progeny to the herd, with a dexterity which no white man could achieve. For five years he has served thus faithfully, in daily intercourse with me, yet he remains still the same savage he was when first engaged as herd.

Seated on a gigantic patch of lobelia, as blue as heaven itself, with the evening sun disappearing in a blaze of glory behind the distant mountains, the cattle peacefully chewing the cud all around, and Koski squatting on his haunches by one's side, one envisages another aspect of life. It is as if a thousand years or more had rolled back, and Koski and I can view the problems of life in the same perspective.

Save for a string of beads round his neck, and the quaint little cap, which is worn by all the men of the Lumbwa tribe, tied under his chin, Koski is as nude as the day that his mother brought him into the world, and his black soft satiny skin shines in the light of the dying sun with a healthy lustre which our white skin never seems able to attain. 'Yes, Bwana,' he says, with a sorrowful shake of the head, 'the good old days have gone! The Sarkali is everywhere! Now, when one wants another woman, one has to go and work for the Wasungu¹ till enough rupees are amassed to pay for her. It is a bad business—bad!' He spat lustily. 'Before your breed usurped our land we were a perfectly happy people. Bloodshed! Of course there was bloodshed. If you want to prove yourself a man you must spill blood. But now the men become even as women—the Sarkali forbids us all our pleasures. Pah!

'We are poorer, too. Cattle do not multiply rapidly when you cannot add to your herd, except by Nature's ways, and as for our women, we can keep fewer of them also—the tax on them is a wicked one.² You, Bwana, must know how impossible it is to keep two women in one hut—as well put two male leopards in

¹ White man.

² Kenya natives are taxed on the number of huts they possess.

¹ Government.

the same bed together. Yet we pay heavily for the peace which many huts insure.'

'Would it not be better and cheaper, Koski,' I asked, 'to keep only one wife?'

'With much ignorance do you speak,' he answered patiently. 'Your women! God alone knows why you even keep so many as one. They are not worth their food! But with us it is different. How otherwise would the maize get cultivated, and the cattle bomas be kept clean?'

'You might do it yourself,' I suggested.

'Such work is not for men,' he answered; 'it is fit only for women.' He spat again, and sighed heavily. 'Besides, if you have only one wife, how can you breed enough children? Many children mean wealth—the small boys can help their mothers harvest the maize, and the girls I sell in marriage for many head of cattle.'

'How many offspring do you possess, Koski?' I asked curiously.

He waved an ebony arm towards the sky. 'God,' he answered solemnly, 'has taken seven. There are only fifteen left. But most of them,' he went on, his face lighting up with a satisfied smile, 'are girls. Five have already brought me a hundred goats and thirty head of cattle, and there remain still six to be given in marriage!'

There was a pause, as Koski, taking some snuff from an old horn by his side, stuffed his nose full of it.

'You talk, Koski,' I remarked, 'of the good old days, but surely there were times when a tribe stronger than the Lumbwas raided you, and carried off *your* women and cattle. Did not an accident like that make you wonder if your system was really a wise one?'

'Certainly not!' he replied. 'The Lumbwas are brave men. It rarely happened, and, anyhow, when it did—it was the will of God!'

III.

Koski's belief in the efficacy of charms is an ineradicable one, but on the only occasion when this art was called to my aid it failed—lamentably. Perhaps the presence of an unbeliever at the rite angered the spirit world, or perchance Koski's own explanation of its non-success was the correct one.

A valuable bull was very sick. The stock inspector, calling, had been unable to diagnose the case, and blood slides sent to the laboratory for investigation had produced negative results. Truly, veterinary as well as medical science is only as yet on the fringe of things.

Koski assured me, however, that he had a charm which would completely cure the beast, and for two or three days he insistently demanded to be allowed to exercise it. Finally, one evening, as the poor brute was obviously going to die, leave was given him to 'go ahead.' Disappearing into his hut, he remained there

for nearly half-an-hour. What he did in his secluded abode during that time I have no means of knowing. A solemn shake of the head was the only answer received to my curious inquiry as to why he had been so long. When at length he did emerge, he carried in his right hand a piece of black root, round, and about the size of a golf-ball. Planting himself immediately in front of the sick bull, he proceeded to nibble a piece off the black lump. It was extremely hard, and some few minutes elapsed before even his perfect ivories had broken off a piece and chewed it into pulp. Then he jumped up, began to dance wildly all round the animal, arms flung high in the air, singing with deep voice in an unknown tongue some weird incantation. When physical endurance was wellnigh exhausted he sank on his knees, and, forcing open the beast's jaw, spat a large amount of accumulated saliva into its mouth, nostrils, and eyes. Finally, holding the bull's lower jaw in both hands, he squatted down beside it, with bent head, still as marble, as if in holy meditation!

It was a strange scene, for night had fallen; a full silvery moon was just rising, casting fitful beams among the feathery bamboos which surround the cattle boma, a shaft of its uncanny light catching now and again Koski's lithe, naked body as he whirled round and round. Any veneer of civilisation which contact with the white man may have temporarily laid over this elderly Lumbwa had completely disappeared. He was, once more, the simple, unadulterated savage. His dusky skin was bathed in perspiration, bare breast heaving with excitement, every limb twitching with nervous fervour, black eyes gleaming like live coals; and round us all, enveloping us, part and parcel of such a rite, the mystical, brilliant moonlight of an African night!

Unfortunately Koski's manifold exertions were in vain. A visit to the boma early next morning revealed the bull lying dead. The charmer stood by its still warm body, looking sadly and thoughtfully down on it.

'The magic spell did not do much good, eh, Koski?' I remarked.

But Koski's faith is of that kind which can remove mountains. 'Many moons,' he answered mournfully, 'have waxed and waned since last I worked that charm. Cursed fool to forget two words of the incantation! Hence death has come!'

THE SMILE.

As sudden sunlight fills the glooming depths
Of pinewoods with a sweet surprise, her smile
Poured from the upper light into my mind.
I glimpsed one instant part of that fair land
Wherein her spirit dwelt, serene and sure . . .
And, as the sunlight fades and leaves the wood
Dark and more desolate still, her smile was gone,
And all my mind was shadowed depth again.

R. W. POVEY.

THE FIRST SCOT.

PART III.

XI.

VO never forgot the awful feeling of utter helplessness when the monster seemed to tower over him as he ran for his life, his famous weapons flung away to lighten him. The narrow escape made him think of the country from which his mother had come, in which these terrible brutes were unknown. She had tried to describe the beasts of prey that did exist in it; but in her recollection of a past so long gone they seemed harmless enough compared with these nightmare horrors.

And to Vo this mysterious land held a stronger attraction—in it there were other human beings like themselves, with whom to associate, to hunt, and among whom to find companions, ay, even a mate perhaps. For young blood called, and Vo was lonely. By the time that he was twenty his mother was old and feeble, for in that strenuous epoch men and women aged fast. She was crippled by disease; and her sufferings made her ill-tempered and hard to live with. Had she been in her own country, she would probably have been knocked on the head ere now by her relatives as a useless burden on them; but her son was unusually tender-hearted for that age and had affection for her, so he patiently endured her grumbling and complaining, hunted for her, and gave her the choicest tit-bits of the birds, fish, and reptiles with which he filled the larder.

Her favourite meal was dinosaurs' eggs, which he often found in the forest; and she liked them better if they contained young ones ready to be hatched out. For she so hated the giant reptiles that it gave an added zest to the dish to realise that she was eating one of them before it could grow into a monster big enough to devour her.

She seldom left the shelter now, as her son had forbidden her ever to do so unless he were with her to protect her, since she was too decrepit to escape if chased by any dangerous beast. So she sat at home, generally nursing her jaw, because she suffered much from toothache—a malady which plagued even the earliest humans. Thus Vo was free to wander and hunt where he wished.

He spent much of his time sitting on the rocks by the sea, brooding over an idea that had long filled his mind. It was how to escape from this island. For it seemed Scotland's unlucky fate, even then, that her children were driven to seek a living elsewhere.

Day after day he used to watch for and spear the big rays and skates in the water below him;

but all the time while he was waiting for them his brain was busy with his great idea. Once as he lay on a rock a fearsome marine creature, thirty feet in length, a plesiosaurus, came to the surface, and, raising its small head set on a long, snaky neck, snapped at his leg dangling carelessly. But the sharp spear took it in the throat, and it floundered back into the depths, to be attacked in its helplessness by a shoal of its own kind attracted by the blood.

Sometimes a sauropod dragged its enormous bulk out on to the rocks near him; but Vo paid little heed to it, knowing it to be harmless. But when an ichthyosaurus with its porpoise-like head and big jaws studded with sharp teeth crawled ashore to bask in the sun, pulling itself up with its flippers like a seal, and eyed him malevolently out of its enormous eyes, he moved to a safe distance; for he knew this fish-reptile to be a dangerous brute.

The stretch of rocks that he frequented was fairly free from the carnivorous land-monsters, since the herbivorous ones on which they preyed would naturally avoid it, and the trees of the forest stretched down to it, offering him a line of escape if he were attacked. Here, day after day, he puzzled over the problem of leaving the island. His mother had told him how she had crossed the sea, and at first he thought of employing the same means to transport them both to her native land.

For in that early age men knew nothing of boats. But Vo decided that to wait for a gale blowing towards the rising sun—this he judged to be the direction of his goal—and then venture out into the storm on a drifting tree was not feasible. He would need something that would travel faster and could be controlled. But what that should be he did not know.

XII.

As Vo had long ago found that stones sank and wood floated, the latter must be his friend. One day he saw a tree with many branches and a bare log swept along by the tide, helped by a strong breeze, and observed how much more quickly the second moved, being unencumbered by boughs. When it finally bumped against the rocks near where he was standing he ran to meet it and placed one foot on it. It promptly rolled over, nearly throwing him into the sea. Clearly he had not found the answer to the riddle.

But he towed it into a large pool among the rocks, which at low tide was cut off from the sea but still contained several feet of water. Then he looked for a fallen tree in the forest, trimmed off the branches with his axe, and cut

it into two or three long logs, which he dragged into the pool. He found that they supported him in the water when placed side by side; but, unless he held them, they separated and rolled over. So he added a few more logs and tied them together, and was then able to stand on them.

He had conquered a new element—the water. He had made the first raft!

But, experimenting with it in his testing basin, he found that he could not propel it when, imitating the flippers of the great fish-lizards, he used his hands as paddles. They lacked power. After some thinking he cut down a sapling and fashioned it into a paddle, which with some practice he learned to use.

To his delight he was able to move his raft about the pool. But so slowly! And when a strong wind blew he could do nothing against it. He was in despair.

The next day two trees with branches interlaced drifted against the rocks. One was partly hollow, with an opening in the side out of the water. He pulled them into the pool, and found how steady each was from the support given by the other through the interlaced branches. He got into the hollow one and tried to paddle it, but the underneath boughs fouled the bottom of the pool. So at low tide he trimmed all the branches off, and substituted for the solid tree a long, light log, joining it to the other by two poles lashed with hide thongs.

Vo got into the hollow tree and found that now he could paddle it at a good rate around the pool, and that, even if he swayed his body from side to side, the tree was steady, could not turn over, indeed, no matter how he tried, owing to the weight of the parallel log.

Without knowing it, he had fashioned the first outrigger canoe.

Rough and ill-designed it was, of course; any boy nowadays could make a better one—for many, many centuries ignorant savages have done so. But no liner or battleship that Clydeside ever launched was as wonderful as this rude canoe. For it was the first boat, Man's first triumph over the sea!

XIII.

Proud of his achievement, Vo hauled it up on the rocks, where it would be safe at high tide, and, axe on shoulder, started off to tell his mother of his success. But before he reached the trees a heartrending shriek of direst agony rang through the forest—and was suddenly stifled. It was a human cry! With a dread foreboding he ran forward; but before he had gone a hundred yards he stopped and dodged behind a tree. On the ground was a writhing, heaving mass, coiling, uncoiling, flashing in many colours; and high out of it rose a flat, pointed head with beady eyes and a red

mouth, out of which a forked tongue flickered incessantly.

It was an enormous python, sixty feet long; and Vo, to his horror, saw that a human body was enfolded in the shining coils, which were slowly crushing it to a shapeless pulp. For a moment they relaxed and he saw the victim's head—his mother's! The old woman for some reason must have disobeyed him and come in search of him, only to be caught by the terrible reptile.

She was dead; of that there was no doubt. Her son was too late to save her. Indeed, had she been alive he could have done nothing. His axe would have been useless. One blow from the great serpent's head, driven like a gigantic battering-ram, would have annihilated him. So he was forced to look on helplessly while the python made its preparations for its dread meal, licked the old woman's corpse all over with its forked tongue, covering it with slimy saliva, and slowly swallowed it whole. Then it dragged its awful length away to its lair among the rocks in a shady dell in the forest.

But through the branches overhead the young man followed; and when the serpent sank into the stupor of digestion Vo climbed down cautiously and crept to within striking distance. Then, with his sharp-edged axe, he smashed the comatose reptile's skull and avenged his mother.

Springing up a tree to be safe from the violent writhing of the twisting coils of the enormous body, he watched until the last muscular contortions had died away, and rejoiced at the knowledge that the problem of his food supply for the intended voyage was solved. The python had eaten the dead woman, and with poetic justice he meant to eat it; so he cut off huge slices of its flesh to take with him in the boat.

The question of water was more difficult; for in that age vessels in which to store or carry it had not been thought of, and, like the beasts, men were obliged to live always within reach of a stream or a lake. But Vo's inventive genius was not long at fault. He had often seen water lodged in the hollows of bamboo stems broken off short by the passing of some huge monster; and this gave him an idea. By cutting off lengths of this tubular plant below joints he made portable vessels which only needed wooden stoppers to enable him to carry all the water that he was likely to need.

His mother's death left him lonelier than ever; and he determined to start on his voyage as soon as he was satisfied with his ability to handle his canoe, the bows of which he had trimmed to a sharp point, taking a fish's head as model. The meat he dried in the sun; and it was still good when, placing it in his boat with his water-vessels, his weapons, and tools,

he pushed off daringly from the shore at day-break on a summer morning and began his great adventure into the unknown.

XIV.

Strange sea-monsters basking on the surface stared at the canoe as he paddled on, taking it to be some new kind of marine creature. Some dived hurriedly to escape it; others were half-inclined to attack it as a rival and a possible foe. But Vo went on undaunted, setting his course by the changing sun, and aided by a northerly breeze that sprang up.

None shall ever write the story of that daring voyage. Even its hero could not recall what happened after the setting of the sun on the second day. The wind freshened, the sea rose, the tides swung him here and there; in the dark he had no idea of direction, in his sleep he drifted aimlessly.

How long the adventure endured he never knew. But Fate stood his friend. One day, when his food and water had been long exhausted and his canoe was almost swamped, he was flung ashore on a sandy beach bordered by a dense forest. The tumbling waves rolled his boat over and over on the shelving sand, and finally sank it; but Vo clung to his precious weapons and tools, even while digging fingers and toes into the sand to save himself from being dragged back by the receding breaker.

The sea and the winds had brought him to the shores from which they had torn his mother! He was in the land that was to be France!

When he rose to his feet he saw a rivulet running down from the forest to the beach. Staggering to it, he flung himself down and drank deep of the brackish water. Then, holding his spear ready in his right hand, the other weapons and tools bunched under his left arm, he advanced cautiously towards the trees.

As he reached them he saw a face staring down at him from the higher branches. In the early ages of mankind human beings were not hostile to each other, even to strangers; because none possessed anything that others need envy, and all were allied in the constant fight against wild beasts. So Vo, fearing no danger, sprang up a tree and, despite the encumbrance of his weapons, climbed towards the unknown, his heart beating wildly at the thought of meeting another of his species at last.

And there, in a leafy bower high above the ground, he was brought face to face with the first woman, except his mother, that he had ever seen. She did not flee, but awaited him in awed wonder, for she had watched his coming over the sea.

She was young, and, judged by modern European standards, ugly as an ape, yet not unlike an Australian aborigine. But to Vo she was beautiful; and he gazed at her entranced, hardly believing that so lovely a creature was real.

In the tongue that his mother had taught him, but with a marked difference of accent, the girl said, 'Who are you?'

'I am Vo,' he replied simply.

'Vo? The New? Yes, you are new. You come from the water?'

He did not waste time in explaining. 'I am hungry,' he cried.

She looked pityingly at him. 'Come!' she said.

XV.

She led him through the branches. After they had gone some distance she pointed ahead. 'The Old Ones,' she said.

Through a screen of leaves Vo saw a gray-haired old man and woman squatting on a platform of sticks in the fork of a tree. They were the girl's parents.

They welcomed him eagerly when they learned that he was a stranger, and begged him not to go from them; for their children, who had hunted for them, had one by one perished by the fangs and claws of the great beasts of prey, all save this girl. And when they saw that their daughter found favour in his sight they rejoiced exceedingly.

And so, in a foreign land, Vo met his mate.

His wonderful flint weapons and tools aroused the admiring surprise of his new kin; and whenever other scattered dwellers in the forest came upon the Man of the Sea, as he was called, and saw them, they too marvelled, and copied them. And their use spread in time to all mankind.

And what was the later story of the island where Vo was born? In the ages that came afterwards Britain rose again from the waves, and the lonely islets became the mountain-tops of Scotland; while long-sunk England appeared above the ocean again, still joined to the continent of Europe, but by an ever-narrowing isthmus across which, as over a bridge, came an immigrant horde of animals and men to people the land. And the fate that had befallen their species elsewhere came to the giant reptiles, and they vanished for ever.

And be sure that among the flood of human beings that flowed north were many of Vo's descendants; for the legend of their wonderful ancestor lived long among the tribe that sprang from the loins of the First Scot!

THE END.

MODERN SMUGGLING.

By a CUSTOMS OFFICER.

I.

IN spite of stringent regulations, and the untiring supervision of vigilant Customs officials, smuggling still flourishes. It is, of course, manifestly impossible for the officers to examine minutely every item in a large ship's cargo. Enterprising modern smugglers are well aware of this, and they now resort to highly technical methods in order to baffle the revenue experts.

Imports are classified as 'free goods' and 'dutiable goods.' Free goods are delivered to the importers after a partial examination by the Customs. However, dutiable goods cannot be removed from bond until the account for duty has been raised and the money paid to the Collector of Customs. Most of the big frauds on the revenue have been found to be dutiable goods masquerading as free goods. But since it is not practicable to examine every article imported, the Customs officers must select a certain percentage for special examination. If, for example, a 'free entry' is passed at the Custom House for ten thousand bales of raw cotton, the officer, before giving delivery, selects a number of bales for inspection. These he 'spits'—that is, he inserts a special iron instrument, which is capable of penetrating to the interior of a large bale and extracting a small piece of the commodity. By means of the 'spit' very clever frauds have been detected.

A variety of 'spits' are used for this class of work. A barbed 'spit' is used for examining cotton, wool, and various coarse goods, so that a portion of the interior may be drawn out. A flat, wooden 'spit' is used in the examination of rolls of carpet, cloth, linoleum, and similar goods, which would be irretrievably damaged by using an iron or steel 'spit.' A short, fine 'spit' is used for probing the stuffing and packing in and around furniture. For seeds, a thin wire is used.

Numerous attempts have been made to secrete dutiable goods in free goods. Saccharin, for instance, has been found hidden in the stuffing of teddy-bears. The tax on this commodity is 8s. 3d. per ounce. Consequently, it is worth while attempting to get it through the Customs without paying the duty. But if the smuggler is caught the penalty imposed is very heavy. Some months back a ship's steward was detected attempting to smuggle 30 lb. of saccharin in Tilbury Docks. For this offence he was fined £441, 4s.

A particularly clever dodge was attempted some years ago. A consignment of champagne

was about to be removed, when an officer decided to open a bottle. To his amazement the 'fizz' proved to be 'Eau-de-Cologne.' The duty on perfumed spirits is, of course, considerably higher than the duty on sparkling wine.

Hollow castings, statuary castings, and drain pipes have often been used for smuggling dutiable commodities. Iron and tin drums, described as containing oil, have been discovered to be fitted with false bottoms and other compartments which contained strong spirits. This ingenious fraud caused considerable loss to the Customs revenue before it was discovered.

Tobacco and cigars have been found in the most extraordinary receptacles. For a long time large quantities were illicitly imported in false bottoms ingeniously made in poultry-coops and pigeon-boxes. Another good dodge consisted in importing empty casks which had double staves—separated by choice cigars! Cigars and tobacco were also found in bread, and in the interior of rich cakes. In fact, every device has been tried in order to evade paying the duty. On one occasion two officers, fencing with imported broom-handles, were amazed when one of the handles broke, and cigars flew about in all directions. The whole consignment was examined, and all the handles were found to be hollow, and filled with cigars. Tobacco has been found hidden in reels of paper, tubs of butter, and in bags of potatoes. Bales of cotton, packages of rags, and fur-waste have also been found to contain the 'fragrant weed.' Some years ago the Customs made a big seizure of smuggled tobacco in the East End, when they captured a huge boiler which had arrived from the Continent. The boiler was so big that it took six horses to draw it. It appeared that this boiler had frequently been sent to the Continent for repairs—and tobacco!

There is another aspect of smuggling which Customs officers must carefully guard against. This is the detection of 'free goods' in the manufacture of which dutiable goods have been used. For instance, all commodities containing spirits or sugar are liable to duty on the proportion of spirits or sugar present. Blacking, jam, sweets, cakes, and plum-puddings are dutiable, because they contain sugar. Moreover, cakes and plum-puddings contain raisins and currants, which are also dutiable goods. Then patent medicines, hair-washes, and a number of other products are liable to duty, which is assessed on the percentage of spirit present. Attempts are often made to deceive the Customs by concealing the percentage of sugar or spirits present in certain articles. However, the trained revenue

chemists soon detect these dodges. Saccharin is a high-duty commodity which smugglers frequently attempt to import free of duty. Attempts have been made to smuggle it in solution in water, glycerine, and other solvents, from which it can be easily recovered when it has left the custody of the Customs. This subtle form of synthetic smuggling is another example of the difficult and highly technical duties which the modern Customs officers are called upon to perform.

II.

When a ship arrives in port she is immediately 'rummaged' by Customs officials. The officers engaged in this work belong to the Waterguard or Preventive branch of H.M. Customs and Excise Department. Preventive officers are also entrusted with the examination of the baggage of passengers. The examination of a ship's cargo, and the computation of the taxes on the dutiable commodities, fall to the lot of the technical officers.

The rummaging of a ship is a colossal task. Rummaging crews are usually in charge of a preventive officer, whose long experience has taught him all the likely hiding-places which sailors use to secrete smuggled goods. In the olden days ships were often specially constructed for smuggling. They had false sides, false bottoms, false bows, false bulkheads, false ceilings, and numerous other clever contrivances for outwitting the Customs searchers. But the heavy penalties imposed on ships so fitted have effectively stopped this form of fraud.

Rummaging a modern liner is a dirty and a disagreeable job. The Customs officers carry electric torches or special oil-lamps. They must search the engine-rooms and inspect pipes, tubes, and every nook or cranny likely to harbour tobacco or spirits. The oil-tanks must be inspected, and the coals in the bunkers must be given more than a cursory inspection. The officers must also crawl through the ship's bilges and examine all the manholes. The beds and quarters of the crew must be inspected. The masts must not be neglected, and in the case of sailing-ships even the bowsprit, the yards, and the topmasts must be examined.

Officers have made the most surprising discoveries during the course of rummages. An apparently innocent-looking ship's 'fender' has on examination proved to be packed tight with tobacco. Coils of ropes left carelessly on deck have also concealed large quantities of tobacco. On one occasion an officer rummaging among the cinders in the engine-room discovered a considerable quantity of tobacco wrapped up in sacking. Tobacco has also been found in neatly scooped cavities made in logs of wood and in lifebuoys.

During the past few months Customs officers made some very interesting discoveries which

resulted in the appearance of the smugglers at the police courts. In one case the master of a British steamer was fined £29, 2s. 3d., being treble the duty and the value of tobacco, cigars, and cigarettes which he had attempted to smuggle. He assured the Customs officer that he had nothing to declare. The officer was not, however, quite satisfied. The cabin was searched, and the contraband found behind a chest of drawers. In another recent case a rum-mager found forty-two gallons of proof spirit in the water-ballast tanks in the forepeak of a ship lying in the Surrey Commercial Docks. A Finnish seaman was prosecuted for this offence, and fined £521, 13s. Not long ago a German cook was fined £18, 16s. at Liverpool for attempting to smuggle 3 lb. of cigars, which he had placed at the bottom of a drawer. A recent case at Grimsby shows how thorough the Customs officers must be in their examination of a ship. In this instance they found 74 oz. of cigarettes and 14 oz. of tobacco wrapped in oilcloth and hidden in the chain-locker of a steamer. Another clever detection was made some months ago at the Surrey Docks, when three Finnish seamen were caught bringing spirits ashore in specially constructed tin appliances, which were curved so as to fit the body. Three of these tins contained a gallon of strong spirits at a strength of 65 per cent. over proof. This spirit was sold ashore, and owing to its high strength—the strength of ordinary bottled whisky is 30 *under* proof—its bulk could be considerably increased by the addition of water. But perhaps the most ingenious smuggling dodge ever adopted was that successfully carried out by an amiable old salt for many years. After each voyage he always carried his accordion ashore along with his kit. He did it so openly that nobody suspected anything irregular. One unlucky day, however, an inquisitive officer stopped him and examined the accordion. It was filled with three hundred cigars!

III.

Nevertheless, it is in the examination of passengers' luggage that the Customs officers experience the greatest difficulty. In pre-war days, when the number of articles liable to taxation was not very extensive, the detection of smuggling was comparatively simple. But now that we have a protective tariff, with thousands of articles liable to high duties, the work of officers is of extraordinary difficulty. Many of these commodities are easily concealed about the person, and consequently the task of detection is no easy one. Moreover, there are several new taxes in force, such as the *Ad Valorem* duty, and the Key Industry duty. In connection with the Dumping duty, the famous dolls' eyes question, which caused no little amusement in the papers some time ago, gives an indication of the intricacy of the Customs officer's multi-

farious duties. Again, under the Safeguarding of Industries Act of 1921, an *ad valorem* tax of 33½ per cent. was imposed on about six thousand articles; and the Silk and Artificial Silk duties introduced this year have added notably to the commodities which must be 'declared' by those entering this country. Thus, when the Customs officer asks a passenger the stereotyped question, 'Have you anything liable to duty?' he has a very lengthy task in explaining the number of articles liable to taxation if the passenger seeks information on the subject. But, generally speaking, passengers are fairly honest. Most of their smuggling exploits consist of trying to get a few pounds of tobacco or a small quantity of spirits through free of duty. However, all dutiable goods must be 'declared' and produced to the officers for examination. The following goods may be passed by the officers free of duty, provided they are the *bona fide* unconsumed stores of the passenger who brings them into the country for personal consumption: Manufactured tobacco, including cigars and cigarettes, half-a-pound weight; spirits (other than cordials and perfumed spirits), half-a-pint; cordials and perfumed spirits, half-a-pint; other dutiables, if the duty does not exceed a shilling.

Clocks, watches, and musical instruments, which are now liable to an *ad valorem* tax of 33½ per cent., may be admitted free if they are *bona fide* personal effects, and duly declared. However, these articles must be few and dissimilar, and their individual value must not exceed three shillings. They are also exempt from tax if they bear clear and genuine indication of British manufacture. In the case of watches which are part of the ordinary wear or equipment of a passenger, an oral declaration of ownership is accepted. All dutiable articles not covered by these concessions are liable to the *ad valorem* tax.

When dutiable goods are not declared, but are subsequently discovered by the officers when examining baggage, duty free concessions are not allowed. Full duty is charged if the quantity concealed is within modest limits. But when there is evidence of a deliberate attempt to smuggle, treble the duty-paid value of the goods is demanded. In extreme cases the passenger is prosecuted, and brought before a magistrate.

Under the Customs Consolidation Act of 1876 Customs officers have the power to search the person of suspected smugglers. The passenger has, however, the option of being taken before a magistrate or a chief officer of Customs. In the case of women passengers it is enacted that a woman 'shall not be searched by any other than a female.' Female searchers are engaged by the Customs authorities for the search of suspected women. A person who denies that he has smuggled goods on his person, if such smuggled goods are subse-

quently found, is liable to a penalty of £100, or treble the value of such goods.

Although Customs officers have a great reputation for gallantry, they are frequently compelled to take the necessary action against women smugglers. These unscrupulous women take advantage of their sex in circumventing the Customs. When being interrogated by the officers they pretend to be suffering from the effects of sea-sickness. In fact, some of them are apparently so ill that the Customs officers have often conscientious scruples about worrying them. However, bitter experience has proved that such women are often expert smugglers. It is only a few months ago since a Belgian woman was caught at Dover with a pound of tobacco cleverly concealed among clothing in her luggage. The officers detained her on suspicion. A female searcher was requested to search her. The result of the personal examination was the interesting discovery that the woman was wearing a specially constructed belt which contained 2½ lb. of tobacco. For this offence she was fined £7, 10s. Customs officers of the old school often tell the tale of the famous Calais-Dover baby which frequently crossed the Channel in the arms of an adoring young mother. One day an officer asked to see the baby. The mother refused to let him raise the baby's veil. He persisted. In the end she yielded. The 'baby' turned out to be several pounds of tobacco! Women have often used their clothes and wraps for concealing rubber receptacles containing cognac and eau-de-Cologne. On one occasion a woman was caught smuggling cigars, which were neatly arranged in the lining of her skirt. Ladies' handbags, rugs, and parcels are not now exempted from examination, owing to the numerous cases of attempted smuggling recently detected.

IV.

Now, it is not possible to search every passenger arriving from abroad. To do so would necessitate a tremendous increase in the present Customs staff. Moreover, a personal search would also be a source of great inconvenience to travellers. Under the present system the Customs officers perform their trying duties in a very expeditious manner. A few months ago a newspaper reporter watched 370 passengers from Calais arrive at Dover and pass through the Customs formalities in less than half-an-hour. As a general rule, the officers never stop passengers unless they suspect them of smuggling. Expert smugglers have been frequently caught wearing waistcoats, corsets, thigh pieces, shin guards, hats, and caps which were specially made for secreting dutiable goods. Recently an officer noticed that an Italian carried an unusually large quantity of tomato soup in hermetically sealed tins and bottles. He opened one of the tins. It contained spirits. The

remaining tins and bottles were then examined. They all contained alcohol, the total quantity being $3\frac{3}{4}$ gallons. The Italian had to pay the Customs £60 for his 'soup.' Of late large numbers of Japanese travellers have been caught smuggling Swiss and German watches from the Continent. One wily Oriental had a valuable platinum and gold watch, studded with diamonds, secreted in a soap-box. Several Japanese smugglers have also been found wearing rubber belts for carrying watches. These smugglers are apparently well supplied with money. For instance, in 1921 a Jap smuggler, who was fined £134, 14s. for smuggling four watches, two cameras, and a magnifying glass, paid the fine at once. However, British subjects are also liable to succumb to the temptation to smuggle goods subject to the new *ad valorem* taxes. In 1922 a London jeweller was fined £560 for attempting to smuggle platinum and diamond watches. On the same day another man was fined £87 for illegally importing binoculars, cameras, opera-glasses, and carriage-clocks.

Smugglers adopt many clever tricks to get watches into the country free of duty. Recently a German steward on a Danish ship was fined for smuggling cheap watches, which he purchased at Hamburg for five shillings each. These watches were sold to Jews, who made considerable profits on the transactions. Men smugglers used to be caught wearing corsets which contained watches secreted in neatly-made pockets. One man had forty watches in a corset. Another clever dodge consisted in smuggling watches in books. Circular holes were made in a number of pages, into which the watches fitted. Gum did the rest, and the books were either packed in the luggage or openly carried in the hand.

v.

Under the Dangerous Drug Act of 1920 the import, export, manufacture, sale or possession of opium prepared for smoking, and the import or export of opium, medicinal opium, morphia, diamorphine (heroin), and cocaine are prohibited except under licence of the Secretary of State. Yet, in spite of the stringent precautions taken by the Customs officers, there is reason to believe that there is a widespread illicit traffic between Great Britain and the Continent in opium, cocaine, heroin, and other harmful drugs. Seamen and professional smugglers are engaged in this nefarious work, which, from a moral point of view, is far more abominable than smuggling tobacco and spirits. Recently in the House of Commons the Home Secretary stated that the authorities were aware that drugs were smuggled into the country, or sent through the post, from the Continent. He said that every effort was made to detect offenders, but short of opening all incoming passengers'

luggage, the minute search of every passenger, and the examination of every postal package, he was afraid it would not be possible to suppress the illicit introduction of drugs into the country so long as it was possible to obtain them without difficulty in other countries.

It has been asserted that there is an international gang engaged in the 'dope' traffic, and that colossal profits are made in supplying drugs to night-clubs and other unsavoury resorts in the underworld of London and other large British cities. Cocaine is the favourite drug of the 'dope' fiend. It is obtained from the coca plant, which is indigenous to South America. A crude extract is first made from the leaves of the plant. The extract is then sent to the Continent. It is believed that most of the cocaine smuggled into this country comes from France, Belgium, and Germany.

In spite of the difficulty of detecting 'dope' smugglers the Customs officers have succeeded in making a large number of clever captures. The devices used by these crafty smugglers are extremely ingenious. Recently two engineers on an Italian ship were fined £100 each, or six months' imprisonment with hard labour, for knowingly concealing 267 grammes of cocaine, valued at £410, with intent to avoid the prohibition against its importation into this country. The cocaine was in bottles, which were hidden in the ship's engine-room. Cocaine is known to the drug traffickers as 'snow,' 'coco,' 'happy dust,' 'the doings,' 'dream powder,' 'dope,' and 'white powder.' Large prices are paid for small quantities, and the chances of being caught are not so great as in the case of bulky articles. Yet the Customs and the police have caught 'dope' smugglers carrying 'snow' in fountain pens and in wristlet watches from which the works had been removed. The subtle 'dream powder' has also been concealed in the hollow handles of walking sticks and umbrellas, and in the handles of suit or attaché cases. A number of phials containing cocaine were found in cavities made in the high heels of a consignment of ladies' shoes. Men have also been caught with 'dope' in the permanent turn-up of their trousers, the lapels of their coats, and the lining of their hats. A smart capture was made some time ago, when the Customs seized a consignment of cigarettes which contained cocaine. Each cigarette held £5 worth of 'snow.' Women have also smuggled it in their hair, furs, and in powder-puff cases.

It is thus obvious that the officers are faced with a terrible task in their efforts to stamp out this insidious traffic. Only a percentage of the smugglers can be caught, and perhaps the least suspected people are often the most dangerous 'dope' traffickers. The officers, however, are more successful in dealing with seamen who have taken up 'dope' smuggling as a means of

increasing their income. Chinamen have, of course, an evil reputation for smuggling opium intended for home consumption, so to speak, in the Chinese quarters. They are frequently found concealing comparatively large quantities of narcotics. Some months ago at Liverpool a Chinaman was fined £10 for being in possession of opium. He was also sentenced to six months in prison for being in possession of sufficient morphine to poison ten thousand people.

Latterly, however, Chinamen have seen the commercial possibilities of smuggling drugs for the use of 'foreign devils.' But the result of recent prosecutions at the police courts should convince them that it is not a profitable trade, now that the authorities are determined to take drastic measures in order to suppress this diabolical drug traffic. Hard labour for six months, in addition to stiff fines of £200 or £300, is a great deterrent, even if 'snow' fetches £27, 10s. an ounce from unfortunate drug takers. Incidentally, a number of scoundrelly seamen are duping the 'dope' traffickers by secretly supplying them with a white powder which is as harmless in its effects as chalk or boric powder. In April 1922 a man pleaded guilty to being in unauthorised possession of, and offering for sale, cocaine. However, an analysis proved that the powder was counterfeit cocaine.

VI.

The parcel post from abroad is frequently utilised by smugglers in order to get dutiable goods through without payment of duty. But since the Customs officers are stationed at the Foreign and Colonial Parcels Depots in all large cities, very few of these attempts at smuggling succeed. Where dutiable goods are declared on the foreign Customs form, the duty is assessed by the British Customs, and the money collected by the Post Office authorities. But where dutiable goods are not declared and are obviously concealed with the object of evading the Customs duty, the goods are promptly seized and deposited in the King's Warehouse, where they are sold by public auction. These sales of seized dutiable goods include all sorts of wines, spirits, liqueurs, cigars, cigarettes, tobacco, clocks, watches, confectionery, cinema films, gramophones, records, and so on.

It is quite certain that smuggling will never be entirely suppressed so long as there are taxes levied on imported goods. Many people think it good sport to dodge the Customs; they do not consider that they are guilty of defrauding the revenue, otherwise they would probably not boast about it. I have frequently been told by respectable members of society how cleverly they fooled colleagues of mine. But Customs officers are human, and unless passengers are attempting smuggling on a big

scale, well, the officer does not see some things, officially.

Fears have been expressed that the rapid development of civil air navigation will result in a new form of wholesale smuggling. This may perhaps happen when aeroplanes are as common as motor-cars, but under the present rigorous system of registration, aeroplanes are completely controlled by the British and foreign Customs. Under the Air Navigation Regulations, 1919, machines must depart from and arrive at one of the approved aerodromes in Great Britain. Customs officers are stationed at these aerodromes. When a machine arrives from foreign parts it brings to at the Customs station. The machine is rummaged, and passengers and their luggage are searched in precisely the same way as if they had arrived by ship. Many of the machines on the Continental air routes carry dutiable goods such as wines and tobacco. Before these can be cleared the official account must be taken, and the duty paid to the Customs officer in charge of the aerodrome.

It is quite impossible for machines flying from Paris to Croydon to engage in smuggling. Their progress is checked as they pass various places on the air route. They are thus prevented from making illegal landings and disposing of dutiable goods. Some time ago one pilot did attempt smuggling. It appears that he was always ten or fifteen minutes later than he should have been in arriving after passing a coastal aerodrome. Then reports reached the Customs that he had been noticed landing at a certain place on a number of occasions. Investigations were made, and it transpired that he was in the habit of descending and handing over dutiable goods to his fiancée.

In America the authorities have now established an aerial police force for chasing air smugglers and air criminals. A number of cases have occurred where air smugglers have carried 'moonshine' and whisky from Canada and South American States to the United States. The new aerial police are, however, making this up-to-date form of smuggling a somewhat risky game. Incidentally, not long ago American Prohibition Enforcement officers used an aeroplane carrying machine guns to capture the British schooner *Annabelle*, which was hovering four miles off the coast of Florida. This ship had on board 11,500 cases of whisky, which was, no doubt, intended to be 'run.'

If Great Britain ever goes 'dry' we may have similar episodes to chronicle. In any case, the aeroplane will be a serious menace to the revenue if machines are allowed to reach this country without notifying the Customs. It is quite possible that in the near future the Customs authorities will be compelled to establish a Preventive Air Force to deal with air-smugglers.

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

WHEN all of us were younger, the time of the goldening of the leaves and their fluttering and falling yielded one consoling reflection that warmed in our thoughts until it was desire. It became a complement and sequence to the summer touch with Nature in her sunny moods, for it was like a consideration of the spiritual works of man as accomplished sedately in his chamber. In such days, still remembered by those who urge they are yet young, the spent September was sorrowed for the less because of the new October that suggested to our northern kind the fireside, the easy-chair, the slippers, and especially the books, old favourites for further devoted attention, some calling for a new and special study, and a few perhaps that were being added to the collection and came sprucely covered, yet with a certain uncouth rawness of outside appearance. This frank and free delivery to books and cosiness was a habit of the people, but we produce Sir Edmund Gosse to witness that it was better practised in the north of our country than in the south. One may be soothingly alone with books in the heart of London, since solitude may be far better indulged in there than anywhere, and one who abides a small part of each year in the Temple was lately telling me that he came from the country and from far islands to read in these old rooms in an Inn of Court the books that in their spiritual and material selves were his dearest friends. Yet for a full sense of the true contentful cosiness for books we need winds without, and a dark and often dripping country, and not millions of dancing lights, millions of revolving wheels, millions of people turned to giddiness. To become entirely detached from all sense of the existence of these things is the hardest exercise in concentration. No place inspires this winter happiness and content with books so well as our northern homes, where the fireside holds for us something of that sacred charm that belonged to it in ancient times. In those old times we entered October gladly with plans for indoor work, the new activities of many societies; but most who were of good and serious mind were given to this book-hunger, yearning for the solace and tranquillity that were

No. 774.—VOL. XV.

gathered from it. It was not merely the desire to acquire new information from the books, nor to delight again in the beautiful arrangement of words often read before. Mixed in the emotions was the desire to hold and fondle and to turn pages of the particular volumes we possessed as old companions with many associations, whose like of the same edition would not be the same. An illusion of living intimacy existed. To read a book was not enough to make it ours to love, nor to read it twice or thrice. It must have been well handled, marked, or dealt with in some personal way, and the better if it had been a journey with us. To select a book for important and lonely travels is a declaration of spirit and of choice that gives it sanctification. Three of my books, small things and as cloth and paper of the smallest value, have partnered me at times of travel for many years. No person has communed with me to such silent contentment and understanding as have these books, and ill as such a thought may be, I do confess that I should be less perturbed to hear that the home of my enemy had been destroyed, than that some thieving rascal had carried off these precious things. A dry philosopher might say, and in bygone days he did, that this was wrong, since we should love books only for the thoughts they hold, and that to fondle the material thing was intellectually an unnatural act, a sign of a weak and shallow mind, and that by this original sin others, like hypocrisy, were engendered, and true culture fell. But the honest lover of books thinks more, feels more, of the books that are truly and of long time his, and ponders on their thoughts, their minds, the more; and that is an answer.

* * *

But do not these hectic times thin out the numbers of such as love their books like this? Not only the young call for excitement instead of tranquillity, and the old race of book-lovers ages and passes away. Almost secreted in a corner of a journal I found the other day, in the form of a letter, impulsively written, a drastic statement by Sir Edmund Gosse, declaring that we are humbugs and do not love literature at all. In form and measure it was the most scathing utterance against us that I can remember. Perhaps it was because it was

SEPTEMBER 26, 1925.

so bitter that the editor printed it in an inside corner. 'Sir,' said Sir Edmund Gosse, 'there is surely a strong element of humbug in the pretension that English people take any practical interest in literature. They are certainly not encouraged by the booksellers to do so. Anyone who suddenly asks for the text of any modern classic will find this out in a moment. If there is an author who might be expected to rouse perennial curiosity it is Jean Jacques Rousseau. I have just inquired at the shops of nine leading booksellers, and have failed in every case to discover an edition. The solitary copy these nine great bibliophiles could produce was one in very small type, very bad text, and an enormous price.' Then he wandered in fruitless search for a copy of Petrarch's sonnets in Italian, and he exclaimed bitterly, 'This experience could be repeated over and over again. The booksellers have no enterprise and no ambition in dealing with any books but those of the moment. Buyers have no pertinacity and no real interest. The whole pretence of a public love for literature is a delusion, and the sooner we recognise it the better.' This was harsh saying, perhaps to excess, following upon a disappointment. But a few days later this eminent critic was serene in the contemplation of a great personal occasion, and then he said that he was a little disappointed in the modern young man as a student and lover of books, for such an one who had been expensively educated seemed not to care to read anything but the newest sensation. One must go to the working people of the north country, he said, to find real students of literature, men and women who read books and not books about books. 'I admire more than I can say,' he added, 'the way in which these people spend their hard-earned money on serious books, expensively printed and produced. They are the true lovers of literature and the serious drama, and they have always been, in my experience, the supporters of the best literary movements, which in cultured London are only too often taken up as fads and speedily dropped.' Serious books, and such as are expensively printed and produced he is thinking of.

* * *

The most humble may feel, sighing, that what they hear of this passion for books is an emotion beyond them, that it requires a peculiar fineness of mind with scholarship. They imagine that the beloved volumes thus assimilated to their owner's souls are, at their lightest, sombre or subtle essays, or they may be philosophies of ancient seers or lovely lines of poets such as a properly qualified person might fittingly take to read on an excursion up the slopes of Parnassus, to muse upon as he sat by the Castalian spring. Such humble view is less than half correct. Admitted are

the charms of the studious and philosophical life, the allurements of the higher graces and refinement; but in this world, where as yet from continuous evidence we are still unthinkable ages from the perfection of our mind and spirit, red blood counts for more than ethereal vision, and the essence of a novel or tale is that it is human and made of blood. Spiritual ideals when joined to human hearts and bones are elusive things, for they grow, not in the ordinary way by means of carbon, nitrogen, and the various food-stuffs of Nature, but upon the airy products of the mind; so that, having by miraculous means increased most prodigiously, it is discovered later when they are examined in a human way, and an attempt is made to feel them, they do not really exist, and so are at an end. Let not an early ideal, established on a limited and youthful experience, be fostered in the mind for many years without some attempt at confirmation. Perhaps it was good for his happiness, and for the world by the inspired works it gained, that Dante had no opportunity to marry Beatrice, for idealisation was being pursued in the poet's mind at such intensity that, finding later that the lady had not been created in a lover's heaven, he would surely have been disappointed, and disaster would have followed. Doubtless he did best to wed the Donati, with whom he was happier than has often, without authority, been stated. For intimacy blood is still always best, and in the case of our friend-books it is better red than blue. Books that are very deep are beloved to some who own and treasure them, lingering upon great thoughts they hold until they could tell you on what page, and what part of it, a certain statement is made or sentiment expressed. They know the appearance of each page, where a scratch shows on the paper, or a stain is seen, which through some association becomes an almost sacred thing, like the mark of a wound received in battle. Certain marks remain on our pages that not for all the calf and gold of new editions would we have removed, for they are signs of life's great moments. Pleasant is the company on travellers' journeys of a small copy of a favourite poet's works, one which has aforetime been on many voyages. Such old travelling companionship is the most exquisite of all as between man and book; but the conditions are such that the favourites of a case like this could scarcely be the fireside lovers too. Discovered collecting things for his travelling cases, a friend who is a playwright of some note recently displayed to me, with the hesitation of a deep and secret affection, an old and much soiled little volume that would have been in tatters but for its worn black-leather covering—his favourite copy of Palgrave's *Golden Treasury*, than which he confessed he would rather leave his clothes behind; and do we not agree that a traveller of fine sense and thought who leaves behind this

anthology has somehow missed a point in the elementary instincts of the traveller? However, we do not settle by the glowing coals, calling up the sense of cosiness from the material things about us and our own helpful senses, in order to pick about among anthologies. Many there are who repeat and enhance some old delights of gentle philosophies attached to imaginary figures for a human effect, as, for a good example, in a volume which is now one of our dearest friends, the *Father Payne* of Arthur Christopher Benson, upon whose death lately this book indeed, published at first anonymously, was mentioned less than any and often omitted from the memorial lists. It is a tranquillising book for short and frequent diversion on winter nights, a preliminary or a supplement, and the better because many of its pages are of books and writing.

* * *

But the humble beings to whom just now we nodded, readers of novels as they mostly are, well know that, given taste for the superb classics of our language two or three generations back, no more better friendship between owners and books can be achieved than this; and here, if anywhere, we experience the intimacy of the individual copy, for none can say that life among the pages of a favourite novel first read, perhaps, thirty years or more ago, could be lived again with such delight and comfort, with illusion of reality, as in the old copy of the first reading. By this passing of twenty years or more it may seem that the material book has slipped back to the period to which its soul belongs, and is not just a novel but the living narrative of its comedy and tragedy. Such illusion, for whatever it may be worth, is lacking in a new copy, and I know men and women—numbering myself among them—who, having by great misfortune lost a favourite, the old and original copy of a story that had greatly pleased them, have preferred never to read it more rather than buy something printed newly now. But with a copy of the beloved among the old novels, drawn curtains and the fireside, even the tortures of governments that live only to tax may lose their sting. For this lover's business the old novels are the best; so many think. Some complaints arise that the new novels of the time are worked too subtly and thematically, with an excess of ugly digging in psychology. However that may be, much of the present writing fits the period, and its defenders will urge, and fairly, that in some points of literary technique it is, at best, superior to all that has preceded it. Certainly the art has been intensely studied by hundreds where once there were only isolated and often careless units. The artistic souls and subtle minds of our present times would be worse than pessimists consider them were there no advance or, let us say, change with an improve-

ment according to certain standards already fixed and sometimes varied, since there can be no final settlement as to better and best in this affair, tastes and standards varying and being altered with age and circumstance. Instinct itself varies with them. We cannot settle even upon what is beautiful and otherwise, or what is good and bad. People of the arts are deep in dissensions upon these matters. Therefore we cannot with supreme conviction declare that one phase of art is better than another, only at the present time that our inclination, due to time and circumstance, guides us to a preference which those who succeed us may deride. Action and reaction is the eternal process of exploration in art and all the great spiritual problems, to the end that a grain of truth is extracted from a million lives in many ages, and, in some distant time, when men have changed, a morsel of some dazzling thing of thought may at last be gained and labelled with final authority in the grandest human triumph, as Truth and Beauty. It is for that that all history is being so violently made. Even a part of this process is the fireside reading of novels old and new, causing the continual movement and exercise, with unceasing alternations, of the human mind and taste. Critics, in condemning our modern novels, write as if they were all of one style and theme, or nearly, when diversity and difference are immense. They can hardly be classified in schools. How much is there in common between Mr Wells, Mr Galsworthy, and Mr Bennett, who are often accepted as three leaders of the times? Perhaps they are all less diffuse, more direct, and more quickly penetrating than the Victorian novelists; their technique may be more subtle and elaborate—but still they are all very different. And the other writers are not like them, even in lower scale. Yet our modern novels have in a large measure a certain common characteristic running through them in that, harmoniously with the times, they are nervous, uneasy, excited, and exciting. They are often, as we might say, jumpy. They may have nought to do with wars and strikes, bad governments and crime, strikes and taxation, fox-trots or national decadence. Such themes may be shunned, and scenes be laid in some Arcady supposed to have survived the general shattering process of the last decade; but the influences exist and work, and tinge all that is written. For such reasons it is hard to regard the new novels in general as being such good fireside friends as some of the works of the great Victorian writers. The neglect into which these fell when Victorianism passed and reaction came was stupidly mistaken, and the qualities of their art are now being better perceived and appreciated by such as were led astray. These were accustomed to deride the careful building up by masses of detail of scenes and characters, yet now they

know what superb building it was and how it lives.

* * *

The old novelists, differing from writers under present influences, achieved with their splendid illusion of reality the sense of comfort with domesticity, in a Britain that was then mostly tranquil. Hence they are not only good fire-side books at any time, but are splendid for the present. We leave Piccadilly Circus with its jigs and glares, and all its vulgarities, and by these old pages we pass into the smooth and shaded lanes of the countryside and live among the people there, in the cottage and the hall. At times with them we come to London, but we do not stay for long, and it is the London of the old and mellow days. Surely the essence of perfect companionship in old novels is full understanding and intimacy with the characters, and the old novelists by their system were marvellously successful in achieving this. Recently I read a remarkable novel published early in the war time, and evidently written earlier by Mr Somerset Maugham, entitled *Of Human Bondage*, and it extended to no fewer than six hundred and forty-eight closely printed pages! Minuteness of characterisation went to limits in this work, and in some ways it was finely, grimly successful; but neither Mr Maugham nor any other of the present age seems able to accomplish in twice the space which the Victorians are considered to have wasted the essential miracle of producing flesh from paper and blood from ink. Thomas Hardy indeed belongs not to our age but to the Late Victorian, and he is the only living writer who in *Tess* accomplished that miracle in something like the old way. Then we may reflect upon Soames, and others of the tragic heroes and heroines created by Mr Galsworthy, but of hardly any others. For living friends in old beloved books, with whom to spend serenest evenings now, where shall we find more grateful companionship than in the *Mill on the Floss* of George Eliot, or in some of the stories of Jane Austen, in which of late interest has much revived? Here in this art, gentle reality, with truth and beauty, is expressed as not elsewhere, and the reader, feeling the art and the life and the truth, gains a deep and composing satisfaction. Who shall not sit indoors for several nights to observe again the subtle Becky at her little games in *Vanity Fair*, no longer 'skipping,' as we were wont to do, but lingering upon this renewed acquaintance? Then surely Scott is for the soft and easy chair, and not an author for the train. I have the pleasure of nearest intimacy with the characters of a great Victorian, whose reputation has somehow suffered in a stupid way by a silly pose of critics and some others, who have affectedly condemned the system of writing to which he, Anthony Trollope, himself confessed,

having a clock upon his table and deciding firmly that a certain number of words should be written in every hour. The posers say that this was contrary to the principles and practices of art, which favours laziness and irregularity; but yet nearly every writer of success and reasonable production adopts something like it, though perhaps not always reckoned or publicly proclaimed in hours and words. Trollope admitted his clock and schedule; a duchess declared it dreadful, and that fancy has remained in all hypocritical minds. For the reflective evenings of a waning and doleful year, and for travelling when, far away, thoughts of our homeland touch us with that hungering tenderness that only travellers know, I know nothing like the Barchester novels, because they are plain and true, and, making a clear and progressive human statement of the course of ordinary life, they are convincing. Knowing the people and where they live and all about them, we join their life at once, happily and sentimentally. Let it be London or anywhere in Europe, Africa, or America, when the day is done we Barsetians like nothing better than a quick return to dear Barchester with the Duke and the parson, the doctor, and all the other people of that simple but intensely human world. We shall look in on Mary Thorne and have a word with her. Anthony Trollope was most excellent in the manner he achieved this effect of intimacy by the simplest and plainest means. He never surprises or excites his reader, all is quite plain and logical, and yet you are never wearied, being with the best of friends. Here is our old country as we remember it, with all its old squirearchical solidity and mellowness, and its rich and rare stupidity. We leave the city or the newspapers, suggesting a strange world of freaks and impossibilities, which are not less absurd because they happen and are reported, and we puff down the backward way of time until here at last is Barchester, with the Duke and Doctor Thorne and everybody, with the most genuine human blood in them. Mary would not bob her hair or shingle it, and she would not smoke; the Duke would always be a lofty duke and not a tradesman; the doctor would play a perfect tact, and the parson's wife would exercise her tongue. Mary, the 'queen of names, Lucy, Amelia, Pamela, Jane—how appealing in sweet old-time simplicity are the names of our friends in some of these old book-bordered communities! We are glad to meet such friends through the same medium as before. No others equal them in human strength, for in this period does it not often seem that after the terrors, the insincerities, of the times in which we live have entered the delicate veins of the characters of new fiction? We make enduring friendships with none of them. We have done for ever with the heroine of the best of sellers as we leave her at the end.

A GALLANT ADVENTURE.

By W. O. SANKEY, M.D., B.S.

IF one earns a living by practising as a doctor in the immediate neighbourhood of Dartmoor one has the great privilege of spending many hours of one's life, both by day, and to a lesser extent by night, in driving alone in the magnificent air and through the lovely scenery of the moor.

Throughout the year the moor charms and fascinates with its ever-changing lights and shades, with its views of the most lovely of the rivers of Devon, the Dart, and its occasional glimpses of sea and coast-line in the distance.

Some of my brother doctors pursuing a more lucrative course may envy one; indeed I have heard some state so after spending a few days' holiday in the district, when the moor is at her best in her raiment of purple and gold.

Let one of these jealous ones accompany me on one of my drives in the small hours of the morning just for seven or eight miles 'out over.' A fairly thin covering of snow makes it difficult to distinguish the edge of the road on the open moor, so that we proceed cautiously. The lack of hedges enables the fierce wind quickly to form drifts through which no car may pass, and if one sticks in the drift the sleet and wind make one ponder whether after all Dartmoor is really the best place to practise in. However, there are compensations.

At times one is intensely interested in the opportunity to witness some unusual happening, and I have longed more than once to have a really good camera, ready for immediate use, in the car with me, together with skill and ability to use it well, in order to record for others what one has enjoyed oneself.

To-day I was fortunate enough to witness one of these incidents, and I have since sincerely regretted that I was armed only with a stethoscope and not with a camera.

After driving about six miles out to a little hamlet on the edge of the moor, I was stopping the car and preparing to walk a few yards to the house of a patient, when I heard sounds of 'Battle Royal.' Glancing down the lane, I saw a hot contest proceeding in a field thirty yards away. The first combatant to catch my eye was a large, heavy, crossbred stag¹ of the Rhode Island type; to my amazement his opponent was a wild cock pheasant.

I naturally postponed my professional visit and hurried to the arena. Before I could get there, two other would-be spectators ran out of a cottage, intent on observing the fray and shouting to me the nature of the fight.

'Twas soon over. The poor stag fell through the hedge and retreated across the lane for home. The victor ran past him, disdaining to take any further notice of his defeated adversary, and rushed on to a small patch of grass where the ladies of the harem were sunning themselves. He singled out one and pursued her across the plot, twice managing to catch some of her feathers in his beak. She, however, while under the observation of her sisters, successfully evaded him, and retired under a bundle of faggots which was standing by a shed. Whether she then surrendered to his bold advances, none will ever know, although I must admit that I ran to see what happened, leaving my two fellow-observers pitying the poor stag, who was standing with bleeding head and comb, and looking as if he had had more than enough of it.

When I got to the faggots the pheasant ran out, and, taking no notice whatsoever of me, passed within two yards in a fierce rush towards another hen, the only sign of disturbance in his magnificent courting plumage being one broken tail feather. Much to my regret the two lady spectators at this time turned their attention from vanquished to victor, and clapped their hands and shouted at him. The invader then rose into the air and flew to the woods by the side of the Dart.

I doubt if the stag would crow loudly during the next few days. I wonder what the elder ladies of the harem really thought about the scandal.

Surely the gallant adventurer will be pardoned, if the excuse that he made to his lawful lady loves to explain the damaged tail feather differed slightly from the tale that he told in strict confidence to his old friend and rival, the cock in the next covert!

AUTUMN LEAVES.

I TURN with pilgrim thoughts for ever tending
In homeward flights, love-laden like the dove,
To where the trees above the Almond bending
Embrace, and seem to love.

I turn from where the late-won gold of harvest
Has vanished from the fields—the stooks are led.
Ungathered gold of Autumn! in the forest
I gather you instead.

Yours is a richer harvest, though forsaken
By passing gleaners, careless where they tread;
For in your pregnant heaps my footsteps waken
Green summers that are fled.

Alone, beneath the sunsets that enshrine Her,
While round my feet the dear dead seasons lie,
Here, in the waning twilight, I entwine Her
This wreath of memory.

W. L. FERGUSON.

¹ Stag, local name for cock or cockerel.

THE EXTRA DAY.

By J. W. HERRIES.

I.

AS John Jamieson McTaggart, W.S., paced through the sedate, suburban streets and terraces in the semi-darkness of an Edinburgh spring evening, the gipsy man's face kept recurring to his mind's eye. He had seen the gipsy only for a second or two under the none too brilliant street-lamp. Yet he seemed to have carried away a remarkably vivid impression of him. He could see still the man's black merry eyes, his gray-brown face—which had also a suggestion of apple-red—the straggling locks of curly black hair which escaped from under his cap. Round his neck was a red scarf. A faded maroon coat was buttoned close, because of the cold, damp air. The shoulders stooped a little. The man showed physical signs of age; yet he had an unquelled boy's spirit in his eyes.

He had seemed to appear from nowhere, near the end of the terrace where the lawyer lived. It was the usual kind of request from a down-at-heel wayfarer—something about an old coat. There was little doubt about the one he was wearing being past mending. The lawyer's sharp glance noted that the upper parts of the cuffs had been worn into semicircles.

He was surprised, and a little irritated, by the stranger addressing him by name. It startled him to realise that he, an unobtrusive figure in an avenue which breathed the very spirit of privacy, should be watched and identified. But of course, he reflected, this was part of these gipsy peoples' trade.

In spite of his appearance, there was no hang-dog look in the man's face or manner. From his eyes, with their hint of merriment, there seemed to come a penetrating look of understanding. He had said something about calling for a cast-off coat at the office. Of course, McTaggart put his foot down on that impertinence. It would never do to have characters of that kind coming about the dignified portals of the Charlotte Square establishment.

And now, as he followed his course through the sedate streets of this residential part of the city, he was conscious of a vague uneasiness. There seemed to be something in the encounter that was struggling for recognition. Something had violently broken in on his complacency; only, he could not give it a name.

Arrived at his club, he made a futile attempt to read. In the middle of the second page he realised that what had gone before had left no impression. This was no new experience. He had for some time been aware of a painful, listless indifference. Everything seemed un-

profitable; but he had never realised the fact with such startling clearness as now.

A vague alarm began to invade him. Why had everything so completely lost its savour? Enthusiasm, zest, the exercise of a lively choice, appetite and satisfaction seemed to have sunk down, leaving only the cold ashes.

This general slowing-down of interest had been a gradual process. The colour had been going out of life for a long time. Why? He had not the least idea. How was it that it had come so forcibly home to him on this particular evening? Was it because of the sharp contrast brought home to him in the person of the gipsy—living hand to mouth, but with a natural vitality surging and glowing within him; whereas he, fortunate from the world's standpoint, was sated with life?

Were other people similarly afflicted? He looked about him. There, in the next arm-chair, was a wealthy architect, cumbrous of figure and blotched of face, a glass of port beside him, a cigar held in his fingers, in the same chair and occupation as on any other evening at this time. Was he enjoying life? He did not look as if he were—with his eyes fixed on vacancy, and his features relaxed in an expression of dull apathy. A government official was reading one of the older more sober magazines, with the air of a schoolboy at a lesson. Two men in a corner were conversing in low tones; and a glance was sufficient to show that neither of them was particularly interested in the conversation.

McTaggart returned to his bachelor home, depressed and out of sorts. No doubt, he tried to believe, the world would have a slightly pinker aspect next morning.

II.

It was always a pleasure to enter the spacious, dignified hall, to note the deferential air of his clerks, to take his seat in his arm-chair at the great desk, and to proceed with the opening of the day's letters. On this morning, the faint satisfaction of this part of the routine quickly faded out. The bundle of letters would bring no surprise for him.

'What had gone wrong?' he asked himself again, for the twentieth time since last evening.

Life had worked out for him according to plan—or better than plan. A fortunate chance had made him partner of an old-established firm. He had found his feet; and saw, with satisfaction, an assured future, with steadily increasing if moderate rewards for his capacity. Then the head of the firm, a family lawyer of the old school, shrewd, solid, and reliable, with sufficient

discretion to leave the finer points of interpretation and the niceties of conveyancing to others, had one day expired at his desk—that desk at which McTaggart now sat. The second partner, Finlayson, a more nervous and fragile type, with a more agile brain but diffident about assuming responsibility, had broken down within a month, and followed the senior partner into the Unknown. The junior partner found himself at the head of one of the oldest and most lucrative businesses in the city. He had taken up his responsibilities with courage and confidence.

His ambitions had been handsomely and prematurely realised, but he felt no satisfaction in the fact. Life had become strangely insipid. Why? Was he out of tone, through overwork? That, he decided, must be the reason.

He proceeded to open the letters. One of them, square in shape, was addressed in an unfamiliar, feminine hand. He opened it, and a glance showed what it was. It was from the niece of the second partner. At the time of Finlayson's death, a year ago, she had been in Italy, and there seemed no adequate reason for her immediate return. McTaggart was one of her uncle's trustees. She now announced her arrival in the city, and proposed to call that morning in connection with some formalities relating to her uncle's estate.

McTaggart rang the bell for one of the clerks, with the intention of directing that certain documents, reposing in one of the green deed-boxes bearing his late partner's name, should be brought to him. His eye scanned the impetuous lines of the letter, written with a broad, fluent pen across the delicately-tinted blue notepaper, and he sought to realise some impression of the writer. He had never seen her. He understood she had been engaged on some research work relating to Roman antiquities. He concluded from the style of writing that she had some of the nervous energy of her uncle, but none of his meticulous precision.

With the corner of his eye he was aware that the figure of his clerk, noiseless, deferential, and attentive, had materialised in front of the desk in answer to his summons. He raised his head to give his instructions.

With a realisation that something was seriously wrong he saw, not the clerk, but the gipsy man of the night before. The gipsy man was looking at him with the same amused and knowing expression that he had then remarked. Alarm seized the lawyer's mind at what he perceived was a disquieting hallucination. The obsession of the gipsy's face had at first rather amused him. This was more serious. Something was happening to him that might require the attention of a mental specialist.

Round the figure of the gipsy was a sort of blue nimbus, as of a different atmosphere, clearer and more charged with vitality than that

of the sombre room. In some respects it recalled the visionary disturbance heralding a digestive derangement, but without the usual nauseating feeling.

As he looked, the margin of blue atmosphere steadily expanded. As it extended, it blotted out the familiar objects of the room. The large oval hid a section of the wall. It extended beyond the bow-window, and obscured it like a shutter. Now it was half-way across the client's arm-chair. He could see the left arm and side of the chair distinctly, but the right side was cut off, as with a knife, by the edge of the blue. Now the door on the left was invisible.

Next he noted a surprising change in the character of the extending blue nimbus. He had apprehended it as a pale-blue plane, as a sort of screen interposed between him and the rest of the office. Now he perceived it had depth. Gazing into it, beyond the gipsy, he saw what looked like distant hills and trees.

This new apprehension caused perplexity and something akin to pain in the lawyer's mind. A little nervously he turned his head to one side—for the blueness now filled in the whole of the area of vision in front of him; and as he turned, the edge of the blueness seemed to swing round as swiftly as his glance; and in a fraction of a second what remained of the room, visible and concrete, was swept away and obliterated. . . .

III.

He was no longer in his chair. He was seated on a fallen tree at the edge of a rough mountain track. On the opposite side of the track, leaning against a dry-stone dyke and smiling at him, was the gipsy. He was browner and ruddier than he had seen him in the street. There was, indeed, something different about him that he could not locate. Was it really the gipsy of last night, or someone strangely like him? He wore an old brown coat, with a deep crimson shirt showing below.

The blueness of the nimbus was now seen to be nothing but space and the blue sky. The track was on the summit of rising heathery ground. In the distance the landscape came into view again—a hilly district with trees.

As McTaggart looked at him the gipsy put his hand on the top of the wall and lightly vaulted over it, disappearing for the moment on the sloping, heathery ground beyond.

Curiosity, perhaps a sense of companionship, impelled him to cross the track to the primitive wall and see where the gipsy had gone. The rough heathery ground sloped steeply down to the bottom of a valley, along which a stream meandered. It was a delightful hill-country stream, its course a succession of pools and cascades. Small trees and bushes grew in profusion along the banks. Here and there were

open stretches; while at different points the stream was completely screened from view by foliage.

The gipsy was lightly bounding down the slope, his movements free and full of life, like those of an animal. An irresistible force made McTaggart leap the wall and follow him.

There flashed through his mind, for an instant only, the thought that this was a strange thing for an Edinburgh lawyer to be doing. He made a distinct effort to wrench himself free from some overmastering force that was carrying him beyond his usual self-conscious habit of reflection. He had a glimpse of the strangeness and incredibleness of the situation; but that point of view required a mental effort, and he felt the power of making it weakening. In a moment or two it had gone. He saw only the leaping figure in front of him, was conscious only of the desire to follow. He was aware also of a new zest and exhilaration. To run bounding down the heathery slope was a joy in itself.

Near the stream the gipsy had stopped, and was crouching down, watching a pool fed by the foaming water of a tiny cascade. In a moment or two McTaggart was beside him, also crouching. Through the clear amber water he could see three or four large trout lazily moving about. As they watched, one of the fish moved quickly upwards, broke the surface of the pool, and for a moment flashed in the sunlight.

The gipsy turned and looked at him. And now, lying on the ground almost within reach, he noticed a peeled wand, intended to serve as a fishing-rod, for it was ready mounted with line and the most primitive fly-hooks he had ever seen. Without anything being said, McTaggart knew the gipsy wished him to take it.

He rose with the rod in his hand. The big trout caught sight of him, and darted off downstream. What a stream it was! Vaguely, McTaggart remembered one like it that he had once fished as a boy—he could not just recall where. He had certainly never seen anything like it since. The fever of the fisherman who senses ideal conditions was upon him. Without a further thought for his companion he set off, crouching out of sight of the trout, for the next likely spot higher up the stream.

The rod was a simple one, but it served. McTaggart was soon wholly absorbed in the fishing. At the third cast he hooked a heavy, strong trout that he had to manœuvre carefully before he had it on the bank. Then, the little pool being disturbed, he moved up-stream to the next, taking one yellow beauty after another.

IV.

Once or twice he paused and reflected on this new and strange experience. But although the reasoning part of his mind tried to concentrate

on the abnormality of the situation, it was a half-hearted effort. The subconscious accepted it as quite natural.

At one point, when he stood opposite a rounded grassy hillock, where the floor of the valley widened out, he had again a sharp impression of the familiarity of his surroundings. He remembered that green mound. But he also remembered an old white house on its summit. There was no house there now, not even a fragment of ruined masonry. The grassy summit had never been levelled to make a site for a dwelling. He had a curious feeling that the house had yet to be built.

The passing of time, of which ordinarily he was always aware, was no longer present to his consciousness. He could not have told how long he had been engaged at the stream-side, or how far he had wandered. But at last he noticed that the sun had declined behind the range of hills on his left, and there were long shadows in the valley; and then he saw the gipsy, apparently waiting for him.

He gathered up the trout, a dozen beauties between half a pound and a pound, and, with a deep-seated feeling of satisfaction and content, made his way down by the stream-side. The gipsy had a couple of partridges and a hare, which he had killed by some strategy of his own; and as McTaggart approached, he turned and led on ahead.

Thus they walked in silence—there seemed no need to say anything. By-and-by they reached the point from which they had started. Farther on, the stream was joined by a tributary, which came out of a narrow, gloomy glen. The gipsy turned aside and followed the smaller stream.

A wood of fir-trees stood in the middle of the glen some distance ahead, and the stream led close beside it. A track ran between the stream and the wood. They emerged on the farther side; and there, in the shelter of the trees, were two gipsy tents, of the semicircular type, formed of canvas stretched on half-hoops. A fire was burning in front of the entrance of one of them, and a brown-skinned old gipsy woman, with keen black eyes, was attending to an iron pot slung from a tripod. She glanced at McTaggart for a moment without any sign of surprise.

McTaggart became aware of a tremendously keen hunger. His companion threw down the game; and he laid the fish beside the fur and feather. By-and-by the old woman came and took them away. He went down to the burn-side and laved his face and hands, and, returning, found the gipsy seated on a fallen tree trunk, and the old woman already serving him with a bowl filled from the steaming pot.

McTaggart seated himself a little distance away; and the old woman in turn filled a bowl and brought it to him along with a horn spoon.

The fragrant smell of the thick dark soup or stew, which contained a generous measure of the tender flesh of some kind of game, almost intoxicated him. Never had he eaten with such a fierce relish.

V.

A drowsy feeling of delicious fatigue suffused all his members. Worry, inquiry, uncertainty had completely left him in the supreme satisfaction of the moment. Not quite completely! There was still a faint element of expectancy, some undefined, unsatisfied longing.

As if in response to this subtle impression there emerged from the entrance of one of the tents the figure of a gipsy girl. Their eyes met; and in the one swift glance, it was as if their souls met too. She smiled slightly, and in her eyes he read sympathy, intelligence, a sweetness and nobility such as he had never known before in any human being. She came forward, innate grace in every movement. The gipsy stooped and kissed her hand caressingly. She glanced again, shyly, at the new-comer, and offered her hand, a strange and joyous emotion surging up within him at the contact.

For a while they sat round the fire, the old woman a silent, brooding member of the party, her face hid in her shawl. The wood and the surrounding hills sank into the blackness of night, and the red glow of the fire became brighter by contrast, throwing mysterious shadows amongst the immediate surroundings. A night bird, with a plaintive cry, flew overhead.

Almost overcome with physical weariness, McTaggart fell at length into a dreamy reverie. Emerging from his abstraction, he noticed that the two women had gone, having apparently retired into one of the tents. The gipsy rose and stretched himself, and led the way to the other, McTaggart following. They lay down on couches of dry heather; and in an instant the lawyer had sunk into a profound, dreamless sleep.

VI.

Some time later, how long he could not say, he suddenly sat up, fully awake. His companion was still asleep. He crept out into the open. Strangely exalted in spirit he stepped forward, his feet making no sound on the turf. Listening intently, he could hear the silvery tinkling voice of the stream near by.

Something made him turn and look back at the camping-place. The form of the tents showed in the diffused light, their outlines softened and uncertain. With a sudden leap of the heart he saw a figure erect and motionless in front of them.

The gipsy girl stood there in the moonlight—a symbol of gracefulness and romance from some dreamworld, that seemed to touch and thrill a chord in his being, and took him back

through the centuries. She saw him, and came forward; and he looked on her bright eyes and her face pale in the moonlight. Time ceased to exist for both of them. Hand in hand they wandered through that dreamland of beauty—where everything seemed to have an intense meaning, or to be waiting on the brink of some great secret.

He became aware of strange longings of the spirit, unfulfilled and crying out for satisfaction, and of depths of his being hitherto starved, but now revelling in sustenance.

They wandered aimlessly, with no thought but for the present. But by-and-by there came a change in the light. Dawn was approaching. They were close to the camping-ground again. Like a startled nymph of classic times, she left him and ran towards the tents. She stopped suddenly, paused, and came slowly back. He took her hands, and read pain and sadness in her eyes. Not so much by any spoken words, but as it were by a process of thought-reading, he saw the sorrow of parting and separation. How it was to come about he did not know, and neither did she; but there was no doubt about an impending catastrophe. There was also steadfastness in her eyes, and a sure message that in the future they would meet again.

VII.

It was morning, and birds were singing amongst the trees, and the whisper of a gentle breeze mingled with the murmur of water. Refreshed and renewed, McTaggart sat up on the couch of heather, to which he had returned. The gipsy was no longer there. He found him outside, moving about beside the fire which he had rekindled.

The gipsy was silent and surly. McTaggart, whose heart was so buoyant that he could have sung for sheer joy, was withheld by a new feeling of hostility which he sensed in his companion. He felt that the other was furtively watching him.

At last the gipsy rose and led the way farther up the glen, signing to McTaggart to follow. The turf was dewy. The sun, over the range of hills, shone mistily through the morning vapours. The gipsy kept on at a swinging pace. The path began to ascend, rising higher and higher above the stream. A sound of roaring water reached the ear. The path swung away from the stream-side for a little, passing through thickly growing young trees, and emerged on a rocky plateau, overlooking a deep black pool. Into the dark depths of the pool the foaming water of the stream, pouring over a steep rock high above the level of their heads, fell vertically in a thundering cascade.

It all happened in a moment. McTaggart, his senses overpowered by the tumult, was gazing at the waterfall, when he heard a girl scream behind him. He turned, and saw the

gipsy about to spring. On the edge of the plateau he struggled and fought. The gipsy's sinewy arms were pinioning him—he felt himself swaying backwards, and he knew he had lost his balance and was falling over into the abyss.

For a moment he saw the gipsy's face, insane with anger and hatred, close to him, and the blue sky beyond. Then the picture faded out. . . .

VIII.

Still breathless from his efforts, and paralysed by the fate that had confronted him, McTaggart found himself sitting in his office chair, his face damp with sweat, with the deferential clerk before him awaiting his instructions.

In front of him was a pile of letters. There was the square envelope which he had opened the previous day. He looked at the letter it had contained, and one or two others, and found he had already seen them.

A little confused, his mind half-numbed, he asked the clerk why the letters had been left lying there. The clerk mumbled something, and looked at him as if he did not understand.

'And why has the calendar not been moved forward?' McTaggart asked with an unaccustomed petulance.

The clerk glanced at the figure. 'That is to-day's date, sir—the 22nd,' he said.

McTaggart paused for a moment. 'What day is this?' he asked.

'Thursday,' said the clerk.

'Oh, very well,' observed the lawyer; 'that will do.'

'I came in to say a lady wishes to see you—Miss Finlayson.'

'Show her in,' said McTaggart, his thoughts in a strange turmoil, and trying vainly to apprehend what the clerk had said about the date.

The door opened, and a young woman in

stylish attire came into the room. He rose to receive her, then stood looking at her in speechless amazement. She was much younger than he expected—little more than a girl. Her face was of a warm brown tint, for which the Italian sun doubtless was partly responsible. She had vivacious and kindly black eyes; and the eyes and the face, the way of smiling, each indefinable gesture and movement, were those of the gipsy maid.

McTaggart had a reputation for quickness and clarity of mind, for a coolness and calmness of judgment which impressed all his clients and created a feeling of confidence in his capacity. These qualities on this occasion entirely failed him. He managed, however, to pull himself together, and talked of her uncle's affairs.

He saw her again at lunch-time, and frequently thereafter. At first she was puzzled at his manner. He showed from time to time signs of joyful satisfaction at apparently nothing at all. He frequently seemed to be watching her expectantly. She did not know that what he was looking for were those little turns and expressions in which personality lies, and which identified her at every point with the gipsy maid.

Intimate friends to whom McTaggart described his unusual experience agreed in considering it an interesting example of the faculty of the human mind—known to the ancients—of compressing into an instant of actual time impressions of apparently prolonged duration. He did not seek to disabuse them. Even the gipsy maid (who was married in due course to her late uncle's partner) so regarded the incident. But in his own mind he rejected that theory. He knew that he really lived through the incidents of that extra twenty-four hours.

This view, however, he kept to himself. It would not do for a lawyer to have it whispered about him that he was in any way peculiar. For the trusty man of business—no!

ASPHALT LAKES AND THEIR STRANGE CHARACTERISTICS.

By FEDDEN TINDALL.

AS we walk on pavements, or our cars run over roads, do we ever stop to think of the toil, the skill, the ingenuity, that have gone to their manufacture? To-day a quantity of oil asphalts, by-products of the oil refineries of Mexico and California, are in use for the roads; but a large proportion of paving is still made by the admixture of stone and sand with fifteen per cent. of asphalt.

The ancients evidently knew a good deal about its properties. Historians tell us that it was employed in the building of the Tower of

Babylon, and took the place of lime in mortar. Early travellers noticed the asphalt in the Dead Sea; and, according to Diodorus, large quantities were collected thence for the embalming of Egyptian mummies. Its use ceased altogether in the Middle Ages, but some two hundred years ago the discovery of rock deposits in France and Switzerland led to a revival. It is found in rocks of all ages, and scientists believe that it is the result of the evaporation and oxidation of petroleum. The first asphalt paving of modern days was laid at Paris in 1838.

Two strange asphalt lakes are among the marvels of the world, one in our own Trinidad and one in Venezuela. They are by far the most important sources of asphalt, and yet the two together would barely cover some large park. Trinidad Lake is about 115 acres in extent, and Bermudez Lake, Venezuela, is 1000. The former has considerably the greater depth and capacity, though it is so much smaller. It also contains more mineral matter, and is preferred for pavements.

Lying in a cup-like depression, 135 feet above sea-level, the black mound-shaped mass appears absolutely tranquil. Indeed, a visitor once remarked that it looked to him very little different from the paving in front of his own house at home. Water flows in channels and crevices, and is inhabited by a number of tiny fish, which can leap great distances from pool to pool, or live a long time on dry land. Rank grass and weeds grow in profusion, and the black mass can be walked over quite safely, though the channels swell after heavy rain so as to be practically impassable. One portion, known as the Mother of the Lake, is soft and unsafe to walk upon, as objects quickly disappear beneath the surface.

Continual complex motion is taking place amid the apparent tranquillity, and enormous holes, made when clumps of asphalt are dug out with pickaxes, fill again in a few days. For forty years work has gone on steadily, and now some 200,000 tons are removed annually, yet the level of the lake has sunk only 14 feet. Three or four years ago an attempt was made to sound its depth; but, after drilling for 150 feet, the tubes became twisted and broken, and are even now coming up in fragments at quite different parts.

Much mystery still surrounds this uncanny lake, which seems almost like a living monster, with its hidden movements. Subterranean gaseous pressure accounts for a great deal. Strange things have happened near by. In November 1911 a small island suddenly appeared south of Trinidad, and disappeared again within a few days.

There is constant drilling for oil in the neighbourhood. At one time the hope was entertained that the lake was reproducing; but now it is believed that holes fill automatically through a sifting and replacing process akin to the way in which water finds its own level. If this is so, the supply of asphalt will be exhausted one day; but it is encouraging to learn that experts estimate this calamity is not likely to occur for another four hundred years.

The General Asphalt Company of Philadelphia has been granted working concessions till 1930, paying Trinidad a minimum royalty of £10,000 a year. On rising ground overlooking the Gulf of Paria stands Brighton, a village

containing offices, refining and barrel factories, a club-house, and many white bungalows, raised on pillars as a protection against mosquitoes. On the other side of the lake, New Jersey is being completed to house some three thousand labourers.

The clumps of asphalt are carried on small cars, which run across the lake on loosely laid rails to a landing-place, where they are weighed, and then raised automatically to an overhead cable tramway, along which, in a steady stream, buckets go downhill, along the jetty, and straight on board waiting steamers. The major portion of the asphalt is refined, however—the water removed by boiling—and then shipped in barrels. On board ship great care has to be taken that those harmless-seeming blocks do not twist away the bulkheads. It is interesting to learn that many roads in devastated France have been restored with Trinidad asphalt.

The Bermudez Lake, in Venezuela, is far less accessible; the journey of forty miles up the San Juan River, and seven miles along its narrow branch, the Guanoco, can be accomplished by ocean-going vessels only if they are towed stern foremost. A narrow-gauge railway connects the town of Guanoco with the vast lake, surrounded by swamps and jungle, inhabited by many animals, including a hideous creature called the mata-mata, described as a 'cross between a turtle, an alligator, and a nightmare!'

The surface of the lake varies considerably. There are springs bubbling with gas, but large portions are covered with trees and vegetation. In parts the men have to toil up to the waist in water, picking out soft masses of asphalt almost like seaweed; in others it is so hard that blasting is necessary. In many places a man is liable to sink into sticky black mush if he tries to walk on the surface, when he can only escape by leaving the soles of his boots behind him.

The same company operates both the Trinidad and the Bermudez lakes. At one time the concession was the subject of litigation with the Venezuelan Government. It is said that an ingenious lawyer prevented judgment being given against his U.S.A. clients by falling in a fit in court. The delay gave time for documents proving the claim to arrive from a distance, and then he acknowledged that he had resorted to the schoolboy trick of simulating foaming at the mouth with soap-suds!

Asphalt is not only used in paving. The tires of many cars contain a proportion compounded with rubber and fabric. It is also valuable in damp courses, concrete floors, roofing felt, and black varnish. Experts called in to exterminate the anopheles, the malaria-bearing mosquito, at the Trinidad Lake, have found the asphalt a useful ally, mixing it with sand for covering drains, and so preventing the vegetation which nourishes the mosquito larvæ.

THE SENIOR PARTNER'S WRATH.

PART II.

v.

A MESSAGE had come from Rushworth's during Mr Maynard's absence asking to be informed concerning the decision Maynard & Co. had promised to make that day. But this decision required the authority of one of the partners, and of these two had gone home ill, so that there remained only Mr Maynard himself, who had apparently forgotten his expressed intention of calling in to see Rushworth's about it. Johnny, therefore, volunteered to try to find his father, and as Mr Maynard was not to be found at his favourite restaurant, and had said something about Ellison's, to Ellison's the unsuspecting, unwarned, unfortunate young man decided to go forthwith.

'They can tell me if he has been there, anyhow,' he thought.

The outer office was still deserted when he knocked, and he also, when he knocked again, heard a faint voice inviting him, if he were any one, to come through. This he did accordingly, and coming in his turn to a door marked 'private,' entered all unknowing and found himself in a big room he thought was empty till he perceived a mass of curls so fair as to be almost golden behind a big roll-top desk, over the top of which a pair of very bright blue eyes steadily regarded him.

'Oh, I . . . I beg your pardon,' he stammered.

'What can I do for you?' inquired a voice that was small indeed, but brisk and business-like.

'Is this Ellison's?' Johnny inquired, feeling the calamity would be unimaginable if it were not.

'This is Ellison's. I am Miss Ellison,' announced the small business-like voice. 'What can I do for you?'

'It's a little matter of business,' began Johnny, and then paused as he perceived that the blue eyes were fixed upon him with a certain attention—or not so much on him as on his head . . . his hat. He had quite forgotten to remove it when he entered, and, blushing, he hastened now to do so.

'I am so sorry—I beg your pardon—I quite forgot,' he stammered.

A stiff, cold bow announced that his apology was accepted.

'I am so awfully sorry,' he repeated, for he felt that to apologise to her was sweet indeed.

'It is of no consequence,' she answered; 'though,' she added thoughtfully, 'I cannot remember that such a thing ever happened before.'

Johnny was suitably crushed, but when he

explained that he came from Maynard & Co. her manner changed. She said it was very kind indeed of Mr Maynard to send him round so soon, and Johnny listened without moving a muscle. She added that she had just had a message over the 'phone. A chance was offered . . . she did not know whether to avail herself of it . . . she would be very grateful for a little advice and explanation. . . . And Johnny, still without moving a muscle of his face, said that that was what he was there for, and might he know the details?

And all unknowing that these things were so, Mr Maynard, senior, slowly recovering under the influence of an excellent luncheon, began to perceive that after all things were not so bad. For his trained and acute mind was beginning now to grasp the fact that while he knew that both Manners and Price had been to Ellison's, they knew nothing of his visit. Consequently . . . well . . . it rather seemed to him that on the whole he had them. His smile grew sweet and pensive as he dallied with a glass of port. Yes, he knew all about Manners and Price, and they knew nothing about him, and they would think twice before letting the story get about the City of how they treated debtors who happened to have very bright blue eyes and fair curls that were almost golden . . . and they would think three times and even four before running the risk of such a story trickling home to their wives—of this Mr Maynard was very sure, for he knew how he would feel himself if Mrs Maynard. . . .

Absorbed in these thoughts, he did not notice how long a time Johnny took that day to his lunch. But Manners and Price, when in due course, since they could not be ill for ever, they came sneaking back to the office, noticed a good deal. Their senior partner was bland, calm, dignified, but . . . well, he understood, and they soon understood, and if he had been something of an autocrat before, now a Bolshevik commissary would as soon have brooked the slightest opposition to his will.

The faintest murmur from Manners, the least protest from Price, was apt to draw a reference to the feelings of Mrs Manners and the emotions of Mrs Price if those ladies ever came to know what indulgence was shown to firms of which the chiefs happened to have blue eyes and fair curls.

'Even in the City you two would never hear the last of it,' Mr Maynard would remark musingly.

Mr Manners lost his temper, and banged his fist on the table. 'It's blackmail!' he shouted; 'neither more nor less!'

'Blackmailer!' repeated Price, glaring fiercely at their unmoved senior. 'Bloodsucker!' he hissed.

Mr Maynard beamed on them both. 'When I was small,' he mused, 'I wanted to be a pirate—and I was right if it's anything like so jolly as being a blackmailer. Oh, by the way, I shall be taking July and August for my holidays this year. You can settle between you which of you will take June and which September. Will you tell Mrs Manners and Mrs Price? Or shall I?'

Those last three words vibrated with a deadly significance, and the two junior partners crept defeated away.

VI.

'He holds us in the hollow of his hand,' sighed Mr Manners.

'We are mere slaves,' groaned Mr Price.

To such a pass indeed had things come that these two unfortunate men no longer dared to call their souls their own.

As for Mr Maynard it was his day—but even while his triumph was still sweet in his mouth, it happened that he chanced to remark in the hearing of his two partners, 'Johnny seems to take a long time to his lunch these days.'

Mr Manners was shrewd, Mr Price was acute; their desperate plight made them more shrewd and acute than ever; and a day or two later, when Mr Maynard was returning from his lunch, he was met by his two partners.

'Come this way,' said Mr Manners.

'Down this street,' said Mr Price.

It was rather like a kidnapping. They marched him along without a word of explanation, and brought him at last to the door of Ellison's.

'Hullo!' said Mr Maynard.

'Hullo indeed,' said Mr Manners sternly.

'Very much hullo,' said Mr Price.

They led him upstairs and through the outer office, always deserted at lunch-time, into the big inner room where Johnny Maynard and Miss Ellison were discussing sandwiches—and business, no doubt—at the big roll-top desk.

Johnny gasped and blinked when he saw the three partners enter. His parent gaped and stared. Miss Ellison sprang forward delightedly, and shook hands warmly with all three.

'It's simply dear of you to come,' she told them beamingly; 'and most awfully good of you,' she added to Mr Maynard, 'to send Mr John so often to help me. I can't tell you how grateful I am to you—to all of you,' she added, fearful lest she should seem to overlook the claims of any.

'You have been helping Miss Ellison, John?' inquired Mr Maynard with enforced calm.

'I've been t-t-trying t-to,' said Mr John, wondering if it were possible that a man who had seen five years of war could nevertheless be at bottom a c-c-coward.

'The greatest help,' asserted Miss Ellison. 'I shall always be grateful to Mr Price for telling me that our account being overdue didn't matter, and to Mr Manners for saying I might have that extra credit, and to Mr Maynard for coming to offer to help me, and for sending Mr John——'

'Ah!' said Mr Manners.

'Ho!' said Mr Price.

And one could almost hear the yoke that Mr Maynard had laid upon their necks fall shattered for ever to the ground.

Then Johnny, not so much brave as simply desperate, stepped forward. 'Miss Ellison and I,' he announced, 'are going to be married.'

'Oh!' protested Miss Ellison. 'I never—I only—I mean——'

Mr Maynard, a little dizzy, looked round and saw how his two partners were watching him. It was the hour of their revenge, and well they knew it.

'Quite a romance,' said Mr Manners.

'Precisely,' said Mr Price.

'The City will be interested,' said Mr Manners.

'Mrs Maynard, too,' said Mr Price.

Mr Maynard perceived very clearly that the situation was, in a manner, awkward. His trained, clear-thinking, business brain told him that at once. And he understood also that when it all came to be explained to Mrs Maynard, then the more united they all were, and the more support they gave each other, the better. In a moment his decision was taken, and with the dexterity of a conjuror he transformed himself from the taskmaster of his partners into their accomplice.

Besides, after all, the boy was bound to marry some day . . . and this Ellison child seemed to possess certain qualities . . . looks, as well . . . and pluck and determination also, besides a clear little mind of her own . . . and if Maynard and Co. took over Ellison's she would certainly not come without a dowry. . . . Yes, if they all stuck together, everything might pass off well. . . . He perceived that every one was shaking hands with every one else, and that in these ceremonies he himself was taking an active part.

'Oh, by the way,' remarked Mr Manners all at once in a very clear and distinct voice, 'Price tells me he is taking July and part of August for his holidays, so that'll leave the rest of August and September for me. You'll let us know whether you decide on June or October for yours.'

'That'll be quite all right, my dear fellows,' answered Mr Maynard.—'Johnny, you have my congratulations.' He turned to Miss Ellison. 'My dear,' he said, 'allow me . . . ' and, bending over her, he bestowed on her a paternal kiss that she gratefully returned.

The last trick remained his.

THE END.

THE MONTH: SCIENCE AND ARTS.

AN INSTRUMENT FOR STUDYING THE STARS.

AN instrument is now obtainable which should prove of great assistance to teachers and learners of astronomy, as, once certain simple adjustments have been made, the setting of a pointer to a star on a celestial globe brings the star into view in a finder. In effect the finder is an astronomical telescope of low power, but without the usual tube, the lenses being held in line by other means. Alternatively, a star may be looked at through the finder, and when it is in the centre of the field of view, the pointer will indicate its whereabouts on the celestial globe. The essential feature of the apparatus is a small globe with the stars and the constellations marked on the outside. A ring, with the end of a pointer in the centre, is held to the surface by three velvet-covered arms, which embrace it closely but yet allow of movement. Attached above this ring, and far enough to one side for the observer's head to clear the globe, is the finder. The lenses of this accessory are set on a line which is exactly parallel with a line from the centre of the globe to the end of the pointer, thereby reproducing the condition of an observer looking at the heavens from the earth. To enable the apparent rotation of the heavens to be reproduced, the globe is provided with an axis in line with the centre and the pole-star, upon which it can be rotated. At the south pole this axis projects through a bearing, and is fitted with a knurled head. A vertical flange, parallel with the bearing and below it, is clamped to a similar flange on a horizontal turntable by a screw through the centre of each. The turntable is provided with a spirit-level and a magnetic compass. These arrangements allow of quickly setting the axis to point at the pole-star. When this has been done with the turntable level, a line is cut across the two flanges which is used for setting the instrument in future when used in the same latitude. The turntable is supported on a metal tripod-stand with telescopic legs, which enable the level to be easily adjusted. An arrow on the compass-card indicates when the axis of the globe is pointing towards the north. It can be finally adjusted by the pole-star. Before any other stars can be found, the globe must be set so that the stars marked upon it coincide in position with those in the sky—i.e. if a hole were made in the globe for each star and the observer could place his eye in the centre, he would see the stars through the holes. Readers of *Chambers's Journal* will know that the apparent rotation of the stars round the earth advances each day until a complete revolution has been made in the year. This feature has to be allowed for

in setting the globe, as well as the time of day at which observations are made. The setting is carried out by moving a time-circle to the correct position against a fixed circle round the south pole of the globe marked with the months and days; then the globe is rotated until the time of day comes opposite a fixed pointer. Naturally, as the heavens appear to move towards the west, due to the rotation of the earth, this adjustment will have to be corrected at intervals. The markings of the instrument are made for observations on the meridian of Greenwich. If the instrument is used much to the east or to the west of that meridian, an allowance in time has to be made. A tiny electric torch is clipped to the finder-support over the pointer, and is lit by a torch-battery on the stand through a flexible cord. This lamp is detachable for reading the circles.

SIMPLE WIRE SUPPORTS FOR RASPBERRY CANES.

A special type of straining wire, with pieces of soft wire for tying purposes at intervals, for training raspberries, loganberries, and fruit-trees, saves much time and trouble when compared with the use of the alternative strings and raffia. Posts are erected in the line of the plants and the wires strained between them. The tying pieces closely resemble hairpins, but have several turns round the main wire at the bend. Being soft, they are easily twisted round the canes. While free to turn round for use on either side of the main wire, they are so secured that they cannot move along it, and therefore keep the canes at definite intervals. The straining wire can be bought in coils of 25, 50, or 100 yards, with wires for tying spaced 6 inches or $4\frac{1}{2}$ inches apart as desired. Being heavily galvanised, these wires last for many years.

AN ELECTRIC MOTOR FOR ANY GRAMOPHONE.

Most people will agree that the winding of a gramophone after each record is an irksome operation. A tiny electric motor is now obtainable which will turn any gramophone disc at the correct speed. The motor is carried on trunnions in a metal bracket having a rubber-shod foot. A soft rubber wheel at the bottom of the spindle, which is vertical, engages with the edge of the disc and drives it by friction. The weight of the motor holds it in position without any fixing; it simply stands against the disc. By pushing the wheel against the disc the spindle is swung to one side on the trunnions, and its tendency to hang vertically imposes a constant pressure that is enough for the friction-drive. A very ingenious device,

which works by centrifugal force, switches on the current to the motor so soon as the disc is given a preliminary swing round, while it cuts the current off when the disc is stopped. These little gramophone motors are wound for 110-volt alternating currents or for direct currents at the same pressure. For higher voltages small resistances are interposed in the circuit. The amount of current consumed is negligible, being only a trifle over $\frac{1}{100}$ of a unit. It should be noted, also, that the spring mechanism of the gramophone is not disturbed, and can be used at any time should the electric current fail. In fact, the wheels turn with the disc, and the governing device regulates the speed, just as when the mechanism is driven by the spring. The motor is connected to the nearest lamp-socket by a flexible lead and plug.

CHEAP HOME-MADE SODA-WATER.

Steel cylinders of CO₂ gas for aerating water are a stock article in the shops of almost any town. All that the householder requires for making soda-water is the apparatus for reducing the pressure of the gas and for aerating the bottles safely, the gas being compressed to a very great degree in the steel storage cylinders. A small British-made soda-water-making outfit has been recently brought out, which is contained in a folding wood cabinet with bottles and glasses. The CO₂ steel cylinder is fixed vertically to the narrow back of the cabinet. Above it is a reducing valve, a push-in valve to turn on the gas to the soda-water bottle, and a fitting for closing the mouth of the bottle and screwing in the stopper. The bottle is held in a metal guard, which is raised to fix the bottle in position for being aerated by a simple system of levers. At each side of the cabinet back is a hinged recessed door with a shelf for soda-water bottles and glasses, and a space below it for spirit bottles. These doors are opened out so as to be in line with the machine when the apparatus is in use. If folded together, the outfit can be locked up. All metal parts of the apparatus are of nickel-plated brass or phosphor bronze, and the cabinet is of polished hardwood. One 2 lb. cylinder of CO₂ will make a minimum of 400 sodas (5 oz. bottles) at a cost of $\frac{1}{2}$ d. a dozen, and at a speed of 150 bottles an hour. Large cylinders of 28 lb. and 40 lb. capacity (for use in hotels, clubs, &c.) make a minimum of 5000 and 8000 bottles respectively.

NOVELTIES IN WIRELESS AERIALS.

Many people, doubtless, have noticed aerials in the form of cylindrical cages which may occasionally be seen fixed vertically to poles in gardens or on the roofs of houses. Probably few, however, know that the conductor of these aerials is a latticework tube of fine wires, having longitudinal straight wires interlaced with them.

This design is based on the fact that the efficiency of an electrical conductor varies to some extent with the exposed surface, which is obviously far greater in this form than in a solid wire of the same weight. Some advantage is also claimed for the introduction of the straight wires, the function being to transmit, with a minimum of resistance, the waves picked up by the lattice wires. The aerial is wound diagonally between the top and the bottom rings of a galvanised-steel frame, and then brought down to the set. The wires being vertical and arranged in a circle, this type of aerial gives equally good reception from all directions. In addition to the ordinary outside aerial, two novel forms of cage aerial are made up from this special wire. One is combined with, and looks like, a lamp-shade. A range of 20 miles is claimed for this device with a two-valve set and a loud-speaker if the aerial is hung 6 feet above the set. With a height of 15 feet, which may be obtained by fixing the aerial in a room above that in which the set is placed, the distance is increased to 75 miles, while a range of 175 miles is obtained with a height of 25 feet. The other novel aerial is a rectangular cage which folds up flat for travelling. It is very suitable for picnic parties, as it can be hung on a tree. When folded, it measures 16 inches by 15 inches by 2½ inches, and the weight is 4 lb.

THE CAUSE OF CANCER.

The brilliant work of Dr Gye and Mr Barnard has revealed almost beyond the possibility of doubt the existence of a minute parasite which, given certain conditions, may invade the cells of the human body and produce the dread disease of cancer. So tiny is this microbe that it passes through the finest of filters, and cannot be discerned in ordinary light even with the most powerful microscope. But by skilful and most ingenious use of ultra-violet rays, with their short wave-lengths, Mr Barnard has made the invisible visible, and his work and that of his colleague have thus rendered *possible* a marked advance in our power of dealing with the cancer scourge. It must be borne in mind, however, that the germ appears to be dangerous only where the conditions are favourable to its operations. When brought into contact with healthy, normal cells it seems to be harmless; but let it meet with cells affected by bruises or by long-continued irritation, and it is apparently able at once to begin its deadly work. Hence there is as great need as ever to remove all causes of irritation—chronic constipation, for example, which can now be avoided by the use of pure medicinal paraffin, as recommended by Sir Arbuthnot Lane. The wearer of artificial teeth and the pipe-smoker should ever be watchful lest constant friction produce harmful effects on the mouth, and should seek medical

advice at the first sign of danger. It may be added that the work of another British scientist, Dr Percy Stocks, goes to show that the failure of the thyroid gland rightly to perform its functions is probably an important factor in the development of cancer, as well as being the *fons et origo* of goitre; while the researches of another worker in this field would appear to suggest that an excess of calcium (or lime) salts in the food, combined with a deficiency of potassium salts, produces a condition of the body favourable to the development of the cancer parasite.

A NOVEL METHOD OF PROMOTING THE GROWTH OF WOOL.

A most interesting experiment is being carried out by Professor Barker, head of the Textile Department of the Leeds University, to determine whether the growth of sheep's wool can be materially increased by the injection of a certain preparation. The idea comes from Japan, but is based upon a statement made some five years ago by a German doctor that unhealthy conditions of the hair and the nails were improved by administering to the patient a particular form of sulphur. (Sulphur, it may be observed, is an important constituent of keratin, the horny substance of which the hair and the nails are mainly composed.) Hoping that the treatment would prove a cure for alopecia, a disease which produces falling out of the hair, a Japanese professor, an authority on skin diseases, began a series of experiments in collaboration with a Japanese chemist. They at length evolved a preparation to which the name of 'Saemin' was given, and which, when injected into a vein, produced favourable results. During the course of the experiments it was observed that the treatment stimulated the growth of fur in the case of rabbits; hence the experiment to ascertain whether it will have a corresponding effect on sheep. The amount of the preparation at present in stock in this country is sufficient for only a single animal; but larger supplies will be available shortly, when experiments will be conducted on a more extensive scale. As injection into a vein of a sheep is necessarily a troublesome process, injection under the skin has been substituted. This, though slower, is said by the inventor to be effective in time. To judge from the results of the experiments on rabbits, it is deemed possible that the wool will become coarser in fibre as well as more abundant, but in view of the American demand for coarse carpet wools this may prove not an unmixed evil.

A RARE QUADRUPED.

'There are more things in heaven and in earth than are dreamt of in our philosophy' is the expression that instinctively springs to

one's lips as one reads the fascinating account of the páca-rána given by Dr James Ritchie, the keeper of the Natural History Department of the Royal Scottish Museum in Edinburgh, in the pages of the *Scotsman*. This elusive quadruped was quite unknown to man—civilised and uncivilised alike—until the year 1873, when a stray specimen was killed in the courtyard of a house in Peru. It was not until thirty-one years later that the animal was again seen, when a living pair were sent in a cage to the keeper of the museum at Para, near the mouth of the Amazon. Living specimens have since been obtained for the Zoological Societies of New York and London, and a páca-rána has now found its last resting-place in the museum at Edinburgh. This rare creature is thought to dwell 'on the eastern slopes and tablelands of the Bolivian and Peruvian foothills bordering on Brazil.' For a rodent it is unusually large in size, measuring about 3 feet from the tip of the nose to the tip of the tail, and standing about 10 inches high at the hind-quarters. It derives its name, the páca-rána, or 'false páca,' to its resemblance in colour to the true páca of South America, from which it differs, however, in its well-developed tail, the absence of cheek-pouches, the full development of all the toes, and the wider chest. The páca-rána appears to be of a gentle, phlegmatic disposition, never biting, rarely growling, and moving 'with a ponderous, waddling gait, even when food is the objective. These animals are prodigious eaters, devouring fruits, tree and fern roots, and bread; and almost invariably they sit upright in a squirrel-like attitude as they eat, holding the food in their fore-paws and gouging out large chips with their chisel-like teeth.' It is suggested that the páca-rána is so seldom seen because it finds safety in obscurity; it may be, however, that it is really as rare as it appears to be, and is another illustration of the 'weak going to the wall.'

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (a) a reply post-card, or (b) a stamped and addressed envelope or post-card, be sent to the Editor, *Chambers's Journal*, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

*. * TO CONTRIBUTORS.

All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

For its return in case of ineligibility, a stamped and directed envelope (or postage-stamps) should accompany every manuscript.

To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them in FULL.

[ALL RIGHTS RESERVED.]

Chambers's Journal

SEVENTH SERIES

THE LABYRINTH.

By LEWIS SPENCE.

PART I.

I.

THE spiriting away of Ilario Cavalcanti, whom all the world knows as the most illustrious of Italy's younger poet-patriots, agitated Roman society to its depths, electrifying its masculine ingredients, and constraining great ladies to a fashionable and æsthetic woe. The salons were inconsolable. Rome raved because its demigod had been caught up like Ganymede in an Olympian wind and whirled beyond the radius of its worship. But on all sides there was ready and tacit agreement that no political significance attached to this evanishment. Cavalcanti, the harp of Young Italy, was indeed one of the Government's most precious assets, and that his removal might have been contrived by such negligible opposition to its victorious policy as exists never occurred to even the most suspicious.

Nor were there adequate grounds for connecting the affair with a personal grudge or with those fugitive or suicidal tendencies which frequently complicate poetic destinies. No man was more ardently in love with life than Cavalcanti. Moreover, his disappearance had taken place in a moment of triumph, and at Ancona of all places, the city where his lyrical eloquence found its most powerful and popular echoes.

As I perused the reports of his disappearance I recalled Cavalcanti as I had known him at Tunis. He had spent six months amid the ruins of Carthage while composing his great epic on 'Regulus,' what time I separated its lone and level sands in search of the vestiges of Punic splendour. I called to mind his fervencies, his astounding gift of vehement rhetoric, the romantic cast of the Roman face with the deep olive tingeing cheek and brow, the tumbling cascade of jet-black hair, the visionary gray eyes. I had known him almost intimately, so well, indeed, that in the frank manner of the Latin, which never fails to fray the edges of our Britannic reserve, he had confided to me the hectic and tangled circumstances of a score of personal romances which I did not in the least desire to hear, and to which I listened with

something less than frigid politeness. When I informed him that I had no similar confidences to exchange, he was not only incredulous but a little hurt. All the same, I think that he was drawn to me, as I to him, by the queer law which governs the attraction of opposites.

So when I read that he had disappeared like a puff of cigarette smoke after his evening of coruscation at the theatre at Ancona, I felt as keenly thrilled as anyone in Rome by the sense of mystery which surrounded this extraordinary obliteration. At the moment I was at a loose end. My digging in the Campagna was finished for the season, and I most emphatically did not wish to return to a London of raw October days. Why not amuse myself with a closer study of the drama which was convulsing Italy? The impulse was, I admit, a rather obviously Britannic one. Mystery, I believe, is the biggest ingredient in our national instinct for romance. Let us call it curiosity, or love of hazard, or what we like, nevertheless it is something deeper than a base hankering after thrills, it is finer than a genius for mere meddling. The idea seized upon me, batted upon me, so that I was no longer Aubrey Wyatt, F.S.A., as I had hitherto known that person, but for many days a restless, prying, pursuing Someone Else, the slave and creature of clues and charts, a prentice builder of evidence, and, at long last, a walker in a labyrinth such as even few F.S.A.'s have ever groped in.

And that explains why, three days after the disappearance of Cavalcanti, I found myself in the great Adriatic seaport of Ancona, that white town where swart shipmen swarm and the speech of sea is heard on every side.

II.

I put up at the hotel where Cavalcanti had been staying, and next morning after breakfast handed in my card to the Chief of Police.

He was courteous, but preoccupied. Nevertheless I wrung from his rather detached communication more actual information than I had gleaned from the somewhat garbled accounts which had appeared in the Roman Press. Briefly, his account of the affair was as follows: At the close of his address in the theatre Cavalcanti

had left it by way of the stage-door and had entered his closed car alone, surrounded by a cheering and enthusiastic crowd of patriots, who hitched a rope to the vehicle and drew their idol through the principal streets to his hotel. On alighting there, as the mob in its enthusiasm threatened to overflow into the establishment, Cavalcanti had rushed into the hall and had excitedly urged his valet Eligio, who was there to receive him, to hold back the human stream while he gained the privacy of his apartments. This the man succeeded in doing after a lively skirmish with the leading files of his master's admirers. He then returned to Cavalcanti's rooms to minister to his comfort, but nowhere was the orator of the evening to be found.

At first Eligio attached no importance to what he took to be a temporary absence. It occurred to him at first that his master might be enjoying a bath after his extraordinary efforts. But when he found the loose black cloak which the poet usually affected out of doors lying on the floor of the bedroom his suspicions were aroused. He recalled, too, that Cavalcanti had been wearing gloves, a thing unknown in all his experience of him. Growing more and more uneasy, he at last went to the manager with his fears. A hue and cry followed. The police were communicated with, and official investigations were immediately set on foot.

The first disquieting circumstance discovered by the police was that a lady had called at the theatre before the commencement of Cavalcanti's address, and had requested an interview with him. She was heavily veiled, and had handed a sealed envelope to the commissionaire on duty at the stage-door. On reading this Cavalcanti seemed at first annoyed, but had ordered the man to show her into one of the anterooms, where he presently joined her. Lingerings outside, the attendant heard what seemed to be a rather heated argument leap suddenly into the turmoil of a furious quarrel, but as Cavalcanti and the lady spoke, or rather shouted, in French, he could throw no light on the subject of their disagreement. Shortly afterwards the lady left the theatre, evidently in a violent state of agitation. The commissionaire described her as fairly tall and as a 'fine figure of a woman,' to translate the Italian equivalent of our Victorian phrase. But he had not caught a single glimpse of her face, which, in spite of what seemed overpowering excitement, she kept scrupulously hidden.

But this was not all. The police had discovered that shortly after Cavalcanti and his cheering supporters had set out on their homeward journey a second closed car had driven up to the stage-door of the theatre, the vicinity of which was now practically deserted except for one or two incurious loungers. Into this there tumbled, almost in a bunch, four men, one of whom was evidently in an

advanced state of intoxication, as the others well-nigh carried him. Regarding the general appearance of this party none of the few onlookers could give any definite description. Scarcely had they entered it so precipitately than the car dashed forward, and, making off at high speed, it was soon lost to view among the network of by-streets which surround the theatre.

From all this the police concluded that someone had impersonated Cavalcanti, had ridden alone in triumphal procession in the closed car provided for the poet to his hotel, and after proceeding to his apartments and casting off the disguise, the heavy cloak, and probably the short false beard which had aided him in his impersonation of the Maestro, had made his way out of the hotel by the servants' entrance.

The theory was that Cavalcanti had been lured by some means into the anteroom which adjoined his private retiring-room at the theatre. His abductors, who must have entered by a side door, had then probably pounced upon him, reduced him to a state of semi-consciousness by means of chloroform or a blow on the head, and had removed him by way of the corridor to another apartment, where he was kept while his 'double' quitted the theatre with the crowd at his heels. Once they had the 'double' well on the way Cavalcanti had been hustled out of the place into the waiting car and hurried off—whither?

All this convinced me that the Chief of Police believed the veiled woman to be primarily responsible for Cavalcanti's disappearance. I concurred, especially in view of what I knew of the popular idol. I considered it more than probable that one of the numerous society women with whom he had dallied had resolved to avenge herself by reversing the rôles of the sexes, and had spirited away my all-too-gallant acquaintance.

III.

Seated in my apartment I reviewed the evidence, such as it was. Looking at it roughly, it seemed to me that two salient points appeared rather obviously to hold out the possibility of clues: these were the identity of the lady who had interviewed Cavalcanti, and the destination of the car in which he had been carried off. The first I considered the more likely to repay immediate attention. Doubtless the police had already followed the slender clue which showed upon the path, but I was in this for my own diversion, and would employ my own methods. Of course I might easily exaggerate the importance which seemed to attach to the incident of the lady caller. She might have been a journalist—only as a general rule newspaper women are scarcely partial to thick face-coverings. Recalling those Carthaginian nights, I felt I could not attach too much significance to the theory of feminine intervention; so I

resolved, as an initial step, to discover if possible the identity of Cavalcanti's veiled caller.

Strolling down to the theatre—a blossom of marble in a lake of olive-green garden—I sought out the commissionaire who had admitted the mysterious incognita, and at the cost of a few lire aroused him to fluency. The lady, he said, had arrived on foot. She was, however, handsomely dressed, but in black—deep black, as if she were in mourning. In handing him the note to take to Cavalcanti she had tipped him generously—for a woman—out of a well-filled purse-bag. Had he noticed anything unusual about her? Yes, several things. In the first place—the signor would pardon him—she was a foreigner, and her Italian was ‘infantile.’ There was something else. The envelope she had given him to take to Cavalcanti had strange letters on the flap, ‘the kind of letters used in Greece.’ She wasn’t a Greek, however. He knew a Greek, male or female, when he saw one. Yes, he had waited outside the door of the anteroom while she had been speaking to Cavalcanti, but not as an eaves-dropper, the signor would comprehend—merely to show the lady out when the interview was over. Indeed, he could not understand a word they said. He heard them both speaking loudly. The lady was evidently furious, but the Signor Cavalcanti had not been angry. He seemed to be pleading with the lady. But she! By the body of Bacchus, she was angry enough—as angry as a queen!

As I strolled back to my hotel I felt sure of one thing—the woman of mystery was probably a Russian. The presence of ‘the kind of letters they use in Greece’ on the back of the envelope she had handed to the commissionaire seemed to place her Muscovite origin almost beyond a doubt.

Acting upon this suspicion, I at once despatched a lengthy telegram to a common acquaintance in Rome, asking him to send me the name of any Russian lady with whom he had known Cavalcanti to be friendly, and to favour me, if possible, with a photograph of her. Two days later I received a brief reply that Cavalcanti had not been friendly with any Russian lady, so far as he was aware. He had been at some pains to avoid one, however, a certain Mlle. Natalie Nordiska, whose name would be known to me as that of a celebrated dancer. As I probably knew, Cavalcanti, strangely enough, detested the terpsichorean art and all its votaries, especially if of Russian origin, for to them he attached the odium of having brought about the downfall of the Czarist régime. He had appeared to hold Mlle. Nordiska in especial dislike. It was an odd business altogether, for, as I should see from the enclosed photograph, she was exceedingly beautiful.

In the photograph which accompanied the

letter she was not alone. The picture had evidently not been a personal gift to my friend, but was of the kind which can be purchased at any kiosk. It showed Natalie Nordiska in a terpsichorean pose along with her dancing-partner, a Spaniard, Alfonso Valles. This young fellow had been the rage, and had achieved even a greater celebrity than Natalie. I had never seen a portrait of either, but to my mind there was something oddly reminiscent about the man's face, especially the eyes and brows. He strongly resembled someone I knew well. Who could it be? Ah, now I had it—Cavalcanti! Cavalcanti, of course! The upper part of Valles's face was so like that of Cavalcanti that, did he wear a beard—ah ha! so this was the man who had impersonated Cavalcanti? And it was Natalie Nordiska who, piqued at his neglect of her, had carried him off by force!

At first this partial solution of the mystery seemed to me much too simple to approach probability. If I had hit upon the truth, why had the police not arrived at the same conclusion? The manner in which I had discovered the delinquents had been so ridiculously easy that I felt sure anyone of average intelligence could have hit upon it. They must be duffers, these Anconan police! I would not come to the assistance of such inefficiency. Had I only known that they had been aware of all this for days previous to my ‘discovery,’ and had I foreseen into what my confounded meddlesomeness would eventually precipitate me, I should then and there have abandoned my investigations.

But satisfied—much too satisfied—with the ‘progress’ I had made, I turned to the second horn of the problem. What was the destination of the car in which Cavalcanti had been carried off?

IV.

This, I recognised at once, was a poser much more ticklish than that I had just grappled with. The car had made off in a northerly direction. For the whole length of the coast of the Marches, in which Ancona is situated, the overwhelming Apennines fringe the sea at an average distance from it of about five miles. Thus few inland roads lead from the main coastal track. Had Cavalcanti been taken to some secluded valley on the slope of the Apennines and hidden away there?

From the first this appeared to me unlikely. The mountains, once infested by brigands, were now, through the activities of that most efficient force the Bersaglieri, as open to ordinary traffic as any county in England, and inquiry in the proper quarters speedily assured me that there was little chance of secreting anyone in the hill country in these times.

If my conclusions were correct, there remained only the coast. That did not seem to offer any

better chances for the concealment of a kidnapped person. No one, it seemed to me, could for more than a few days be hidden away on the village-crowded shores of the Adriatic. Nor could I believe that Cavalcanti's captors had taken him abroad. The sea! Was it possible that he had been hustled on board a yacht and transported to some far distant place? I knew that the scrutiny exercised over all in-going and departing craft on the Italian coast was particularly rigid. The risk would be too great, and, in any case, the police had a full record of all maritime comings and goings.

But the obvious thing to do was to try to trace the car as far as possible on its journey, so I hired a small two-seater and steered northwards along the great coastal road.

I had not the slightest clue as to the make or appearance of the car in which Cavalcanti had been whisked away. All I could glean from the few loafers who had seen it leave the stage-door was that it was a 'big' car, evidently very powerful, and painted a dark colour. It was unlikely that Natalie Nordiska would have used her own car for such a purpose. She had probably hired one. On the other hand, it was improbable that she could have engaged such a car anywhere else in the vicinity than at Ancona. But inquiries I had made before starting made it certain that no car of the kind

had been hired out in the town on the night in question.

My progress was necessarily slow. I halted at every village, at every cluster of houses almost, on the long, white road overhung by the tints of autumn. But all to no purpose. The livelong day, with the gentle sighing of the Adriatic in my ears, I sped north-westwards. At Sinigaglia and Fano no car of the kind had been seen on the night of Cavalcanti's disappearance at an hour which would have allowed of its leaving Ancona at about 10.30 P.M. At length I came to Pesaro, after a run of nearly forty miles, where I refreshed myself, and, utterly wearied out by the thoroughgoing manner in which I had pursued my quest, went to bed and to sleep.

Next morning I was up betimes, and on the road back to Ancona, immensely discouraged. But it was not till after I had passed Fano on my southward way that I stumbled upon a piece of information of the value of which I was dubious at first.

I am one of those people whose knowledge of cars is confined to the business of driving them. My ignorance of their inward mysteries is an abiding reproach to me, so when my two-seater began to misbehave, I alighted at a wayside blacksmith's to have it seen to.

(Continued on page 709.)

ANNE OF DENMARK.

By E. MARSHALL.

1.

THE political position of Anne of Denmark was more important than that of any preceding queen-consort of England, for she was the wife of the first monarch who reigned over all the British Isles—James I. Before, however, she attained this dignity, she had presided for fourteen years over the court of Scotland.

Anne was the second child of Frederick II. of Denmark and Sophia of Mecklenburg. The king was the richest prince in the north of Europe, and both he and the queen bore a high character among the Protestants for their many domestic virtues. The princess was born at Skanderborg on December 12, 1574. Though she was extremely well made, and in after years was famous for (and very proud of) her graceful dancing, she could not walk alone till she was ten years old. She was educated as a zealous Protestant of the Lutheran creed, and, as she had a rich dowry, her hand was eagerly sought in marriage by many suitors. There had for many years been talk of a marriage between Anne and James Stuart; but Queen Elizabeth always opposed the match, because the Danish king had exerted himself to clear Mary Stuart's name from

the accusation of having connived at the murder of Darnley by her third husband, Bothwell. As, however, in 1587 the King of Denmark intimated that he would seize the Orkneys and Shetlands (which had been pawned to an earlier Stuart king) if his daughter were still slighted, negotiations were resumed, for the Scots had a shrewd idea that the Princess Anne would bring a rich 'tocher' (dowry) with her. James accordingly sent his old schoolmaster, Peter Young, to make all needful inquiries, and prepare for a speedy wedding. He returned to Scotland with the news that King Frederick was dead, and so Anne had lost the rank of daughter of a reigning monarch; but he also brought a miniature of the princess, showing her to be a very pretty girl. This fact seems to have had great weight with James, for without loss of time he despatched several Scottish nobles, with the Earl Marischal of Scotland to be his proxy. The earl, therefore, acted the part of bridegroom for his royal master, and received Anne's hand in marriage at the strong fortress of Kronenborg on the Sound.

A great fleet was prepared to carry the young Queen of Scotland to her future home, but it encountered three terrible storms, which were

attributed to witchcraft, and which drove the ship carrying Anne into a Norwegian sound. News of this disaster reached Scotland in a roundabout way, and James at once decided to go himself to fetch his bride, so that she might be spared the discomfort of a long winter in the north. An autumn voyage over stormy seas must have been a great ordeal to one of so timid a nature as James's was, and it is much to his credit that he undertook it. He landed safely, and was married to Anne the day after his arrival in the little parish church of Upslo in 1589. (Upslo was the site of Christiania, now Oslo, the modern capital of Norway, which was built by Anne's brother, Christian IV.) The day after the wedding James gave Anne as his 'marrying gift' the palaces of Dunfermline and Falkland. The royal pair were obliged to spend the greater part of the winter at Upslo, but when milder weather came they paid a visit to Anne's mother at Copenhagen. There they were married over again, Lutheran fashion, and so many festivities were provided for their amusement that their stay at the Danish court lasted till April 1590.

II.

The king and queen met with a warm welcome when they arrived in Edinburgh on May Day, and James immediately turned his thoughts to the celebration of his wife's coronation, borrowing for the occasion from his nobles silver spoons and a pair of silk stockings for his own use. The loyal citizens gave her a casket of jewels worth 20,000 crowns. Anne took great pleasure in her palace of Dunfermline, and, though only sixteen, insisted on economy being practised in every department of her new home, which she fashioned on the pattern of the Danish court. We are told that she astonished the officials by her 'marvellous gravity.'

Queen Anne's first child, a son, was born at Stirling in 1594; he was called Henry Frederick after his two grandfathers. The queen's distress was very great when she found that according to Scottish law the heir to the throne should be brought up in Stirling Castle under the guardianship of the Earl and Countess of Mar. In vain she pleaded for the possession of her new home, and when she failed she declared herself the enemy of the Mar family, and made several efforts to have her baby restored to her by force.

The next child was Elizabeth, and then came Margaret, who died in infancy. For these princesses King James wrote an order for 'mutches of laines' (flannel nightcaps), 'four stools for the rockers,' 'ane birst to stroke their hair with, and two babies (dolls) for them to play with.'

The second son, Charles, was born on November 19, 1600. He was so weak that he was baptised immediately, as his death was hourly expected. The number 19 occurs very frequently in this Stuart family—James was born

on June 19; he first saw his wife on November 19; Prince Henry was born on February 19, Princess Elizabeth on August 19, and Prince Charles on November 19.

There was yet another son, born in 1601, who lived to have a grand christening, and to receive the name of his famous ancestor, Robert Bruce. He is generally called the queen's 'dearest bairn.' Several quaint entries in the household accounts are found concerning this little prince, ending with 'ane kist of aiken timber to lay duke Robert in after his death.'

Early in 1603 King James entered into possession of the realms of England and Ireland. He decided to go to London alone, and when one remembers how fatal England had been to his ancestors, it shows unexpected courage in the otherwise timid king, as well as affectionate consideration for his wife and children to save them from possible risks. Accordingly, the queen was left behind, and Prince Henry remained at Stirling with the Countess of Mar. Before leaving Scotland James wrote a long letter of good advice to his son, and dedicated to him a book he had written, called 'Basilicon Doron.'

No sooner had the king gone than Anne set off for Stirling and demanded the surrender of her boy, but the old countess was true to her trust, and stoutly refused to give him up. This so enraged the queen that she gave way to violent bursts of temper, and it required many letters from James, beginning 'My heart,' to pacify her, and in the end he had to consent to the two elder children coming to England with their mother. Having been once successful in getting her own way, we find Anne occasionally becoming very perverse, and the obstinate fit continued till she had gained her point.

III.

Queen Anne left Scotland in June 1603, and at all the resting-places on the way to London she was received with great honour, and fêtes were held on a lavish scale. She was specially pleased with one called 'The Masque of Fairies,' written by Ben Jonson. The queen did not make a very favourable impression on her new subjects, for she slighted all the stately old dames of Elizabeth's court, and bestowed her favour on young, sprightly women of her own age. She held her first court at Windsor, at the same time as Prince Henry was knighted, that ceremony taking place at a solemn Chapter of the Order of the Garter. At her coronation Anne gave great offence by refusing to receive the Holy Communion according to the rites of the Church of England. An income of £6376 was settled on her, and her private residence in London was Somerset House. The plague was raging so badly in the capital that the court removed to Winchester Palace, and there the long autumn evenings were enlivened

by playing at various games. The favourites seem to have been a series bearing the quaint titles of 'Rise, pig, and go!' 'I pray, my lord, give me a course in your park,' and 'Fire!'

Little Prince Charles was soon sent for, and he was placed in the care of Lady Carey, under whose sensible management by degrees he outgrew the tendency he had to deformity, and became a healthy boy. Two more children were born after Anne came to England, both of whom died as babies. Their names were Mary and Sophia. The pathetic monument of an infant asleep in a cradle still marks the resting-place of the latter little princess in Westminster Abbey.

Much of Queen Anne's time was taken up with entertaining the famous foreigners who came to congratulate their Majesties on their accession to the English throne. Amongst them we find Sully, the great minister of Henri IV., King Christian of Denmark and Ulric of Holstein, the queen's brothers, and the Spanish ambassador. For these guests splendid masques and revels were enacted, the most famous of them celebrating the day when Prince Henry became Prince of Wales. There was also the stately court mourning for that prince, whose early death in 1612 was a lifelong sorrow to his parents; for a time, indeed, they were 'beside themselves with grief.' The marriage of Elizabeth to the Prince Palatine left James and Anne with only one child, Prince Charles, who was his father's favourite. The queen never loved him with the same warmth as her eldest son, and she is said to have predicted that he would live to 'plague three kingdoms by his wilfulness.'

IV.

One of Queen Anne's extravagances was having her portrait painted by all the great artists of the time. In one of these she wears a curious hunting-dress, and her dogs are introduced into the picture. They are greyhounds, and a very small one is sitting up begging. She had a negro groom, and generally rode a fat gray steed, with a long cream-coloured mane. Sometimes, when hunting, the queen took a crossbow in her hand to shoot the deer, and one day by mistake she killed the king's beloved dog, 'Jewel' or 'Jowler.' At first James was very angry, but, seeing his wife's distress, he told her 'not to be concerned, for it was an accident, and

he should never love her the less.' The next day he sent her a jewel worth £2000, pretending it was a legacy from his dear, dead dog.

The queen did all she could to save Sir Walter Raleigh from the block. She wrote many letters to the king's favourite, 'Steenie,' the Duke of Buckingham, asking him to intercede for him with James. These letters generally begin with the curious mode of address, 'My kind dog.'

When the king was absent in Scotland, Anne made progresses to Bath, Bristol, and Salisbury, and also spent many weeks at her hunting-lodge, Theobald's Park, in Essex. In London she liked to hold her court at Greenwich, and on one of her visits there she patronised a breaking-up party at a large boarding-school for young gentlewomen at Lady's Hill, near Deptford. Of course a masque was acted, and this was followed by a concert, and then the girls performed three dances, in which they arranged themselves so as to form the name Anna Regina. In a second dance they formed the words Jacobus Rex and Carolus P. in compliment to the king and Prince Charles. After these entertainments they brought to the queen gifts of their own needlework, patterns of acorns and rosemary, the initial letter of these being the same as Her Majesty's—Anna Regina. The queen had some god-daughters at this school. This is the earliest mention of a girls' school in history; up till the Reformation girls were educated by the nuns in the convents.

In 1617 Anne's health began to fail; she had gout first, and often complained of pain in her fingers in writing to the king. James was very anxious about her; he often urged her to make a will, but she would not do this till she was actually on her death-bed. She died at Hampton Court in April 1619. Her body was brought by water to Somerset House, and buried in Westminster Abbey. She was deeply mourned by James, who survived her for six years. He wrote an epitaph upon her containing an allusion to a comet which was supposed to forebode her death. The elaborate composition bears witness to the love James had for the Danish lady whom he had made his wife, and many of the minor poets of the day testified to her virtues in tributes in verse—'To the memory of Anna Regina.'

SHOPPING IN PEKING.

By GRACE L. MORROW.

IN no other city of the world can be found such a superb shopping centre as in Peking!

Leaving the modern 'Legation Quarter' behind, the ricksha coolies amble steadily down the wide dusty roads which do duty for streets in the Tartar capital, through the Ch'ien Men

Gate and Tartar Wall, into Great Ch'ien Men Street, where the pulse of Chinese life throbs steadily, and China goes indifferent to the foreign devil, though far from indifferent to his purse.

Here is the great shopping centre of Peking.

To the right and left stretches a maze of narrow lanes with flowery names denoting the speciality of the shops therein—Jade Street, Silver Street, Embroidery Street, and Lantern Street, with its shop signs of huge red lanterns.

Porcelains and silks can be had in the Great Ch'ien Men. Furs, too, are in great demand, as Peking is very cold in winter. Sable, minx, chinchilla, otter, ermine, arctic fox, mongolian dog, seals, astrachan, and larger skins like wolf and bear, can be purchased very cheaply, but must be disinfected before using. Many a case of smallpox is traced to this omission!

Embroidery Street! who could imagine that behind those little doors in windowless walls are shops containing such gorgeous garments? Penetrating through many little courtyards, we found them. Long-coated, black-satin-capped Chinese men unrolled Mandarin coats stiff with gold embroidery. On the quality of the embroidery and the history of the coat depends the price demanded. If the coat is faced with 'Imperial yellow,' much more is asked; and 'Peking stitch,' which is like tiny French knots, is valued.

Old embroidered garments come on the market through deaths or great poverty in families. But in some cases the embroidery has been cut off from worn-out clothes, and glued or stitched on to new material. Modern embroideries are produced in many districts all over the country, each district having its own special designs and colouring. 'Fakes' are made by cutting out and stitching on designs from European ribbons.

In Jade Street we found shops with glass windows! Rare in the Far East. Here, behind strong iron grilles, were displayed many valuables: pearls, carved ivories, ambers, carved amethysts, and exquisite jewel jade, in many forms and colours.

Among the Chinese shopkeepers much courtesy and quaint humour are found. They waste much time in bargaining; but if the buyer shows a real appreciation and love of good work, then the inner shrine is opened and rare treasures are displayed, for which a very high price is expected.

Bargaining concluded, tea is always offered, and it would be discourteous to refuse. Clad in black satin trousers under her short coat, a woman enters with fragile handleless cups of fragrant 'flower tea,' which she hands round on a red lacquered tray. If a second cup is asked for, pleasure is shown, and 'Missie's' wants are supplied with a smile.

On leaving one shop, customers are accosted by all the neighbouring merchants with urgent invitations to enter theirs. 'Will Missie not come? Look-see! No need buy.' But, of course, once in 'Missie' always does buy something, and, if rash enough to leave her name and address, is never safe from invasion in

the privacy of her bedroom. A knock comes to her door, and without waiting for a reply, in walks a Chinese merchant, followed by an assistant with a bundle, which he at once proceeds to unroll. If discovered in selling a 'fake' he will always give back the money, or substitute a genuine article. It is 'up to' the buyer to know the difference!

A long run by ricksha is out to 'Tiffany's,' owned by a six-foot Chinese, who so delighted the New York 'Tiffany' by his artistic taste that he allowed him to have his name printed on business cards. And huge Chinese Tiffany was a great favourite at the U.S.A. Legation.

In the Lu-li-Chiang is the greatest curio district in the world. Here many treasures of a less expensive order can be unearthed—Peking snuff-bottles, kingfisher feather articles, sets of ivory chop-sticks, ladies' shoes for 'bound feet,' painted fish-bowls, enamelled buttons in sets, coolie waterpipes, and mandarin chains with filigree beads carved in camel-bone, enamelled silver balls, and rank insignia intact.

We, somewhat rashly, visited a Chinese fair. Lung-fu-Ssu is held on six days a month. Leaving our rickshas outside, we jostled in crowded alleys, between stalls piled up with brasses, bronzes, household utensils, and potteries of lovely shape and colour. Tiny birds, *painted* every colour of the rainbow, were for sale; also salmon-pink geese, and pigs with long black hair.

Many Manchu ladies were buying pearls and amber. The Manchus with their vividly painted magenta cheeks, tall-boarded, black satin head-dress, and long silk coats, are easily distinguished from the Chinese women in the wide trousers and short coats, with uncovered sleek black hair.

But the dense crowds and the terrible diseases! Red and fresh smallpox marks on the surrounding faces make Lung-fu-Ssu, however interesting, unpopular with foreigners. Ragged beggars displayed loathsome sores; one woman's head was tied with a scarlet handkerchief, over which her scalp was bulging. We soon had seen enough, and begged our guide to take us out; but, thoroughly enjoying himself, he took us through many densely crowded alleys before we saw the last of Lung-fu-Ssu.

As our rickshas carried us homeward, we looked into the provision shops of Peking—rows of terra-cotta varnished ducks for sale, entrails, and dried octopus, baskets of grains, and bulbs like rotten tulips! Bits of sugarcane, lotus root, and bamboo shoots, bottles of sticky confectionery, sugared melon seeds, and many mysterious things floating in highly-coloured syrups.

When the sunset died from the sky our ricksha boys lit their brass lanterns, and ahead loomed the Tartar Wall with its mediæval watch-towers silhouetted darkly against the

fading opal of the afterglow. At the street food-stalls the evening trade was now in full swing. The Chinese love fried pasty things, and street cooks rolled out bean cakes and mixed dough-nuts, while cauldrons of frying fat were smoking. Hungry, homeless coolies clustered round the stalls. Where the wide roads, which intersect Peking with almost the regularity of an American city, cross at right angles, what noise, what dust and confusion! Hundreds of ricksha

coolies yelling as they try to avoid collisions, and now and then the brazen 'honk-honk' of modern autos, adds to the din.

But, safely back in our large modern hotel—'replete with every modern convenience'—surrounded by the smartest of cosmopolitan society from the Legations, jazzing, and drinking cocktails in true up-to-date luxury, soon we forgot poverty-stricken China and our fatigues from 'Shopping in Peking.'

AFRICAN SILHOUETTES.

II.—PAULO THE BUTLER.

By C. M. M. PATERSON.

MUCH, one hopes, will in the problematic future life to which we are all travelling be forgiven those who have amused others, and lightened by their sayings and doings weary hours in our present pilgrimage.

If this confidence in the pardon for many transgressions of the cheery ones on earth materialises, then my 'boy,' Paulo Oloyich, will assuredly find himself among the blessed, for he has tickled his Bwana's¹ sense of humour, given many hours of amusement, and often sent him off laughing to the trivial round, the common task, on those happily rare days when isolation on a Central African farm, miles from any other white man, has been almost overpowering. Six feet two in bare feet, and ebony-black is Paulo, with perfect teeth set in a gargantuan mouth, and a look of radiant innocent happiness in the big brown eyes, such as one sees sometimes in the faces of little children—and his laugh can be heard half a mile away!

Besides this attractive roar he possesses other virtues, for he can bake excellent bread, and roast venison as well as any cook at the 'Ritz'; and during all the years which have slipped away since first I made my home in Africa, he has ministered to my bodily needs, with much the same tender solicitude that a mother or a devoted nurse gives to a helpless imbecile child!

Paulo was introduced to me by the 'boy' of a friend, who gave me kind hospitality during the opening weeks of sojourn in a strange land.

'He is good "boy," master,' said Paulo's presenter, 'though to-day he has no knowledge of the curious ways of Wazungu,² or the method of cooking the odd food which they eat; but leave him with me a week, and I will teach him—everything!'

In so far as efficiency went, it was not a first-rate character. Paulo, however, seemed

to consider his friend's speech quite the drollest one he had ever heard, for at the end thereof his huge carcass shook with a roar of laughter. Such an infectious timbre there was, too, about that laughter that, helped by the sight of the rascal's cheery countenance, my decision was quickly made—incapable or not, this big nigger must be attached somewhere near by, that I might hear that roar of mirth again, and catch a glimpse of his genial black face.

II.

The guaranteed week's tuition produced wonderful results. Shaving water, boiling hot, was ready at the desired moment. Boots were cleaned daily, and pyjamas folded decently when morning came, and laid under the pillow. Paulo had even mastered the complicated order in which knives, forks, and spoons repose on the table before one begins a meal, though to this day such disposition cannot be hurriedly accomplished—it still requires time and thought!

Into all the daily ordinary ways of the white man he had certainly been rapidly initiated, but to diagnose the reason of any uncommon want or action he was, and often still is, incapable.

Several weeks after this quaint character had entered my service a violent attack of malaria—cursed legacy from the Salonika front—assailed me. Shivering over the fire one evening, at moments shaking the chair on which I was seated with the violence of my paroxysms, at others lying back exhausted, with a dry, burning flame devouring my skin, totally unable to swallow any dinner, I was the object of much commiseration to my faithful servant.

'Paulo,' I remarked at length, 'bed is the only place when one is like this—bed, and warm blankets; and,' I murmured, as he slid past to lay out my pyjamas—'a hot-water bottle.' Now, it is only on rare occasions that this effeminate article is my bedfellow; but when in the grip of malaria to get into a vulgar sweat

¹ Master's.

² White men.

as rapidly as possible is an immediate object, and a hot-water bottle does undoubtedly assist this process.

Rising stiffly from my seat, I investigated a suit-case in which were kept commodities not in daily use, and unearthing the comforter handed it to Paulo.

'See,' I said, 'that the water you put into it is really hot.'

Quarter of an hour later his huge form passed again through the sitting-room to my bedroom—in his hand the consoling rubber bottle.

He was absent, noisily absent, for several minutes. 'Bwana,' he remarked when he did reappear, 'all is ready. Do you wish assistance in getting to bed?'

I nodded a negative. 'No,' I replied, 'and do not call me till past eight o'clock.'

Just as he left another shivering fit seized me. I sat on by the fire, waiting for it to subside before going to undress. When at last, my toilet safely accomplished, I got into bed, it was to discover therein no hot-water bottle. High and low I searched all over the room—there was no sign of the comforter. Paulo's hut was a quarter of a mile away, and it had begun to rain heavily; so, rather than paddle out in the wet to ask him where it had been put, I went to sleep without its consoling influence—cursing the fool I had for a servant.

Next morning, when he brought the early tea, Paulo's faithful, dog-like eyes were full of solicitude.

'Has Bwana's sickness abated?' he asked tenderly.

'It would have abated considerably more, you old fool,' I replied, 'if I had had my hot-water bottle! Where the devil did you put it, and what the deuce did you imagine it was wanted for?'

Paulo's expression, half-puzzled, half-sorrowful, disarmed my anger.

'I put it,' he answered penitently, 'where he could look down on you!' With a forefinger he pointed upwards, and there, just under the rafters of the ceiling, on a forgotten nail, high up on the wall, hung the cold hot-water bottle! Somehow, in all my searchings, I had never glanced skywards!

'Why up there?' I asked savagely.

Paulo shook his head, despair on his face. 'The wants of the Wazungu,' he said at length sadly, 'are difficult to understand. That queer bag, I thought, was a charm to drive away the sickness. I hung it where its eye could watch you.'

The eye was a rubber label in the article's middle, with the hieroglyphics 'North British Rubber Company' written across it!

III.

Though many years have slipped away since that incident, this huge Kavirondo still remains

an imperfect servant. Try—as I know he does—hard, his memory continues hopelessly bad. Three times a week, at least, for example, salt does not appear on the table.

'Paulo,' I said but yesterday, 'you have again forgotten the salt!'

He clapped his great black hand to his woolly head—and his laugh almost shook the flimsy structure in which I dwell.

'So I have!' he exclaimed. 'What *can* be the matter with my head!'

A holy Christian is Paulo, though profession of this creed in no wise deters him from being the proud possessor of three wives! He waits at table with a huge crucifix slung round his neck, and as the sun, in all its African glory, sinks behind the distant hills, and the mystical silence which heralds the tropical night steals over the world, the chant of the 'Ave Maria' bursts on the stillness. Solemnly, every sundown, in the kitchen, before he peels the potatoes for my dinner, Paulo's powerful voice may be heard reciting this summary of his belief—woe betide the heathen who disturbs him at such a moment!

The savage which is (and will remain for many generations) uppermost in the so-called Christianised native is still strong in Paulo's nature—the veneer is of the shallowest description. Behind the crucifix and the 'Ave Maria' is the heart of the primitive savage—the mind of a dear, simple, honest old heathen!

Daily intercourse with him emphasised this fact, but it needed, perhaps, an eventful week at our centre of civilisation, when the big agricultural show was in progress, to expose the distance between our social development and that newly grafted on to the African native. My tent was pitched near the show-ground, so that personal superintendence of some valuable Arab stallions, placed in my charge, could be more easily accomplished.

As I was sitting before a table at my tent door one morning, just about to eat my breakfast, there happened to stroll past the fattest settler in the country, nodding to me as he went. Colossal in build, he carries also more adipose tissue than any man, I should say, the world has ever seen. Paulo was, at that moment, serving me bacon and eggs, but the dish remained suspended in mid-air, as with mouth wide open, eyes gleaming, and the light of a strange zest on his face, he watched this Mzungu lumber past.

'Bwana,' he asked at length, when he had again remembered his duties, and the bacon and eggs were safely landed on my plate, 'when that bwana dies will his relations save the fat out of his stomach?' (Fat is the most valuable luxury among Paulo's tribe.)

'Certainly not,' I replied. 'White men do not eat each other, dead or alive.'

'I know,' he replied, shaking his woolly

head, his eyes suddenly dim with sorrowful regret—'I know! But what a waste! God! What a waste! Why! There must be debbies¹ and debbies full of fat in that bwana's tumbo.'²

No one who has been served by Paulo would dream of exchanging him for an experienced English butler. They are common goods, and he unique.

THE HAWTHORN BUSH.

By H. MORTIMER BATTEN, F.Z.S., Author of *Habits and Characters of British Wild Animals, Tracks and Tracking, &c.*

I.

IT was the bleating cry of her fawn which brought the mother roe-deer, red-eyed and furious, to the place. She had left him safely hidden in the bracken, and she knew that he would not leave his form of his own accord. Now she was just in time to see the red fox bowl him over—but the red fox did no more.

He knew, evidently, that he was playing a dangerous game, for though the mother roe-deer made no sound as she came up, shoulder deep in the bracken, the fox saw her. The little fawn was now at his mercy, but he rightly judged that to delay another second would be unwise. He turned and fled, slipping like a snake through the undergrowth, but a desperate mother roe-deer is about as swift as any living thing.

Next moment the fox had to bound, and to bound for his life. One heard the malicious click of his fangs as he did so, and but for a sweep of his spreading rudder, which served to hurl his hindquarters out of the danger zone, he would have got no farther. As it was, two knife-edged forehoofs ploughed up the leaf-mould and cut down to the clay beneath the very place where his spine had been the merest fraction of time previously.

Then, ere the fox could rally, the roe-deer struck again. Dodge he could not, but he shot into the air like a steel spring, and again that white-tipped tail of his came in useful. It lashed across the roe-deer's eyes, momentarily blinding her, and when she recovered she saw the fox 'slick' into the bracken six feet away, as a worm 'slicks' into its hole.

But to rid the country of such a peril to her fawn the roe-deer hind was prepared to go any length, and she made one tremendous bound into the bracken, alighting five feet beyond the point at which the fox had disappeared, and just about where she thought his spine would be. The fox, however, was too wise a hunter for that. He had twisted to the right, and his pearly fangs clicked on one of the mother roe's hind-legs as she landed, smiting only the earth again.

¹ Debbies are four-gallon empty kerosene tins, largely used for cooking and carrying water.

² Stomach.

Then, in the twinkling of an eye, the fox was eight feet up a pine-tree on her right—standing on a limb and regarding her insolently, his tongue lolling. Out of reach he might be, but only just. He had seemed to run up the vertical trunk. Again the roe-deer leapt. Her forehoofs smote the trunk six feet up, and the chips flew, but when she came down there was a gash across her nostrils.

The fox had struck as a weasel strikes. So quick was the movement that human eyes could not have detected it—that one could not have credited that he had actually touched her. But this seemed to sober the roe. She went back to her fawn, which lay quivering in the leaves where the fox had left him. She sniffed him from end to end, but seemingly no hurt had befallen him, though at the scent of her own blood in her nostrils the mother's fury returned. She returned to the fox, and pranced and bounded round the tree, uttering a grunting bark with every bound. These sounds, and the crashing in the undergrowth, reached the ears of the keeper down in the wood, and he concluded rightly that a mother roe had found a foe. Also they reached the ears of her mate, and he came silently and swiftly up, as she had done, his eyes very big and very bright; and when he smelt the blood and saw the fox standing defiantly on the branch of the pine, he too went mad.

II.

For ten seconds he stared at their foe, and Reynard's coat sank a little as he glanced up to make sure that the next branch was within safe reach. Then the roebuck leapt at him like a wild-cat. He did not strike with his dagger horns, but with his hoofs, as the doe had done. These actually smote the branch on which the fox was crouching, and it seemed that simultaneously the fox leapt for the higher fork. He simply sailed up like a red limp cloth, and as the buck fell back there he was—comfortably cradled in the fork twelve feet from the ground. He was safe now, and—the complete audacity of it—he permitted himself a luxurious yawn.

As for the roebuck, his face too was streaming blood, and as he shook his pretty head it spattered down on the leaves. He snorted and seemed veritably to snarl. Both the roe-deer had become obviously uneasy, though the fox

had curled himself up, apparently to sleep, watching them through his bushy tail.

The deer exchanged quick glances; then the doe went over to her fawn. She grunted to him, and patted him with a dainty forehoof, at which he rose and made off down the runway, the doe at his heels and influencing the direction he took by touching him with her nose. So he was partly under her, the safest place for him, while the buck stood by and watched the fox till they were gone.

By that time the fox was also uneasy, and he clearly wanted to come down, because he too had heard. But he had more sense than to try while the roebuck was there, and when finally the roebuck went it was too late to descend.

As a matter of fact the keeper had become interested in the hubbub, for it was part of his training to profit by such indications. Of course the roe-deer might be squabbling among themselves, but he knew that the mothers were partial to the pine corner where the bracken was dense, and there was the alternative that a fox or a wild-cat was responsible. So the man took up his gun, and, leaving his job, stalked silently up the wood.

He did not see the roebuck, because that gentleman departed through the bracken one second before the man appeared. He did not see anything at all, for he failed to look up into the branches of the pine. Had he done so he might have seen the fox, or again he might not; for the fox had flattened himself out like a squirrel, and all that was visible of him was a patch of fur, the same colour as the bark, and about the size of a man's knuckles. So the man gave it up and went on into the wood, but ere he disappeared the fox slipped down on the other side of the trunk and made off, having experienced a very nerve-testing three minutes.

III.

It was the month of June, and the weather was hot—so hot that even the flies were glad to avail themselves of the forest thickets. For three days or so after his escape the fawn was sick, though no actual injury had befallen him. He would not take his food, and in view of the fact that he was a roe-deer fawn, it is rather surprising that he lived, for the roe-deer fawn is the most fragile child of all the woods.

The doe's wound healed quickly, because, though deep and ugly, it was within reach of her tongue; but the wound the buck had received was destined to give him trouble. It was perilously near his right eye, and the tear-pit was injured, and even had it been winter he would have suffered much with it. He could not, of course, apply Nature's massage, and, irritated beyond endurance, he rubbed the wound repeatedly against his outstretched foreleg, which was not so antiseptic as it might have been. So

the wound went wrong, and for days he hid in the thickets, and his wife saw nothing of him. Extremity at last drove him out, and instinctively he went to his mate, and she it was who, by the understanding of those who dwell in companies, applied the only healing power within their reach. So in a few days the wound healed—but it left the buck with one blind eye.

Meantime the fawn had thriven apace, and in the dusk of any evening he might have been seen capering in rings round certain favourite bushes, till he had worn distinct pathways—the roe-deer's fairy rings. Often his mother joined him in this peculiar game, and there was no prettier scene in all those wonderful woods than the dainty mother and the elf-like fawn gambolling thus. Quick they were as the swallows, which flashed and dipped about the waters of the little woodland loch the roe-deer loved so well, in and out among the silver birches, till presently the fawn would turn to menace his mother with lowered head. Then she would leap clean over him as he shook his imaginary horns and skipped aside, and so the game would begin and end among the lengthening shadows.

When the buck came back he occasionally took a part, but he seemed to have something on his memory, and generally he watched. And once or twice, when playing, he collided heavily with the timber on his blind side, whereupon he would retire, dispirited, from the game. But soon he adapted himself to his infirmity, and no roebuck in all the woods was more keenly alert than he was.

IV.

Neither the buck nor the doe forgot the incident of the fox, and even at night-time, when it is customary among the roe-deer to travel far afield, the fawn's mother never ventured far from the place where she left him hidden. No, they did not forget the fox, and one night the buck all but caught him out.

In the hollow of the wood the keeper had his pheasant-pens, and he had been tending these that day when the fox hid in the pine. Alongside the new enclosures, which contained the young longtails of that year, was an old enclosure he had used some years ago—an oblong about thirty yards in length and twelve or so in width, enclosed by a nine-foot screen of wire-netting. As a matter of fact it was not totally enclosed, for the keeper had removed the netting from one end for another purpose, so that only three sides remained intact.

Down there by the pens was some of the sweetest browsing in the wood, and it was a favourite haunt of the buck when his wife was on duty. That night he was there, a ghost among the shadows, when he saw the red fox come sneaking round, gazing covetously through the wire, which he dared not touch.

The buck stood stock-still among the shadows, watching, till presently the fox slipped in at the open end of the old enclosure. There the roe, who knew the place well, had him enclosed on three sides, and by accident or design he chose that moment to charge.

The fox, conscience-smitten as usual, fled for the timber as he heard the buck behind him, but he came up with a thud against the wire, and was hurled back by the recoil. The buck struck but missed, and with a cat-like hiss the fox leapt up at the screen, obtaining a hold six feet or so from the ground. But he had to relinquish it instantly, springing back, for the roe-buck also leapt, and this time he struck with his horns, which smote the wire just as the fox left it.

But luck was against the buck that night. At the top of his leap one of his horns caught in the wire, and there he hung, suspended helplessly. Then, indeed, was Reynard's chance to attack had he chosen to take it, but it would have profited him little, and he selected rather to grasp the opportunity to escape. With an interval now to take in his surroundings he perceived that he had walked into a veritable trap, and in a second he had slipped back by the way he had entered. But for that moment when the buck hung suspended ere he freed himself by a desperate side wrench the fox would undoubtedly have been pinned against the wire.

V.

It has been said that the wild folk do not remember evil—that sordid disposition belongs only to man. This may be so, yet for much that exists in the world of men and women there is an exact counterpart in the wild. Evil to themselves, personal injury, the wild folk as a rule do not remember. They strive only to avoid a repetition of it, but they bear no malice for it. Thus it was not because the fox had done the roe-deer irreparable injury that the latter strove to destroy him. Had that been the buck's only memory he would have stolen quietly to another part of the wood, leaving Reynard to his own devices. But there is one kind of evil the wild folk remember for all time—evil to their young. That they never forget, and sometimes they will go to almost incredible lengths to avenge the death of their offspring; for this is an instinctive bidding, a bidding to keep their enemies in check, so that their race may prosper. It is not a personal enmity—that, indeed, belongs to man—but a patriotic hatred. Thus exist the feuds between feline and canine, between fox and eagle—feuds of world-old bitterness, deep-rooted in an order which knows no change of custom.

Many times that summer the deer saw the fox, and on every occasion they tried to stalk

him in the hope of trampling him down. But the fox was wise. He belonged to the rugged mountain stock, and in the heights above the woods his cubs had been born that spring, and every dawn he carried food for his vixen. Full well he knew that he had made bad enemies of the two roe-deer, and that they were now the most formidable of his wild foes. A master of woodcraft and hillcraft, he knew them afar. There were many roe in the great range he hunted, but most of them he did not fear. In this respect he was different from the roe-deer themselves, for to the outraged parents a fox was just a fox, and they had sworn eternal enmity towards the race, so any fox that came along was in peril of his life.

More discerning was Reynard himself. On his way down from the heather he would often pass within a few yards of a family of roe, paying no heed to them, while they would merely move aside if they found themselves in his direct line of travel. But a little farther on he would see a single buck or a buck and a doe passing through their rack from the wood. Instantly he would 'freeze,' one paw upheld, and when their heads were turned away he would sneak into the deep heather and go by a different route. And he knew them, not by the scars he himself had left across their faces, but as he knew so many of the wild folk about him—as individuals.

VI.

As the fawn grew up and became able to feed himself many of the perils which had existed in his earlier days ceased to be, and that autumn it would seem, indeed, that the old evil was forgotten. In the plenteous fruit and berry harvest the three roe lived less by themselves, and often they joined little herds of their own people, drawn together by some common attraction. There was, for example, the isolated hawthorn bush near to the keeper's cottage. Its fruit was ever the first to ripen, for it obtained all the sun, and this year it bore an exceptionally heavy crop—indication, some would say, of a severe winter. There the roe-deer of the locality were wont to forgather in the gray of morning, and it was no uncommon thing to see as many as nine of them feeding there. They seemed on excellent terms—I am inclined to think that the roe-deer community of the valley was for the most part related, as indeed was the human community.

In due course the present fawn, if all went well with him, would grow up and mate, making his corner near. So he and his doe with their fawn would in due course meet their parents at the meeting-places—no longer as blood relatives, but at any rate as old acquaintances.

Thus that autumn the parents met their children who had gone before, each one now with its own little family ties, so that the com-

munity of the hawthorn bush was a friendly one. That, indeed, seemed clear when one watched the fawns playing together—little cousins of the same parental cluster.

The hawthorn stood far out in the open, two hundred yards from the nearest cover, and as winter drew on the keeper could have shot any one of the roe-deer from his cottage window during the breakfast hour. Nor could one have blamed him for it, for the factor of the big estate had said: 'The roe-deer are becoming too plentiful, M'Leod, and they're playing havoc with the new plantings. You'll have to kill off a few of them.'

But M'Leod was an old servant, whose job was safe, and he answered promptly, 'Nay, sir, that's a thing I canna' dae. I aince shot a roe, and it sobbed like a wean, lookin' up at me with its twa big een. I've never forgotten it, sir, and if ye want thae roe shot, ye maun dae it yersel', or get some ither body. It's nae for me.'

'But it's your job, M'Leod,' the factor protested limply.

'Maybe, sir, but her ladyship likes tae see thae roe about the castle, and I'm no' deprivin' her o' the pleasure.'

So, thanks to the old keeper, the roe-deer had been spared, and they were now strong in the coverts.

But in those same woods Reynard was looked upon as the worst of vermin, for there was no fox-hunting, while the pheasants were regarded as all-sacred. For the factor himself these were anxious days. Many of his calling had gone from the adjoining estates, crushed under the heel of the new order, and he feared that any day conditions might compel his own retirement. One circumstance was in his favour—the exceptionally fine pheasant coverts of that property; and indeed it may be said that his job hung on the sacred pheasants and the moor game. If the estate could be made to produce record bags, big rents were certain and his job was safe.

VII.

The prophecy of the berry harvest was early fulfilled, for in the latter days of November a blizzard swept the country. Two inches of snow fell; frost came—and held. Each morning the sun rose in a dead-clear, cloudless sky; each evening it sank behind the blue hills in a glory of crimson which filled the glens with softest purple haze. And as it sank the buzzards wheeled and the sea-gulls gathered in their thousands, screaming and flashing above the loch. They, indeed, seemed to revel in the remorseless brightness, but for others it brought hunger and departure from their usual ways. Every day the packs of starlings and finches and redwings grew and grew. Birds and beasts accustomed to living solitary lives flocked together, for that is the order of the Frost King. Soon even the red grouse were in packs, which

surpassed all records, darkening the hillside as they passed from place to place, and in the taproom of the village inn a robin took to perching on the cash register.

The snow on the highway was beaten into ice, and between school hours the music of children's voices stabbed the crisp stillness. Even the river froze, all but its central race, and when the salmon had turned seawards from the shallows, where every pebble was ice-rimmed, otter-tracks were seen for the first time on record about the village fowl-houses.

As for the roe, at night-time they travelled far, and the manse garden across the valley bore evidence of their visits; but invariably the breakfast hour found a buck and a doe and a dainty fawn within sight of the castle windows. So her ladyship and the children came to love these pretty creatures. Gentle they seemed, like fairies of the birch groves, and every day food was placed for them on the greensward opposite the French windows.

One day the mistress was discussing the animals with old M'Leod, when the keeper said, 'Ay, yer ladyship, they're bonny, but I'd like you and the children tae see anither pretty scene—the muckle pack o' black game that comes tae feed each sundown in the hawthorn bush opposite the lodge. They come prompt tae the meenit every day, and in a' my experience I've never seen sic a pack. They weigh doon the branches tae breakin' point, but in a few days the tree will be strippit, so yer ladyship maun come sune.'

'We'll come to-day,' his mistress promised. 'I'll bring the children, and we'll take a cup of tea with you, M'Leod.'

So that was settled, but little they guessed what rare glimpse into Nature's ways was to be theirs.

VIII.

The keeper was not the only one interested in that immense gathering of black game which assembled each evening in the isolated hawthorn. Another had watched from the covert edge, but with very different feelings. These were lean days for the red fox of the hill, and he had studied the gorgeous game-birds with covetous, shining eyes, but how to outwit them he did not know. There must be some way, yet to approach unseen across the two hundred yards of treeless park was obviously impossible. He could not have approached the merest robin that way, say nothing of a party of shot-hardened blackcock.

But eventually the fox had hit upon a scheme, and at night-time he went over to the bush and made for himself a bed in the heart of the thicket. In that bed he could lie unseen, and daybreak found him sleeping there, ready to await his chance. How long he had to wait did not matter much, because his bed was sheltered and cosy.

Some time before the black game were due to appear the little party arrived at the keeper's house. It was destined to be quite a merry little party, for the factor and his wife chanced to be passing, so they too were invited to stay and see the black game.

Prompt to the tick of the clock there was a strong burr of wings overhead, and here they came, slanting downwards in a straggling line, each gorgeous creature reflecting the sunbeams in emerald and purple, and even sapphire. Then they came thickly abreast, gliding easily down the slope. They alighted clumsily in the bush, as blackcock do, and on the ground all around it. More and more crowded into the branches, till they veritably crowded each other off the tips. It was indeed a sight worth coming to see. The factor said that he did not know there were so many black game on the hill, which resulted in an indignant snort from M'Leod.

The bush was black with birds, each one pecking greedily at the berries, when suddenly—something happened! It was as though a hand-grenade had exploded in the centre of the bush, for with one accord the game-birds hurled themselves free of its thickets. Some had difficulty in disengaging themselves, but for the most part that pack was a-wing in the twinkling of an eye, scattering in all directions, and as the branches were cleared the party at the keeper's window saw the reason.

There stood the fox, holding a struggling blackcock in his jaws, while he gazed guiltily, half defiantly, towards the keeper's cottage. Where the fox had come from they could not at first make out, because as yet there had been no time to realise that he must have been hiding all the time in the heart of the hawthorn bush. It seemed as if he had arrived miraculously, and the sight of him standing there gave everyone quite a shock.

'The brute!' muttered her ladyship.

'The varmint!' gulped M'Leod, turning for his gun.

'Well, if that doesn't beat——!' began the factor.

Then as M'Leod possessed himself of his thumb-polished twelve bore, he felt the pressure of the factor's fingers on his arm. 'Wait a minute,' said the factor almost breathlessly. 'Something else is going to happen. Look!'

For they had caught sight of a very angry looking roebuck coming quickly up towards the bush from behind the fox. The very poise of his head, with its upright dagger horns, indicated that he was out to cause trouble, and he had almost gained the bush when the fox leapt down, the blackcock in its jaws, and saw him.

IX.

This was a dramatic crisis. The fox flattened down in the snow, his gorgeous quarry between his forepaws, awaiting developments. Of all

creatures on earth, he had not desired to meet that spiteful little warrior just now. Two courses were before him—to stay and fight it out, or leave his long-coveted prize and bolt for the woodlands.

The latter course was evidently distasteful to the fox, or he would have made off with seconds to spare. Instead, he remained perfectly still, while the roebuck came right up to him; and which of them was the first to strike, one could not tell. Reynard was seen to leap, while at the same instant the horns and forehoofs of the roe shot out, and through the cloud of flying crystals they saw the roe whirl round, standing on his hind-legs. Clear it was that the fox was in deadly peril, since, quick though he might be, the roe was quicker, and next moment Reynard was forced to dive headlong into the cover of the bush.

Not many seconds, however, was he allowed to remain there. Heedless of the thorns, the roe crashed in after him, and simultaneously they broke cover on the other side. There followed a bewildering exhibition of twists and turns, the fox striving by dash and twist to get back to his prize, the buck between him and it. Once they collided, and the fox was thrown on his side. How he escaped the rain of blows which followed him up it was impossible to see, but when he had recovered himself it was clear that his only desire was to get quit of the place. He had evidently forgotten the blackcock, or, at least, he was prepared now to leave it; yet he feared to make the dash across the open, knowing that his adversary was swifter than he was.

So, with his head towards the buck, the fox began to back away, while the human spectators expected every moment to see him trampled in the snow, hoping now that that would not be so, for Reynard had played a pretty game. He had attained a great ambition by a piece of strategy worthy of his race, and after all this was the Hunger Moon.

But old M'Leod had no such sentiments. To him foxes were a curse, and he denied them even the right to live. So, while the others watched, he had slipped to the door in the hope of obtaining a long-range shot at the little free-booter. He had, indeed, raised his gun, when he noticed a hind and her fawn coming out of the wood in his direct line of fire. They were stalking up behind the fox, evidently intent on surprising him, but they might as well have tried to stalk one of their own alert race. Without looking, the fox half-turned so as to keep all three of them in his line of vision, and now he was backing and dodging, dodging and backing, straight towards the cottage. Each lightning dash saw him a few yards nearer, as though he were seeking the aid of the very humans—and even M'Leod could not find it in his heart to interfere.

It was a rare thing they saw that day, for the fox came right up to the garden gate, and neither he nor his furious little persecutors noticed the figure in the doorway or the other figures at the window. The hind and the fawn had thrown in their lot, and a veritable barrage of blows followed Reynard through every move he made. As an example of animal quickness it was almost frightening to watch, and it served to illustrate quite a new side of the characters of those gentle woodland deer; yet somehow the fox gained the gate unscathed, and slipped through it. Next moment he dodged to the right, leapt to the roof of an outhouse, and, running along the walls of the kennels, he dropped down on the other side, safe in the woods once more.

'Well, I never!' exclaimed M'Leod, gazing at the three angry roe, which quickly made off. 'Who would ha' thought it?'

'I'm glad you didn't shoot,' said her ladyship. 'It was wonderfully interesting, but I am glad it is all over without bloodshed.'

'Yes,' agreed the factor. 'That fox deserved to live.'

'And the roe-deer too!' added her ladyship meaningly. 'I can't imagine foxes becoming very abundant when those little creatures are about!'

The factor was thoughtful. 'It certainly does open up a new line of inquiry,' he admitted. 'It's worth while having a few roe-deer if they will keep the foxes away. What's your opinion, M'Leod?'

'I expressed ma opeenion long ago!' said the old keeper. 'We havena' been much troubled wi' foxes since the roe-deer increased, an' ma opeenion is that we want tae leave them alane!'

And M'Leod's opinion carried.

THE CORAL FISHERIES OF THE MEDITERRANEAN.

I.

THERE is something pathetic about the death of a trade, even of the most commercial and unromantic; but when it is a beautiful and delicate craft, worked for generations by a picturesque people with materials from the very heart of Nature, and yielding as its results ornaments of real artistic worth, the pathos is touched into a deeper emotion.

This is the fate of the coral fisheries of Italy. It is a bare half-century since the coral fleets of Naples and Lipari, Pontesacco and Girgenti, were famous; since bronzed seamen sailed out over the pellucid sea under a sky of intense blue, bound on the eternal task of robbing the pitiless deep of its treasure. Smaller and smaller the white sails would become as the ships crept on, infinitely tiny in the wide waste of blue; and the sailors' chants would fade and die on the softly-moving air as they sailed away on their romantic quest.

It was no easy task they had before them. So many were the dangers of the coral reef, so difficult the manœuvres that must be accomplished before the coral fleet could return home to the safety of the harbour, that the work was considered an excellent preparation for naval men, and a man who had been a coral-fisher was sure to find a welcome from his country's fleet. For the coral banks are hard to come at, and long, sharp-toothed promontories extend under the surface of the limpid blue; winds fail, or veer round to an unexpected quarter; and happy is the fleet that returns to safety at the expected time, bearing its precious load of coral.

That was fifty years ago. Nowadays the

coral fleets do not sail so often, and there are fewer towns that send them out. Good coral is becoming increasingly rare about the coasts of the Mediterranean, and the towns, such as Torre del Greco, that still carry on the coral industry, do not depend on the local fisheries for their supplies, but send abroad for the raw coral which is to be worked up into jewellery. During the first nine months of 1923 the quantity of raw coral imported into Italy amounted to eight and a half tons.

There is, of course, a certain amount of coral in the Mediterranean still, and boats will yet sail in search of it; but only in the Gulf of Naples and off the coast of Sardinia do they meet with any considerable success. In days gone by the fleets went abroad as far as the Ægean Islands and the northern coast of Africa; Sicily was a happy hunting-ground; Corsica, Sardinia, and Vallona were ransacked. Now, owing to the enormous cost of fishing, these ventures are abandoned; and since 1914 Sicily, with its coral bank of Sciacca, is the farthest point of the coral-fishers' journeyings.

II.

Coral itself is a curious substance. It is generally imagined that the coral brought up from the sea is pink or red. Sometimes it is, and when it is 'rose coral,' or 'peau d'ange,' as it is sometimes called, it is worth its weight in gold—quite literally. A really fine piece of branching rose coral is worth £10 an ounce. But pink coral is increasingly rare; and most of that now obtained is the black 'dead' coral, which must be soaked in hydrogen peroxide for some days before it regains its colour. Sometimes an immersion of three days

will restore the desired pink ; sometimes it must be soaked for over a week. The coral obtained from the 40,000 square miles of Sciacca is 'decayed' or 'dead' coral, and must be treated with peroxide before it is worked and polished by the craftsman.

The coral cargo is packed in chests closely locked and tightly roped, and generally unladen in the harbour. The less valuable coral lies on top—broken fragments, black, decayed, unpromising enough in appearance. Below this, carefully packed, comes the better stuff, big branches which will bring in a handsome sum, smaller pieces which are still well shaped ; and, if the fleet has been lucky, there may be found in a corner of a chest a knotted handkerchief containing really fine pieces of 'rose' coral.

The cargo is sold as a whole, the good with the bad ; the coral merchants take possession of it, and the work of the fleet is done, for the time. In a few days they will set out again on the hazardous quest. Only on one day in the year does the coral-fisher refuse to leave the harbour. No sailor, however bold, will go coral-fishing on the Vigil of Our Lady of the Rosary ; neither love nor reward will tempt him out until the bells have tolled midnight and the Vigil is over.

III.

The raw, or unworked, coral is now handed over to the workmen on shore, and many are the processes to which it must be submitted before it is ready for sale. The rare specimens of red or pink coral can be dealt with at once ; but, for the most part, the coral brought in is the decayed black substance that must be immersed in its peroxide bath. In a few days it has regained its colour, and the red coral we know so well is ready to be worked.

There are now very few towns that carry on the industry of coral-working ; indeed, in Italy the manufacture is confined to Torre del Greco. In Naples, Rome, and Paris the only work done now is the mounting of coral, already prepared, in metal settings. In Torre del Greco, however, the industry still survives, and it is there that the coral-fisheries send their cargo. It is a real 'manufacture,' for the coral must be worked by hand entirely, on account of the many inequalities in surface and size.

The processes through which the coral must pass are very many. First, it must be cut with files or nippers into convenient pieces. Any particularly fine specimens, which will be made up into single objects—cameos, penholders, and so on—are put aside. The cutting of coral requires judgment as well as skill ; a fine piece may be spoilt in shape by careless cutting, or a good workman may detect well-shaped fragments on an otherwise poor piece. The cutting

is entrusted to both men and women, who soon develop great skill and rapidity.

When the coral is cut into convenient pieces there follows the work of boring. This is a task that requires a steady hand and a delicate touch, and it is assigned entirely to women. The boring is done with a special tool, a kind of small perforator, which is selected in accordance with the size of the coral to be pierced. The bored pieces are then threaded on iron wire, and there follows the very delicate task of planing or filing.

Only women undertake this work. The coral, threaded on the iron wire, is laid on beams of a specially hard wood. The women, exerting a pressure which only a skilled worker can judge, pass over the brittle surfaces a small grindstone dipped in water. With this instrument they plane down all irregularities, and gradually file the surface down to a uniform thickness.

IV.

The coral, cut to shape, pierced, and planed to an even surface, is now handed over to the polishers. It is put, together with a quantity of crushed pumice-stone, into a small bag made of raw linen, and the whole is shaken in a tub, over which a small column of water plays. A hole in the tub carries away the water as it flows through the bag. When it has been thoroughly 'pumicated' the coral is rinsed and put into a second bag, which contains, not pumice, but a substance known to the workers as 'pulimento.' It is, perhaps, significant that the craftsmen of this dying trade cannot tell what 'pulimento' is ; they merely accept it and use it, and there their interest ends. It is to them merely red or white 'pulimento,' without which one cannot polish coral. In the same way they accept the peroxide that restores the colour to decayed coral without question as to its nature. One thing reddens coral ; another polishes it. Why ask what is the nature of these agents, so long as the work is done ?

The 'pulimento' is not used quite as the pumice was. The bag is first shaken dry ; then a little water is added ; then a great quantity of water is used, and the bag is shaken violently under the swift rush. Then the coral is withdrawn, brilliant and gleaming, ready for mounting.

It is a real handicraft this preparation of coral. Each branch has its special workers, its tools, its own importance, its own skill ; and yet the trade is declining fast. The care, the patience, the love of the craft, which are needed for work such as this, are dying out. Handicrafts are losing the hold they once had ; romance itself seems to be dying. Machinery is superseding the delicate skill of the hand-worker ; and glass and china are ousting as ornaments the branching jewellery of the treasure-house of the sea.

SEVENTH SERIES

THE BRITTANY OF SPAIN.

By W. VICTOR COOK, Author of *Grey Fish*, &c.

I.

SOUTH-BOUND ships, after leaving the currents which eddy far out into the Atlantic off the Breton rocks, cross the Bay, and pick up the jagged cliffs of Spain's north-western corner—bare, mountainous pyramids ranged in sierras against the skyline, sternly dark, but tinged in the sunshine with the purple of their distant heather. Be the ocean ever so calm, the slow heave of its rollers breaks in snow-white foam around their feet, and the smoking surf runs threateningly along the reefs which flank the island masses that stand guard at the entrances to Galicia's deep bays or *rias*.

White lighthouses, like snow-spots in the sunshine, dot the cliff-tops by day, and twinkle along the perilous coast by night. This is the Brittany of Spain, the home of people who, though they have lost the Celtic mother-tongue, retain many of the characteristics of the Celtic race to which they mainly belong, among these being an intense pride of nationality.

Deep into the heart of the land the smiling *rias* run back from the austere coast, their clear waters dotted with little fishing craft, the green slopes of their rich valleys filled with vines and maize, vegetables and fruit. Palm and choice southern flowers thrive in the sheltered spots, and on the heights are the bracken and the long purple heather, and here and there, like feathery crests in the distance, the tall straight pine.

To a casual visitor, especially to one acquainted with the sun-baked barrenness of many parts of 'sunny Spain,' this pleasant land of Galicia seems a veritable paradise of natural wealth. And yet, partly from political causes, partly from the prevalent system of splitting up the tenure of land into infinitesimally small portions, the Gallegos are for the most part miserably poor—so poor that the young men who wish to make their way cannot stay in the land, but emigrate by thousands every year to the southern countries of America. Emigration offices are a feature of the waterside at the principal ports, and it is said that as many as twenty thousand depart yearly for South America alone. Many Gallegos go also to

Portugal, where, though climate and speech are similar to their own, the economic conditions are such as to enable them to turn their own industry as field-workers to profit, and often to return home and become small proprietors with their savings. Many, too, go as hewers of wood and drawers of water to other parts of Spain itself, where their strongly-marked provincial speech, their lack of pride, and their patient industry make the name of Gallego almost synonymous with boor, and where they are the butt of a good deal of undeserved ridicule.

II.

The heavy emigration of the young men of Galicia is largely responsible for a peculiarity which strikes at once the notice of every visitor to the province—the universal labour, and heavy labour, of the women. While a great proportion of the men who remain at home are engaged in the fishing, which is the principal industry of the long sea inlets, and the young men who go abroad become the manual labourers and the burden-bearers in the countries whither they repair, at home in the province the hard work of everyday life is mostly performed by the women. It is embarrassing for a stranger from the north, on arriving at one of the Galician ports, to have his luggage scrambled for by a bevy of women, young and middle-aged, who pile on their heads a load which few Englishmen would like to carry on their shoulders, but it is useless to resist. The woman porter, strong and erect and supple, balancing the heaviest load without apparent effort on a little round pad laid upon her hair, walks with regal gait to the customs office and thence to the hotel of the traveller, passing easily through doors and round corners with her terrifying load without touching anywhere, avoiding obstacles with unfailing instinct, and even turning to chat casually with an acquaintance as she goes. Among the Galician women the head is the one and only place to carry everything except a baby. A huge pitcher of water, which an ordinary man would certainly not care to lift, they will carry long distances up hill and down, to and from the public fountain in the plaza, and with equal sureness

of balance will stride along with a single bottle standing upright on the head.

Morning, noon, and night, the public fountain is the habitual place of gossip, for the jets of water run comparatively slowly, and the great water-vessels which the women slide under the jets along the metal rails laid for the purpose from the fountain's edge take some time to fill, and many others are waiting. So round the fountain the women stay and talk, and sometimes quarrel, while the rows of stone or metal pitchers wait their turn to be filled along the fountain's edge, and the traffic of the town goes by—slow ox-carts drawn by beautiful long-horned brown oxen, pulling tremendous loads without any harness other than the yoke on their great necks and shoulders; pack animals laden with the infinite variety of goods which furnish the stalls of a southern market-place; and now and again, seeming an anachronism in the narrow, winding, stone-flagged streets of a Galician town, a motor-lorry or a motor-bus, the latter still following the lines of the old-style diligence in its divisions of 'berlina' (the first-class compartment in front), 'interior,' and 'coupé' (bare benches on the roof, in front of the piled luggage).

III.

For all the beauty of the country, the comparative absence of laughter is a conspicuous aspect of peasant life. The Gallego has none of the sombre pride of the Castilian on the one hand, and on the other none of the light gaiety of the Andalusian. Beauty of feature and fineness of form are common among the Galician women, but the beauty is quiet and grave, with a frequent hint of the tragic behind great brown introspective eyes. Many a face that would make a painter's Madonna looks at you from the purple vineyards or the crowded, clamorous market-place. The men, for the most part, seem of a poorer calibre, until one remembers that the best of them are earning their return in exile, or swinging in their little vessels on the great slow rollers outside the *rias* of the coast, catching the fish for the factories whose multifarious odours pervade the shore-line of a Galician township.

Like their northern brethren of Brittany, the Galicians in their fiord-like *rias* have always been notable seamen. It was at Pontevedra, midway down the coast, a clean old town of white-flagged, narrow streets climbing round a church-crowned hill, that Columbus's ship the *Santa Maria* was built, though in Pontevedra to-day there is no memorial to mark the site of that notable piece of shipbuilding. Pontevedra men sailed in her on her heroic voyage to the New World, and the Galicians, with a justifiable pride, speak of her still as *La Gallega*—'the Galician girl'—which was her original name, they say, before the Admiral of the Ocean-Sea took her for his

great adventure and the Church rechristened her. When I tried to find the exact spot of the *Gallega's* building a member of the local Archæological Society, who, with a truly Spanish courtesy, gave up an entire day to showing me things of interest in his home city, could locate it no nearer than one of two quays at the point where the river enters the *ria* of Pontevedra—a rather deserted spot to-day near the tawdry sun-baked bull-ring and a dirty fishing village.

IV.

The great church of Pontevedra has a curious origin. In the Middle Ages an Archbishop of Santiago de Compostella, Gaspar Avalos, Primate of all Spain, granted special permission to the men of Pontevedra to go fishing on Sundays, on condition of their devoting part of the proceeds for the ransom of captive Gallegans in the hands of the Turks. In this way a league called the Confraternity of the Holy Body was formed, and became so wealthy and powerful that besides its original purpose it was able to raise the fine church of Santa Maria la Grande, with an extremely good façade in carved effigies—perhaps the finest piece of medieval artistry remaining, with the exception of Santiago itself, in this part of Spain. The maritime character of the church's origin is recalled by a little chapel just outside the most generally used entrance, containing an altar of the 'Cristo del Buen Viage'—the Christ of lucky voyaging—before which a pious taper is generally burning, and many a fishwife kneels to pray.

Religious pilgrimages, though shorn of much of their former importance, are still a feature of Spanish life in various places, and in no place in the land is there a shrine of greater renown than that of Santiago de Compostella, Galicia's most famous city. The origin of the name has been disputed, but the common derivation as the 'Field of the Star' is picturesque, and fits the curious legend associated with the founding of the city.

According to the legend, in the year of our Lord 813, a supernatural light was observed glowing on the top of a high oak-tree among the mountains, and sounds of celestial music were heard. Word of the marvel was taken to the Bishop of Iria Flavia (now Padrón), about fifteen miles distant, and the bishop, with canons of his church and other persons, visited the spot and verified the supernatural manifestations. More than that, they discovered, in the undergrowth near, a cave, and under a small altar in the cave a sarcophagus covered with a stone slab, at each end of which was a smaller stone coffin. On removing the slab they found a body in the sarcophagus, together with a parchment declaring: 'Here lieth the holy James, son of Zebedee and Salome, brother of John, whom Herod beheaded in Jerusalem; he came by sea, borne

by his disciples to Iria Flavia, and thence on a car drawn by the oxen of the Lady Lupa, owner of these estates, which oxen would not pass on any further.'

James the Apostle is credited with having been the first missionary of Christianity to Spain. The story of the miraculous discovery of the saint's body, after nearly eight hundred years, was related by the pious (and possibly astute) bishop to King Alphonso II., who went to Iria Flavia with his great men from Asturias, ordered the erection of a little church on the site of the wonderful cave, and endowed it with a league of land around. Thus commenced, as one of the great shrines of Christendom, the city of Santiago de Compostella, for ages the resort of countless pilgrims, upon which the piety and superstition of medieval Spain lavished wealth and treasure to an almost incredible extent.

At the close of the tenth century the Saracen general, Almanzor, captured and destroyed Santiago, though the sacred tomb itself, beside which a monk knelt in prayer, is related to have been spared. The account of the infidels' booty, including four thousand Christian captives, on whose shoulders the big bells and heavy doors of the church were carried to Cordova, suggests the strides which the new city had already made. The Moors did not long remain at Santiago. More than three centuries later, when Cordova itself was regained by 'Saint' Ferdinand, the same doors and bells are said to have been returned to Compostella, borne on the shoulders this time of Mussulman prisoners.

A new temple in place of the church destroyed by Almanzor grew up during the stormy period of the eleventh and twelfth centuries. Money was supplied by the faithful, and armies of pilgrims of all ranks, and of every age and sex, eagerly assisted the workmen with their own hands to convey the stone from the quarries in the neighbourhood. Kings and queens, notable saints and founders of the great religious Orders, were among the pilgrims. So numerous were the English pilgrims alone that they founded a hospital and church for themselves near Lugo.

In the year 1120 the See of Santiago was raised to an archbishopric, and soon afterwards Pope Calixtus II. granted to the cathedral the privilege of the Holy Year, which it still retains. Holy Year occurs when the patron's day falls on a Sunday, and throughout that year the holy door, or *Porta Cœli*, stands wide open, and all who pass under it obtain special indulgences.

v.

The cathedral of Santiago, enriched by the thronging devotees of successive ages, remains to-day an inexhaustible storehouse of Spanish

history and art. Splendid in position and noble in design, the very richness of its internal furnishing oppresses the mind. But from the crowding wealth of its interior ornamentation one thing stands apart, the wonderful sermon in stone called the Gate of Glory. It stands just inside the main western doors of the cathedral, so close to them, indeed, that no adequate pictured representation of it can be made. It consists of a gateway in three arches, occupying the whole width of the nave, each arch filled with the most exquisitely carved figures, and the entire conception preaching with fecund imagination the lesson of the ultimate triumph of good over evil. The sculptor, named Mateo, took twenty years over the work, from 1168 to 1188, a date preceding that of most of the famous porticos of European cathedrals, and drew his inspiration from the Bible alone. The monument is one of the most remarkable achievements of medieval Christian art. It was originally painted in gold and colours, but these have worn off with the passage of the centuries. The Spaniards declare, moreover, that the portico has been injured by the hands of workmen sent from England to make a reproduction for the South Kensington Museum. At the back of the Gate of Glory, kneeling towards the altar at the foot of the central arch, is a figure said to be that of Mateo, which is credited by tradition with the virtue of averting mental disorders from those who touch its head with theirs.

A curiosity of Santiago cathedral is its great censer, or *Botafumeiro*, a huge vessel of silver, the largest of its kind in the world. Its use is confined to special occasions, when it is brought out and swung on ropes running over pulleys attached to a strong iron structure, which is built on to the cupola that surmounts the intersection of the central nave and the great transept. Ten men pull the rope, which slowly raises the huge censer from the pavement of the cathedral above the people's heads. When it is a few feet above the height of a man, an attendant causes it to sway slightly, and men with the rope, with slow up-and-down hauls, set it swinging. Gradually the speed and the length of the arc increase, till the whirling silver vessel is swinging back and forth almost to the top of the roof of the nave, flashing and glowing amid a semicircle of white vapour. This goes on for about a quarter of an hour, while clarionets play a shrill accompaniment—a weirdly impressive spectacle. The use of this great censer goes back very far into the past, and is said to have originated as a means of disinfecting the cathedral in the days when the crowding pilgrims, unable to find accommodation in the town, spent the night in the building. It is on record that in 1499, during a visit of Catharine of Aragon to the cathedral some

time before her departure to become the bride of Prince Arthur of England, the chains of the great censer broke as it was swinging, but that, though it was broken, it neither hurt any worshipper nor even dropped an ash!

VI.

The city of Santiago itself is one of the most interesting in Europe—one of those cities, like Venice or Granada, with an unforgettable 'atmosphere' of its own. It shows itself to magnificent advantage. Encircled by great, dark, boulder-covered hills—grown over with bracken and purple heather—which rise gloomily outlined against the brilliant blue sky, Santiago lies along a hillside facing to the west, the three great towers of its cathedral focusing the landscape. Facing the cathedral from the other side of a wide square, and standing straight up from the bed of one of the little streams which flow round the city, rise the walls of a great seminary; and another side of the square is occupied by a wonderful old building known as the Hospital of the Catholic Kings, originally built by Ferdinand and Isabella for the accommodation of the thousands of pilgrims who flocked to the city. The building, a great rectangle in four courts, with cloisters and balconies, is now used as a public hospital in the modern sense of the word, and is one of the largest and best equipped in Spain. To a British visitor it is curious to find such an institution quite open to the general public, who are allowed to stroll freely through its well-filled wards and courtyards at all times of the day, both men's and women's wards being equally open to the curious visitor.

Just outside the city, across the little bordering river beyond the cathedral square, and facing the hundred-windowed walls of the seminary, lies a bastion-like spur of rising ground, round which in shady avenues and flowered expanses runs a splendid circular alameda, or public gardens and parade. Few promenades command such an outlook. On the one side lies outstretched the old gray city of the Middle Ages, with its thronged, white stone-flagged streets, and at its feet the green river valley with maize and vines and orchards; on the other side, beyond pine-woods and cultivated hill-slopes, the bleak, dark line of the sierras. The aspect of Santiago from this alameda at sunset, with the red light burning on the old stone walls, and wrapping the cathedral towers and the whole city in a purple mist, is something quite impossible to forget.

Like other southern cities, Santiago has its daily market, but it is also the scene of a weekly cattle-market, which is held, of all places, under the trees of the hill round which the public alameda winds. The spectacle of bullocks, horses, pigs, donkeys, and mules being

sold in a setting of flower-beds and ornamental walks and statues of Galician worthies is in itself sufficiently strange, but it receives an added piquancy from the curiously variegated assortment of costumes of the peasants and their animals. The pigs, a stand-by of the Galician farmer, are white and are kept remarkably clean. The Galician looks after his pigs with affectionate individual attention, often calling them by name like a dog, and in the intervals of market business may frequently be seen clipping them with big scissors, much as a sheep-shearer clips his sheep, holding the young pigs between his knees for the operation. Particular attention seems to be paid to keeping the pig's eyelashes nice and short. On the farms it is a common sight to see the wife or daughter of a good-class farmer fondling a pig like a favourite dog, the pig snuggling up to her or lying contentedly on the ground during the process. The pigs are taken to market, if the distance is short, by driving them along the road, sometimes in little flocks kept together by a man or a woman with a long branch—for they appear to be much more amenable to reason than our home pigs—or sometimes, if in ones or twos, with a cord round one leg after the Irish manner. If the distance to market is long—and some of the farmers come a surprisingly long way by road—the pigs are brought in slow-moving ox-carts, converted into temporary cages with hurdles, lined inside with brushwood and fern to keep off the fierce heat of the sun.

VII.

It would be difficult to exaggerate the picturesqueness of the Galician hill-country, where the poorest shack has its own vine-arbour overhanging its plain and often ugly front. The roadside villages of Galicia, like those of Brittany, are frequently ugly in themselves, for, whatever his virtues may be, the Gallego seems to have no sense of the picturesque himself, and the distant view of red-tiled roofs bleached by the hot sun, the white walls, and the green of maize and vine, often rouses anticipations which closer acquaintance dispels. The Gallego of the villages has not learnt the elements of sanitation or public cleanliness. On the other hand the towns, with their bright white houses, their narrow white stone-flagged streets, give for the most part a very agreeable impression of cleanness and freshness, which is helped by the southern absence of smoke or chimneys, by the frequency of broad stone balconies in the upper storeys, the cool colonnades which often run down the whole side of the older streets, supporting the upper storeys of the houses on strong stone columns, and by the numerous miradores which are such a favourite device in Spanish houses—small balconies enclosed with deep glass windows on

all sides, giving at once full opportunity for viewing what is going on, and keeping the inner rooms shady and cool in the hot weather.

Endowed by nature with a climate and conditions which should make it one of the most prosperous lands of Europe, Galicia is still the most thickly-populated province of the Peninsula. In recent years it has made great strides in the direction of attracting visitors from other lands, and the motor-bus, a comparative novelty in most parts of Spain, is already well established on the principal roads, and new services are growing up. The British tourist agencies every year send greater numbers of visitors,

and though to be one of the 'sheep' in an agency flock is scarcely the way to learn to know a country, there is a growing number of appreciative travellers who, wandering at their own will in this nearest corner of Spain, find in it the charm of unsuspected delight. And the quiet traveller may rest assured that it will be long before the combined efforts of the progressive Galician Association and the lure of the tourist agencies will bring back to Galicia's winding hill-tracks the teeming thousands of pilgrims who caused the Spaniards to give to the Milky Way their expressive name of 'the Road of Santiago.'

THE LABYRINTH.

PART II.

v.

SEVERAL fishermen hung about the smithy door, watching the process and whispering among themselves. Presently one of them lounged up to me. 'Did not the signor inquire here yesterday if a certain car had been seen on a certain night?' he asked mysteriously.

I replied hopefully that I had.

'I heard so,' he said, nodding sagaciously. 'I was not here yesterday, or I might have saved the signor a longer journey. I have only now returned from the fishing. But I saw the car . . . and much else.'

'If that is so, and you can give me any information of value about it, I shall reward you handsomely,' I assured him, handing him a twenty-lire note as an earnest of better things to come. 'The car I spoke of was that in which the Signor Cavalcanti was carried off.'

'Cavalcanti!' He started at the name. 'Let us walk yonder, signor'; and he pointed towards the shore. 'Cavalcanti!' he resumed, as if the mention of the celebrated name had given him a fresh interest in the business. 'Well, I was here on the night on which he disappeared, but I never connected what I saw then with that bad business. I had just come in from examining my inshore nets. It was after midnight, one o'clock, perhaps. We fishermen do not carry watches. I saw the lights of a car on the road near the beach. It was some distance away, but I walked towards it, wondering whether the folk in it had had a breakdown. As I came nearer, I saw three men lift another out of the car and stagger down to the water's edge. I hid behind a rock and watched them. Someone whistled, and I saw a boat steered inshore. Into this they lowered the man they carried, and then, jumping in themselves, pushed off.'

'But why did you not report this to the

police?' I asked sternly, blessing the fellow all the same that he had not done so. Oh yes, I felt very clever at that moment.

'Would the signor have had me tell this to the police—to my worst enemies?' he exclaimed with Southern emphasis. 'Give information to those who fined me for drying my nets on the beach in accordance with immemorial custom?'

I could not be angry with him. In fact I sympathised with him. Yes, the police were absurd blockheads. But where had the men in the boat disappeared to? Was there a yacht or other vessel standing off the coast?

'None, signor,' he answered earnestly—'none that was visible; on that I will stake my soul. The affair puzzled me for a while, puzzled me greatly until—until another man told me what he had seen that morning some miles out and shortly after sunrise.'

'And what was that, pray?'

'I can tell you just as much about it as that other can,' he said eagerly. 'He does not need the reward, and I am a poor man. I know the signor is not of the police. Well, this man—I need not tell you his name—was returning about dawn from the fishing and saw the periscope of a submarine about three miles from land.'

'The periscope of a submarine! Do you mean to say that you think it was to a submarine that these men carried Cavalcanti?'

'Reason would seem to agree with such a conclusion, signor,' he said sententiously, in one of those flights of 'superior' language that interlard the speech of the Latin peasant. 'There was not another vessel within miles of this place, except a few small fishing smacks.'

'And that is all you have to tell me?'

'That is all that anyone could tell you, signor. The man who saw it himself could tell you no more.'

'Well, here is another note for you. But in what direction did this submarine of yours seem to be steering?'

'Oh, straight out across the Adriatic, signor. She was going at a high speed.'

VI.

When I returned to the smithy the slight defect in my car had been rectified, and I hastened back to Ancona. After a late meal, I sat down with a pipe to try to get my bearings.

If my fisherman was right in his surmise the business was much more complicated than I had thought it. The appearance of the submarine gave quite another aspect to the affair. To me, indeed, it once more assumed a political significance, for I could not believe that a mere Russian dancer had acquired such a vessel for the express purpose of spiriting away the man she both loved and hated. The idea seemed preposterous. Nor could I bring myself to think that she could have prevailed upon any naval officer to aid her in so wild a business. But when I came to consider the political power, wealth, and amazing resources of *mesdames les danseuses* I didn't feel quite so sure of my conclusions. Such a woman was not to be easily turned from her intention and, having set her mind upon it, might well call to her assistance resources at which I could only guess. The first thing was to find out what opportunities Natalie Nordiska had of acquiring such a vessel. That she was not now in Ancona the police had grudgingly informed me. In any case I resolved first of all to proceed on the assumption that she had inspired this submarine abduction. It was clear to me that I must necessarily absolve the Government from all complicity in the affair. Again, as Cavalcanti had by no means striven to reawaken the dormant patriotism of his countrymen by diatribes against other powers, none of the neighbouring states could have desired his downfall. It seemed absurd to presuppose foreign intervention. One thing was very clear—a suspicious vessel on the coast near Ancona would at once have been remarked, and the use of a submarine seemed to point to a carefully premeditated scheme.

At the same time, I could not for the life of me discover any definite reason for connecting Natalie Nordiska with the whole extraordinary business other than the fact that she had had an interview with Cavalcanti on the night of his disappearance. This, however, seemed to me sufficient evidence on which to suspect her of being responsible for that occurrence. But where had she taken him? 'Straight out across the Adriatic,' the fisherman had said. What did that imply? She might have taken him to—I consulted a map—to Greece, to Yugo-Slavia, to Albania!

Two things weighed with me here. The

submarine had been sighted making as if to cross the Adriatic. Then why had Cavalcanti's abductors waited their chance until his visit to Ancona? So that he might be the more easily conveyed by sea to a place prepared for him? It was not likely that he could have been removed to any other part of Italy. Yugo-Slavia, too, was out of the question. National barriers would have prevented him from landing on its mainland, or in Greece, or Albania.

The problem, indeed, began to take on a hopeless complexion. And then it occurred to me to do what I might have done before. I ferreted up and down Ancona for two whole days in an effort to discover in what manner Natalie Nordiska had busied herself while in the town. Assisted by her photograph, I found at last that she had put up with a maid at a small but select hotel in one of the suburbs, under an assumed name. They had not much to tell me there except that they had hired a car for her. I hunted up the driver of the car, who informed me that amongst other journeys he had on several occasions driven her to the neighbourhood of the docks, where she had made several purchases. Yes, he could take me to the very shops she had visited. I drove to one of them and found that she had purchased there a couple of oilskin wraps such as are used at sea, some pairs of stout boots, and several powerful electric torches. Oh yes, the ship-chandler remembered the lady quite well. She was the same lady who, some weeks previously, had bought a large Government chart. A chart of what? He could not recall now, but his assistant might. The assistant did. It was a chart of the Archipelago of Quarnerolo, which lies among the more northerly Dalmatian islands. But there was more. The lady had asked him to procure for her, through a firm of booksellers in the town, a copy of Stampa's *Archæology of the Dalmatian Archipelago*.

'Now we are coming to it,' I thought.

I at once bought every guide-book on the Dalmatian islands he had in stock, and in a mood of fervent expectancy hastened to the municipal library to examine Stampa's book.

VII.

Interesting as is its subject, *The Archæology of the Dalmatian Islands* is scarcely an inspiring volume. But between its covers, I felt sure, was to be found the secret of Cavalcanti's whereabouts. I knew that many of the Dalmatian islands are occupied as summer residences by people of all nationalities—Italians, Austrians, English. Their wonderful beauty and the comparative isolation they afford cause them to be sought after by people of artistic tendencies. The larger islands are haunted by painters, while the smaller, mere islets some of them, are rented by more solitary-minded folk, who turn these detached spots into hermitages, visited

only at wide intervals by small steamers and launches, which bring occasional supplies. How in such a micronesian maze was I to discover any trace of my abducted friend? True, I might charter a yacht and cruise among the islands on the offchance of picking up some clue. But that hope seemed vain enough. No! I must seek the end of the clue in Ancona before going any further.

However, I recognised that my search must now be restricted to the Archipelago of Quarnerolo, of which Natalie Nordiska had purchased a chart. This group stretches over an area of about sixty miles in length by twenty broad, and lies nearly forty miles south of Fiume. At least a dozen fairly large islands occupy its waters, and a regular constellation of lesser islets and rocks lies between its greater cyclades. I argued that if Natalie Nordiska had specially ordered Stampa's book on the archæology of the Dalmatian islands it must have been to study conditions in some island of the Quarnerolo group, the chart of which she had procured. Hastily I consulted the contents list of Stampa's volume. Only one island of the Quarnerolo group was alluded to therein—the island of Velo.

There were, indeed, many pages relating to this island, but one of the guide-books I had purchased furnishes an account of it so brief but so useful that I append it here.

'The solitary island of Velo,' it says, 'lies about three and a half miles to the east of Lago, and is seldom visited unless by those of an antiquarian turn of mind. It presents the appearance of a large, circular rock, about a mile and a quarter in diameter and nearly four miles in circumference, honeycombed by a network of caves and artificial galleries, the origin of which archæologists refer to a prehistoric people of Pelasgian affinities. It has never been properly explored, owing to the impossibility of threading its maze-like passages, and this has led to the assumption that it was formerly one of those ancient labyrinths in which the image of a monstrous deity was secluded, as the Minotaur, the bull-headed god of Crete, was supposed to be confined in the labyrinth at Gnosus. Travellers are advised not to enter the galleries without adopting every possible precaution.'

Stampa's book alluded at great length to this labyrinth, but it was obvious that he had not visited it. He recited many legends regarding it, but I gravely doubted the dimensions of its galleries which he pretended to supply. Indeed, as in so many foreign works on archæology, the actual facts were overlaid by a mass of legend, rhetoric, and pseudo-scholarship.

At the same time I was convinced that I had hit upon the retreat to which Natalie Nordiska had taken Cavalcanti. Her purchase of Stampa's book, and the character of the island itself, were

both eloquent of the justice of such a conclusion. I made up my mind quickly—rashly, some people might say. I resolved to go to Fiume and there charter a yacht to cruise about the Archipelago of Quarnerolo. I would take Cavalcanti's man, Eligio, with me, if he would go. The poor fellow was still hanging on in Ancona, as if hoping against hope that his master, whom he adored, might suddenly reappear as miraculously as he had vanished.

When I told Eligio of my plans he at once volunteered to accompany me, and so one fine morning, after a long and wearisome journey, we found ourselves in Fiume, that city of Italy's hope and agony and ultimate triumph.

I had little difficulty in chartering precisely the kind of yacht I required, a craft of about forty tons, specially suited for cruising among the islands. After we had laid in such stores as we needed, and the usual formalities had been complied with, we set sail one cloudy October morning, heading down the Gulf of Istria with a light north-easterly wind behind us. I had not seen fit to acquaint the commendatore and crew of four with the exact purpose of our cruise, which they evidently imagined was merely a pleasure trip.

That night we arrived at the northerly fringes of the Quarnerolo group, and anchored off the island of Lago, about three miles from Velo.

Then I gave the commendatore a general idea of what we were there for. At first he was uneasy, and seemed to think that some political significance attached to our cruise. But I reassured him as to this, and I think he believed me, although he certainly retained the impression that I was one of the craziest 'mad Englishmen' he had ever encountered. Then, seeking out Eligio, I told him that that night I intended under cover of darkness to creep within half a mile of Velo, showing no lights, and reconnoitre in a small boat in which he would accompany me.

(Continued on page 728.)

TO THE MADONNA OF THE 'STEADFAST EYES.'

THE restless murmur of an angry sea,
The moaning of the wind in stay or shroud,
The moving blackness of the storm-tossed cloud,
The placid stillness of a southern sky
Soft-mirrored in the gently swaying tide—
All these alike before your eyes shall pass,
As dim reflection of a shadow-world
Whose darkly looming spectres, Sin and Grief,
To our unseeing eyes alone have form
Clear-visioned in their frame of time and space.
But still beyond the shadow-play of time
Your eyes shall pierce the mystery of 'Was,'
And, gazing past the sunrise of 'To be,'
Find Peace and Hope in that which always 'Is.'

L. D. DU TOIT.

SOME DISCLOSURES OF AN AUTOGRAPH CATALOGUE.

By JOHN HORNE, F.S.A.Scot., Author of *A Canny Countryside*, &c.

'BURN this letter.' So concludes an epistle by George Borrow to his mother. The subject is private. He is uncomfortable in his work, and is inclined to resign his position as representative of the Bible Society. But he wishes the matter kept quiet. 'Burn this letter and speak to no one about it,' he urges her. Yet here it is, offered to anyone who will pay for it! Perhaps it is human nature to keep what we are implored to destroy; but the reasons for this frailty, could we analyse them, might turn out to be trivial enough. Anyhow, the habit—for such, I fear, we may call it—is not without value. Scraps from private letters often tell us more than pages of laboured biography. They reveal incidents of circumstance and temperament which enable us more faithfully to picture the real person. As they are generally of such a fugitive nature they escape the net of the dignified biographer. And there is much encouragement to humble souls in the revelations of the irritations and struggles of greater people.

It was well known that Blake was subject to fits of temper and even spleen, which alienated many of his friends; but a few lines from a letter in this catalogue are illuminative, and show that rare soul in the toils. 'I begin to emerge from a deep fit of melancholy,' he writes, 'melancholy without any real reason for it. A disease which God keep you from, and all good men.' Overleaf is a letter from Charlotte Brontë which, singularly enough, sings something of the same sad dirge. She is hard on herself. 'Many a pining and repining hour, many a day of fruitless despondency, stands against me in the book of the Recording Angel; many silent but impious rebellions are registered there.' Then she softens the confession by the reflection that 'I believe there is hardly a human being breathes but might say as much.' There are several Nelson letters in the catalogue, and they confirm the opinion of his almost relentless jealousy about his 'beloved Emma.' He writes as a Frenchman might write. A certain prince is anxious for Lady Hamilton's acquaintance. Her Horatio will have no weakness displayed. 'May God bless you and make you firm in resisting this Vile attemptor. May God blast him. Be firm. Go and dine with Mrs Damer on Sunday; do not, I beseech you, risk being at home. Did you sit alone with the Vilan for a moment? No, I will not believe it. Oh God, oh God, keep my senses; do not let the rascal in.' Was ever lover more dramatic? But great men must be great in all their attributes. Like commoner mortals, however, he has his spells of disappointment and belittle-

ment. In another letter to the same lady (whom he addresses as Mrs Thomson, as he occasionally did, when desiring secrecy) he uncovers a human heart. 'I have had my days of glory, yet I find this world so full of jealousy and envy that I see but a faint gleam of future comfort'; but he hopes 'to find in the smiles of my friends some alleviation for the cold looks and cruel words of my enemies.' Less ambitious aspirants for the world's medals may wisely extract some useful philosophy from this frank avowal of our incomparable hero.

Not infrequently the writers disclose hints of their unguessed sufferings and worries. Famous and obscure are alike in this very natural propensity. One scarcely knows in what mood to take these lines from a letter by George II. to his son, the Prince of Wales: 'The Professions wch. you have lately made in Your Lettrs for your Particular Regard for me, are so contradictory to All your Actions that I can't suffer my self to be impos'd on by them. You shall not reside in my Pallace, which I will not suffer to be made the Resort of Those who foment the division you have made in my Family. It is my Plasure that you leave St James's with All your Family.' This is so emphatic as to sound like comedy; but it proves that palaces are no more exempt from inner feuds than cots. R. D. Blackmore is pained by an estrangement from his brother, who loses no opportunity of showing his hostility; yet the writer is quite in the dark as to the cause of it all. So human, too! In an epistle by Swift to John Barber he gives rather a moving account of himself. 'As to my self, I am grown leaner than you were when we parted last, and am never wholly free from Giddiness, and weakness, and sickness in the Stomach. I ride a dozen miles as often as I can; and I always walk the streets except in the night, which my head will not suffer me to do'—being a neurotic subject. But he has some consolations. 'My chief support is French wine, which although not equal to yours, I drink a bottle to my self every day.' No situation in life is wholly unrelieved! Mark Twain has trouble of another kind. He has been lecturing to a disappointing audience and is nettled. He is in New York and writes from Langham Hotel to his agent. 'The fog got so thick, and so depleted my audience, that I got desperate. I can't talk to thin houses. I would so cheerfully have paid half-a-crown to every man who would come, but I couldn't say that, and so I had to talk and go on suffering.' It is gratifying to the humdrum man to realise that Mark Twain himself cannot find humour in every situation, even when it has an aspect which (as in Mark's case)

suggests that quality to bystanders. One other distinguished character is also fretted; and his letter shouts for quotation. Whistler has had some trouble with his secretary. An application for money sets this eccentric soul on fire, and (writing from the Continent) he answers: 'Your complaints of want of money I have no sympathy with for reasons that you well know. You were idle and ill behaved habitually long before I came away. Why should you be furnished with money beyond your salary, that your friends may still believe in your sham pose of ease and influence?'—which is biting enough, in all conscience. But, like the impulsive swaggerer he is, he surrenders to a new whim, and adds, 'I enclose cheque for two pounds—which is rather a weak conclusion to what I am writing.' It is; but the conclusion is wholly creditable to his whimsical heart. One wonders what could have tempted the secretary to preserve this defamatory letter.

Perhaps those letters which discover the private opinions of great men, and especially of each other, are the most inviting. In this catalogue are not a few; and although the particular references are short and scant, and buried among a mixture of detail, they are quite vivid. Here, for instance, is Wordsworth letting slip his opinion of Wellington in a line or two. 'As to the Duke of Wellington . . . poetically treated he may pass for a hero, but to the searching eye of the Historian, and still more to the biographer, he will, I apprehend, appear as a man below the circumstances in which he moved.' In the same letter he alludes to Byron as 'the bold, bad Bard.' In these quotations the gentle poet of the Lakes justifies the reputation his biographers have given him of possessing some other qualities as well. In a similar belittling strain, Browning has a pinch at Dickens—which is more surprising. He rates Victor Hugo far above our English writer, and asks his correspondent to compare the two in scenes to which they have both set their hands. Then he adds, 'Since, two or three years ago, I went regularly through all the romances of the gifted Frenchman, my admiration for our countryman has paled down paler and paler.' The comparison with Hugo is rather unfortunate; but Browning's bias is evident. The biographer of Dickens, John Forster, is represented by a letter to Ainsworth, which, although not issuing any opinion of him, indirectly delineates Ainsworth as a lazy and tardy worker. He is urgent. 'I only wish I could prevail on you to write on my principle—to fill a certain quantity of paper every day—no matter how. For God's sake consider this—revising all errors of the MS. after it is finished. . . . All your friends are waiting for you. I speak for them all, as yielding to none in affection or hope.' There is a letter by Hood, in which he writes of Lamb, which must not be omitted. 'Lamb was an

odd man,' he says, 'and a shy one. It was necessary to know him to understand him—to understand, to like him. I was very intimate with him when his neighbour. We spent three evenings a week together at one house or the other, and I found him an excellent friend and the best of critics. I saw him to his grave.' This short but touching picture of the two intimates is very unaffected and sweet.

There are lively and skittish passages in some of the letters, which demonstrate that the big men can be boys at play when they like. Beaconsfield writes a gossip epistle to his sister; and in the course of it he refers to Bulwer Lytton in the following comic fashion: 'Bulwer has taken a new house in Savile Row—de street ob de corncutter and all that sort of respectable gentlemen.' How much is conveyed in a sentence like this—raillery, fun, criticism, complacency, and what not! In a somewhat parallel mood of poking witticism, Lewis Carroll declares that 'the qualities I like best in children are (1) Pride, (2) Ill-temper, (3) Laziness and deceitfulness (these two always go together, they set each other off so well). . . . He writes thus to a little friend because some of the girls he would like to know are said to have one or other of these inapposites! Butler of *Erewhon* (whose letters, by the way, are very rare) must be the last example of this happy group. He airily distinguishes between lying and inaccuracy in this entertaining strain: 'I don't mind lying, but I hate inaccuracy (copyright). This last is because I so very often find myself inaccurate & it gets me into such holes. I very often lie, too, but I generally have my wits about me when I do this, & it gets me out of more scrapes than into them, whereas inaccuracy being guided by no intelligence is like walking down a dark lane at night & tumbling over half a dozen posts.'

IN THE BLACK SALT MARSHES.

WITH fever-laden eyes and teeth chattering,
As the ague gripped them;
With hands buried deep within their hands,
They sat in the Black Salt Marshes—
Beings who once had been men.
Slowly the sluggish tide went crawling seaward,
Leaving mud banks, where the cayman crawled;
Silent the poisoned mist rose upward,
Stifling God's own purer air.
Then from across the oozy Black Salt Marshes
Rose a ranting, wild sea-song;
They with fever and death-haul on them
Straightened their backs and sang.
As closed the long shadows about them,
Roared they their ranting sea-song—
Then rose with the marsh-fever on them
And chorused that song again.
Thus they met *Death* in the Black Salt Marshes—
Sing a wild refrain;
Thus they met *Death* in the Black Salt Marshes,
Men of the Spanish Main.

CAMPBELL OF SADDLE.

IN THE VALLEY OF DECISION.

(3) OLD BLUNDERBUSS.

By ASHLEY L. BARNES-LAWRENCE, Author of *Jacob Bateman's Ladder*.

CHAPTER I.

I.

WITHIN a mile of my rectory, and just outside the borders of Wingate Parish, there is a fine stretch of common, where it is possible to ride as hard as you please for a couple of miles without drawing bridle.

The turf is not so tough and springy as, let us say, on the Downs between Brighton and Lewes—that grand Southdown country which I used to enjoy when going at speed with the Southdown foxhounds, or nosing along after a hare with the Brookside harriers; but still on Rudstone Common it is possible to get a good gallop, and towards the common, therefore, it was my custom to turn my horse's head as often as opportunity occurred. He was a powerful Irish chestnut, with not particularly good shoulders, so that he was a rough goer, but he was amazingly good at getting over the ground, a fine trotter, and a hard galloper.

I had just pulled up three miles from home, and as 'Oolaboy' was rather blown, I stayed for a few moments to breathe him, and to enjoy that lovely view of a well-wooded undulating country which opens upon one from the corner of Birkin Copse. Just then the beat of a horse's feet was to be heard in the direction of Wingate, and it was evident that whoever was on our trail was coming along at a great pace. And sure enough, in a couple of minutes a rider turned the corner, and with a view-halloo, and shaking his hunting-crop at me, he was speedily at my side.

'Caught you at last!' he cried. 'But what a chase you have given us!' It was my old friend George Ullathorne.

He told me he had been to the rectory, and on learning the direction I had taken had followed hard in pursuit.

'You will come back and lunch with me,' I insisted; and so he did.

Ullathorne was an old school-fellow of mine. At the close of school life we had been at Oxford together; and now, quite recently, he had come into my neighbourhood, about eight miles from me, having bought a very nice little place there, with pretty surroundings and good gardens. He was a bachelor, fond of outdoor life and devoted to hunting, and had taken, he informed me, the earliest opportunity of hunting me up.

This, then, was the renewal of our earlier friendship, and before long I was calling him 'Old Blunderbuss,' as we all used to do in the old school and college days long gone by.

II.

Except that he was now a burly country squire, and stouter than he used to be, Ullathorne was the same warm-hearted and impulsive fellow, of somewhat careless speech and manner, whom I had known before. At luncheon we recounted some of the scrapes he was always getting into when we were younger, and his roars of laughter showed how keenly he enjoyed the recollection of them.

No wonder he had been called 'Blunderbuss.' But of all the scrapes my friend ever got into, none was so big and so bad as the one still in front of him that day when he galloped after me and caught me at the corner of Birkin Copse. If he had never caught me perhaps the colossal blunder of his life would never have been perpetrated. But it is impossible to know these things with any certainty. All we can say is that, in a sequence of events, we are sometimes led to believe that a really important matter has hinged upon the veriest trifle.

'I'm off to New York next week,' I happened to say, and went on to outline my prospective journey and month's holiday.

He listened with evident interest, and at last broke in, 'Now, my dear man, why shouldn't I come with you? Do let us arrange it. Of course you'll go and stay with your friends there, but I shall be quite happy for a few days in my old quarters at the Washington Hotel. I've not seen New York for an age,' he said; 'but the voyage is the thing, a sniff of sea air, and your good company.'

'I ought to have told you,' I said, 'that I sha'n't be entirely unattached on the voyage, for I've been asked by my old friend General Maxwell to keep a fatherly eye upon two of his daughters; they are going across in company of an aunt of theirs, but I've promised to do what I can to see to their comfort.'

'Oh well, then, I'm afraid I shall be *de trop*,' and he seemed to be disappointed. Probably his proposal to accompany me would have fizzled out, but, upon reflection, it occurred to me that, in the circumstances, his companionship would be a decided relief to me as an esquire of dames, if only he cared to come.

So presently I referred to the subject again; and as, in answer to his questions, I was able to depict all three ladies in an attractive light, and as quite *comme il faut*, I was pleased to find that he still wished to accompany me.

It had been settled with the ladies that I

was to meet them in London, and take them down to Southampton, and see them safely on board the White Star liner *Oceanic*; so Ullathorne arranged to join me there.

III.

On the appointed day I took my party down with me, and we went on board. The ladies disappeared into their cabins; and I was free to inspect my own quarters and take a general look round.

Ullathorne was to share my cabin, and now, as there was no sign of him on the vessel, I began to be anxious, and to keep a look-out for his arrival. It was just like 'Old Blunderbuss' to be slow and sure: 'slow to depart, and sure to be too late.' Or, if he was not going to be 'too late,' he generally made up for previous slowness by a hurry and skurry at the expense of all other persons, making them skip about while he affected a judicial calmness which was designed to show that every one else was late, or slow, except himself.

I had just about given him up as a bad job, for all the usual signs and signals for departure had been made, when, with a rush of porters, there he was. He really had to run for it, and in a few seconds he and his luggage were hustled over the gangway.

But he was quite his old self—immensely amused at my anxiety, and inclined to think he had shown exceptional prowess in overcoming difficulties such as few travellers had ever had to encounter.

That evening he ingratiated himself with my ladies, and paid great attention to Miss Maxwell, the aunt, and it was evident he made a very favourable impression upon her and upon the young ladies in her charge. The fact is that Ullathorne could be a very amusing fellow when he liked, and his best stories were always those he told against himself. He had smiling eyes and an open countenance; and the very tones of his voice, and the easy dignity of his somewhat massive frame, radiated a cheery contentment, and made him a pleasant companion.

But it was somewhat of a surprise to me to find him day by day devoting himself in a half-brotherly, half-fatherly fashion to the young ladies. I had not regarded him previously in the character of a ladies' man, and chaffed him about it.

'But, my dear chap,' he exclaimed, 'you don't come across such nice girls every day! Don't you think they're charming?'

And, as a matter of fact, they were thoroughly nice girls—refined, educated, unaffected, intelligent, friendly, and withal attractive in appearance and manners.

IV.

Elizabeth was the eldest of three sisters, her age about twenty-four; Henrietta came next,

two years younger; and Letitia the youngest—my special pet, who had stayed at home on this occasion with her widowed father—was still in her teens, though quite grown up.

Probably it had never occurred to the parents when they named their offspring Elizabeth, Henrietta, and Letitia, that before they left the nursery they would be known as Betty, Hetty, and Letty; but so it was. By intimates of the family they were never called anything else.

Betty was, perhaps, a little more thoughtful and grave in manner than Hetty, as became the eldest of the family; and for the past three years, since her mother's death, she had tried to take her mother's place.

Hetty, who was a little taller than her sister, was also more vivacious, and was described by Ullathorne as 'great fun.' She was a good horsewoman, and good at sports, and it seemed to me that if friend Ullathorne at his time of life was at last going to succumb to female charms, he was in a fair way of sacrificing himself upon the altar of Miss Hetty—that is, if she would have him.

Certainly he and she speedily entered into a state of mutual understanding and *camaraderie*, though, of course, the sort of flirtation they seemed to engage in might have been, like many another flirtation, all on the surface.

An unfailing source of amusement to our party was Miss Rachel Maxwell, the aunt. She had the apparently incurable habit of calling people and places by the wrong names. In fact, she was quite a Mrs Malaprop, so that when she addressed Betty, she as often as not called her Hetty, and *vice versa*; and when she referred to any one of the three sisters in general conversation, Betty, Hetty, and Letty, it became a very complicated question whether she really meant the one she had spoken of.

Hetty evidently thought all this to be great fun, and rather laid herself out to make 'confusion worse confounded'; for perhaps the funniest part of it all was that Ullathorne himself, being a real 'Blunderbuss,' blindly followed Aunt Rachel into her maze of ambiguity, and with an injured expression upon his face often seemed unable, for a while, to collect his thoughts, and to say with certainty who was who.

We were all very happy together, and were favoured with pleasant weather, and too soon the voyage was over.

V.

Arrived at New York, we separated. The ladies were carried off by an Americanised uncle, who came down to meet the *Oceanic*; George Ullathorne went to his hotel; and I hurried to catch my train for Belleville, as the friends with whom I was going to stay resided there, some thirty miles away.

Two days afterwards a letter reached me

from Ullathorne, and as it rather startled me, and gave me pause to think, it may be as well to give the important part of it *in extenso*.

'My dear old chap, I want you to be a good friend to me—not for the first time in my life—in a matter largely affecting my happiness.

'No doubt you noticed on board ship how greatly I was taken with the eldest daughter of your old friend General Maxwell. Of course I know there is a considerable disparity of years between me and the young lady, but I think she is fully aware of my feelings towards her. I did not venture, before we parted, to make a definite proposal of marriage; for in the circumstances it seemed hardly fair to her, and more decent to wait till she got home again, and then to ask her father to allow me to address her.

'But since we said our "adieux" I have felt so desperately lonely in this crowded place, and so tormented by hopes and fears, that I have rushed the matter, and have written to-day to her father, and enclosed a letter for him to give to her as soon as she gets back.

'They will be back, she told me, in a fortnight's time, and as I daren't trust myself to return by the same boat, I shall clear out of this as soon as possible and go home.

'Now, dear man, what I want you to do is to back me up if paterfamilias should write to you about me. You and he are old friends, and I have told him that you know all about me, and that we were intimates at school and college. To some extent also I have felt that the young ladies while on board the *Oceanic* were in your charge.'

There was more to the same effect; and it was obvious not merely that Ullathorne was head over ears in love, but that he meant business.

It occurred to me how joyfully many a match-maker of the opposite sex would have revelled in taking a hand in such a business; but, for my part, I have never wished to get rid of my bachelor friends or to lose my lady friends by marrying them off; for, in the nature of things, marriage does get rid of them, by transferring them to a different plane, if not to a different hemisphere.

But, of course, I promised George I would do what he wished, and congratulated him heartily on his excellent choice of a wife, and told him he would be a very lucky fellow if he got her.

I did not tell him that I thought he was a fool to have rushed matters instead of waiting patiently until he could have called upon the general *in propria personâ*. Nor did I tell him that I had never thought of him in connection with the eldest girl Betty, as he had seemed to devote himself on the voyage to the younger sister.

But then, of course, I don't profess to be very cunning about these matters, and George's

byplay with Hetty may have been one of a lover's modes of approach to Hetty's sister. I remembered also he had been very attentive to the aunt, probably for the same reason. Let us hope that the aunt had not been misled by such subtle devices into thinking that she herself was the intended.

However, after pondering the whole subject, it seemed to me that Betty was just the sort of girl to train up Master George in the way he should go, and I had no doubt he would make a thoroughly good and devoted husband. He was able also to assure to her a thoroughly good position in society, with adequate means; and altogether it wasn't a bad catch for her.

The only thing for me now was to await the development, or *dénouement*, or whatever the result might be.

CHAPTER II.

I.

NO further news of Ullathorne's affair reached me until my return home, when amongst the letters awaiting me there was one from General Maxwell, and one also from George himself.

The general invited me to come and spend two or three days with him at his place in Berkshire, and very particularly specified a day for my arrival, because he expected another visitor on that same day. He went on to tell me that this visitor was an old friend of mine, George Ullathorne of Stapleton Hall, who had just become engaged to Hetty, his second daughter.

'It is his first visit to us,' he added, 'and I can't say I know him very intimately, though we have met once or twice in former times, but of course I know all about him; and I may say that the fact that he lives near you, and is a personal friend of yours, has weighed with me in giving my consent. My sister also, who was one of your party to New York, can't say enough in his praise. He wrote me a very good sort of a letter from New York, and is prepared to make a handsome marriage settlement. I can only trust that my little girl will be happy.'

George Ullathorne's letter also announced the engagement, and was full of exuberant self-congratulation; and he expressed his gratitude to me for being the means of introducing him to such happiness.

I noticed that in referring to his fiancée he called her Hetty, and as this tallied with what her father had just written to me, it was evident that in his previous letter to me at New York he must have blundered in telling me that it was the eldest daughter who had captivated him. At the first, as I already have stated, it had seemed to me that his choice was likely to be the second daughter Hetty, and not Betty; and

then I had had to revise my ideas when he informed me it was the eldest girl. And now I had to revise them once more. Well, Hetty must be the one to be congratulated then, and not her sister, when I went into Berkshire to pay my visit.

II.

It was now Saturday, and Tuesday was the day I was expected; and as George also was to be there, the occasion was to me a very interesting one.

Upon my arrival there was, of course, a good deal of very hearty hand-shaking and congratulation. The general, as usual, was full of welcome; and so were the girls; and Letty kissed and hugged me as she always had done from earliest days.

'And what's become of Betty?' I asked.

'Oh, Betty would go to town,' said her father, 'and I'm sorry she will miss this opportunity of seeing you. She is staying with my sister Rachel, and I expect she'll be there a week or two.'

'And you are expecting Ullathorne, are you not?'

'Yes; he ought to arrive pretty soon now if he's to be in time for dinner. We dine at half-past seven.'

It was not until a few minutes after that time that I set eyes on him. In fact he kept us all waiting for dinner; and at dinner it amused me to notice that, seasoned man of the world as he was, no youth in his teens could have been more nervous and ill at ease than he.

Possibly this was not unnatural in the circumstances; but during dinner that night, and throughout the evening, the thought occurred to me that George would have presented a more youthful aspect, in harmony with the occasion and with the appearance of the bride-elect, if the exuberant good spirits which he had displayed on board ship had not deserted him.

There had been plenty of sunshine about him then, and his wit had sparkled; but now it was as though the sun had retired behind a cloud. He was absent-minded, and looked worried and out of sorts.

My young friend Letty, however, did her level best to redeem the evening, and played and sang, and radiated such a fund of merriment and good-humour that my heart cried 'God bless her!' For, to tell the truth, although I had had really nothing to do with promoting this engagement, it was just possible that Hetty's father thought I had.

Before we retired to rest the general managed

to get a bit of a chat with me, and it was a relief to my mind that he had taken a liking for his prospective son-in-law. He commented, however, upon Ullathorne's gravity and reserve, for he had been given to understand that this was not usual with him.

III.

The evening wore on, and about half-past eleven we all said good-night. In due course I was just about to hop into bed, when a gentle knock at my door announced a visitor.

'Who is there?' I challenged. And on my opening the door, who should enter but George himself.

'May I come in?' he said. 'So sorry to intrude upon you, but the fact is I've been wanting all the evening to have a word with you in private. I am in a most awful huddle. Something must be done about it at once, but I haven't the least idea what I ought to do.'

'Well,' I said, 'I must get into bed, and you shall sit in that chair and tell me all about it.'

And so he did; and if, poor fellow, he had looked worried and ill downstairs, he looked ten times more so now, for in the privacy of my room he made no effort to conceal his real feelings.

Our conversation lasted a long time, for he told his story disjointedly, and it was necessary to ask him a good many questions; but the gist of the matter was as follows.

It is to be remembered that in the letter he addressed to me at New York he stated that he had fallen head over ears in love with General Maxwell's eldest daughter, and that he had written to the general enclosing a letter to the daughter, and this letter contained a definite proposal of marriage.

It is also to be remembered that upon my return home I had received two letters, one from the general, and one from George, announcing a definite engagement, and mentioning Hetty as the young lady in question.

But now it appeared that George had addressed his letter to Hetty, under the impression that this was the name of the eldest daughter, to whom he had given his affections.

What would have happened if Hetty had not accepted him, it is impossible to say. Perhaps the blunder would never have become known. But, poor girl! and poor man! she did accept him; and of all the blunders that poor old Blunderbuss ever perpetrated, surely this was the worst. He had actually proposed to Hetty, and had been accepted by her, when all the time the girl he had set his heart upon—oh, it was too awful for words!

(Continued on page 734.)

SOME UTILITY HERBS.

I.

THERE are a few plants intensely bitter to the taste that used to be regarded with a respect almost uncanny. Bitterness really seems to have been looked upon as the mark of pharmaceutical perfection. Of such plants is Rue. Rue was the specific for the pest, and formed the chief ingredient in plague-water. The houses during a visitation of that dreadful scourge were permeated with the stink of rue, the bare spaces at the back-doors were sprinkled with rue-water, and people went about their business with their nostrils stuffed full of its leaves. Rue keeps 'seeming and savour' the winter through, and botanically is very interesting on account of the beautiful provision it possesses for the fertilisation of its flowers.

Wormwood and other species of *Artemisia* also for long centuries have been notable among bitter herbs. The name is supposed to be a modern form of an Anglo-Saxon original, which alluded to its employment as a destroyer of moths. Nearer our own times it was esteemed as a spring tonic, but one has to look up what Nicholas Culpeper has to say about it to comprehend how much wormwood was thought of. Now, when its honourable connection with medicine has lapsed, the pretty gray foliage in which it clothes itself in summer and autumn renders it, along with rue, an acceptable addition to the flower-garden of the æsthetic in temperament.

A far more popular herb than this is Southernwood, so loved for its peculiarly searching fragrance; its popularity demonstrable from the large number of names it is endowed with. Its value in pharmacy is now overlooked, yet its physical properties were known to Horace, who remarks on the foolishness of the uninitiated prescribing *Abrotanum* to the sick. Yet those persons, if there be any left, who carry a sprig of Applingie meekly to church are unconsciously acting on the principle that induced sixteenth-century people to carry it and other aromatic herbs about them as a preservative against infection. Applingie, it may be remarked, is a very interesting Scots word, which can be traced through French to the Latin *Abrotanum*.

The Common Mugwort is another of the *Artemisias*, and along with Jack-by-the-Hedge, Archangel, and Bryony, is a frequenter of old hedge-banks. Mugwort at one period enjoyed a splendid popularity. Mothers of anæmic daughters fed them on 'Nettles in March and Muggarts in May.' Now it is passed on the wayside without recognition, save perhaps by

some precocious schoolboy who smokes its leaves as a substitute for tobacco.

The last of the genus worth mentioning is the Sea Wormwood. Up to about thirty years ago villagers near the coast between Dunbar and North Berwick gathered this herb annually, and of its dried leaves made a decoction that the members of the family drank in spring. It was regarded as a prophylactic that assured a state of robust health during the succeeding months of the year.

II.

Sea Wormwood grows abundantly near the mouth of the East Lothian Tyne, where it was wont to be gathered. Near by is a colony of Henbane, whence is derived the invaluable hyoscamine.

Henbane in many respects is a most interesting native plant, and that in spite of its coarse foliage and flower and the distinctly revolting fœtid smell it emits. Yet the plant is of great value, and during the Great War its habitats were diligently sought for, and, when found, its seeds carefully gathered to satisfy the need for hyoscamine. Henbane at first sight would lead one to suppose that the name alludes to a bane or poison fatal to domestic fowls, though many ingenious attempts have been made to show that it means something else than a purpose so vulgar. However, it is always worth while to hark back as far as possible to find what people of earlier times called things. Therefore, when we get 'hennedwole' as one of its earliest names, the case seems clear for hen-poison, dwole or dwale being a known name for a general poison that stupefied. It has, on the other hand, too readily been assumed that the 'juice of cursed Hebenon' was derived from the *Hyoscyamus*. Henbane, again, has for centuries been associated with witches and quack-salvers. The method employed by the latter to cure toothache is mentioned by a sixteenth-century herbalist, and the operation of the inhalation is described more than a century later by Dr Salmond in the *British Herbal*, thus: 'Mountebanks and Quack-Salvers pretend to cure the toothach with the fumes of the burned Seed and to bring many Worms out of the Teeth and Gums therewith. It is true that the Fumes of the Seed will give ease in that pain, but the pretence of Worms falling out of the Teeth is a Cheat which they put upon the bystanders, for these Vile Fellows, to deceive those from whom they would get Money, cause the Patients to hold their Mouths over a Bason or Bowl of fair warm Water, they receive the Fumes of the burning Seeds up a Funnel: these Seeds are stuck fast upon a

Stick, with a great many bits of very fine Lute String, which being mixed with the Rosin and fixed on the Stick with the seeds afterwards, while the Rosin is hot, as the Rosin stick is then kindled and burns melting the Rosin, and as the Rosin burns the Fumes go up the Funnel into the Mouth, and the Seeds burst and the very small bits of the Lute string fall into the Water, which seem to move or stir themselves, whereby the lookers-on think them to be live Worms come out from the Teeth and Gums, whereas in truth they are nothing but these bits of Lute String mixed and blended with the Rosin.' After this involved description and exposure, it may be added that a simpler method, probably still in use among herbalists, was to cast the henbane seeds on a shovel of glowing embers, catch the rising fumes in a tumbler which was immediately thereafter filled with hot water, the steam being inhaled by the sufferer. There is no reason to doubt that this simple process cures caries in the teeth.

III.

Folklorists know well that the pre-Reformation church bothered itself about the food of the people, at least during certain periods of the ecclesiastical year, some of these old customs remaining till the present day. Thus in the north of England, perhaps still, but anyhow at a not far distant date, people on the second Sunday preceding Easter ate roasted peas. These were the common gray field peas and were called Carlins, while that Sunday was known as Carlin Sunday. There is an old couplet showing the sequence of the Sundays in Lent, in which carlin appears:

Tid, mid, and misere,
Carlin, palm and pace Sunday.

The 'a' in this case has the very broadest accent, while in carlin, denoting an old woman, the 'a' is acute. The latter word is clearly the feminine of Carle, but the other carlin is obscure. There is no pea that has ever been known by that name, and the use of the pea was not confined to a religious ceremony, for carlins formed a dish at Border merrymakings, as we find in a line of an old song, where there were 'Carlins baith sodden and raw.' It has been assumed that the cooking of the legume may have evolved as a reminder of the time when the painful penance of walking to church with uncooked peas in the boots of the penitent was an ecclesiastical punishment.

There was another dish usual in the north of England, but confined to the western counties and extending as far south as Lancashire, carlins, on the other hand, being perhaps solely confined to Northumberland and Durham. This was called a herb pudding or arb puddin', and there were other ways of pronouncing it according to local peculiarities of speech. And

here it may be noted that although this was usually an Easter dish, herb puddings or pies were common even in the south of England, as is demonstrated by a recipe contained in *Markham's English Housewife* (1623, 3rd ed.). Also the dish is not by any means out of date, though one may look in vain for it in modern cookery books. The writer has frequently partaken of herb puddings, which, when properly mixed and cooked, are appetising and rich in vitamins.

The dish may be had at any time of year, and the selection of vegetables varies with the seasons, but in the case of the Easter puddings the choice was restricted. Though no recipes I have seen are exactly similar, yet in every instance they contain a few herbs of the same kind.

IV.

The following is extracted from a periodical of date 1849 for an Easter pudding. Mercury, spinach, coleworts, young nettles, turnip sprouts, white foxglove, easternman giants or ledges, one leek or a few chives, parsley and sorrel, a small quantity of pearl barley, with condiments to taste.

Some of these ingredients are known to everybody; the identity of others is obscure, and from time to time questions appear in appropriate periodicals asking what they may be.

Mercury is *Chenopodium Bonus Henricus*, and is still cultivated in Lincolnshire under the vulgar name. Up to the time of Linnæus, *Mercurialis* was its botanical designation, hence mercury. However, it is most commonly called Good King Henry, to distinguish it from the poisonous mercury of damp woods. Many good people have thought that they were indebted to Henry VIII. for this herb, whereas 'king' is an interpolation of some amateur botanist unaware that it is the Guter Heinrich of the Germans. The plant is frequently to be seen near the site of an old garden, and close to the decayed village of Preston, in East Lothian, it still grows abundantly opposite one. The leaves, which are slightly bitter, are the parts used, but the young stems, divested of foliage and peeled, were also at one time eaten, being cooked like asparagus, to which they assimilate in taste.

Concerning Nettles, it is a well-attested fact that the young shoots were very widely in request as a spring vegetable. Need one remark how among the self-laudatory accomplishments of Andrew Fairservice was that of cultivating nettles? There is even a rhyming catch about 'cowing' nettles; and, strange as it may appear, of two varieties that with reddish stems and dusky leaves was considered superior to the bright green variety. Nettles to the taste are more sharp than bitter.

Turnip Sprouts are the young growths from old roots in spring, and are very bitter. White Foxglove is not the plant which we know as such, and which, indeed, would be a rather dangerous addition, but the *Campanula latifolia*, which would yield its young shoots, similarly to nettles. It could be only of local use, as it is not a common plant.

The next in the list is by far the most interesting of all, and has been the cause of more inquiry than all the others put together. The forms of the name are very many. Easterman Giants is properly Easter Mangiants. The form Easterledges is common, and as the name is traced back we find it simplified to Oisterloyte and even Oisterich, which gives a clue to the origin of this certainly strange appellation. The particular plant is the Bistort (*Polygonum Bistorta*), and how it happened to be burdened with these names is explained from the fact of far-away physicians believing it to be the *Aristolochia* of their Greek medical forerunners. It is not difficult to understand how Oister became Easter and loyte ledges, but mangiants is not so easy to place. I think that 'giants' may be put out of court, and the supposition that mangiants is French is as likely as any.

The other vegetables call for no remark.

But these herb puddings possess an interest more far-reaching than the names of the vegetables of which they were composed. It will be noticed that several of these are bitter, and others sharp in taste. Does it not strike one that besides being a food suitable to the Lenten season, these Easter puddings may have been representative of the bitter herbs of the Jewish Passover?

V.

I approach with some diffidence a part of my subject which may appear too common for serious discussion—that of the homely Cabbage and its affinities, all sprung from an original stock. The cabbage itself might well be hoary, if antiquity would impart that condition, but older still is that delicious winter vegetable called Kale, better known in the north as Greens. The Savoy has at least three centuries of usefulness to its credit, the Cauliflower quite as lengthy a period, though Broccoli has only two hundred years or so, that is, as an inmate of English gardens; Brussels Sprouts not much more than a hundred years, though cultivated previously on the Continent for an indefinite number of years. There is every reason to believe that cabbages originated on the Continent too, for the figures of these in early English herbals were printed from blocks drawn for foreign herbals, and it may be remarked of useful vegetation in general that facts point to its original having been exotic and not indigenous.

As already noted, a coarse kind of Kale or

Colewort would be the earliest type of the vegetable. The parts eaten were the midribs of the leaf and the pith of the stem. Not so long ago the pith was utilised for food in the northern counties and in Scotland, and probably it may still be occasionally. Elderly women thirty years ago, when preparing cabbages, used to scoop out a bit of the pith as a tit-bit. Readers of Burns need no reminding how the lasses on Hallowe'en did the same—

And gif the castock's sweet or sour,
Wi' joctelegs they taste them.

The old song already put under contribution tells us that at the wedding feast—

There'll be costies and reeforts
An' skink to sup 'til ye rive.

Also there is an old saw inculcating liberality in these words, 'Cast the cat a castock: every day's no' Yule day.' The castock is Scots vernacular for kale stock, a derivative of *caulis*.

Of broccoli it may be noted that it was almost unrecognised until the thirties of the eighteenth century, though John Evelyn, better known for his Diary than for his profuse output of horticultural literature, mentions 'brocauli' many years previously. In the thirties, then, Stephen Switzer, who kept a shop opposite Westminster Hall, published a pamphlet recommending along with a few other vegetables this new 'brocoli.' He states that the varieties were white, and green, and purple, and the Sprouting Broccoli of the present day gives a good idea of what they were like. He further states that it was also called Italian Asparagus, and why is obvious from the directions given for cooking it. The parts eaten were the flower stems; these were peeled, tied in bundles like asparagus, and so cooked. Cauliflowers, which, up to little more than a hundred years ago, had very little curd, were treated similarly.

The fact is well-attested that a seaside weed having leaves somewhat like kale, but glaucous in hue, had been used as food by coast-dwellers from time immemorial. In order to whiten the shoots when these began to push through the sand, they covered them with more sand, and called the plant Sea Kale. It has always been assumed that the celebrated Dr Lettsome brought sea kale into notice as a vegetable of merit. But long previously it had been noticed in a very scarce book entitled *The Gentleman Gardener*, of date 1716, and written by a schoolmaster, who calls it Beach Kale. Seeds had been brought from Italy a few years earlier than this date, and they were sold by a seedsman named Gray in Pall Mall at five shillings per ounce. The author informs his readers that this new vegetable is ready for use the second year after sowing the seeds, that its sprouts were to be covered with gravel in mounds of the shape of a hop-hill, and that a plant provided several cuttings annually.

Chambers's Journal

SEVENTH SERIES

THE KING OF THE ISLAND.

By W. D. GRAY.

PART I.

I.

THE boat's keel grated on the shingle. Hurst rose to his feet, caught at the painter, and waded ashore. He moved stiffly and painfully, for he had been three days and nights alone on the sea, and though he had not suffered from hunger or thirst, he still ached in every limb, and was almost blind from loss of sleep. His first act was to pull his boat up high and dry, his second to fling himself down on the warm sand with a gasp, almost a sob, of joy and gratitude. For the first time since the wreck of his ship he dared to hope.

'I have a chance now,' he said to himself. 'I'm the only one left—but I have a chance.'

His mind wandered back over the events of the past four days, and he gave an involuntary shudder. He was a man of thirty-five, and had spent most of his life on the sea; but it was only during the last week that he had realised its immeasurable strength and cruelty. Four days ago he had seen his ship crushed and destroyed like a handful of rotten sticks. The tempest had rushed upon them suddenly and swiftly, as a tiger leaps from the jungle. He remembered how the wind had yelled in his ears and battered at him like a living thing possessed by a desire for his individual life. The hurricane had come upon them at nightfall, and when it abated with the dawn, they saw the *Vulcan* was sinking fast. The captain and four men had been swept overboard during the night. Hurst, as first officer, took charge and gave orders to man the boats. But they had delayed too long, and there was little time for it. The *Vulcan* was settling down more and more every minute, sinking by the head. Only two boats drew clear before the end, and one of these was drawn down and sucked under in the vortex. The other, containing Hurst and three sailors, by the most desperate exertions had managed to keep clear, and the rising sun saw them safe—but alone.

A further tragedy followed that same afternoon: the weather was still wild and unsettled, and a sudden furious squall came down on them which swept the three sailors overboard and

filled the boat with water. Hurst gave himself up for lost, but baled for his life, and almost by a miracle his life was preserved. His boat still floated—the weather moderated. Then came three days of absolute loneliness, his little craft a black speck in one unchanging circle of sea and sky. By the third day his loneliness pressed upon his heart; he grew somewhat light-headed and almost thought of himself as the sole survivor of humanity in a dead world—in a world as indifferent to his extinction as to the death of a gnat.

But Hurst had all a sailor's toughness of fibre, and in the midst of his loneliness had formed a plan. He knew his ship's position when she sank, and was aware that she had gone down in the midst of the great ocean, thousands of miles from any continent. But some hundred miles to the north was Stoneland Island, and for that island he steered. There was a compass in the boat, and after the squall which had destroyed his comrades, the weather remained fair and the wind true. His was a race against time and the sea, for he had only a week's food and water, whilst any further bad weather would have meant the end of him. But the Fates were kind, and on the morning of the fourth day, an overcast dawn, he saw the island right ahead. That same afternoon his boat grounded on its shore.

Stoneland Island received its name from the man who first sighted it—Captain Stoneland, of the whaler *Michigan*, in the year 1836. As has been said, it stood alone in the midst of hundreds of miles of empty sea, and was uninhabited. So much Hurst knew, but he also knew further comforting facts. The island was not sterile and desert, but was well watered; it was of some size, four miles long by two in breadth, and was the haunt of many sea-birds. There were also reputed to be wild goats in the interior. But further, and most heartening fact of all, Hurst knew that on the southern beach, somewhere near to his landing-place, there was a hut, or supply depot, full of stores, established for any shipwrecked unfortunates such as himself. A British man-of-war periodically visited the island to inspect this depot, and

though she made only yearly visits, it might be that one of them was nearly due. All things considered, Hurst could esteem himself fortunate. It seemed as though, out of all the *Vulcan's* company, the jealous sea had relaxed its hold of him and ordained that he should be saved.

He rose to his feet and shook himself, with a vast accession of strength and spirits. Then, after taking a drink of water from his beaker and eating a biscuit, he looked about him keenly. He had landed in a little bay, whose shores sloped gently upwards towards the centre of the island. Grass grew almost down to high-water mark; there were scattered shrubs and trees, which on the left thickened to make a considerable wood. The sun was declining, but still shone down brightly and warmly from a cloudless sky. Hurst heard the twittering of birds in the trees and the buzzing of wild bees as they flew swiftly to and fro. After his three days and nights of the empty sea, even such evidences of life were inexpressibly comforting. But his first task was to find the supply hut before darkness fell, for he promised himself he would sleep in its shelter during the coming night.

He considered for a few moments. From where it stood he thought it must be somewhere beyond the point on his right, perhaps no more than half a mile away. There was no safe anchorage off Stoneland Island, but the depot had been established in the most sheltered spot available. Hurst set off, keeping just above high-water mark. As he strode onwards birds rose up almost from beneath his feet, and he heard small unseen animals scampering swiftly away from him amidst the undergrowth. At all events, there was no lack of life on the island. He breasted the slope on his right and looked down on to another wider and deeper bay. Right in the centre of it a little stream meandered down to the sea. At its mouth a rough stone jetty had been built, and some two hundred yards inland was a strong timber hut with a galvanised iron roof. Hurst gave a shout of joy, forgot his stiffness, and broke into a run. Report had not lied: here was the supply depot.

He reached it in a couple of minutes, after splashing through the little stream, and saw the door on his left. There was no lock or key, but he lifted a stout wooden bar, and entered without difficulty. Two small windows lit up the single room, and he looked around expectantly. But the hut was empty, save for a broken packing-case and one or two logs of wood lying on the floor. There was nothing else in it, nothing from which a fly could have obtained nourishment.

Hurst fell back against the door-post. The blow was staggering. He suddenly realised how much he had relied on these supplies, and

now, confronted with this empty desolation, his disappointment seemed almost unbearable. He did not know what to think—whether the depot had been abandoned as useless and the stores removed; whether some passing ship had callously taken them off; or whether the whole report had been false from the start. One thing at least was certain—there were no stores now.

He tried to pull himself together, squared his shoulders, and moved outside again. The sun was very near the horizon; in an hour it would be almost dark. 'They've left the hut itself,' he reflected grimly. 'I may as well sleep in it.'

He retraced his steps back to his landing-place, launched his boat again, and rowed round to the other bay, where he moored her securely to the stone jetty. Then, taking up his boat cloak and his scanty supply of provisions, he re-entered the hut and closed the door behind him. Twilight was coming on and the island was very quiet. The only sounds were the distant splashing of the waves on the beach and the nearer gurgle of the little brook. He felt immensely tired; his three almost sleepless nights in the open boat seemed to descend upon him suddenly and weighed down his eyelids. 'I'm done,' he muttered heavily. 'Got to sleep. Must think of what to do in the morning.' He spread his boat cloak in a corner, flung himself down, with a log for a pillow, and in a few moments sank into a dreamless sleep.

II.

When Hurst awoke, the sun was shining merrily again through one small window. He had no idea of the hour, for his watch had stopped long ago; but, from the height of the sun, it seemed the morning was well advanced. He rose to his feet and stretched himself, feeling hugely refreshed. Now, after a long night's rest, his disappointment did not appear so staggering. After all, things might have been very much worse. He was safe ashore; he had a few days' provisions left; there was an abundance of fresh water on the island; he had a fishing-line in his boat; and, though he had no gun or arms of any kind, he could surely devise traps or snares of some sort for the birds and beasts of his new country. No, he would not starve at the worst of it.

He went out, bathed in the stream, and made his breakfast off two more of his ship's biscuits. Then, cutting a stout stick from the nearest bush, he set himself to explore the island with some thoroughness. He thought he might be able to cover it all in the course of the day. As a commencement he walked to the other end of the bay, for there was some object on the beach which attracted his attention and puzzled him. As he drew nearer he saw it was a ship's boat, rather larger than his own, and

in a broken and wrecked condition. She had been cast up by the tide above high-water mark, and was lying on her side with her planking stove in. Hurst considered her with a puzzled face. There was no ship's name on her bows, or if there had been it was obliterated, and she was absolutely empty, save that a broken oar was lying across her thwart. From her condition it was evident that she had been lying there some months.

'Queer,' said Hurst at last. 'Perhaps she broke adrift from somewhere. But it's queer she should be on this beach.'

He gave up the mystery and turned to his explorations again. After walking for an hour, he supposed he must have been nearly half round the island without finding anything noteworthy. The scenery everywhere was the same, a grassy slope down to the sea, sometimes rising inland to inconsiderable little hills, with clumps of bushes and small trees scattered about which occasionally thickened to small woods. Always the higher ground was towards the centre of the island. At last he came to another stream running down towards the sea, and turned aside to follow its course. He thought it might be as well to reach the higher ground in the interior, whence he might be able to survey the whole of Stoneland Island.

As he walked inland the grass grew longer and more luxuriant, and the bushes and undergrowth more frequent. There was a constant calling of birds all about him, and once he saw, far off, on the side of a hillock, a couple of large animals, which he took to be wild goats.

Suddenly he emerged into an open space by the side of a stream, and halted with a low cry. An expanse of short, close-knit turf lay before him, almost like that of an English park, surrounded by moderate-sized trees. In the centre of this open space was an oblong green excrescence, evidently the work of human hands. Hurst gazed at it with wide-open eyes, and then slowly approached. It was not until he was close upon it that his suspicions became a certainty. 'It's a grave!' he muttered to himself. 'Someone's buried here.'

A chill seemed to settle on the sailor's heart as he looked down on the ominously-shaped mound. What could this mean? Who could be buried on Stoneland Island? It had never been inhabited. It was one of the forgotten places of the sea. If a ship sighted it once in a twelve-month that was as much of the world as it ever knew. And yet here was this mysterious last resting-place of some sentient human being. 'Perhaps he was landed from some ship,' he thought; 'or perhaps he came in that boat. But then—who buried him?'

He moved around the grave, and coming to the head, he saw a piece of planking embedded there, half covered by the long grass. Some words were roughly carved on it. Hurst

brushed the grass aside, and with a little difficulty made out the half-defaced inscription: 'John Cavanagh,' he read. 'Executed May 2nd. H. R.'

Hurst's lips framed themselves in a soundless whistle. He straightened himself up and stepped backwards from the grave with a rather white face. 'Executed!' he said, in an astonished whisper. 'What for? Who executed him? What does it mean?'

There was no answer. Birds flew out from amidst the trees and settled down again. The stream gurgled happily over the stones, and a little breeze blew pleasantly from the sea. But the grave seemed to cast a deep shadow over all that glade.

The sailor bent down and read the inscription again. 'Executed!' he repeated. 'There's no mistake—that's the word. Well, it's beyond me. And it's not very old, either, perhaps only a few months. That poor devil—who can he be? Ay—and who is H. R.?'

Again there was no answer. The cold chill settled deeper into his spirit. He shook himself angrily and turned away. 'No good wondering,' he said aloud. 'It's a mystery. It's about the biggest mystery I have ever handled. And I have not the key to it.'

He looked back over his shoulder at the silent grave, and then, with a short irrepressible shudder, moved on through the scattered trees until it was lost to sight. It was now getting towards afternoon, and he took food from his pocket and sat down on a fallen tree to eat it. But he discovered small appetite. That lonely tomb and its curt inscription still seemed to brood over him and daunt him. 'This is August,' he thought. 'He was "executed" in May—presumably this May. It does not look any older. Executed! That's the word which fairly sticks in my throat. Well—let's get on.'

(Continued on page 749.)

SULIMANI THE BOATMAN.

ACROSS the cool green waters that to the ocean flow,
Among a maze of palm-trees—'tis there all day I row,
With my load of golden mangoes, and pawpaws ripe and brown,
And many a dusty traveller who seeks the distant town.

The mighty ships go by me, a-sailing out to sea,
With many precious cargoes of gold and ivory;
But I shall never wander far from my native sands,
Nor carry wondrous treasures unto the northern lands.

But here I am contented each day to row and row,
To bear the market burdens, and folk who town-wards go;
My oar is sometimes crazy, and tattered is my coat . . .
Yet who can cross the waters without my humble boat?
MALCOLM HEMPHREY.

THE SCHOONER *AMERICA*.

By FRANCIS B. COOKE.

I.

ALTHOUGH there is no sporting trophy better known than the *America's* cup, comparatively few people have any knowledge of the history of the famous vessel from which it derives its name. Yet no craft has played a more prominent part in the evolution of the racing yacht, and few have had such an adventurous career.

The visit of *America* to this country in 1851 originated in a casual remark made by a London merchant when writing to a business friend in New York. He mentioned that there was likely to be a regatta in connection with the forthcoming Great Exhibition, and suggested that the inclusion of an American yacht would add interest to the event. This letter was shown to Messrs John C. Stevens and George L. Schuyler, prominent yachtsmen who, a few years before, had taken a leading part in the formation of the New York Yacht Club. Captivated by the idea, they persuaded five other members of the New York Yacht Club to join them in the formation of a syndicate with a view to building a yacht to race in England. Letters were exchanged between Mr Stevens and the Earl of Wilton, Commodore of the Royal Yacht Squadron, who, on behalf of the members, extended a cordial invitation to the American yachtsmen.

The contract for the American yacht was placed with George Steers, who had achieved a considerable reputation as the designer of speedy pilot-boats. Steers was confident that he could design a boat to beat any vessel of her tonnage in the world under any conditions, and he and Mr W. H. Brown, who financed him, having the courage of their conviction, agreed to take back the yacht if she suffered defeat either in the United States or England. It was a strange contract for a shipwright to make, but Steers's confidence was fully justified by subsequent events.

The schooner *America* was launched on 3rd May 1851, her principal dimensions being as follows: length overall, 94 feet; length on waterline, 83 feet; beam, 22 feet 6 inches; depth of hold, 9 feet 3 inches; and draught, 11 feet 6 inches. Her registered tonnage was 170 tons, and she was rigged as a fore-and-aft schooner. Her mainmast measured 81 feet, her main topmast, 33 feet. Her foremast was 79 feet, and she carried no fore-topmast. The mainboom measured 58 feet, and her bowsprit, 32 feet. As soon as the vessel was ready for sea she was tried against the sloop *Maria*, which, at that time and for a good many years

after, was the largest single-masted yacht in the world. As *Maria* was no less than 25 feet longer on the water-line than *America*, her defeat of the new craft was not perhaps surprising, particularly as the trial was sailed in smooth water off Sandy Hook, conditions that suited the big sloop admirably.

A suit of racing canvas was made for *America* by R. H. Wilson of New York, the total area of the three lower sails being 5263 square feet. Her racing sails and gear, however, were not used during the voyage across the Atlantic, being carried in the hold, and she made the passage under some sails borrowed from the pilot schooner *Mary Taylor*. Her sailing master was Captain Dick Brown, a Sandy Hook pilot, who was part-owner of the *Mary Taylor*. He had with him, as mate, Nelson Comstock, and eight other hands. The ship's company also included, as passengers, George Steers, her designer and builder; James Steers, and the latter's son Harry, a boy of fifteen.

II.

America sailed from New York on 21st June 1851, and, after an excellent passage, arrived at Havre on 11th July. Her best day's run was 284 miles, giving an average speed of almost twelve knots, a fine performance for a vessel of her size, sailing under an old suit of canvas not made for her.

During her stay at Havre the yacht was painted and refitted for racing, her owners thinking it undesirable to give her future rivals any opportunity of studying her lines before meeting her. Commodore Stevens and Mr Edwin Stevens joined her whilst she lay at Havre, and she then sailed for England, entering the Solent during the night of 31st July in rather thick weather. She brought up about six miles from Cowes, where the news of her arrival aroused considerable excitement. Early the following morning, the *Laverock*, one of the fastest of the British cutters, sailed down to meet the visitor and show her the way to Cowes. The owners of *America* were not by any means anxious to try their vessel's paces with an English craft, as she was heavily laden with stores and all her cruising sails and gear. Immersed some four or five inches below her designed water-line, the yacht could not be expected to show her true form, but as *Laverock* stood by and waited for her, they had no alternative but to get under way. Any doubts they may have had were, however, soon set at rest, for *America* quickly worked out to windward of *Laverock* and reached Cowes roads with a lead of more than a quarter of a mile.

The schooner was accorded a great reception on her arrival, but her performance with the *Laverock* created something like consternation among the British yachtsmen. Although the utmost hospitality was extended to the visitors no owner cared to pit his yacht against the redoubtable Yankee schooner. Commodore Stevens issued challenge after challenge to race *America* against any British vessel of any size or rig for any sum up to £10,000, but there were no takers. The *Times* pointed out that, although there would be no disgrace in defeat, the courage of our yachtsmen would be in question if *America* were allowed to return home without a match. Then, at last, Mr Robert Stephenson offered to race his schooner *Titania* against *America* for £100.

America, however, had an opportunity of showing her prowess before the match with *Titania* was sailed, as her entry was accepted for a Royal Yacht Squadron race to be sailed on 22nd August. The prize was a cup presented by the Royal Yacht Squadron, and not, as has sometimes been erroneously stated, the gift of Queen Victoria; and the race was an ordinary regatta match, and not in any way an international contest.

This famous race has so often been described that there is no necessity to do so again. Let it suffice that *America* defeated her fourteen opponents—the flower of the British pleasure fleet—with consummate ease. Great crowds, both ashore and afloat, turned out to watch the race, and among the spectators was Queen Victoria in the royal yacht *Victoria and Albert*. The story is told that the Queen, whilst waiting for the return of the racing vessels, inquired of a signalman, ‘Are the yachts in sight?’

‘Yes, Your Majesty,’ was the reply.

‘Which is first?’

‘The *America*, Your Majesty.’

‘And which is second?’

‘Your Majesty, there is no second.’

As a matter of fact the *Aurora*, which brought up a breeze with her, finished twenty-four minutes after *America*, but few of the others were timed in.

III.

Attempts have been made to belittle the performance of *America* by pointing out that several of her competitors ran ashore, and that she did not round the Nab lightship. To such criticism it may be replied that the mishaps to the British yachts were occasioned by faulty navigation, and the Nab was not mentioned in her sailing instructions as a mark of the course. Furthermore, *America* was leading by a mile off Ventnor, long before the yachts approached the Nab, and the result was even then a foregone conclusion. But perhaps the best answer to *America*’s critics is the extraordinary effect her

victory had upon British yachting. The science of yacht design was, indeed, revolutionised, our naval architects thenceforth abandoning most of their preconceived ideas.

Prior to the advent of *America*, the yachts of this country were, for the most part, of what is called the ‘cod’s head and mackerel’s tail’ type. That is to say, they had bluff bows and their greatest beam well forward, tapering away gradually to the stern. *America*, on the other hand, had her greatest beam amidships and a fine hollow bow. And it was not only the shape of her hull that upset the theories of our designers, for her sails were equally revolutionary. In those days the sails of our yachts were made of hand-woven flax canvas, and cut with so much flow that they hung like bags upon the spars. To make them stand better it was the custom to wet them when the yacht was on the wind, which was done by means of buckets secured to the end of long poles. The crew of *America* had no need to resort to such practices, as her sails were cut to set as flat as cards. They were, moreover, laced to the spars, whilst those of the British yachts were loose-footed, and being fashioned of light, machine-made cotton duck, the American schooner’s sails caught every little draught of wind. She was thus able to make appreciable progress under conditions of weather that left our vessels stationary, and, thanks to her flat-setting canvas, could lay a course much closer to the wind. Indeed, so superior were her sailing qualities to those of her rivals that it was a popular delusion that she had an engine concealed on board. The effect of her victory was at once apparent. British designers created vessels of similar type, or as near to that type as they were able, whilst existing craft were cut in halves in order that new hollow bows might be built on to them.

The day after her victory *America* was visited by Queen Victoria and the Prince Consort, who were shown all over the vessel by Commodore Stevens, and it is safe to say that no other craft in the history of yachting has created such a sensation as this Yankee schooner, which was little more than a glorified pilot-boat. If we lost the historic trophy which now bears her name, we reaped much benefit from the visit of *America*, for from her advent dates the first big advance in the science of yacht design in this country.

IV.

The match between *America* and *Titania*, which was sailed on 28th August 1851, resulted in an easy victory for the former, despite the fact that *America* carried away the jaws of her fore-gaff, and lost a deal of time in temporarily repairing the damage. The race was sailed in a strong wind, and the fifty-two minutes by which *America* won was estimated to represent a

distance of seven miles. After this race the American schooner was bought by Lord John de Blaqui re for the sum of £5000. Her new owner at once proceeded to alter the yacht, cutting down her masts by some five feet and stiffening her internally with iron braces. These modifications completely spoilt the vessel, and the following season she suffered defeat by the British cutters *Arrow* and *Mosquito*. She, however, contrived to beat the Swedish schooner *Sverige*, a vessel built on much the same lines as herself, but nearly thirty tons larger. During the same year *America*, whilst cruising in the Mediterranean, was caught in a severe gale, and lay hove-to for four days. She came through the ordeal triumphantly, thus proving herself as good a sea boat as she was a racing vessel.

In 1853 *America* passed into the ownership of Lord Templeton, who, after using her during the following summer, laid her up at Cowes, where she remained in a mud-berth until 1859. She was then taken round to the Thames, and hauled out at Pitcher's yard at Northfleet. When surveyed the vessel was found to be in a deplorable state, owing to dry-rot, and as she seemed fit only for the scrap-heap, the owner of the yard bought her at a nominal figure. The purchaser, loath to break up a yacht of such fame, decided to rebuild her. This he did at his leisure, substituting for her rotten timbers new ones of oak, and replanking her with teak and elm. Although probably a good deal heavier than in her original state, the schooner thus rebuilt was strong enough to last a lifetime. When launched she looked much the same as when she won her famous victory, but the golden eagle and scroll which had previously adorned her stern was missing, for this emblem had been placed on the parapet of the Eagle Hotel at Ryde in lieu of the usual publican's signboard.¹

America was bought in 1860 by Mr H. E. Decie, who changed her name to that of *Camilla*. Her new owner raced her occasionally that year, but met with little success, and she then departed for a cruise to the West Indies. The yacht was subsequently sold to Savannah, where she arrived early in 1861, but the name of the buyer has not been recorded.

On her return to her native country the schooner once more changed her name—to that of *Memphis*—and entered a new sphere of activity, for a gun was mounted on her deck, and she served the Southern forces as a blockade-runner and despatch-carrier. Little is known of her activities during the American civil war, but it is recorded that the Northern blockading fleet occasionally saw a schooner-yacht of extraordinary speed, which defied all their efforts to

capture her. Once she was chased by the frigate *Wabash*, but contrived to escape. So great was her speed in a good breeze that she could run clean away from their fastest steam vessels, and, as in light weather she was successfully hidden away in some secluded anchorage, she for a long time led a charmed life. In April 1862, however, the gunboat *Ottawa* found her sunk in the St John's River, the yacht having been scuttled to avoid capture.

v.

The schooner was raised, and Commander Thomas H. Stevens of the *Ottawa* waived his rights to prize-money for her capture on condition that she was taken over by the government for use as a training-ship for midshipmen at Annapolis. For several years after this, *America*, which had reverted to her original name, was used for the purpose of instructing young naval officers in seamanship. Her yachting days, however, were not over, for, when Mr James Ashbury challenged for the *America's* cup in 1870, the historic schooner was fitted out by the naval department to take part in the defence of the cup. Although then in her twentieth year, she finished fourth in the contest, defeating no fewer than fourteen of the eighteen vessels that competed in the event. A few days after the defeat of the British challenger *Cambria*, the *America* was put up for auction and purchased for \$5000 by General B. F. Butler, and she remained in the ownership of his family for many years. Resuming her racing career under General Butler's colours, she defeated, among other noted vessels, the schooner *Resolute*, and also won the Philadelphia Exhibition race from Sandy Hook to Cape May and back.

During the summer of 1876 *America* met with an accident that necessitated her being partially rebuilt again, for, as the result of running on the Brigantine Shoal, she tore off her keel and stove in her garboards. The work of repairing her was entrusted to Mr D. D. Kelly of East Boston, who in 1880 gave her new timbers and deck beams, and almost entirely replanked her. The following summer General Butler raced her against the full-rigged ship *North American*. Sailing over a course of five hundred miles out to sea, the yacht beat the ship handsomely. After that race General Butler cruised in her to the West Indies, and in the course of the voyage the schooner covered four hundred miles in forty hours, and on one occasion made good two hundred and sixty miles in twenty-four hours. Although she still had a fine turn of speed for cruising purposes, it had been apparent for some time that the yacht was outclassed by the more modern racing vessels. Her owner therefore decided to have her modernised. He placed her in the hands of Edward Burgess to be brought up to date as far as possible, and she was given a lead keel weigh-

¹ Some years ago the golden eagle was purchased by the Royal Yacht Squadron, who presented it to the New York Yacht Club, a graceful act that was much appreciated by American yachtmen.

ing twenty-five tons, new masts and spars, and a new suit of sails. At the same time her old jib-boom was removed and a bowsprit thirty-five feet in length substituted.

In her altered trim the form of *America* proved disappointing, and after she had twice been badly beaten by *Fortuna*, General Butler was forced to the conclusion that her racing days were over. The yacht was, however, retained by the Butler family for cruising purposes, and at many of the subsequent *America's* cup contests the old schooner that had originally

won the trophy figured among the pleasure craft which followed the contestants.

For a good many years past *America* has been laid up in the Charles River at Boston, but she has recently been taken under the wing of the United States Naval Academy, and converted into a naval museum at Annapolis. No more appropriate use could be found for the old schooner, and yachtsmen all the world over will rejoice that the most famous vessel in the annals of their sport will be well cared for as long as she holds together.

THE INDEFATIGABLE LETTER WRITER.

By AGNES BROWN.

SOME months ago I accepted an invitation to spend a week-end with Colonel and Mrs Gibson. They have a rather nice house at Marlow. When I arrived on the Friday afternoon, Mrs Gibson met me at the station, full of lamentations and apologies; three of her friends had failed her, and she was afraid it would be dreadfully dull for me, as there were only two other guests, her nephew Tony and the girl he was engaged to; also, Tom (the colonel) was beginning one of his bad colds.

When we reached the house, after a short drive, she was still lamenting, and I began to wish I had stayed at home. It was pelting with rain, and there was an atrocious icy east wind. I thought with regret of my cosy little flat in town, and week-end visiting seemed a foolish sort of pastime.

We found the colonel, with Tony and his fiancée, sitting by the fire in the big hall waiting for us. Tea was brought in, and I began to feel more cheerful—but not for long. It was painfully obvious that Colonel Gibson was not only suffering from a bad cold, but was in a pronounced Anglo-Indian mood as well. When these moods are on him he seems to seethe with ill-suppressed grievances. His theme at this moment was tea; some fool or other had forgotten to order his special China tea, and, according to him, this was the one unforgivable crime. Tony and Miss Waller talked to each other during Colonel Gibson's monologue, and paid not the slightest attention to anyone else.

Miss Waller was a rather insolent noisy young creature. Tony called her 'Mouse.' She seemed to me more unlike a mouse than any other animal; and during the week-end I failed to discover her mouse-like qualities. I was glad when the dressing-bell rang—one step nearer to bedtime, I found myself reflecting.

The evening was not very lively. The moment dinner was over Tony and Mouse

disappeared, and were no more seen. Colonel Gibson played Patience in a furious manner all evening, and, quite regardless of appearances, had a small gray woolly shawl draped round his shoulders. The effect was extremely depressing.

Mrs Gibson and I sat and talked, or rather I listened while Mrs Gibson talked. She had a great number of things (all bad) to tell me about her servants, and her three daughters-in-law. I was thankful when the time came for barley-water and bed.

I awoke the next morning to the dismal sound of rain beating against the window-panes. At breakfast Mrs Gibson made the horrifying suggestion that I should spend the morning on the links with Tony and Mouse! A painful silence followed. Tony tried to look pleased, but with small success; a slightly cat-like expression began to appear on Mouse's face; I alone rose to the occasion, and in a firm tone announced that I had some very important letters which I simply *must* write.

I hastened to the library immediately after breakfast, and sat down by the writing-table near the fire. I had no letters to write (no one hates writing letters more than I do), but the fact remained that I must write at least two letters, or what would Mrs Gibson think of me? I thought of a cousin in South Africa who sends me a card every Christmas. I hardly know her, and haven't seen her for years, but no matter—I might as well write to her as to anyone else. I did so, a very long letter full of all kinds of family news. I then remembered a sort of second cousin in British Columbia, and wrote to her as well—eight pages. Still an hour to pass before lunch, and the rain had begun to drip on the panes again. Why not write to my old school friend Enid, who went to India nine years ago? I had just finished these three long letters when Mrs Gibson came into the room.

'Still writing! What an indefatigable letter-writer you are;' and she smiled the pleased

smile of the hostess who sees her guest happily occupied, without any strain or effort on her part.

The next day, Sunday, was fine. In the morning I went to church with Mrs Gibson, and in the afternoon two pessimistic colonels came to tea. I left early on Monday morning.

It is now more than two months since my week-end at Marlow. I have had lengthy replies to my three letters, and they all end with this dread sentence: 'Now, *do* write soon again, another long neway letter; I shall look forward so much to it.' And now I am reflecting bitterly on what I have done. I have wantonly stirred up those harmless, far-off phantoms;

so remote, so passive, and so consistently refraining from troubling me. It had been so easy and pleasant in the past to send them cards (rather beautiful and expensive ones, as they were so delightfully far away) every Christmas. In a vague and tranquil way I used to think of them (but only at Christmas). I imagined them, and their various activities, in those far-off lands; dancing and flirting in India, tending their ostriches in South Africa, plucking their magnificent apples in British Columbia.

But now! I can see myself, down a long vista of years, eternally engaged in the hideous occupation of writing the long 'neway,' 'chatty' letters of the indefatigable letter-writer.

THE LABYRINTH.

PART III.

VIII.

WHEN night had fallen we up-anchored and sailed in the direction of the island of Velo. In about half-an-hour we saw its rocky mass loom out of the darkness, a deeper shadow among the sapphire glooms of the Adriatic night. Eligio and I got into the yacht's dinghy with two of the crew, and, muffling the oars, rowed slowly towards the island. For nearly a quarter of an hour we pulled in absolute silence, and coming fairly close inshore, rowed completely round the place. The southern night had such a luminous quality of its own that every detail was almost as distinct as during the day, and this even though the moon was in her thinnest phase. The great rock—it was little more—towered above us in cliff-like blackness, and here and there among its shadows the mouths of caverns showed like deeper blots of darkness. I counted at least seven of them, but my chief preoccupation at the moment was to discover if any lookout was stationed on the island. Peer as I might through the blue darkness with my night-glass, however, I could not observe the least sign of human occupation or any sign of watchfulness. If Natalie Nordiska and her friends were on Velo they evidently had confidence in the impenetrable nature of the labyrinths with which the place was honey-combed to guard the secret of their presence there, and to have posted a sentry on these heights would, indeed, merely have drawn attention to the fact that the island was occupied.

Having satisfied myself that our operations would be unobserved, I next sought to discover which of the cavern mouths was the most probable entrance to the labyrinth of passages. With the utmost caution we essayed an opening on the southern side. But it proved to be

nothing but an anteroom of the ocean, an upper hall of the sea, perhaps forty feet long and half as broad, which ended abruptly in a black wall of porphyritic rock, smooth and towering. A second cavern was merely a smaller reproduction of the first, and a third proved too narrow to permit of the entrance of our craft. The fourth inlet gave us a good deal of trouble, as it extended far into the recesses of the rock in a narrow funnel, from which we had some difficulty in emerging. But here, too, we drew blank. On entering the next, however, a capacious and vaulted cavern on the north-east side screened by a barrier of rock, I felt more hopeful, for at the entrance the beams of my powerful electric torch glimmered upon the iridescent colours of oil floating upon the smooth, black water. Indeed, we had not penetrated the place for many yards ere there loomed up the dark hull of a fairly large vessel lying deep in the water within the cave as in a dock.

'The submarine!' exclaimed Eligio in a loud whisper, and indeed the submarine it was. One of the yacht's hands at once identified it as an Austrian vessel which had been sold to a firm of shipbrokers on the Italian occupation of Fiume. It was small and of an obsolete type, but still in good enough commission for all but combatant purposes.

We floated past its black length, and our lamps searched out a weed-covered stairway cut in the rock, and leading into an upper darkness so intense that I must say I faltered at the bare idea of negotiating it. Indeed, the moment I saw those steps I concluded that we had gone far enough for one night, and that, keen as Eligio was to prosecute the search out of hand, we were not properly equipped to undertake any prolonged examination of such labyrinthine galleries as those we must

traverse. But the longer I gazed at that flight of steps the more attracted I was with the idea of the mystery which lay beyond them, and at length, giving way to Eligio's pleading, I agreed to test them and reconnoitre a little.

So I gave instructions to the two yacht hands who had accompanied us to await our return, impressing upon them that if we did not show up within a couple of hours they were to come in search of us. This they promised faithfully to do, and we paddled up to the foot of the stairway and clambered on to its lowest step.

IX.

I must say my heart misgave me at first. The steps were extraordinarily shallow and their angle was as upright as that of a ladder. Although it was plain an effort had been made to clear them of the sea-growth of centuries, they were still so slippery and offered such a precarious foothold that I could scarcely believe it possible that a captive man could have been dragged or carried up that treacherous height. Up we went, slipping and stumbling for nearly forty feet, until I thought that nightmare of ascent would never come to an end. Then I saw Eligio, in the white ray of my electric torch, suddenly fall forward, engulfed in blackness.

I called out to him, and he answered. He had merely stumbled on the top step and had sprawled forward on to solid rock. In a moment I was beside him, and, flashing my powerful torch in front of me, found that we were in a long gallery about six feet wide, the far end of which was lost in Egyptian darkness. The first thing that struck me was the peculiar character of the symbols scattered over the walls. These, I saw on closer examination, were the imprint of human hands in red ochre, and out of my archæological experience I immediately recognised their significance. Such impressions of the human hand are found in many parts of the world, the prehistoric caverns in the Dordogne in France, in Bushman caves in South Africa, on the north-west coast of America, in Mexico, in China, and elsewhere. They are, indeed, relics of human sacrifice, registers, as it were, of the immolation of a captive to some god or demon who dwelt within the recesses of the cavern where they were made. This place, then, had evidently been a centre of human sacrifice like the famous labyrinth of the Minotaur at Gnosus in Crete, where an annual tribute of maidens was driven into the monster's den by priests who held the secret knowledge of the paths which approached it. It was probably tunnelled by a people of Pelasgian origin, of the same stock as the Cretans, I surmised, as I stumbled along on the heels of Eligio, darting the rays from my torch hither and thither among the assembled shadows.

Well, from an archæological point of view, at least, I was glad I had come to Velo. What a brochure could be written round the place!

We made our way down the gallery for at least fifty yards before we came to any turning. At length the tunnel forked into two separate paths. We chose that to the right, but had only proceeded along it for perhaps a hundred feet, when we encountered such a network of passages as, I saw at once, it was hopeless to choose from if we did not wish to get utterly lost and remain for ever in the depths of Velo. One thing I observed, however, and that was, on our entering the second tunnel the impressions of the human hands had disappeared.

Retracing our steps, we essayed the passage to the left. Here the handmarks reappeared. And then a great light broke upon me. Was it not probable that these impressions were made by the long-dead victims on the route to the place of sacrifice alone? There would be no purpose in leading these unfortunates up a cul-de-sac to force them to record the symbols of their doom. In the course of centuries thousands of unhappy wretches must have been immolated to the evil deity in the inner shrine, and in all likelihood the evidences of their dreadful journey would extend right up to the inner sanctuary itself.

The hope of justifying my theory made me throw caution to the winds. I took the lead, and flashing my lamp, now in front of me on the lookout for pitfalls, now on the walls in the search for handprints, I forged ahead at a great pace. At about every fifty feet now we encountered a branching gallery. But doggedly I continued to choose those upon the walls of which the doomful signatures of the red handmarks were visible. If they did not lead anywhere, they would at least provide a clue by which we might regain the entrance.

I need not say that we proceeded almost noiselessly along these silent galleries. But I was not a little discouraged to find not a single trace of human occupation. Not a speck of dust lay on the hard, rocky floor of these ancient tunnellings, so that no footprints showed. Indeed, had it not been for the evidence of the submarine, I should have gravely questioned the presence of any human being in the recesses of this dreadful place.

On, on we went. We must have walked for miles, and, according to my pocket compass, had several times changed our direction, now going south-east, now due west, then north-west, but always following the direction of the handmarks. It was now about two in the morning, and I was seriously considering giving up the quest, for that night at least, when suddenly I started back—for my torch had flashed on the surface of water.

We had just rounded a corner, and almost at the very turning was a treacherous slope,

lapped by a dark, seemingly profound stretch of water. Where on earth had we got to? Had we emerged at another outlet to the labyrinth, which gave on the sea? No, for on each side of the watery channel before us rose rocky walls similar to those by which the galleries were bounded. The light of my torch would not carry to the end of the canal, for that is the only word I can find adequately to describe it. I dipped a finger in the water and carried it to my lips. It was salt. So the sea must enter somewhere, and had been utilised by the ancient contrivers of this mysterious retreat to assist in keeping out intruders. Taking some of the cord I had brought with me, I attached it to a bunch of keys and sank it in the water. I heard the keys rattle on the rocky floor of the 'canal,' and drew the line up. When withdrawn, it reached nearly to my shoulder, and there was no saying how deep the water might be farther on.

But here Eligio asserted himself. He was, he whispered—it was astounding how we had caught the trick of whispering in this queer place—a swimmer of extraordinary strength. He would explore this stream. Without waiting for my sanction, he doffed his clothes and, placing them neatly on one side, slid into the water. He struck out strongly, but it was with misgiving that I saw his sleek black head and white shoulders gradually disappear in the gloom outside the radius of the beams of my torch.

X.

I waited for what seemed an eternity. I could hear the rhythmic splashing of Eligio at what seemed an extraordinary distance, then the distant sound of his landing. The moments passed, but I dared not hail him. A faint splash followed, and then the remote noise of the returning swimmer, uncannily loud in that hollow place. Another interval, and the gleam of white skin in the ray of the torch.

Eligio clambered on to the rock at my feet. 'It is about two hundred yards,' he gasped, 'and very dark. I thought it would never end. I was nearly turning back, signor, when I came to the steps.'

'There are steps?'

'Yes, three steps, leading out of the water to a rock floor, and to the right and left there are openings into two passages. I felt my way.'

'They must have a boat—they could not have brought your master across otherwise.'

'I cannot say, signor. Had I only taken my torch—'

'I will go,' I replied. 'I will tie my torch round my neck. There *must* be a boat.'

'As the signor thinks best.'

I slipped out of my clothes, and, securing the torch to the nape of my neck by a piece of cord

so that it would remain clear of water, launched noiselessly into the dark canal-like stream.

It was cold as death, a heart-seizing chill, and for a moment my courage forsook me so badly that I almost turned back. But I simply couldn't face up that plucky Italian boy, who had never even hinted at the icy rigors through which he had passed, and, cursing myself for a coward, I struck out with all the vigour I had. Oh, that two hundred yards of snowy water, chilled to Arctic temperature by lying in the deep, rocky basin into which it had flowed. I cannot adequately describe the agonies of my passage. Such a nightmare of icy pain I hope never again to experience.

How Eligio had ever succeeded in swimming back through that terrible stretch of frigid water I cannot imagine. I only know that when at last, after what seemed ages of agonized struggle, I crawled up the three steps which he had reached, I collapsed for a moment into miserable semi-consciousness.

But once out of the ghastly clutch of that soul-grIPPING chill, I rallied. I unshipped and flashed my torch, and gazed blinkingly around. Yes, there it was, sure enough, a yacht's dinghy, capable of holding four people, and triced to a worn iron ring in the rock. I loosed the rope and jumped in. The oars lay in the bottom. With a jerk I pulled them out, and began rowing back.

In a few minutes I was back at the other side. I got out, and scrambled into my clothes, and we both took a good pull at my flask. Then we tumbled into the dinghy and rowed to the steps opposite.

XI.

On leaving the boat I saw that, as Eligio had said, we had a choice of passage-ways. But here we had no longer the guidance of the handprints. Both walls were bare. We must be getting nearer the nucleus of the labyrinth. In desperation I chose the left, and we crept cautiously along the tunnel.

We had gone perhaps thirty yards when we came to a winding staircase cut in the solid rock, such a staircase as one might find in the turret of a medieval castle. Up this we climbed cautiously. It seemed endless, and I concluded that it must reach almost to the 'roof' of the island. And now for the first time I began to observe other signs of human proximity than those vouchsafed by the submarine and the boat. The impression of feet littered the dust-covered steps, and here and there packing-straw and paper flecked the rocky floor. At length we had scaled the steps. Another passage confronted us, a single one this time, and as I entered it and groped my way along, something rocked slightly beneath my feet like a sewer-top on a roadway. I halted, and looked down. It was a man-hole, cut in the rock, and

covered with a stone slab into which was let an iron ring. With infinite caution I knelt, and raising the slab, shadowed my torch with veiling fingers and peered down. The length of a long, wooden ladder plunged into seemingly bottomless depths. In a moment I was descending it, followed by Eligio.

We stood in a fair-sized cellar, crammed with bales, bundles, and boxes of every kind. To the right was a kind of alcove, shadowed by dusty curtains.

I heard a rustling, a shuffling of feet behind the curtains. I signalled to Eligio to draw his revolver, and springing at the screen, saw it gently aside. A smaller cellar lay beyond. Three men, tough-looking fellows, were tumbling out of truckle-beds.

'Hands up!' I cried, which order they obeyed drowsily and with very evident bad grace. 'Where is Signor Cavalcanti? Better speak quickly, or it will be the worse for you.'

'He's in there,' replied one doggedly, pointing to a narrow passage beyond the cellar. 'You'll have to—'

'I'm not asking for advice,' I said sharply. 'Now, Eligio, keep these beauties covered. If they try any tricks, don't hesitate, but shoot.'

Eligio having made it clear that he would be only too pleased to have the chance of shooting, I dived into the passage. To the left was a door—quite a modern door, recently fitted, it seemed, and this I opened without hesitation. I started back, for I found myself in what was obviously a lady's bedroom. A dim light was burning, and from the depths of a great bed a female figure rose in a tangle of dark hair and heavily-draped protesting arms.

'Stay where you are, Natalie Nordiska,' I said sternly in French. 'I am armed, and your fellow-conspirators are overpowered. What have you done with Ilario Cavalcanti?'

'I shall not tell you,' she stormed. 'How dare you intrude in this manner? How did you . . . how *could* you possibly find your way here?'

'That shall be explained to you when you appear before an Italian court of justice,' I replied. 'But I have no time to waste. Where is Cavalcanti?'

She raved, she threatened me with penalties possible and impossible. I allowed her to go on until she seemed exhausted.

'I have a yacht lying off this island,' I said, when she had simmered down to silent wrath, 'on that yacht Cavalcanti returns to Italy to-night. Where is he?'

She smiled—not pleasantly. 'Very well,' she said, 'but if he goes back, monsieur, he does so as a discredited man. If I choose he can never hold up his head in Italy again.'

'And why, pray?'

'Why, my English friend? Because Cavalcanti the poet, the patriot, the adored of all

Italy, was the dancing-partner of Natalie Nordiska, the Russian danseuse. That is why. Will he face his people again with such a tale, this writer of epics, this great orator who was so fond of dancing that it absorbed one half of his life? Will he tell them how he took the name of Alfonso Valles, how he shaved off his beard the better to appear as the Spanish dancing-partner of the notorious Russian woman, and how he procured a wonderful false beard from the clever American hairdresser at Nice? How Italy will laugh!'

'Good. But you didn't kidnap him because he danced with you?'

'Monsieur, you are absurd! I hold him here as a hostage because he refused to do so any longer. He dreaded detection, he who was so closely associated with the Government, who was one of its most powerful props. You can see, monsieur, that his withdrawal from partnership would have utterly ruined my prospects. Natalie Nordiska without Alfonso Valles! The thing was hopeless——!'

'So you got a man to personate him while you abducted him? You managed to secure an obsolete Austrian submarine by some extraordinary means—you took all this trouble and risk for an end so ridiculous—all because you had made up your mind to coerce him into remaining as your dancing-partner?'

'And why not? I am a woman of business. My entire future was at stake. There was nothing more in it than business. Cavalcanti is nothing to me. Alfonso Valles is everything. Cannot you comprehend, monsieur?'

I saw Cavalcanti. He was in normal health, but like a caged lion after his fortnight of incarceration in the depths of Velo. He was alive to the danger of exposure, and dreadfully apprehensive that if the facts of his abduction leaked out he would become a public laughing-stock.

How it came about I can't really say, but that evening, on my yacht, they approached me like a couple of shy children. They had, they said, arrived at a compromise. It had occurred to them simultaneously, it seemed, while leaning over the yacht's rail watching the slow coming of the soft Adriatic night, that marriage would render it unnecessary for Natalie to continue her terpsichorean career. The necessity for a dancing-partner, too, would vanish automatically. With this view I heartily concurred.

They were married at Fiume.

I need not tell you how Cavalcanti was received on his return to Ancona, as it must be fresh in your memory. He explained his absence as being due to a romantic desire on the part of his wife to spend the honeymoon in the absolute seclusion of an uninhabited island.

'Ah, so like Cavalcanti!' said his Italy.

THE END.

RANCHING IN PATAGONIA.

By ANTHONY RYLAND.

I.

PATAGONIA, as the British call it—the Argentines have long discarded the name, and speak only of the territories of Rio Negro, Chubut, and Santa Cruz—begins south of the Rio Negro, about 38 degrees lat., and stretches for a thousand miles almost to the Straits of Magellan, in lat. 53 degrees. In breadth the country reaching from the Atlantic seaboard to the foot of the Andes is at its widest about 480 miles; there the Chilean boundary runs, and thence Patagonia extends to the Pacific. Argentina and Chile own Patagonia between them, the former republic having by far the larger share of the territory, and in addition the finest pasture lands for sheep.

It is a wild, desolate, forbidding-looking country, almost devoid of vegetation other than the coarse pampas grass and stunted shrubs, over which the fiercest and coldest winds in winter blow with hurricane force from the Pacific. In summer the temperature goes to the other extreme, and you may swelter on the plains under a burning sun, with the thermometer at 120 degrees F. As you ride along these vast endless plains, which in their monotony are like the sea itself, the wind almost lifts you out of the saddle, and stinging sand rises before it, making the skin smart and the eyes water. Here and there swift and dangerous rivers have carved for themselves passages from the Andes to the Atlantic; of these the Gallegos and the Santa Cruz are the best known. This monotone in brown, the prevailing colour of the Patagonian pampas, stretches right away west until it is swallowed up by the thick forests that begin on the eastern spurs of the Cordilleras, the home of wild animals, and as yet virtually unexplored, so far as settlement is concerned.

Magalhaens, it is now believed, overrated to a great extent the stature of the Patagonians, and judged these wild men from a Spaniard's viewpoint. They are not more than six feet in height, as a rule, and do not even carry off their height well, as they become pot-bellied with age, and look much smaller. The Patagons (literally 'big feet') were given this name by the early navigators; but a Scottish or Irish policeman has quite as good a grip on this planet as any Patagonian. Of course, the foot of a big savage with all the toes growing as nature intended, and not cramped into a boot, looks to us inordinately large.

The pampas of Patagonia offer splendid hunting of a sort that does not, as in East Africa, endanger the life of the pursuer. Ostriches, pumas (akin to the panther, not

ferocious if he can slink away), the guanaco, skunk, and other wild beasts are to be met with. Lady Florence Dixie obtained a good deal of notoriety some forty years ago by riding with her husband through what must have been then an even more desolate country, and in her book, *Across Patagonia*, she gives some amusing descriptions of the total lack of civilisation and creature comforts in this trackless waste.

II.

It was in 1877 that Patagonia first attracted the attention of sheep farmers who came over from the Falkland Isles, some three hundred miles from the coast, bringing with them the nucleus of stud flocks and making homes for themselves on the uninhabited plains. These men were hardy Scottish and English pioneers, and their descendants are carrying on to this day the ranches that they had so much difficulty in starting; and year by year Patagonia contributes in increasing quantities wool and frozen meat to the export trade of Argentina. In addition to Britons, many Argentines of Spanish ancestry are to be found, as well as Italians, Austrians, and French, all engaged in shepherding, shearing, fencing, and carting.

Despite the climatic drawbacks, the population of Patagonia is increasing, and the towns of Gallegos (West Wind), Santa Cruz, and Punta Arenas are places of considerable importance. The country round Punta Arenas (owned by Chile) carries perhaps some 2,500,000 sheep, and farther north, south of Rio Santa Cruz (Argentine territory), a million and a half or more may be taken as a conservative estimate. All the wool is shipped from these three ports, the bulk being put on board at Punta Arenas, which one-time sleepy settlement is now very wide-awake, and holding its own as one of the big shipping ports of the world, so far as wool is concerned. Punta Arenas exports, as a rule, from sixteen to twenty million pounds of wool in good seasons, having a value of close on two million dollars, to say nothing of a million or so of hides and other things. When Argentines boast—as they do justly—of Buenos Aires as one of the largest wool and hide markets in the world, it must not be forgotten that the Patagonian contribution goes far towards making up its grand total of 80,000,000 head of sheep, or thereabouts.

When the traveller lands at Gallegos, the port at the mouth of that river, he must not expect any hotels Majestic, Ritz, or Plaza, or even a decent 'taxi' to convey him over the execrable stony tracks—for 'road' is too good a name altogether to call them by. They are, in

truth, vile; and the *coche*, with its rats of horses, galloping over the ruts, is one of the best cures for a torpid liver that the writer knows of. Everybody comes down to meet the small steamer, as her arrival is an event, and Gallegos, on this occasion at all events, springs into life. The process of loading wool at Gallegos is a simple and inexpensive one, due to the enormous tide (about 40 feet) of the river. When the tide is out steamers and other craft are left on *terra firma*, so that all the wool carters have to do is to drive their teams up alongside and roll the bales up a plank. When the ship's hold is full she steams out quite easily on high water.

III.

As in Australia, the lonely wayfarer, riding or driving over the cheerless, treeless plains, is always assured of hospitality when he arrives at an *estancia*. The ordinary life, however, of a Patagonian *estanciero* is far more primitive and comfortless than that of the average settler in Australia, simply because nature has done nothing for him to make his home comfortable. A garden is one of the greatest rarities, and often there is not a tree within hundreds of miles to give even a stick of firewood—much less timber to build a house.

Now and again one comes across a homestead with a row of willows planted to break the razor-like blasts that sweep down from the Andes, and, perhaps, some cabbages and turnips growing to make life a little more tolerable. But the average *estanciero* has literally nothing but his corrugated iron shanty—an edifice imported in sections and carried scores of leagues on bullock-carts at great expense, and his fuel for cooking purposes is dried sheep manure, which is quite a good substitute—'like Irish peat. In this box-like habitation he tries to make himself and others 'at home,' and some have succeeded in their endeavours, lining the living room and furnishing it with arm-chairs and sofas.

This applies more to the English and Scottish 'rancher,' who makes a home, no matter where he is, and will have a garden if it is possible to grow anything. But the Patagonian hybrid, the man descended from the old Spanish-Indian stock, is often a veritable savage. He leads a lawless kind of a life, usually lives out of wedlock, eats the coarsest of food, and washes not, nor takes his clothes off for months at a time. These settlers, it is true, will give the traveller a 'shake-down' for the night and allow him to corral his horses, but you may not always be asked if you are hungry and want a meal after your journey, as at an English, Scottish, or Irish *estancia*, and you may have to throw yourself down on a pile of malodorous sheepskins and sleep as best you can. The *viagiero* not long out from Europe may be forgiven if he feels nervous sometimes in the presence of these

semi-barbarians, and keeps his Colt or Smith-Wesson handy. Indeed, in many cases, this 'hospitality' is offered to travellers, not through any good-will, but simply because, were it refused, the wayfarer might do the ranch-owner not a little harm by cutting his wire fences, mixing up stock, killing sheep, and in other ways taking revenge for being refused shelter.

IV.

Owing to severe snow-storms in winter, freezing winds, and lack of sustenance, the losses among Patagonian flocks are frequently terrible. It is recorded in one instance that a sheep-owner at the end of a severe winter had but a thousand left out of an original thirty thousand. The constitution of a well-fed sheep is proverbially strong and able to withstand heat or cold, but when herbage is wanting the poor animal must lie down and give up the ghost. The grasses found in Patagonia in the summer are sweet and succulent, and stock thrive remarkably well, but the Antarctic severity of a Patagonian winter is dreaded by man and beast. A sheep dying in the snow, however, is not altogether a dead loss, as the cold preserves the carcass, and at the end of the winter every shepherd goes wool-gathering. He skins the carcass and brings in the fleece, baling it with the rest, until the sum total compensates in some degree for the loss of the stock in winter.

Every article, from a needle to a windmill, is hauled at funeral pace over the endless plains by bullocks. Wool comes to the Atlantic seaports from as far back as the spurs of the Andes. It naturally takes a man of considerable substance to withstand this constant expense on his 'clip,' and by the time those bales reach Antwerp or London, what 'with freight, insurance, and agents' fees, the Patagonian *estanciero* can hardly be dubbed a profiteer. Getting goods into these remote regions costs as much as getting them out, and, as nothing but grass grows 'way back,' all the necessities of life except meat and water have to be pulled league after league on bullock carts.

Anyone contemplating ranch life in Patagonia must of necessity be as tough as nails, stout-hearted, able to withstand any weather, and to put up with little or no society. True, he will find crowds of wasters and idlers at the *boliches* (roadside drinking taverns), but he will do well to give these undesirables plenty of sea-room. He must, on the other hand, be he English, Irish, or Scottish, take care not to offend the native *estanciero*, as the latter can make things very unpleasant for him.

Many well-to-do settlers in Patagonia to-day own tracts of 175 square miles of country, with flocks of thirty to forty thousand sheep, and probably do not regret the day they went there. They are men who take a lot of beating—the true, unflinching, straightforward type of pioneer.

IN THE VALLEY OF DECISION.

(3) OLD BLUNDERBUSS.

CHAPTER II.—continued.

IV.

'BUT surely,' I said, 'you found out the mistake the moment you got here and actually saw her?'

'Well,' he said, 'I did and I didn't. I'll tell you exactly what happened. As soon as I got here the servant showed me to the drawing-room, and there—at least so I expected—was my young lady waiting for me.'

'She was standing at the window with her back to me, and as I hurried across the room I called out, "You darling Hetty, here we are at last." And then, just as I was putting my arm round her, she turned her face to me, and I saw it was not Hetty—I mean it was not Betty—confound those names!—it was No. 2, I mean, and not my girl at all.'

'However, she turned round, and not only allowed me to kiss her, but seemed as if she fully expected it. And I thought what a jolly sort she was for a sister-in-law.'

'She began asking me about my journey, and then said, "How wonderful to think that that trip across the water should have made such a difference to us all!"'

"Yes," I replied; "but where's Hetty? I haven't seen her since our landing at New York."

"You mean Betty!" she exclaimed.

"No, I don't," I said; "I mean Hetty."

"Oh, you dear old thing," and she burst out laughing. "You are as naughty as ever you were. I declare you are as bad as Aunt Rachel."

'She then drew herself up, and put her hands on my shoulders, and, smiling in my face, said, "Now, tell me, am I Hetty or Betty?"'

"Why," I said, "of course you are Betty."

'She almost screamed with laughter. "Really you are too killingly funny!" she exclaimed; "and you said it as gravely as a judge, and as if you quite believed it."

'The dinner-gong now sounded, and she told me dinner would be ready in half-an-hour; "so we had better go and dress," she said, "or we sha'n't be ready."

'Off I went to my room therefore, and, as a matter of fact, I began to feel rather piqued that my young lady had not been the first to welcome me.

'Hetty called after me, "You will see Letty at dinner. She's awfully excited about meeting you."

"That's all right," I replied; "but you haven't answered my question about Hetty yet. What's become of Hetty?"

'Her only answer was another peal of merry laughter.

'I left the drawing-room, and on my way

upstairs to my room all of a sudden a horrible suspicion seized me and sent a chill to my very bones.

'It so happened that just at that moment a maid-servant was coming downstairs, and I detained her for a moment. "I understand that Miss Letty, the youngest daughter, is at home?"

"Yes, sir, Miss Letty is at home."

"And her eldest sister, Miss Hetty, is she not at home?"

"You mean Miss Betty, sir. No, sir! Miss Betty has been in London since last Saturday, and won't be at home until next week."

V.

At this point Ullathorne paused, and begged for a drink of water.

'Pon my word, George, I am sorry for you,' I murmured; 'this looks like a bad business. But what did you make of it? What happened next?'

'Well,' he said, 'I went to my room and sat in a state of bewilderment, feeling sick and dazed. And then I began quite mechanically to dress for dinner, and scarcely knew what I was doing. Of course I felt that something had gone utterly wrong; but it was only after some minutes that I was able to take stock of the situation and to understand clearly what had happened. And then it all flashed upon me like a blaze of light.'

'I could hardly pull myself together to meet you all at dinner. I was a bit late, you remember, coming down, and you couldn't fail to see what a pitiable exhibition of myself I must have presented all the evening.'

'Then you haven't said anything yet, George, to Hetty or to her father?'

'No, not a word. Just think of the bomb-shell it would be! And how impossible my position in this house would be! Why, the general would simply have me kicked out of the house.'

The position did, indeed, seem very desperate; and the more I thought of Ullathorne's plight, the more truly I pitied him.

All the same I felt exceedingly angry with him. What about poor Hetty's unenviable position? And the whole family—they were such dears! And this blunderbuss of a fellow—how could he have blundered so hideously! But perhaps the girls themselves, and that idiotic aunt of theirs, were partly to blame, with their 'Betty' and 'Hetty,' and teasing and mystifying poor simple-minded George as they had done on board the *Oceanic*.

My surmisings were interrupted. 'For God's sake tell me,' he said, 'what you think I ought to do!'

CHAPTER III.

I.

FOR some moments I looked at him. 'George,' I said, 'you have just invoked the name of God. Do you really believe in God? Do you ever pray to Him?'

'I do sometimes,' he answered wearily, 'but not, I'm afraid, as much as I ought to. But what's that got to do with it?'

'My dear man, it has got this to do with it: you've managed to get into an awful hole, and it almost passes the wit of man to pull you out of it. And it isn't only you who are in a tight place; we must think of our poor friends here also.'

It is wonderful how the humility of prayer, and the sense of reliance upon a power and wisdom infinitely greater than our own, tend to calm the mind, and to clear the understanding until that path of duty, which previously may have seemed to be only full of pain and punishment, is discerned to be the path of safety and the way of peace.

'Now, George, tell me,' I said at last, 'have you considered the possibility of going forward with this engagement of yours? Have you any overpowering objection to marrying Miss Hetty? She is a very attractive girl, and would make you a good wife, and do you credit.'

Poor Ullathorne gazed at me. 'I might have entertained it,' he moaned; 'indeed, it might have been my duty to do so if there had been no one else mixed up in this business. But then, you see, there's Betty; and the very fact that she left home when she heard I was coming here shows how deeply she must have felt it.'

'Felt what?' I asked.

'Why, my coming here.'

'Do you mean to say,' I rejoined, 'that before you parted from her on board ship you gave her to understand that you really cared for her in that kind of way?'

'I did,' he assented; 'and, what is more, I do care for her, and as long as there is any chance at all of marrying her—why, I could never bring myself to destroy all my hopes of winning her by going on with this affair. I couldn't go through with it. It's all a beastly misunderstanding; and as for me marrying her sister in such circumstances, it couldn't possibly bring happiness for either of us.'

He spoke with bitterness and passion, but his view seemed not unreasonable.

'Well, then,' I rejoined, 'the only alternative is that your engagement with Hetty must be put an end to. But how are you going to do it?'

I warned him that in ordinary circumstances it must be a painful business to throw a girl over, but in this case Hetty would have the additional mortification of feeling that she had been made a fool of, and that while she was thinking of marriage with him, and indeed had

consented to marry him, he, on his part, had never even given her a thought. A horribly humiliating position for her!

One thing, however, stood out clearly; if the engagement with Hetty was to be broken off, it must be broken off at the earliest possible moment. Any further make-believe of love and marriage would indubitably brand him as an impostor and a villain, and would make the position worse and worse.

II.

The longer I considered it, the more certain I felt that there was likely to be a very painful experience for us all, and possibly a very unpleasant scene. Miss Henrietta was a young lady of high spirit, and her self-respect would be mortally wounded; and the general, her father, would be simply furious; and I feared Ullathorne would have to make a very ignominious departure.

And as for any chance of securing Betty hereafter, it seemed to me that he might as well whistle for the wind.

'Now, George, have you made up your mind what is best to be done?'

No, he hadn't.

However, I told him that if he hadn't I had. 'There is only one way of it; you must cut and run. Remember, there are times when discretion is the better part of valour.'

I made him fetch me a *Bradshaw*. It appeared there was a train due to leave Tollington Station at a quarter past seven in the morning.

'You must clear out of this house, bag and baggage, at six, before any of the family are up. There is a man who is a cab proprietor not ten minutes' walk from here, and you must rout him out before six.'

'I won't go with you to the station, because I must stay here and fight a rearguard action to cover your retreat.'

'I'll tell them that to your dismay you discovered that there was business at home which you were bound to attend to, and by my advice you had taken the first train back—the business was too important to wait—and that you would write and explain. That will serve for the moment.'

'And what you have to do on getting home is to write to poor Hetty, and to the general, without any delay. That is the important business you have to transact. And I should advise you to make a clean breast of it, and to write as nicely as ever you can.'

'For my part, if I can get the opportunity, it may be as well to give to the general and his daughter an inkling of the truth before they get your letters, and to refer as sympathetically as I can to your very difficult position. I'm not sure I sha'n't lay the blame for it upon Aunt Rachel. And poor Hetty herself was, I imagine, partly in fault. Of course I shall

tell them you are writing, and by the time they get your letters the first blaze-up will be over.'

Poor George's eyes filled with tears as he grasped my hand and said, 'Good-night,' while he murmured something about a friend in need.

I need hardly say it was a big burden for me to shoulder, but I saw no other way out.

III.

It is not necessary to recapitulate all that took place next day. Ullathorne, of course, was not at breakfast; he had managed to get off, as we had arranged, by the early train. My apologies on his behalf were humble and profuse rather than convincing; and when breakfast was over I took the earliest opportunity of making my friend Maxwell acquainted with the real facts.

He was quite as furious as he ought to have been, but after a while calmed down sufficiently to consider the case as affecting not merely Hetty but the happiness of her sister Betty.

'We must wait,' said the general, 'for his promised letters, and see how he regards the matter himself, and whether he is sufficiently apologetic for making such an ass of himself. And perhaps we had better say nothing yet to my poor Hetty, but let her hear it all at first-hand from him.'

In the end he agreed that it might be as well if he prepared Hetty for her bad news of to-morrow by telling her that some difficulties in the way of the marriage had arisen, and that George's letter would explain matters.

The following day the post brought the letters we expected, and I returned home.

Subsequently General Maxwell wrote to let me know that, upon Betty's return home, he had told her all about it, and that she had felt it very much. So far as he was concerned, he did not object to Ullathorne renewing his proposal of marriage at the right time; but that time was not now, for at present Miss Betty was tremendously up in arms on behalf of her sister. And so there, for the present, the matter must rest.

Such was the tenor of General Maxwell's letter, and I told George how the ground lay.

George's idea, however, was that as a matter of honour he ought not to delay to acquaint Betty that if he had blundered he had not been unfaithful, and that he cared for her as much as ever, indeed more so.

He wrote to her, therefore, and told her so.

Her answer was not long in coming. 'I beg you,' she wrote, 'to forget all about me, even as I myself wish to forget the resentment which I feel when I think of your inexcusable conduct towards my sister.'

IV.

And here my story might have ended; but there was one person who apparently thought

that such an ending would be altogether too pitiful, and not at all satisfactory.

My 'sweetheart' Letty (as she loved me to call her) has not hitherto appeared much on the scene, but she appears now. She had that gift of true womanhood, a heart of pity, which is a heart of gold. She greatly pitied Hetty; but pride—very proper pride—came to Hetty's support, and within six months she was engaged to a very nice young fellow, an officer in the 5th Lancers; and, no long time after, married and went to India. A few months later Betty also married, and this time it was a young barrister who was the fortunate man.

Letty, therefore, felt that she was not called upon to waste any more pity upon her sisters.

At first she had pitied Betty immensely; but when, soon after Hetty's departure for India, Ullathorne had tried his luck again with Betty and renewed his proposal to her, and once more had been refused, all the pity that Letty's heart had ever felt for her two sisters was transferred to the unfortunate man who seemed to her to have been torn to pieces between them.

From time to time when I saw her she shyly and tenderly inquired how he was, for I had told her that my poor friend Ullathorne was sadly changed from what he used to be. But I also told her that one good result from his trouble was that he had become more considerate about other persons, and was interesting himself in church work and in the welfare of his poorer neighbours.

All this was of great interest to Letty, who was a religious girl herself, and a great church worker.

Well, the long and the short of it was that when Letty came to me on a visit, as she did occasionally when I had my sister with me, I happened one day to ask Squire Ullathorne to come over to dine and sleep.

And there is an old saying that 'pity is akin to love.' It was so in this instance. And so that is how George married Miss Maxwell at last—not Betty, nor Hetty, but Letty.

'So that's your story, is it?' said an old college friend. 'I often wondered what was the real story of George Ullathorne's marriage. But he's been lucky. When a blunderbuss goes off with a bang, as he did, and peppers a whole covey, a man is lucky if he bags a single bird.'

'Quite right,' I said; 'but Old Blunderbuss is not such a bad shot after all. Anyhow, you take my word for it, he's managed to secure a rare good bird. And his wife tells me that if he had not been a blunderbuss, one thing is certain, she would never have married him.'

They are quite devoted to each other, and as happy as the day is long.

THE END.

SEVENTH SERIES

TALES OF THE GERMAN AIRSHIPS.

II.—THE LAST AIR-RAID IN SCOTLAND.

By Brigadier-General WALTER B. CADDELL.

I.

DURING the latter part of April and the beginning of May 1916 the whole of Scotland was visited with perfectly delightful weather. Indeed, an anticyclone had spread itself far out over the British Isles and the North Sea, and even those awful miry ditches in Flanders—known to soldiers as trenches—were dried up. The 24th of April was the first of a sequence of bright sunny days, and so far as the weather prophets were able to forecast, the warmth was more likely to increase than abate.

The majority of the inhabitants of Edinburgh rejoiced in the sunshine, but not so our friend of the previous air-raid,¹ Mr Bruce Gower, who, like the hardy Scot he was, preferred his native city in its more seasonable and bracing condition of keen invigorating breezes.

It was, perhaps, through no fault of his own that Bruce became abnormal in that spring heat-wave; it affected him like a fever; his irritability increased as each succeeding day grew warmer, until the morning of 30th April found him intolerable and ready to seek a quarrel even with his devoted and uncomplaining wife, Jenny.

He who, a week before, had been the cheeriest of men and most complacent of husbands was on the last day of April 1916 hardly fit for any human society.

This curious disorder which had so upset him was, however, about to reach its crisis, and the watchful Jenny was the first—as she naturally would be—to notice the fact. It would hardly be fair to give any further details of his distressful disease, of its symptoms, or of what he did or said; suffice it to say that the man was not himself.

On the evening of 1st May 1916 he arrived home from his office weak and weary, physically worn out; but his mind was clear, and he was ashamed.

He recognised that he was normal again, mentally at any rate, and he was ready, if need be, to go down on his knees before Jenny and

beg her forgiveness. But Jenny anticipated his feelings; she took him in hand at once, and, whilst making him believe that she was really to blame for all his troubles, coaxed a confession from him that he had been a brute and a bully, and was unworthy of her.

Never was woman so womanly as Jenny that evening, and Bruce, fallen away from his man's estate under the spell of her charm, became like a child again in her hands.

She made him say things he did not mean, and knew from experience he ought not to say; she played with the man, now a baby, cooing at him and teasing him, using all the pretty persuasiveness that had been handed down to her sex throughout the ages to enforce her will on his; and at last, when she knew he had finally capitulated, she made him promise to do what she wanted.

He made a vow to her that on the very next morning, by the very first train, he would pay a visit to one of his favourite haunts in Aberdeenshire, and stay there until the weather became cooler.

Bruce was anxious that she should accompany him, but she in her wisdom refused, and he had to put up with her refusal.

It came about, therefore, that Bruce arrived at Rhynie early on the evening of 2nd May 1916. He had chosen the place mainly on account of certain tender memories of a happy stay there with Jenny in their early married life; there was also the attraction—a minor one, perhaps, in his present condition—of a good trout stream in its neighbourhood.

II.

On 15th April 1916 the main fleet of the British navy had reached its stipulated strength, and certain alterations in its dispositions were proposed for the better protection of the east coast-line of the United Kingdom. A German naval raid on Lowestoft took place on 25th April, when that town was shelled from the sea and extensive damage done to property; Yarmouth also suffered, but not so severely. As a result of that raid the Third Battle Squadron and the Third Cruiser Squadron left Rosyth and

OCTOBER 24, 1925.

¹ See *Chambers's Journal* for July 1925.
No. 778.—VOL. XV.

proceeded to Sheerness, where they arrived on 2nd May 1916.

It is probable that the German higher command by some means or other obtained information of these changes, and, with a view to discovering complete details of the new positions of the British warships, gave orders for an extended aerial reconnaissance to be made from the Wash to Cromarty.

According to plan, therefore, on the morning of 2nd May 1916 no fewer than ten airships of the German Naval Air Service left their sheds in the neighbourhood of Cuxhaven, and had their rendezvous at Borkum. They were L.7, L.9, L.11, L.13, L.14—which had raided Edinburgh and Leith just a month before—L.16, L.17, L.20, L.21, and L.23. L.7 and L.9 were comparatively old ships, and returned to their sheds about 1.30 p.m., after seeing the other eight well on their way.

So far as is known, seven of those ships were ordered to Scotland, whilst the eighth, the L.23, being the newest and largest of the German air-fleet, was to make southwards along the east coast of England. It was the intention of the Director of Airships that Rosyth, possibly the Clyde, and certainly Cromarty, were to be attacked; but the elements were against him, as those who read this story will learn.

The 2nd of May was the end of the moonless period, and, although everything pointed to a continuance of the anticyclonic conditions that existed, the weather, unknown to the German meteorologist experts, was about to break.

The air-fleet crossed the North Sea in three groups of one, five, and two ships, and the squadrons kept in those formations until the British coast-line was sighted.

A Danish steamer, the s.s. *Hermia*, saw them, and noticed that, when they were about seventy miles east of St Abb's Head, the squadrons broke up, five ships turning southwards, and three, L.11, L.14, and L.20, continuing on their westward course to Scotland.

The instructions of the Director of Airships were therefore carried out by only three vessels, instead of seven, and this default on the part of their commanders was due almost entirely to the weather.

Over the North Sea, north of a line from the Tyne to the Helder, the weather was fine, but southwards by 6 p.m. on 2nd May rain was falling at Spurn and Nottingham, and a depression was rapidly approaching Scotland from the south-east, accompanied by low clouds and a fresh breeze.

III.

The three ships, L.11, L.14, and L.20—the last-mentioned being some distance behind the other two—were now rapidly drawing nearer to the Scottish coast.

The commanders of these craft were amongst

the boldest and most accomplished in the German Naval Airship Service, and were well fitted both in skilfulness and character to deal with the difficult conditions of the raid. The commander of L.14 had previously visited Scotland, and his ship and L.11 were afterwards present at the Battle of Jutland.

When ten miles east of St Abb's Head, at 8.40 p.m., L.11 was engaged by H.M. ships *Portia* and *Semiramis*, and, although the airship was flying low and was broadside on to the attack, it does not appear that she was hit.

The visibility at that hour of the evening was very poor, and no doubt handicapped the gunners of the warships seriously. L.11 was turned to the east on being fired at, and she was not seen for about two hours after her engagement, when she arrived over Beal in Northumberland. Two bombs were dropped, the first at Goswick and the second on the sands between Holy Island and the mainland, but no damage was done. Proceeding in a southerly direction, L.11 was next seen at the mouth of the River Coquet at 11.15 p.m., and the inhabitants of Belford, Seahouses, Alnwick, and Amble caught sight of her as she passed over them. At Alnwick she dropped a reconnaissance flare in a vain endeavour to pick up her bearings. The ship was then headed on a northerly course towards the Firth of Forth, but low clouds, drizzle, and a freshening south-easterly breeze disconcerted her commander, and she was last observed at 6 a.m. on 3rd May half-way across the North Sea on her way back to Nordholz.

The action with H.M. ships evidently made her commander miss his landfall, and, although he eventually found he was too far south, he was never really certain of his position, and so failed to carry out his mission to bomb the Forth district and Rosyth.

The aimless manner in which bombs were dropped by those responsible for this task in the L.11 seems to have affected the other squadrons of the air-fleet that were flying over the north of England on that night. L.23, operating over Yorkshire, let fall an incendiary bomb at haphazard on Danby Moor, setting the heather there alight; the four other ships following her, seeing the flames, dropped no fewer than forty bombs at or near the same spot.

IV.

The second of the three ships in the northern or Scottish group was L.14—the heroine of the raid on Edinburgh and Leith in April 1916.

She made her landfall at Eyemouth, north of Berwick, at 8.25 p.m., but turned eastwards and went out to sea again. Her course was then evidently altered to north-west with the intention of renewing her acquaintance with the Firth of Forth. No allowance was, however, made by her steersman for the change in weather conditions, with the result that she

was driven too far north of her intended destination by the south-easterly wind that had arisen since her departure from Germany. At 9.30 p.m. the ship was seen fifteen miles due east of the mouth of the Tay, and she did not come over the land until Lunan Bay was reached.

L.14 was seen just north of Arbroath at 10.50 p.m. The steersman was obviously very uncertain of his whereabouts, for L.14 here circled in the air for over half-an-hour.

To relieve his feelings the commander gave orders for some bombs to be dropped, and at 11.40 p.m. three fell in a grass field near the farm of Bonhard, and two more in a potato-patch on the farm of Panlathie in the parish of Arbirlot.

The result of this bombardment was that at the first place one horse was slightly injured; at the second place just one single pane of glass was broken.

The airship was then steered in a south-westerly direction along the coast, and flew over the north shore of the Firth of Tay.

It is probable that the north shore of the Tay was mistaken for the north shore of the Forth, and no doubt the steersman expected to find himself in the vicinity of Rosyth.

What the commander of L.14 must have said to his pilot when he found he had lost his way can probably be well imagined, and it is not intended to go further into the matter in case some members of the fair sex may possibly read this story.

The ship then passed hard by Dundee for the first time, and it can scarcely be true that her commander was heard to mutter something about 'Down with the bonnets' as she flew over that town! Perhaps the German official account of the War, when it is published, may have some remarks to make on this important point! The burgh of Carnoustie was then reached, and the Tay crossed in a southerly direction.

At 12.7 a.m. on 3rd May, the ship was seen at Tayport, going towards St Andrews Bay, where several bombs were dropped into the sea, and she was last reported from the Isle of May about 12.30 a.m.

As in the case of L.11, L.14 was greatly hampered by the low rain-clouds and rising wind, but on the other hand her commander showed a lack of enterprise in his battle with the elements that did not tally with the wonderful flights he had previously accomplished.

Perhaps the heat-wave disagreed with him as much as it did with Mr Gower, and weakened his moral courage so that he hesitated and was lost.

V.

His was, indeed, a sorry effort compared with that of the commander of the L.20, who, though he wrecked his ship in the undertaking, per-

formed one of the finest feats of navigation ever recorded in the accounts of the air-raids on these islands.

Regardless of rain or of wind, he flew over nearly three hundred miles of Scotland's mountains, dales and lochs, without faltering, in his endeavour to find the object of his attack—Cromarty.

L.20 made her landfall at Redcastle, Lunan Bay, at 9.55 p.m., and, flying in a north-westerly direction, passed over Inverkeilor, Brechin, and Careston, where she arrived at 10.15 p.m. She was heard at Justinlaugh and Glen Ogil, and the hills of Pinderachy almost trembled with rage at this invasion of their peacefulness. The ship, however, floated by them undismayed, and sailed over Ben Screavie into Aberdeenshire. Braemar Forest then reverberated the hum of her propellers, and it was not until 11.30 p.m. that she was actually seen for the first time, just south of Aviemore, calmly pursuing her north-westerly course. The inhabitants of Errogie, near the north shore of Loch Mhor, were awakened at midnight by a clatter that sounded to them like hundreds of motor cars passing by. At Balmacraan, Milton, and Lennie the beauty sleep of many charming lassies was interrupted by the inconsiderate action of this airship.

The Caledonian Canal now lay beneath her, and no doubt her commander would have pushed on to Cromarty had he not been informed that the supply of petrol left was only barely sufficient to take the craft home again. It is probable he had realised by this time from the drift and speed of the ship that the wind had been aiding him, and that it would have to be faced on his return journey. L.20 was therefore turned about, and after proceeding for a short distance on a southerly course, changed direction to the east, so as to avoid flying against the then prevailing wind. The position of the vessel was verified at Aviemore, and forty minutes later—at 1.50 a.m.—she flew over Rhynie. A mile or two south of Rhynie lies Craig Castle, which, being beyond the restricted lighting area, was lit up. The attention of the commander was drawn to these lights, and the bombing officer, taking a careful aim, launched a salvo of six high explosive bombs on this inoffensive target. These half-dozen all fell within forty feet of the castle, the windows and roof of which were damaged, but luckily there were no casualties.

VI.

Mr Bruce Gower was tired after his journey from Edinburgh, and with all his cares behind him fell into the first really comforting sleep he had had for a week or more. Suddenly a noise that he likened to the buzzing of a million bees awakened him, followed by a curious whistling sound as if some one had sat on a bagpipe; and it was not until the roar of the exploding bombs reached his ears that he realised there was an

air-raid in progress. He was out of his bed in one bound, and in thinking over the whole affair later on could not recall such an agile movement on his part since he jumped the Oxford full-back when playing Rugby football for Edinburgh University nearly thirty years ago. It will be recollected, too, that he had gone to Rhyndie to repair a body that was physically very much below par, so that his effort could not have fallen far short of what is known as championship form.

He thought he caught a glimpse of the airship from his window, and he may possibly have done so, as she was flying low and was very close to him. His heart was almost bursting with excitement, but he was not even nervous. On the contrary, his senses were elated and far keener than he had ever remembered them to be; the flesh of the man had, so to speak, been swallowed up in the spirit, making him unmindful of it and of time or space.

For perhaps a minute he remained in this intensely interested state, experienced only once in a lifetime, and as the noise of the airship grew fainter in the distance, so the man's materiality gradually but reluctantly reasserted itself and dragged his thoughts down again to the grossness of earth.

He was hoping that the airship might possibly return and that he might see her more clearly than he had done, but although he watched for her at his window for half an hour he heard no sounds. She was gone, never to be seen again in Scotland.

Regretfully he got back into bed, and his mind, amongst the many fleeting reflections that passed through it, turned to the question of what news he ought to send to Jenny. After much deliberation he decided to send her no information, realising that he had in reality been only on the fringe of events. His sense of humour again came to his aid, and he fell asleep smiling over the fact that the tables had been turned on him.

VII.

Meanwhile L.20 was rapidly leaving Aberdeenshire behind her. After passing over Kennethmont she dropped five bombs at Knockenbaird and Scotstown, but these fell in open fields and caused no annoyance to man or beast.

Three more bombs were let go when the ship was three miles east of Knockenbaird; these only disturbed the pasture-land near Freefield House in the parish of Rayne. The airship was seen between Rothienorman and Oyne, and also at Old Meldrum, and at 2.40 A.M. the crew of L.20 bade good-bye to the land of mists and winds, after spending five hours over it.

Her commander, with an inadequate supply of fuel, now commenced his struggle with the

south-easter, and, although he made a brave attempt to cope with it, found he was steadily being driven northwards.

At 5 A.M., on the morning of 3rd May, the ship was sighted by a trawler ninety-five miles due east of Aberdeen, and it must then have been evident to all on board her that the attractions of Scotland were likely to cost them dearly.

The anxiety of her commander must have been more tragic to behold than even Euripides pictured in any of his characters. His position appeared to be hopeless, and his fate seemed to be as certain as that of the commander of L.19, who in February 1916, after flying over the Midlands for eleven hours, came down on the North Sea off the Spurn, where he and his crew were drowned. The training of the sailor, however, came to his aid, and the commander of L.20 at once dismissed all thoughts of making the Fatherland. He decided to keep his ship on her eastward bearing and to risk a forced landing in Norway—and, as events turned out, he chose the wisest course, for the petrol supply lasted just long enough for the ship to reach that inhospitable coast.

She was flying very low, and just before she passed over the land the second-in-command and some of the crew jumped into the sea and swam ashore. At 10 A.M., on 3rd May, the L.20 came down at Jaederen, south of Stavanger, but with no assistants at hand to guide or help her she drove on over the ground until she collided with the hill of Jaataaberg near Sandnaes. The impact forced the afterpart of the vessel up almost at a right angle, but in spite of this terrible injury she rose again into the air for the last time and pitched into the water of Hafstrfjord, where she broke in two. She had then been flying for twenty-five consecutive hours. She was destroyed later on by the Norwegian authorities, as her repair was beyond the powers of the inhabitants of that country, and so one more of the great air-fleet, and a very gallant one, passes out of these tales.

The second-in-command and those of the crew who jumped out of the airship and swam ashore were treated as shipwrecked sailors, and were sent back to their homes, but the remainder, including the commander, who is said to have found his way back to Germany at the end of 1916, were interned.

VIII.

Those who remember their history will doubtless recollect that, in 1588, when the mighty Armada set out to destroy the naval forces of this kingdom, it was wrecked by the wrath of God, and that in 1688 when the Prince of Orange was ready with his ships to leave Holland and save England, the crowds in Cheapside were praying for an east wind so that he could set his sails.

So far as Scotland is concerned, the year 1916

should not be forgotten by her historians, for it was the south-easterly wind that then saved her capital and its people from what would inevitably have been great sufferings and tribulations.

The air-raid of 2nd-3rd May was the last that took place over the northern half of Great Britain, and it may truthfully be said that on the whole the damage caused was comparatively very small.

The aeroplane, as compared with the airship, had not been sufficiently developed in 1916 or indeed in 1918, to enable it to reach even

the Midlands of England from Germany. But this is not the case to-day.

In such circumstances it is possible that a Jenny and a Bruce may come to life again in these pages—the Editor, of course, consenting—far sooner than may be thought. Who knows?

Nearly ten years have passed by since Scotland was invaded from the air, and the older members of the Gower family feel—wrongly, perhaps—that when the next invasion occurs they will have gone where the airship and the aeroplane cease from troubling.

GERSON'S SECRET.

By NORMAN WYATT.

I.

‘COURAGE is a peculiar thing—a most peculiar thing.’

These words were uttered by my old friend Lewis, the much-knowing and the far-travelled, as we sat together one night in his quaint little smoke-room, where the spoils of a hundred journeys lay littered around in gorgeous confusion.

We had been chatting away for some time in luxurious indolence while darkness gathered around us, and it was only an idle chance that had led us on to this topic. But from my long acquaintance with Lewis I knew instantly from the way in which he made these observations that a fine yarn was on the tip of his tongue.

Even were Lewis not the best and truest of friends, I am sure I should still have been powerfully drawn to him by his inexhaustible fund of tales and anecdotes.

I became instantly very attentive, and shifted myself into a more wakeful attitude.

‘Yes,’ he repeated, his strange, high, jerky voice sounding very strident in the dim quiet. ‘It is indeed a strange thing. You see, there are so many varieties of it, and it can spring from such an endless diversity of sources.’

He stopped suddenly, as if uncertain what to say, and glanced swiftly round the room, as though it had been filled with people, and he suspected that they were not taking his observations seriously. I perceived that the incipient yarn was passing through a critical stage, and I prepared to give a little tactful assistance.

‘You’ll have seen a good many queer brands in your time, most likely?’ I ventured, trying to speak in a casual manner.

‘Yes, I have,’ he admitted impressively, as he commenced to fill his pipe with his characteristic, quick, uneasy motions. Seeing this, I knew I was now assured of a most absorbing recital.

‘I was thinking,’ he began, ‘of rather a

curious form of pluck I had once encountered. I have never been able to decide whether it was a marvellous example of unconscious heroism or merely a case of baffled cowardice—outwitted funk, if you know what I mean. But I’ll give you the whole story, and you can judge for yourself.

II.

‘I’ll have to take you back a good few years, to the time when I was working for the newspapers, and had shipped aboard the old *Lagos* to procure copy for a series of articles on the lot of a sailor of the merchant marine. I shipped at Liverpool to work my passage. There were three other strangers to the ship besides myself on board. Mrs Maddon, the captain’s wife, her four-year-old daughter, and Robert Gerson, the man with whom my tale will be principally concerned.

‘I never fully ascertained the reason of Gerson’s presence on the *Lagos*. As the captain treated him with scant courtesy I soon guessed he was no friend of his, and surmised he was some influential business man indulging in some whimsical notion of a novel holiday. This I afterwards found to be the correct explanation.

‘He was a queer-looking, stout, bespectacled, owl-like sort of fellow, and, to judge from his appearance, about the last person on this earth from whom one might justifiably expect anything heroic. I do not mean that he was one of those great balloon-like caricatures of men, but his figure possessed just that degree of rotundity necessary to deprive him of any shreds of dignity which his great, ugly, horn-rimmed spectacles left to him.

‘Yet he must have imagined himself quite an imposing personage, for he had a pompous, imperious manner, which soon gained him the entire ship’s company’s hatred. He quietened down considerably under the chilling treatment he received in consequence, and became almost penitent-looking at times. I grew a bit sorry for him as he wandered forlornly about the

deck, his little gray eyes blinking at everything with that queer puzzled expression they had.

'Then it was that he started cultivating my friendship. He astounded me one day by claiming to have known me before. I cannot say whether he really thought so, or was merely saying this in order to get some one to speak to, but at any rate that started a sort of intimacy between us.

'I found out rather a lot about him, for he was basically a simple fellow. Robbed of his bluster, he was only a weak, uncertain, good-natured person. He was a man who seemed to drift through life with aimless bewilderment towards the only ideal he knew worth following—the amassing of a fortune. Not much of the heroic fire in such a character, you would think, eh? Just a narrow-souled little money-grubber; and that was all I learned of him till disaster overtook the *Lagos*.

III.

'We were somewhere off the coast of Labrador when a cry of fire broke out. The fire, however, must have been burning for long before it was detected, and I realised at once we should have a hard task to save the ship.

'I won't weary you with the account of the struggling and slaving we had in vain—there was nothing startling or novel about it all. All I need say here is that in the end the fire beat us, and we were ordered to take to the boats.

'As we pushed off from the blazing ship a stiff northerly breeze sprang up, and long before she sank it had developed into a fairish gale, which drove us farther and farther out of the regular track of ships. Our position was thus made serious. The captain's face grew grave and anxious, and there were sad hearts among us, I fear.

'Gerson, however, seemed absolutely unconcerned. In fact his courage appeared to rise as our position became graver; nothing troubled him at all. Chance had placed Gerson in the same boat as the captain and myself. He leaned back quietly among a heap of stores, and, with his left hand supporting his head and his right thrust into his breast-pocket, gazed away over the heaving gray sea.

'As darkness fell the wind went down a little, but still kept driving us southward.

'“I say, what a fine night for stars,” said Gerson to me, lifting his eyes to the myriads of gleaming points above.

'I stared at him through the gloom, wondering. The man's voice was as calm and as even as the voice of a nun at prayers. Did he fully realise the gravity of the position? Could he be some sort of harmless imbecile?

'“Do you know the name of that big bright one?” he inquired with almost childish eagerness.

'For a moment I hesitated, undecided whether to be irritated at his absurd chatter or pleased at the diversion it afforded. Then I told him, and so started a conversation which lasted till my turn came to keep watch. Gradually the men beside us began to feel the influence of his radiant calmness, and the conversation became general and wandered off on to many topics. Whenever it flagged he put new life into it: he was marvellous.

IV.

'That was the beginning of Gerson in his new rôle of general entertainer and reviver of drooping spirits. As the days passed he became more vivacious and amusing. He seemed to draw energy and inspiration from the knowledge of the responsibilities which thus devolved on him. But there were few who really shared his light-heartedness, though all drew some solace from it. Our plight was fast becoming desperate. Our stock of provisions and water was rapidly becoming depleted, and at any time a squall might spring up which would swamp the boats.

'Days passed and never a ship was sighted. Rations were reduced and yet again reduced. Faces became thin and pinched, and eyes grew strangely bright with suffering, yet Gerson's marvellous tranquillity abated not a jot. Long dreary days succeeded long sleepless nights, with the first pangs of hunger beginning to stir within us and the horrible spectre of death by slow starvation hanging over us all. And still the fellow seemed untroubled. His cheeks were a little sunken, and his laugh maybe was not so sonorously merry, but that was all. Never in word or deed did he display the faintest anxiety for the future. Even when the captain announced a further cutting-down of the rations he did not seem in any way more concerned than if he had just heard some casual remark about the weather.

'What we suffered after that I simply cannot describe. It was fearful sitting there while the flesh faded from our bones and death came slowly and painfully upon us. We were sore and weary too from damp and exposure, for the spray often lashed over us, and our bodies were covered with great sores. We were a ghastly company.

'We seldom spoke now. We were too emaciated and exhausted to find any interest in each other's talk. When we did speak it was only in short, low sentences. All but Gerson—true, indeed, his voice was no longer ringing out merrily, but his spirit was still as care-free as ever; his eyes alone were devoid of that haunted look which told of dark thoughts preying on the mind behind. Whenever he was not on watch he was sitting in his original position—though there was little left to lean against—staring over the heaving billows with his mild, unruffled little eyes. Beyond the fact

that he was considerably thinner, his terrible experience seemed to have had no effect on him, unless it had caused the development of his anxiety for the contents of his breast-pocket. It was a curious fact this, and I can remember having sometimes idly wondered what his pocket might contain which could require such assiduous care, for every now and then he would touch his pocket as if to reassure himself that something was still there; then he would smile and sink back contentedly. As our sufferings became more excruciating I noticed that his hand sought his pocket more frequently. What priceless gem, thought I, must be concealed there that it should claim the attention of a man in his last few tortured moments on this earth? Never a grumble escaped his lips; he was always serenely patient and ready to help.

v.

'Then sickness came amongst us. The captain's daughter died; then his wife and one of the crew became affected. The captain's wife sank—sank rapidly, for she was painfully weak from lack of nourishment.

'One day, just before she died, I noticed Gerson quietly engaged in conveying his scanty allowance of water to her. Glancing up suddenly, he saw me watching him, and instantly he grew more confused and worried-looking than ever I had seen him. He quickly finished decanting the precious fluid, and, coming close up to me, whispered feverishly, "For Heaven's sake don't start thinking me a hero for what you've just seen me doing," he said. "I am not—I am an arrant coward, if you only knew the truth. I could not stand having you think me a hero. My God, man, the mockery of it would drive me mad. For Heaven's sake say you don't think me a hero," he ended frantically.

'Fearing that the long-continued strain of our position had destroyed the plucky little chap's mental balance, I quickly complied with his singular request in order to humour him. He calmed down instantly. The fierce red colour faded from his cheeks, and his eyes regained their calm, steady light.

"That's it, thank you," he said. "I couldn't bear to have anyone thinking me a hero when I know what a funk I am. What you have seen me do might have been heroism if any of the rest of you had done it. You would have been risking death by a most painful process of thirst, but there was no such consideration where I was concerned. You must understand I've always hated the sea, and before I came on this trip I made provisions for such an emergency as this. I'm really a very foolishly nervous man." He thrust his hand suddenly into his mysterious breast-pocket, and relapsed into silence as a soft, easy smile stole over his features.

'The captain's wife died that night, and before morning another member of the crew had taken ill. From that time onwards we were remorselessly thinned by harrowing deaths till only a pathetic, famine-stricken remnant remained.

'What the others thought then I do not know, but it was about this time that I began to give up hope. Nevertheless, if Gerson in any way shared my forebodings, he very effectually concealed his thoughts. He seemed to be actually drawing courage and fortitude from some invisible source; not a forced, determined courage, but a soft, easy bravery. He had all the calmness of utter resignation, with none of its attendant bitter weakness.

vi.

'Then we came into dense mists, and knew no more of our whereabouts till one windy night we heard the crash of breakers on the shore. We tried against fate to pull out, but the wind was dead shoreward, and our united strength was barely sufficient to have made much progress in a dead calm.

'Right onto the coast we were forced, and I had a fleeting impression of an ugly rocky ledge with a white fringe of swirling foam before the boat struck a projecting rock and capsized. I remember struggling desperately for a moment, then something struck me, and a great, sudden darkness descended upon me.

'I awoke to consciousness of cold and wet, and a terrible pain in my head, to find the captain bending over me and Gerson sitting a few feet distant. Everything was white with snow, and snow was falling heavily.

"Rouse yourself, man," said the captain.—"Here, Gerson, lend a hand."

'By their combined effort they dragged me into a sitting position against the rock.

"You've got to rouse yourself," ordered the captain. "If you lie here you will die of cold."

'Slowly the position of matters was brought home to me. We were the only survivors of the boat, and, wet and enfeebled, we were exposed to the fury of a snowstorm in Labrador. As my strength returned, and I was able to struggle to my feet, I perceived that Gerson was indeed in a sorry plight, and seemed on the verge of utter collapse, though he was still as willing and as unruffled as ever.

'A minute or two I leaned against the boulder; then I moved out in obedience to the captain's order. I gasped as the icy wind caught me with a rude foretaste of chill death. The whole world seemed obliterated in a driving cloud of snow. But the captain, being familiar with the coast, recognised the spot, and judged that the nearest village lay some six miles to the northward.

'Our progress was painful and slow, for the

snow was soft and newly-fallen, and greatly impeded our footsteps, and the biting wind was dead in our faces. Then the cold and wet were chilling us; we could feel our limbs grow leaden as we walked.

"Quicker," commanded the captain. "We shall never keep warm at this rate." We made a desperate attempt to obey, floundering along grimly in the snow-drifts. For what seemed an age we plodded on thus; then Gerson sank into the snow and lay still. All our efforts to rouse him were fruitless; he merely groaned and shook his head.

"Here, man, is that a light there?" asked the captain, peering anxiously into the darkness.

"Yes," I answered; "and I think I can hear voices."

Next minute a group of men burst upon us out of the driving snow, and our troubles were ended. Gerson being carried, the captain and I being helped, we were speedily conveyed into the village.

But Gerson could not be revived. He called to me feebly as he was laid upon a bed. When I bent over him he smiled, thrust his hand into his breast-pocket, and nodded to me; then he

closed his eyes and fell into a swoon, from which he never recovered. Thinking he intended me to take charge of some precious package which he had guarded so jealously through all his privations, I put my hand into his breast-pocket, and was surprised to find my fingers encounter a hard, smooth object. I drew it hastily forth into the light, and beheld a small green bottle labelled PRUSSIC ACID—POISON.

Then in a flash I saw it all. Why he had been so solicitous of the contents of his breast-pocket, and what he had meant by saying that he was not a hero! He had carried this poison as a resource against fate, and from it he had drawn his strange, placid courage! By some queer process it had given him a sense of security that had enabled him to endure everything with wonderful fortitude. It had inspired him with courage as well as any glorious cause ever inspired hero or martyr.

'Strange sort of courage, wasn't it? I know he considered himself a dreadful coward, but I've often wondered if he was. You see, there are so many varieties of courage.'

And Lewis bent forward over the fire and began slowly filling his pipe.

THE BASS ROCK.

By D. S. ALLAN, Sen.

I.

IN recent numbers of *Chambers's Journal*¹ there have appeared instructive articles on the locust, which must have been read by lovers of natural history with the greatest interest. They recalled to the writer's mind a long-past day—a day of thrilling experience, laid away in the archives of memory—when he saw, and held in his hand for the first time, a living locust that was found on the Bass Rock, that rock that has stood for ages like a guardian angel at the mouth of the Firth of Forth.

Geologically the Bass is of Trap Tuff formation. It shoots its head more than three hundred feet above sea-level. Three sides of the rock are perpendicular, and as white as the cliffs of Dover. On the south-east side it slopes down to the water's edge, and here is the only landing-stage. (For many days during eastern gales landing is an impossibility.) On this shelving southern side were the fort, the prison, and the chapel, and a good spring of fresh water.

The Bass is a fragment, left all alone, of the prehistoric land that at one time united Scotland to the western end of the European continent, before the cooling crust covering this part of our globe of liquid fire was sucked down, during the great upheaval times, when

our mountains were being made, and our islands formed—down to the level of our coal basin, over part of which flows the Firth of Forth. If the roots of the Bass sank with the crust, it must have stood, like its neighbour, North Berwick Law, five or six hundred feet high.

The classical rock, laden with memories of the past, was a Mecca to some. Hugh Miller, the geologist and historian, was a student of the Bass, and he said there was a halo of glory encircling its hoary head. Few saw the halo as he saw it; they had not his geological eyes, nor his broad historical mind. Miller, by the way, was one of the first contributors to *Chambers's Journal*. He must have been a frequent visitor to Canty Bay, where the writer resided for some time. This is the loveliest, smallest, horseshoe bay on the south side of the Forth, and it was then the gateway to the Bass. Hundreds visited it every summer.

The Bass was accessible nearly all summer to the most timid inlander, and during that season there was a stream of visitors; so much so, that though there were only six families in the bay, the tenant had a licensed house to meet the demands of the visitors. For some months of the year, however, a stranger was never seen within the threshold of the door.

All visitors to the rock had to pass this way. The tenant of the bay was the tenant of the Bass, and he alone had the right of access.

¹ August 1923, May 1924, and August 1925.

Visitors came from all vocations of life, and for every conceivable purpose. No doubt some were just the ordinary globe-trotters, everyday sight-seers, who gloried more in the number of labels on their baggage than in the knowledge they might accumulate in their travel. There came the gentle lover of nature's wonderful works in general, with his quiet inquiring eyes, asking questions of rock and sea and sky; and oft with him the nervous scribbler, with his paper and pencil, looking for some fresh article for his bread-supplying journal, or pertinent thoughts or subjects for his next book. Religious history had a greater place then in the reading community's mind than it has to-day, and the object of some was to see the site of the martyrs' prison and their graves. These were the psychological visitors. But among the companies that came year after year could be seen men with a definite practical purpose. Sentiment was nothing to them; they were Bass Rock materialists. Among them was the geologist with his hammer and his bag, the botanist with his spud and tin, the ornithologist with his glass and wool-padded box, the artist with his palette and brush, the taxidermist with his gun and corpus case. The last-mentioned had to pay toll for every bird he shot; but he often came to the Bass, for he found it one of the finest aviaries in Scotland.

II.

I remember that day vividly. A lovely July day. Everything was shimmering in the hot sunlight; the sea was like molten silver, and the Bass in the glare of light was like a marble column. We scarce had landed when the boat was recalled by signal from the shore, where another party was waiting. While the boatmen were away, Neil and the writer were seated in the Old Fort garden, overrun with nettles three feet high, a rare old rabbit-warren. The young were bobbing out and in among our feet. While watching their spasmodic gambols we saw a curious creature feeding among the green herbage. By casting a light cloth over the plant, it was easily secured; but it was a stranger—a stranger even to Neil, who was guide and encyclopædia to hosts of visitors.

While we were puzzling over our find, an old gentleman had been watching us unobserved. With a merry twinkle in his eye, and smiling as if he had met an old friend, he took it into his hand and said, 'That's a rare find, lads; it is a locust.' Laughing, he addressed the insect itself, 'Are you here, old friend? Whence have you come, and how did you come?' Then he told us he had seen millions of locusts on the wing, darkening the light of midday and laying waste miles of fruitful land. This one must in its flight have got itself entangled in the rigging of some vessel in an eastern sea, homeward bound. As it was passing up the Firth the

locust either had seen the green on the Bass or felt the scent of earth, and, taking to the wing, had found a resting and a feeding place. After the find there was such a searching and hunting by the other visitors. There was racing and chasing on the Bass lea, but the lost bride (if it had one) ne'er did they see. The unusual find was notified in the *Scotsman* a few days after by some of the city party.

The revenue to the tenant from the Bass came from three sources: the monopoly of carrying the visitors, the rabbit-warren, and the young solan geese. There must have been sheep on the rock at one time, for an old writer says that mutton from the Bass was counted a delicacy. If he had said it was a rarity, it could more easily be understood. For a ewe and her lambs would need to work more than forty-four hours a week to keep life going; and more, they would need to be the blackest of black-faced sheep for hardiness, for every wind that blows tousels the hairy herbage of the Bass's scalp.

The gannet has been described as a British bird, and has the honour of having a book of nearly six hundred pages all to its royal self. If the penguin is the aristocrat of the southern isles, the gannet is the aristocrat of the Bass. It is said that in the seventeenth century the gannet was a prized dish on kingly tables, and the birds were worth £200 a year to the owner of the Bass. If so, it is no wonder that Charles II. paid £4000 for possession. The rock belonged for generations to a family of the name of Lauder, and the head was known as Lauder of the Bass. For the first sixty years of the nineteenth century hundreds of young gannet were killed, dressed, and sold in the markets for human food at sixpence each.

On the first favourable day of each week, during the nesting season, a boat went out with four men and a dog. Two mounted the Bass; the others, with the boat, passed round the foot of the cliffs to gather up the dead. One of the men on the Bass, with a rope attached to him, slipped over the edge with a mallet, and every bird that was ready for the market he just tapped on the head, and threw over into the sea to be picked up. They were birds just ready to leave the nest. But this they will not do of their own free will; instinct tells them that there is danger, that their wings cannot carry them, so they cling to the nest for safety. The parent birds know, too, by instinct that their time for nesting is past, and the young geese are hustled over the ledge, a drop of over three hundred feet, screaming, plunging, fluttering down till they reach the welcome sea. But as they cannot fly, they cannot dive for food; they just swim about the shelter of the rock, living on their own fat, till they have reached the normal life weight. Then they take wing and ascend to the great white throng. They do not

reach the white stage themselves till they are two years old.

When the boat returned from the Bass with its load of dead, all hands set to work, men and women plucking, cleaning, and dressing, the offal being boiled down to secure the by-product, dubbing-grease, for the leather currier. Every Friday morning the light van was packed, Donald yoked, and told to go on. The cliff road was so steep that it climbed up the hill-side in a zig-zag, and so twisted that it overlapped itself. Donald marched on, the men walking behind, till he reached the first steep lap and stood still. He would not put his shoulder to his collar again till he found the men's hands on the van to push. So they drew and pushed, sliding and spluttering, till they reached the high main road to Haddington, where the birds were sold at the old market stance. On arrival the bell-man was sent round, proclaiming their advent, but there was such a demand that he had scarce gone his rounds ere they were all sold at sixpence apiece. No doubt they were a big, fat sixpence worth.

III.

The history of the Bass is interwoven with the political and religious history of Scotland since the sixth or seventh century, when St Baldred, the pioneer of Christianity in East Lothian, who built churches from the foothills of the Lammermoors to the shores of the Forth, was imprisoned on the Bass for years, pining away and dying in sight of his beloved church and his people's homes at Auldham. From that time till the eighteenth century the Bass served as a prison—a prison that could accommodate at least one hundred men. Many Covenanters were here kept in durance vile. Finally the prison was removed, and the rock passed into the hands of the Dalrymple family.

This island prison was not for the Macbeths whose hands were incarnadined with the blood of their fellows, who had murdered sleep and themselves could sleep no more. It was for religious and political offenders whose hands were clean, and whose consciences were unstained. These men had a right to a cenotaph, for theirs was a rôle of heroes. However mistaken their faith, or misguided their zeal, they were true to their individual liberty to accept or reject whatsoever they were convinced of was truth or error, for which they suffered or died. It was the sufferings and martyr deaths of men like these that became the seed plot from which grew our liberty of conscience and of thought.

When Tantallon Castle was the glory and the power of the Douglas, many a savoury cooked solan goose graced the dinner-table of that nobleman and his retainers, and often the wild bird's eggs would enrich the breakfast-table. The bay would be their boat-shore, for it is the

nearest deep rockless cove, only a few minutes' walk away. The cragsmen would often pay visits to the rock to keep the castle larder filled; even when besieged they could find their way to the Bass store of winged food.

Sir Walter Scott, who immortalised the Douglas and Tantallon, brought Marmion with his armed band by North Berwick and the Canty Bay road to the castle. We have often wandered among the Fonesse Mounds, and sought in vision to behold the flooded moat and the flying Marmion on the drawbridge, or see the tragic parting at the castle door, and hear the loyal democratic Douglas, as he looked into the blanched face of Marmion, declare :

My castles are my king's alone
From turret to foundation stone,
But the hand of Douglas is his own,
And never shall in friendly grasp
The hand of such as Marmion clasp.

When the artist sees the bay for the first time, his eyes are fixed, his heart is gripped, and down goes his stool. And no wonder! Looking down from the high cliffs, one's mind is filled with an unforgettable vision of calm beauty; its sloping, shelving sides, clothed with living green from the lapping wave to the crowning ridge, and decked and bespangled with the modest primrose or its more gaudy cousin, the cowslip; its narrow belt of crescent golden sand; its low ridge of rock running out to sea on either side, forming the horseshoe sheltered cove; the boats riding at anchor in the calm harbourless bay; the Bass rising out of a silvery sea like a marble column, its green turban crowning its hoary head; in the shadowy distance the Isle of May, lying low like some sea monster stealing up the Firth; and the hills of Fife, blue tinted, creeping up to the sky-line.

While the artist sits dreaming and watching the kaleidoscopic light and shadow playing on the Firth, there may fall on his ear the tuneful voice of 'Lillie of the Bay,' laden with the words of the Boatmen's Song:

When the wind is fair to westward, and the baldie
jowks and sways
To the waves that skelp along the keel,
The fisher's heart is merry as the wind among the
stays
Or Haddie Jenny linton to her creel.

It's fine to clear the harbour in the stillness o' the
nicht,
And glide awa' to meet the comin' day,
To shoot the squirmin' nets into the phosphorescent
licht,
Or jig for muckle herrin' at the May;
Thar's mony a ane wad swap his job wi' me.
But when the nicht comes roarin' doon, an avalanche
o' sleet,
And you're paying oot the gartlens fra the sulls,
Wi' the rinnin' snoods to bait, as they pass you in
the weet,
Thar's few wad change the fireside for the hulls.

ANACHRONISMS.

By I. WANLESS DICKSON.

I.

LIKE a mighty Mahmud on his golden throne sat Cheops, the first Pharaoh of Pharaohs. The scene was in a court of summary jurisdiction, which court had just been brought to its close, and the royal son of Ra had dismissed the acquitted and the condemned. He lay back in the deserted state chamber, gazing on the mighty colonnade, those huge pylons of granite, quarried by countless thousands of slaves, from the vast works at Karnak, down the Nile. The day was hot, and the sheltering palms did but little to cool the arid air that came through the open spaces in fitful puffs. Behind his throne, in blazing hieroglyphs of red, of purple, and of gold, were the words, 'Life, Blood, Power'; and he who sat gazing on this spectacle held in his hand the sceptre, that symbol of awe and majesty, 'wherein doth sit the dread and fear of kings.' As he sat musing, like his prototype of ancient Sicily, he fell asleep, or perhaps into a trance, wherein his Ka went on a journey down through the ages, seeking for the answer to the riddle of the universe. Whilst his Ka sojourned, the guards of the court kept watch and ward, that none might intrude on that august presence.

Leaving the throne, Cheops's Ka wandered out, perhaps on the wings of the wind—who knows?—over the desert, and there he stopped and contemplated the almost incomprehensible work in progress on the world's greatest monument. It was the pyramid, the pyramid of Chufu. As he mused, he wondered how he would enjoy the wanderings that he yet must make, whilst his other, his corporeal self, lay asleep in that mighty mausoleum. He stood unseen by the slaves, who laboured under the lash, driven by stern, austere, unmerciful taskmasters, at piling stone upon stone, which task generations of their like had been doing and would do for millenniums.

II.

As the mood took him, so he wandered off to Upper Egypt, unheeding the beauty of the Nile, the glory of its palaces, the solemnity of its temples. It had been given him by the omnipotent Osiris to see into the future for one swift day. At last he came to Thebes, the mighty Thebes, that walled city of mystery, the wonder of whose being, he foresaw, would amaze the ages, yet would ultimately crumble to the dust. Wearied, he gazed off to the east, and, as if transported on wings of thought, he came upon a scene of tremendous activity; he realised that he was in the presence of his descendant,

Rameses II., Rameses the Great, and he marvelled at the changes which had taken place in those four thousand years in his beloved Egypt. How hard it was to understand that these submissive people, under the leadership of one of this world's most outstanding figures, were there being hammered by time and fate into a coherent, thinking whole. He was grateful to the All Wise for this glimpse, and he could enter into that state of mind wherein time and place had no meaning, and thoughts only survived. As he considered what these wild nomadic tribes had been, and then contemplated what they were to be—the keystone of the peoples of Asia, how they were to be the possessors of the richest land then known to man, how they were to build a temple: true, a miniature in size as compared with the incomensurable temples of his own race, yet such a temple as would leave an impression indelible, ineffaceable, indestructible in the minds of countless generations in the millenniums yet to be, when the temples, yea, the very gods themselves, of his own race and creed would be utterly unknown—it was a staggering thought! These slaves, under the control of one, Moses—that they, in the fulfilment of time, would direct the course of thought in a world so much vaster, so much more magnificent than hitherto he, in his wildest dreams, had ever imagined; that they should evolve an idea of deity of sufficient cogency utterly to submerge all and every trace of belief in Osiris, in Esis, in Hathor, in Nemesis, was too vast for that child of time's first dawning to think upon unmoved. He was swept away with emotion and determined to quit the scene.

III.

On turning, he found a white-robed figure, as insubstantial as himself, beckoning him to come away, to leave these unborn realities and visit something yet more glorious, if not indeed more catastrophic to the pride, the dignity, and the power of his immortal Egypt. Reluctantly, yet half willingly, he followed his ethereal guide to the mouth of the unconquerable Nile, and there, on its delta, he saw such a mighty pile of masonry in such new guise that he was bewildered at its glory and its luxury. The sovereignty of Egypt in alien hands! True, in the hands of a barbarian conqueror; and he gained some little satisfaction from the thought that that same conqueror had overthrown and trampled in the dust Assyria the Great, Babylon the Great, and Persia with her limitless satraps. Yes, he could foresee the descendants of Sardanapalus, in all their voluptuous splendour,

dressed in the pomp of power, now servile to a foreign foe. All this, Assyria, Greece, Carthage, Babylon, Persia, welded into one colossal empire of which his beloved Egypt was but a part. No longer the mistress of the world, the 'arbiter of others' fate, a suppliant for her own.' He foresaw the Macedonian raise out of the ruins, which time and the foes of Egypt had laid in the dust, such a city as would make the name of Alexander unforgettable and unforgotten till 'the moments of time were lost in the dawn of Eternity's day.' This Ka of Cheops's bowed his head subdued, dumbfounded; the weight of ages, as a great oppression, pressed down upon his being.

IV.

As he pondered these things in his heart, the white-robed figure returned. Gazing at him with a countenance filled with pathos and commiseration, the white-robed prophet of Osiris spoke to him, saying, 'My Lord Cheops, this is not all. Come with me and behold a mightier yet.' And he who ruled all Egypt turned and followed.

Across the blue Mediterranean they sped, over the glorious isle of Sicily, to a land his Egypt had never known—and with him time sped too. It was in the reign of Vespasian and in the imperial city of Rome that he next found himself. Turning to his companion, the Ka of Cheops asked, 'What may this place be?' 'My Lord Cheops,' he made answer, 'this is Rome, Earth's Eternal City. There lies the palace of Cæsar. Its glory and its majesty are portrayed in a guise new to you. Her legions uphold her power away in far-off Egypt, in North Africa, in Carthage. She dwells in marble halls, and in that new world of Spain and Britain and Gaul her sway is supreme. To be a Roman citizen is the highest honour this world can bestow; but, my lord, I would ask you to dwell here but a short space, consider the magnitude of the splendour that surrounds you, and then to come with me to the distant horizon in the west. At your feet there lies the Circus Maximus, the scene of countless contests of strength and valour; the wild chariot races; the contests of gladiators. There to the south stands the Coliseum, just finished; a theatre so vast that all Thebes, with its seething population, might congregate to witness a contest of gladiators. Yonder lies the Palatine, a hill yet to be world-famous, and on its summit stands the temple dedicated to the worship of Olympian Jupiter, that god which now supplants Osiris, Isis, yes, even the Hawkheaded One, from their places in the kingdom of Heaven. Even you, who are accustomed to power, must feel the weight of humility, which in truth is befitting, when you gaze upon the progress of mankind. From the east unto the west Rome rules the world. Her culture and her laws are imposed

alike upon the Ethiopian; the Jew, whose temple you wondered at, yonder in Jerusalem; in Greece; in Tyre, no longer the proud mistress of the Inland Sea; in Gaul, in Britain, verily in all the world. But it is only a symbol, a forerunner, of such power arising in yonder Britain, as will stagger human minds with the wonder of its greatness for ages yet to be. Come, my lord, let us away to the isles of the sea, and I will show you the capital of an Empire so great, so vast, so far-flung as will dwarf to insignificance all that Egypt, all that Assyria, Greece, Carthage, Rome, Babylon, ever knew.'

V.

Straightway on the wings of Time they sped to the new world of the west. Down through the ages they had come, into the future, seven thousand years, and in their flight they stopped in Britain, the mistress of the world. She who had conquered Egypt and the Sudan, she who held the Mediterranean as in the palm of her hand, she who held whole continents and millions upon millions of people under her sway. 'And there, my lord, stands her capital. You will be amazed when I tell you that all that immeasurable greatness is hers, yet from one end of her dominions to the other there is not one slave; there is no autocratic power; there is no tyranny; there is that which is undreamed of in yonder Egypt—the rule of liberty. And this boon of liberty has been the gift of Britain to the world.

'Yonder lies what seems to you perhaps a great columned temple. It is a museum, in which are housed many of Egypt's secrets, born and unborn. There lies the mummy of Seti I., Pharaoh of Egypt in the early days of Moses; he who sat on his awful throne dispensing justice, as you, my lord, did but this morning; and now he no longer sits beneath that emblem of majesty and greatness, nor does he wield his sceptre, nor is there blazoned above him "Life, Blood, Power," as in your court in Egypt. His two thousand five hundred years of sleep are undisturbed; his Ka waits on. There lies only the dust, his corporeal semblance, in that gray columned edifice, and strange as it may seem to you, that gray columned edifice is not erected to house his dust, as your mysterious pyramid will one day harbour yours! It is a place where all may come—the wise and the foolish; the reverent and the irreverent; the young and the old; the philosopher who tries to understand, and the sightseer who finds food for his amusement in the earthly remains of yonder Seti. That building holds evidences of empire from the sunrise to the sunset; from the banks of the Indus and the Nile to the lands of perpetual ice and snow. It is a symbol of Britain's greatness. There is no nation under Heaven where her greatness and her power are

unknown. Egypt, my lord, in the presence of such might, dwindles away till she has but the power of a simple city state, in comparison. Are you satisfied, O Cheops's Ka, with this vision of the future, or shall I take you over all her realm?' Cheops answered, 'O white-robed prophet, show me no more. I would return, overwhelmed, bowed down. I would return to my ancient kingdom, there to ponder and to contemplate this vast mystery of Time and Life.' 'Your will, my lord. Let us betake ourselves back across the sea to the kingdom of Egypt. It may be that this vision of the future will modify the actions of the years you still may spend as Egypt's Pharaoh. Let us away.'

VI.

Somewhere in the courtyard outside a tumult arose. Perhaps it was but a street brawl—at all events, it woke to consciousness the Pharaoh Cheops on his throne. For some moments he could not collect his thoughts. Murmuring to himself, he said, 'By Esis, what has happened? I have been on a pilgrimage seven thousand years. I have seen unborn to-morrow and dead yesterday, with all its mystery, its wonder and its might; and lo! I stand here in to-day, and my vision tells me I am but a speck of dust. I know not what it means, nor can I comprehend what destiny Osiris has in store for me. The world is great, how much greater than I thought, great Amen only knows. I feel the weight of my old age. I will hurry on the work in that tomb. I will double the number of slaves, for of a truth, I fear me, it will not be ready for me, else.' So,

tinkling a cymbal, he called for his royal chariot to take him back to his palace.

That night he lay awake in a reverie, and he determined that his tomb, at least, would survive; that though all he saw in his daytime trance might indeed come true, yet would he, Cheops, Pharaoh of Egypt, lord of life, blood, power, build such a memorial—not for personal aggrandisement—as would outlive Time itself. And so musing, into his thoughts there crept the substance, though not the words, of Mathilde Blind's 'Where the Mummied Kings of Egypt':

Where the mummied kings of Egypt, wrapped in
linen fold on fold,
Couched for ages in their coffins, crowned with
crowns of dusky gold,

Lie in subterranean chambers, biding to the day of
doom,
Counterfeit life's hollow semblance in each mazy
mountain tomb;

Mured in mighty mausoleums, walled in from the
night and day,
Lo, the mortal kings of Egypt hold immortal death
at bay!

Shall we suffer Death to trample us to nothingness?
and must
We be scattered, as the whirlwind blows about the
desert dust?

On the changing earth unchanging let us bide till
time shall end,
Till, reborn in blest Osiris, mortal with immortal
blend.

And on the sanded wastes of Egypt the
tomb of Cheops has outlived the ravages of those
seven thousand weary years.

Is this the explanation of the pyramids?

THE KING OF THE ISLAND.

PART II.

III.

HURST rose to his feet and pressed forward swiftly, for he felt a longing to finish his self-imposed task and get back to the hut and his familiar boat. As he came nearer to the centre of the island, the trees and undergrowth grew thicker. He found himself constantly ascending little hills, or rather hillocks, their sides covered with vegetation. From these he descended into green valleys, each with a rather higher eminence on the farther side. At last the highest of all seemed to stand before him, and he considered that when he reached its summit he would be at the centre of the island. He began to ascend it, and then halted suddenly, as though nailed to the ground. On the farther side of the hill he heard a human voice.

It was that of a man, apparently singing in a rough, untuneful fashion, but the listener could not make out the words or even the

language. There seemed to be something wild, something eerie in the song; or, again, it reminded the sailor of a child, happy with its play, who croons and murmurs to itself without intelligible speech. For the second time that day Hurst felt his nerves thrill and his skin pringle. He chided himself angrily for his foolishness. 'It's a man, anyhow,' he thought. 'It's a human being, and not a savage, unless he came in a ship. Some poor fellow who was cast away, as I was. He's been here some time, I suppose, and has formed the habit of talking to himself. And of course he does not know a fellow-creature is near and listening to him. That's all there is to it—so what are you worried about? Here goes to introduce myself.'

He ran rapidly up the hill, and gained its summit in a couple of minutes. Below him there lay a little circle-shaped depression, or small valley, with lower hillocks on the farther side. At the foot of one of these was a

V-shaped opening, evidently the entrance of a cave. In front of this there was built out a rough arbour, where one could sit in shelter in the open air. A few logs were scattered about, and at the mouth of the cave two blackened flat stones evidently served as an open-air fireplace.

In front of the cave stood a human figure. It was that of a very tall man, who was cutting at a billet of wood with a sailor's clasp-knife. His aspect was strange and fantastic. He wore no hat, but on his long black hair there was a kind of fillet, or improvised crown, formed of leaves and intertwined twigs. His arms and legs were bare and were burnt brown by the sun, but the rest of his dress consisted of the ragged remains of a suit of blue sea-cloth. On his feet were a pair of what appeared to be sandals of his own manufacture. His dark bearded face had a curiously happy and complacent expression, and again the sailor received the same impression of a child absorbed in its play. Hurst took in this apparition, as it were, at a single glance, and gave a low repressed exclamation. But low as it was the stranger evidently heard it. He raised his head and saw the sailor standing before him on the hillside. Instantly his face changed and became bitter and malignant. He flung down the piece of wood and rushed forward, the clasp-knife in his hand.

'Who are you?' he demanded, in a great roaring voice. 'What do you want on my island? Are you one of those dogs come to life again?'

There was something so daunting and intimidating about the man that Hurst involuntarily gave back a pace or two. Then, realising that the other had spoken in English and was a fellow-countryman, he found his courage and his voice. 'I don't know what you mean,' he said. 'I have been shipwrecked and in an open boat for three days. My name is Hurst, and I am an officer in the merchant service. I only landed on this island yesterday.'

'You are alone?' demanded the other, still frowning.

'Quite alone.'

'Are you a loyal and honest man?'

'I—I hope so,' said Hurst, in an amazed voice. 'But I don't quite understand you?'

The menacing look left the other's face, and it again assumed its first somewhat foolishly complacent expression. 'You do not know who I am?' he asked.

'Naturally not,' said Hurst. 'Except that you are a fellow-countryman.'

The stranger drew himself up haughtily. 'A fellow-countryman!' he repeated disdainfully. 'You are much mistaken. You have the honour to address a king.'

'A what?' cried Hurst, doubting if he had heard right.

'A king,' repeated the other. 'I am King Henry the First of Stoneland. And everyone,

every human being in my kingdom, shall acknowledge me as their ruler. I will suffer no rebels to my authority. So what have you to say—do you acknowledge me?'

IV.

Hurst listened open-mouthed. Thoughts chased each other swiftly through his mind, and he had a sudden feeling that everything was now explained.

'Mad!' he reflected rapidly. 'Mad as a hatter! I was a fool not to see it at first. My stars! What a mess I've landed in! No doubt this blighter was shipwrecked like myself, and his hardships and sufferings turned his brain. Yes, it's all clear now. H. R. means Henry Rex, and that poor chap who was "executed" was one of his companions who wasn't "a loyal subject," and would not acknowledge his authority. I wonder who this fellow is—and I wonder what the deuce I'm to do!'

The king of the island broke in upon his reflections by advancing nearer and raising his clasp-knife threateningly.

'I asked you if you acknowledged me as your rightful ruler?' he thundered.

'I heard you all right,' said Hurst grimly. He eyed the other attentively, noting his great height and sweep of chest, and the muscles which rippled in his bare arms and legs at every movement.

'The beast's a perfect Hercules,' he thought bitterly. 'I shouldn't have a ghost of a chance with him, to say nothing of his confounded knife. I've got to humour him—for the present at all events.'

'I must ask your pardon,' he said aloud. 'You see you took me by surprise, for I was not aware that Stoneland Island had a king. But I am prepared to acknowledge you as its rightful ruler, and to become your loyal subject.'

The other's face cleared once more, and he smiled like a happy child. 'That is well,' he said graciously. 'You have decided wisely; but I saw at once you were a man of sense. Ah! Mr—Mr Hurst, I wish all my subjects had been like you. But you would not imagine how foolish men can be. I came here with three companions six months ago—I may tell you that before I assumed the crown I was the captain of a ship, and was known as Henry Everill. I landed here, I say, with three companions, and none of them was loyal; they all rebelled against me at one time or another. I was compelled to execute them, much against my will.'

Hurst could not repress a shiver. 'I think,' he said hoarsely—'I think I came across the grave of one of these men. John Cavanagh!'

'Ah, yes!' said the other regretfully. 'Yes, I buried him. But he was quite hopeless, Mr Hurst. Just imagine it—not only did he deny that I was his ruler: he actually asserted that

I was mad. Of course, that was the end of him. Come with me; you are now my loyal subject, and you shall enjoy my hospitality—a king's hospitality, Mr Hurst!

The sailor knew that it was dangerous to smile, but he could hardly refrain from doing so, as he followed obediently across the little valley to the entrance of the cave. 'Very jolly, I'm sure,' he reflected grimly. 'I wonder he doesn't speak of this cave as his royal palace. A king's hospitality—good Lord! I suppose he'll offer me roots and raw flesh, and speak of it as a banquet. If only I could see my way out of this mess. A madman and a murderer, and I've got to play up to him and humour him!'

His cheerless reflections were cut short by the other waving him into the cave. 'I bid you welcome,' he said graciously. 'I will light a candle, as you may find it dark. Here is the way, to the right. You have my permission to be seated, Mr Hurst.'

'Thank you, sir,' said Hurst gravely. 'Well, that's about the limit,' he muttered to himself, as he obeyed and looked round. The cave was much larger than he had supposed, opening out wide on either hand, with a lofty arched roof. The floor was of firm dry sand, with a tarpaulin spread over it. Against the side was rigged up a rough plank bed, filled with dried grass and brushwood. At the back of the cave there lay a great heap of tins and cases, and as Hurst examined them more closely he became aware that another mystery of Stoneland Island was now dispelled. These were the stores which he should have found in the hut. There was enough tinned food and biscuit to last one man for a twelve-month or more. The larder of the royal palace at least was well stocked. 'He's been carrying them up here,' he thought. 'No doubt considered they belonged to him—part of his precious kingdom. There's a good deal of method in his madness—and that's the worst of it.'

The king fixed his candle in a niche in the wall and flung himself down on the bed. 'There is food yonder,' he said condescendingly, with a wave of his hand towards the stores. 'And there is fresh water in the wooden bucket. Eat and drink, my friend—a king invites you.'

'I thank your majesty,' said Hurst, as gravely as before. He got up and searched until he found a tin of corned beef and an open case of ship's biscuits. As he ate, the king of the island leaned back on his bed with the same fatuous smile on his bearded lips. Hurst noticed, however, that his black eyes were sharp and alert and that they were fixed on his new subject attentively. 'I must be cautious with him,' he thought. 'He's mad, all right, but at the same time he's not altogether a fool. But only let me get a chance and you'll have another rebel to deal with, my fine fellow.'

Wish to goodness I had brought a revolver in that boat.' He rose to his feet and felt in his pocket. 'I thank you for your royal hospitality, sir,' he said affably. 'Have I your permission to smoke?'

The other's face lit up. 'Surely,' he cried eagerly. 'I will even accept some of your tobacco myself. Unfortunately, there is none growing on my island, and I have used all I brought with me long ago.'

Hurst held out his tobacco-pouch with a bow, and the king filled a great black pipe. His face took on a beatific expression as he puffed at it. 'Good,' he murmured happily. 'This is excellent tobacco, Mr Hurst. I am very pleased with you, very pleased indeed. Your whole attitude is very different from that of my first unhappy subjects—though they, of course, were only ignorant sailors. Yes, whatever may be the future of my kingdom, you will always be my favourite subject in it.'

The favourite subject bowed solemnly once more. 'Good old King Hal!' he muttered under his breath. 'He only wants six wives and then he would be complete. And it seems I am cast for Cardinal Wolsey.'

'I am going to reward you, Mr Hurst,' the other went on. 'No doubt you are not aware that my kingdom, though small, is yet exceedingly rich. Many greater rulers might envy me my fortune. You shall have a share of my treasures.' He felt underneath his bed and produced a small canvas bag. 'Take these jewels,' he said loftily. 'These diamonds. They are yours. A present from your king.'

Hurst opened the bag, and in the semi-darkness saw a number of what appeared to be small, light-coloured pebbles. A kind of bitter laughter welled up in his throat. 'Diamonds, eh?' he thought. 'What's the next foolery, I wonder? Well, he is at least consistent in his idiocy. If I could only forget that he killed those men I might almost see the fun of all this.' He thrust the bag into his pocket. 'Your majesty overwhelms me,' he said, choking down his laughter. 'I hardly know how to thank you.'

The king waved his hand graciously. 'There is no need of thanks,' he said in measured tones. 'I know how to reward loyalty—and how to punish disloyalty. But come, if you are rested; we will take a stroll before it grows dark. I suppose you have not yet seen the whole of my kingdom.'

Hurst rose to his feet with alacrity. He felt a great desire to get into the fresh air again and see the good sane face of nature once more. 'If I have much more of it, I shall go mad myself,' he thought irritably.

v.

They left the cave together, and the king led the way towards a part of the island which

Hurst had not yet explored. It was now late afternoon, but the sun was some way above the horizon, and there were still some hours of daylight. As they walked, Hurst noted afresh the other's amazing physical strength. 'I should be a child in his hands,' he thought with disgust. 'And I notice he has brought his clasp-knife with him. All the same, I'm about sick of all this nonsense.' He noted also that the other's delusions seemed to increase as they walked. The king expatiated on the beauties of his kingdom, and indeed, on this wonderful afternoon, Stoneland Island seemed very fair. But the madman took it all to himself, talking of 'my birds,' 'my trees,' 'my streams,' and 'my valleys.'

'What a chap!' thought the sailor irritably. 'He'll soon be talking of "my sea" and "my sky!"'

As they passed across a little valley the king halted for a moment. He pointed to where a mass of bluish, soapy-looking rock and gravel jutted out from above the soil. The grass was trampled down all around it, and there were signs that the rocks had been dug up and crushed. 'That is where my diamonds come from,' he said.

Hurst gazed indifferently. 'Indeed, sir,' he remarked. 'Very interesting. And has your majesty any gold mines in your kingdom?'

The other glanced at him keenly. 'No, sir, I have not,' he said with dignity. 'To my knowledge, there is no gold here. But all else that one can desire is to be found on Stoneland. And I have many plans, Mr Hurst. I intend that my kingdom shall be a model to the world. I have been considering the question of a national flag. What do you think of one of yellow, with a black border and a white star in the centre?'

Hurst's strained nerves gave way suddenly, and he spluttered with laughter. 'That would be a devilish jolly sight!' he replied incoherently.

The moment he had spoken he recognised his foolishness. The other turned upon him like a flash, his face contorted. 'What do you mean?' he cried fiercely. 'Do you dare to joke with me? Do you understand who I am?'

For a moment Hurst thought of trying to smooth things over with an abject apology, but then a sudden uncontrollable anger seemed to seize hold of him. He clenched his hands and his face flushed. 'I know who you are, all right,' he replied recklessly. 'You're a madman who ought to be in an asylum; or, if not, you're a murderer who ought to be in the dock. In either case I've had about enough of you and your tomfoolery.'

He had more to say, but he was given no time to utter it. With a beast-like roar of rage the king sprang upon him. Hurst stepped back a pace and struck out at the wild bearded face in front of him. It was a beautiful blow, with

all the sailor's thirteen stone of bone and muscle behind it. It caught the king fairly on the point of the chin and whirled him to the ground. Such a stroke might have been decisive with an ordinary man, but this great giant was instantly on his feet again, bellowing out threats and execrations, and feeling for his clasp-knife. Hurst saw that he was lost if he stood his ground. He swerved to one side and flew towards the sea for his life, with the other at his heels.

Long afterwards he remembered that race. It had a strange, dream-like quality, and yet it was real—desperately real. He ran and ran, the wind whistling past his ears and his heart thudding against his ribs. It was his idea to make for the coast, and then to bear away to the left and reach the jetty and his boat. He believed he could outlast and outdistance the madman, despite the latter's height and strength. But he was speedily disabused. Do what he might, he heard those feet behind him, coming nearer and nearer. There was no throwing off such a pursuer.

Hurst spurted frantically, the perspiration streaming from his forehead. He was close to the coast-line now, but to his horror he saw that he was making for a kind of promontory, where cliffs went sheer down to the sea. He had no time to think or change his course before he was close to their edge, with the madman only a yard or two behind, howling exultantly for his blood. Hurst set his teeth and faced round. The king rushed at him furiously, the clasp-knife in his hand. 'The king's justice!' he roared. 'The king's justice on a rebel!' Hurst dropped to his knees, avoided the sweeping stab, and rolled to one side. The impetus of the missed blow carried the other forward to the cliff edge. For a moment he staggered frantically against the skyline, then with a shriek of rage and fear he plunged down the precipice.

Hurst rushed to the edge. He was just in time to see that giant body strike the sea fifty feet below, with a splash which sent the frightened sea-birds whirling up into the air. It vanished—and did not reappear.

Hurst waited, panting. The moments went by, the gulls regained their courage and settled down again, but the first king of Stoneland Island had gone.

'He's done for,' said Hurst aloud in a trembling voice. 'There must be submerged rocks down there, and he's struck one and broken his neck. Yes, he's dead. Well, he'd have done for me all right—and yet—'

He broke off suddenly. A small round object emerged from the sea beneath his eyes and floated on the little waves. It was the absurd crown of leaves and twigs with which the madman had adorned himself. Hurst eyed it for a moment, broke into strange hysterical laughter, and then fainted away.

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday*.

IT is a healthy sign, nothing more, perhaps, that a belated accession to the best kind of popularity by John Sebastian Bach, who died in 1750, is coincident with an improved taste in music of such people as ourselves. We cannot fairly regard it as more than a chance of parallel to stir our speculations, for the people's knowledge and strength in great music is still too slender for direct initiatives. As yet it lacks intuition and the trained taste. Yet there is coincidence, and historians at present unborn may make a note of it. This ascension during the present generation to a popularity as fervent and high as that accorded to any of the old masters, from what we may regard as almost a half-obscurity, is one of the most noteworthy facts in the records of fame, for it is not a matter of fashion or caprice, but of an establishment. One can scarcely find a parallel in any of the arts where, especially in literature, the mood and the taste of the people change, and their favourites with them, like the fashions of the intellect. Thus all the dead who are good enough should get their turn in time, and, after sleeping for another century, they may observe the indefatigable mortals, who, meantime, in their funny way, had been picking holes in their eternal genius, allowing them a second turn or yet a third. Hence we mortals feel we are discerning and are just. In music it is like this, except that we do not drop a genius as we would a poet, because we cannot. An old master rises to give us a turn or a season of his music, and then resumes his place in this supreme and heavenly choir. Only Beethoven has seemed exempted from such vicissitudes, so tremendous, terrifying at times, so much the master of the souls who hear him. Yet Bach seems not to have had any period of his own before, though he passed to his immortality twenty years ere Beethoven was born. (I had just written in the careless way that he 'died,' yet how stupid is this expression, when the voice of the genius is heard all over the earth night after night, and always!) Now he is in full and intelligent appreciation. Formerly his genius was recognised solemnly and academically by the organists and the students; they murmured praises of him, as they recognised

his shadow in the distance, and expressed their fear that he might never be understood and valued by the multitude. Bach existed as a mystery.

* * *

Now he draws the people to the concert-halls with the surety of Beethoven, Mozart, and Wagner. If, indeed, the common people have been innocent of a recognition which is good for the credit of the world of to-day, we cannot ignore such a circumstance as this, that choirs from various little Surrey villages gathered one day this year at Dorking and, without rehearsal, gave a good performance of one of Bach's sacred pieces, which they had selected; or, again, that at another small place, Petersfield, a competition festival was held and only Bach was heard, twenty-three competing choirs devoting themselves to him. Yet we can only explain the ascent of Bach at the present time as the fulfilment of simple justice by laggard, yet faithful, time. Certain influences, perhaps, have been against him. He was known as a composer who had written fugues for the organ—marvellous fugues; but the idea of the fugue is not well understood by the people. It is not an enticing name, and it seems to imply something intricate, dissective, complicated, and wearisome. But the fugue was the thing for this great master-builder of music. A steady and faithful recognition, however, has been exercised in certain quarters in our time. Some who had ears to hear sounded their faith and love unceasingly in the grand music of their master. One great organist, as we are assured, has been mainly accountable for an increasing attention to Bach's music among the organists of this country. Student and lover of it, he has imbued his pupils with like understanding, and, succeeding to the seats of the great organs in the cathedrals and the churches, they have set the grandeur of Bach to throb continually. For, though Bach was such a master-composer of organ-music—and his fugues are what have made him—he has not had his true place even among organists until recent times. The judgment of the city of London is strangely good in matters seeming often to be foreign to its main concern of business and finance; and a note is made that at organ recitals given in some city

churches with a certain regularity at noon, for the advantage and relaxation of busy people in that tense throng, Bach has had a constant place of honour, while not long ago, yet before the new vogue of Bach set in, a series of six recitals was given at one of them in Cornhill.

* * *

Yet one is inclined to place at the front of the impulse which has given Bach his proper place, the devoted and splendid effort of Mr Harold Samuel, the pianist, who, once a year in a concert-hall in London, plays Bach for a whole week, afternoon and evening. This he has now done for some years, and the achievement has yielded to him a peculiar fame of his own. It is not only that Mr Samuel exhibited his understanding and affection in this earnest way when he felt them, but he displays intensity by such a demonstration of music-memory as leaves his listeners in bewilderment at the capacity of the human mind. Some who enjoy it in good measure inform the wonderers that really it is an easy thing to memorise exactly many pages of long and intricate compositions, that it is either a trick or an instinct; but yet it is not understood by various others, who, players of some instrument, and perhaps not without fair education in music, labour heavily in committing to playable memory but a score of bars of some piece with whose musical trend and notation they are familiar. One remembers hearing long ago the violinist Ysaye, with Raoul Pugno at the piano, playing in duet for a succession of afternoons at the Queen's Hall some of the great works of Beethoven, and then, as not before, for certain reasons one wondered exceedingly when these performers went through the Kreutzer Sonata without looking upon a printed note, and with that perfect and unified exactness, the least departure from which, before a highly critical audience, must have meant disaster. Now continually we may see at the big orchestral concerts, some young lady playing the violin for half-an-hour in a concerto with an orchestra to increase the tensivity of the test. Nobody can pretend that these things are not amazing in their revelation of a form of human mental capacity; and nothing is explained by saying that the proper rendering of the music could not be made without them, the player needing a mind free from such labour as reading notes, and examining the values, times, and phrases, and the rhythmical variations. At the theatre we sometimes marvel upon the memory of actors in learning by heart so many parts, but this seems infant's work compared to that of the musicians, especially in the London theatres of long runs, and with the travelling companies which have only a small repertory to perform. In some foreign countries where repertory companies have a greater significance than here—as in Spain, for example, where the theatre has

a strong individuality distinct from that in any other country I know—the memories of actors need to be most acutely trained. I recall that one of the chief exponents of the Spanish classics, Enrique Borrás, who in his time has attempted one or two of the plays of Shakespeare also, and has acted Othello for thirty nights, told me that he had been on tour with over sixty plays at once, prepared to present any of them at an hour's notice, and that altogether he had about a hundred parts at his disposal for touring purposes. But I know the part the prompter plays in the Spanish theatre, where his sizeable box looms blackly up among the footlights. At times we can plainly hear the prompter. Borrás, insisting that he himself could do without the prompter, though he knew many who could not, told me that the memorising of so many parts was not a difficult task for him, but that, on the other hand, he could memorise nothing else, and especially, as I remember well, he said he never could memorise a single line of music exactly. Another famous actor of the Spanish classical drama, Ricardo Calvo, told me that in two and a half months at one place he had played as many as sixty-four parts.

* * *

Specialised practice of memory can lead to remarkable results; but yet there is something in all this that none of us can ever understand. Sometimes we are asked to marvel at the magnificence of man, his superb development, and so forth, and now, having some appalling failures much in mind, some hesitate in their admiration as they should or need not do; but to me this thing of memory is the most amazing thing about him. Yet what is entirely unintelligible should, perhaps, not be considered as amazing. We know not how it happens that one single thing can be remembered for one instant only; that is a secret of creation, and as secret as the profoundest of all mysteries of life. If, then, we know nothing of the ways and means of memory, should we be surprised that words and music needing hours and days for repetition should be remembered? It is not more wonderful than that I now should suddenly remember a really trifling detail of something that happened thirty years ago and had never been thought of since. But yet, wondering more upon it, we do surely feel that music is in some special sense a thing divine, and is blessed with some heavenly fostering care. We know that the actors make a slip sometimes, forget a line and leave one out, and it matters little; but the player of music makes or should make no such slips, nor can he think forward for his assistance, the passion of the moment being absorbing and complete. Thus we see that music is far apart from all the other arts, and hardly in any way is to be grouped with them. Contemplation of such a mystery,

divine as it truly is, sometimes leads to a fancy that when this civilisation of ours collapses and is blotted out—when, maybe, the elimination will be completer than that of any other, so much of our material being of paper, gas, and shoddy—our music will be one of few things, perhaps indeed the only one, to be carried forward to the next. Now, think again of the prodigious feat of playing Bach in all his intricacy for one whole week without looking at a single printed note! In such a week Mr Samuel has played sixteen preludes and fugues, ten French suites, partitas and English suites and other things to the number of about a hundred and fifty movements. I know the man; sometimes he plays to us in private company as we chat upon affairs. His round and genial face suggests no mightiness of memory; I believe him able to forget where last he left his missing umbrella. Yet he has been an instrument of Providence to remind us that in our common human carelessness we were overlooking a feature of the majesty of music.

* * *

'Old Bach'—nearly all who comes to understand and appreciate his music refer to him occasionally in this strange familiar way. It seems a trick of instinct and not just imitation. A controversy of a kind was once started upon the reason why, because it seems so odd, and in some respects is not appropriate. We could not say 'old Beethoven,' or 'old Mozart,' or 'old Haydn'; the stupid incongruity of such a style of reference would be repulsive. Nor would we say 'old Shakespeare,' or 'old Velasquez.' It is not a matter of the subject's age, nor that in his own time he was called in such a way, nor that there was any peculiar simplicity or freedom in character such as to invite a familiarity. This style of appellation becomes almost one of the minor mysteries of music, and is worth a consideration. For myself I fancy that two main points have thinly suggested the familiar style, and an admiring public has snapped at it for the rest. First there is a certain euphony, and 'old Bach' makes a sonorous breadth of sound that the music of the master possesses. It is not easy to say 'old Mendelssohn,' without seeming silly and self-conscious when saying it, especially as Mendelssohn in his life was more of the fine gentleman than most other great composers. But the second point of reason is a different thing. Let us recall in searching for analogies and considering others whom we thus call 'old,' that it is, indeed, a term sometimes lightly used in playful reference to the higher gods of mythology. Thus we may understand such a reference as 'old Jupiter' or 'old Jove,' and herein may be the explanation that we seek, in that we are thus familiar when respect and awe are immense indeed, yet in some way

inadequate to the object, who is beyond their scope. Thus we abandon our recognised proportions, our system fails, and we fall back upon the crude familiarity of our beginnings. It is a psychological affair. Bach is always picking up an idea, a theme, the germ of a tune, and elevating it, then adding another, piecing these and many more together, and building them up in a vast and most harmonious structure reaching majestic heights. So in most musical compositions of the grand and longer class, but Bach, as a builder of harmonies, has a magnificence of his own, and as he builds, his harmonies seem to go rolling through the universe, caressing the peaks of mountains and floating among the stars, until an effect of overwhelming power is produced in the mind of the listener, who yet is not saddened or even frightened as when at times he hears Beethoven.

* * *

That may be how representatives of the common people, like ourselves, just gaining, as we think, a glimmer of the truth, would try to describe their emotions on hearing Bach, though it may be far from the way in which the learned critics might consider the essential quality and features of the music of this composer. When I have the privilege of listening to it, those words, 'rolling,' 'sublime,' 'universe,' and 'deep,' somehow begin to move about in me. And mountains are always raised up in the mind for such music to roll around. Every great composer, his business being with souls, his own and others, is treating continually and emotionally of the awful problems of life and the eternal. But it seems even to the most humble, like ourselves, that no other gathers into his sense and meaning the whole universe, and eternity to his harmony, pouring forth his expression of immense and sublime profundity, as does Bach. Here some may see an effect of his early devotion to the organ, for it fascinated him as a boy, and as a young man he had a reputation throughout Germany for playing it and composing also. He made himself the organist's composer; no other will ever draw more from this king of instruments than Bach has done; we dare prophesy that none will ever entice so much. It may be right that the beauty and magnificence of his work should not be revealed to the common people on their entry to this happy and spiritual community of music. One must work some way in understanding before Bach is heard aright, or heard at all. But our amazing generation, having music injected by various scientific and mechanical means, thought once in its humble ignorance that it could never understand what such as Beethoven had composed, being to it then like a strange mixture of senseless sounds, yet it is now as familiar with the Fifth Symphony as once it was with the songs

from the light operas, and finds delightedly that the charm of such music lasts for ever, and does not cloy. The same generation can now appreciate the tremendous descriptive effects of Wagner. So it even approaches Bach, weaving his patterns in the most intricate and varied threads. It takes a key to him in the beautiful Aria in the D Major suite that everybody knows, finding in its breadth and depth that there is here a noble song of music that never tires though he be heard ten thousand times. The organ was Bach's best instrument; but upon others his music in its own way takes supremacy. Thus this Aria as we know is most delicious when played entirely on the sonorous G string of the violin, and he who has not seen Suggia, entrancing combination of nerve, spirit, and emotion, with technical precision and dexterity, seat herself upon a platform in her own imperial way, and then, dismissing earth, pour forth unaccompanied from her 'cello the music of Bach, has yet to perceive another aspect of his grandeur, and one wherein he is well served by his interpreter. He was far more versatile than the newcomers to his admiration sometimes think he was. He never attempted opera, and there need be no regrets for that. Always serious, he is hardly ever really sad. He does not bring to you ideas of gloom and death; life in the eternal universe is always in the spirit of his music. So it was composed in its immensity two hundred years ago, in the period when so much of the great music was composed that will delight the human race as long as it endures. He composed sonatas for instruments now obsolete like the gamba, the lute, and the viola pomposa, the last of which he invented for himself. What if he had had the instrumental resources of to-day? He could have done no more. No, he wrote no opera, and is always serious; yet old Bach could for experiment be light, and once he wrote a 'Peasant Cantata.' Here is a scene and an idea, and music to fill it up. A crowd of village folk assembles to celebrate the arrival of the new squire, singing all manner of simple, sweet, and rustic songs at the revelries outside and as they march off to the tavern.

* * *

Is it because they live tremendously, burn themselves out with the fires of their art, that nature seems so frequently to reserve for great composers the unhappiest of earthly ends? Many of these lives have been hugged by tragedy. It must be true that complete and perpetual content is thin stuff for art to live upon. Give to the genius misery to shake him, to wring him, to make him feel intensely in every little nerve, and he may work his best in the pain of body and soul, and not when he is lulled by any anodynes of bliss. Consider Beethoven, standing for perhaps the

finest conquest art has known of adverse circumstance turned to glorious achievement. Misery filled his world, and torture was carried beyond extremity until it was almost ludicrous when he was turned deaf. No wonder that in his masterpieces he should sometimes lead us down with him to hearken to the dirges of his anguish. Old Bach and Handel were both blind towards the end of their lives. For his last thirty years Bach dwelt at Leipzig, practising a choir, and conducting a sort of life which, except during the time when he was engaged composing, was not splendid like his music. He had a score of children, too many even for a time like that. A majority were sons; but of these only four survived their father, and only one, Carl Philipp Emanuel, went on to musical fame. Old Bach had at one time no more than some forty pounds a year with which to support his family. Yet this was the man of whom Schumann said 'Music owes almost as much to Bach as a religion does to its founder.' He died, but none can lay a wreath upon his undoubted resting-place. For a while his bones lay in a churchyard of Leipzig; but later there was some digging there, and the dust of old Bach was scattered to the winds, to float, as we may think, for evermore among the majestic and eternal harmonies he breathed into the firmament. (A grave supposed to be Bach's was discovered in 1894, and the remains were reinterred in 1900 in a crypt below the altar of St John's Church.) Forty pounds a year for Bach, while composing music for eternity! It is less than would now be paid to a soloist to play one of his concertos. Our world of material immensities and poverty in sense and loveliness shakes out some queer contrasts. Mischa Elman, the violinist, paid £10,000 for a Stradivarius the other day, and the cheapest of such would cost at least thousands, yet Stradivarius himself sold his fiddles as he made them for ten pounds each. Sargent, the recently departed painter, was certainly well paid while living for his work, belonging to the money age, but he was scarcely cold ere his most trifling efforts were making prices that would have bewildered him a year before. And if old Bach could return to-day, and play the organ as he loved to do when young, and compose the sublime music he created when paid forty pounds a year, with what riches might we not reward him! It is true that we could not pay him a small part of what we must give to Mr Dempsey for a little prize-fighting, or to Mr Chaplin for his amusing antics as represented upon the cinema screen. I have been told that one of the greatest and most serious composers of modern times can only live simply in a small house, for his income is minute, and to be reckoned only in a few hundreds. If he would but make what is called a 'stunt' of some description it

might be different; but he likes composing music for cathedrals. Like him, old Bach should have enough to live upon if he were

with us now, remembering always that as there is in music no politics of any sort, he must keep his material ambitions down.

FIFTEEN BERRIES.

By HUGH SHOBRIDGE.

I.

THE agent at Missanaba gazed pensively at a document tacked to the wall of his office. It was nine-fifteen, and a sun, already high in the heavens, shone upon the muskeg and the forest. It gleamed brightly on the twin rails that ran east and west in a swathelike clearing; the gravel road-bed looked dry and dusty; the grasses that clung to the sides of the gravel dump, that grew thickest about the dry ditches, and that covered the right-of-way to the forest edge—these grasses were sere and only faintly tinged with green.

While his key chattered away as different stations muttered in Morse, the agent read again the document which he had only recently affixed to his office wall. It was addressed to Leslie Lorne Wilson, Agent at Missanaba, and the essential part of it read: 'You are assessed fifteen demerit marks¹ for using abusive language to Conductor Thomas Parker, on July 17th.' The notice was signed by the division superintendent.

It was going to be hot. Had it been possible, the agent would have removed more clothes, but since he wore only a soiled shirt, a pair of discoloured khaki pants, and a pair of running-shoes, he had little scope in that direction. Indeed, he recalled with a sigh that before the local passenger-train arrived it would be necessary for him to get into attire more fitting to the representative of a great railway.

When the agent went onto the platform he could see all Missanaba. Eastward stood the tall wooden tank, and beyond, by the river-bank, was the pump-house, from which came the steady throb of a gasoline engine. Westward and across the tracks the section-house stood behind a neat little lawn and two circular flower-beds; at the side of the section-house was a well; for the rest he saw a sky that began to dazzle, two walls of green forest, two shining lines of steel.

He took a pail and went to the well. While he lowered his pail into the dark depths Frieda Muske came running from the section-house with a pail in her hand, and flaxen hair streaming behind her. She rested her pail on the coping, seated herself, swung her feet, and fastened her blue child-like eyes upon him. Frieda was twelve.

¹ Railway discipline involves the infliction and award of 'demerit' or 'merit' marks, which adorn or disfigure a man's record. 'Berries' is a slang term for these.

'Well, Frieda. How's your mom this morning?'

Frieda smiled impishly. She seemed to scent irony in the question. 'Mom's all right. Only she kind of wants hard to know what you got after her being to all the trouble to report you. Mom's kind of shy to ask.'

The agent regarded her grimly. He never knew how Frieda stood in this battle between himself and her mother. It was Frieda who had told him, with what motive he could not fathom, that her mother had written a laborious letter to the superintendent about the abuse and blasphemy that almost daily passed between the way freight conductor and the agent. Then had followed a visit from the assistant superintendent, the taking of statements, the administration of discipline.

II.

It is impossible to get back to first causes, but we can at least trace those fifteen demerit marks back to William Hohenzollern, at one time German Emperor.

Mrs Muske was at heart a true daughter of the Fatherland, and although she had lived fifteen years in Canada there was a lingering tenderness for her old home by the banks of the Rhine. Entirely laudable, perhaps. Her Fritz often told her that now 'we was Canadians,' and he had loyally shaken hands with the pumper and the agent that day news of the armistice came. Ah, that armistice! Mrs Muske had looked upon them from behind her curtains, and her heavy face had set in ominous lines; her pale blue eyes had grown flinty, and a sudden impulse had made her turn to her little Frieda and command her, 'Nefer, nefer, nefer, have to do with that agent.'

The agent was new at that time. He had lately returned from France, and he walked with a little limp; but that was nothing, had he not been so—so—so—flip. That was the word. He talked a lot with the pumper, who was a cockney. Mrs Muske heard them; they derided her people; they called names; they told incredible, senseless, foolish stories. Their ignorant talk made Mrs Muske shake with wrath. How she would have loved to open upon them a barrage of scorn. But that might not be; her Fritz was a section foreman, and a section foreman on a Canadian railway could not have a pro-German wife. So she locked her lips and her eyes grew flinty, and she urged

upon Frieda, 'Nefer, nefer, nefer, have to do with that agent.'

This had gone on for more than five years since the armistice. Always it had gone on when talk turned upon the war. In the summer evenings when the men lounged upon the station platform, and Mrs Muske sat in the porch of her house, their voices carried across the tracks and took her attention from the hum of mosquitoes and the biting of black flies.

Then the great swearing championship gave Mrs Muske a just complaint. It had long been claimed on the Kamleau division that Joseph Pelletier, an old extra gang foreman, had the finest flow of abuse for many hundred of miles. Then Conductor Tom Parker had eclipsed the old man, and when men gossiped around the shops or the yard office in Kamleau someone was sure to say, 'Did you hear what Tom Parker called the agent at Missanaba yesterday?' The agent at Missanaba was possibly his only rival, and one of his great points was his originality. There was always some new flower in his speech. Matters had come to a point where Conductor Parker preserved his best things for Missanaba, but he always found the agent ready for him.

'Mine Frieda is a young thing,' wrote Mrs Muske to the superintendent, 'and such it is not right she hear.'

III.

Now the agent would not satisfy the curiosity of Frieda. He took her pail and lowered it, filled it, hauled it up, and carried it for her to the porch of the house. 'That's not for your mom, Frieda,' he said; 'that's for you.'

She thanked him gravely, and watched him take his own pail to the station. The way freight was coming now; the front brakeman threw a switch.

When Conductor Parker strode along the platform, Mrs Muske was on her porch, looking steadily at the station. The agent did not regard her.

'Good morning, Mr Parker,' he said evenly. 'It is to be hoped the state of your health is of the best. The despatcher would be charmed if you would be kind enough to meet Number Eight Five Six at Kenemos. If you will be so good you will take the hole.'

'Indeed, Mr Wilson. Will you give the despatcher my compliments and say that nothing would please me more? I sign here, I think? Yes. Thank you so much. By the way, who is that beautiful lady standing on the porch over there?'

'Surely you know. I understand she got you fifteen berries just as she got me. That is the lady we are going to crown Missanaba's Queen of Beauty. Observe the stately lines—something like a battleship, don't you think?'

'Well, by the crying out loud. Isn't she a

daisy? The grace of a submarine. Does she ever submerge?'

'I wouldn't say I've ever seen her submerged,' averred the agent; 'still and all I wouldn't be surprised if she was sometimes half-seas over.'

'Angel face,' said the conductor, not now referring to the fuming Mrs Muske, but speaking directly to the agent—'angel face, would you do me the favour of receipting this small consignment of food stuffs from Kamleau? Sausages—one case. Bacon, tea, two bags potatoes, sugar. Does that check right, darling? Then if you would sign here and that half-witted engineer has finished getting water we'll be toddling along. But I'll miss you. And I'll pine for another sight of Venus there.'

'You'll be with us again to-morrow, sweetness,' assured the agent, 'and you have fifteen berries to remember her by.'

A lesser woman would have gone within and closed her door on their foolery. Not so Mrs Muske. Her grim lips may have tightened, her heavy chin may have bulged, but she still stared sternly over their heads.

IV.

Frieda got into the habit of coming into the station on hot afternoons and sitting on the table beside the clicking instruments. She swung her feet and gravely regarded the perspiring agent as he tilted back his arm-chair and smoked his dirty old pipe. Frieda did not talk to him much. Sometimes she asked a question, sometimes she gave him a little news of what mom said to pop and what pop said in reply. More than once she quietly watched him fall into a light afternoon snooze, while the station smelt of hot pine and blistering paint.

He came to like having her there, and missed her when the visits ceased quite suddenly. There was something soothing about the quiet, pretty child with her baby-blue eyes and flaxen hair.

The visits ceased because Mrs Muske found where Frieda spent so much of her time. 'I told you nefer to have to do with that agent,' she scolded. 'Now, mind you. The next time I see you there, next time I hear you been there, I take the strap. You see it. Well, you feel it too. Mind what I say.'

Frieda minded. Her mother had taken the strap before, and the times had not faded from Frieda's memory. Nevertheless, she spoke up and revealed her feelings on the subject. 'I like that agent,' she said; 'he's nice. I tell him things and I ask him things, and he don't get mad.' She paused and left her parting shot for her exit. 'One time I marry that agent,' she said, as she sped up to her attic to try to sleep under the scorching roof.

This time Mrs Muske had really got beneath the agent's skin. Demerit marks are, after all, things to be regarded as part of the day's work.

You get them or you don't get them—like measles. It was different robbing him of a companionship he had come to value; he was vain enough to think it cruel to little Frieda. Worse than that, one of the sectionmen said that the woman sometimes took a strap to her. That made the agent's blood boil. The pretty, fragile child, the great, heavy woman, the strap—pah! He began to wonder what he could do about it.

v.

One day a weapon seemed forged and placed in his hands. He saw Mike Muscovitch and Pete Muscovitch, sectionmen both, start cutting wood at Muske's wood-pile. It was only two o'clock in the afternoon when they came in from work on a hand-car, and went with the slowness of their race to the great pile of wood which the section foreman had accumulated. After the agent had watched them for a while he sauntered across, sat down on a log, and idly interrogated them. 'No work track to-day, Mike?' he asked.

Mike shrugged his shoulders. 'Work chop wood,' he asserted—'just same work.'

'You no get time for this,' suggested the agent. 'Boss pay you, maybe?'

Pete became alarmed. 'No get time? What you mean? Sure get time. Gospodi Pomloui. All the time hard work.'

'Oh, all right, Pete,' soothed the agent, 'don't get alarmed. I'll bet you get paid for it some way.' He chatted a while about indifferent subjects, and then the shrill ringing of the despatcher's telephone took him across the track in long strides.

Four days later he held in his hand the sectionmen's time-book. It was in a sealed envelope, addressed to the roadmaster at Kam-leau, and was merely entrusted to him for the mailing. Nevertheless he slit the envelope, and, drawing forth the book, studied the entries closely. As he had suspected, the Muscovitch brothers had both been credited with full time for every day.

The agent smiled, and then grew troubled. He drummed with his fingers on his table, frowned, whistled dolefully. It was a heavy afternoon, and for some days the sun had been veiled by the smoke of a hundred bush fires. To-day there was an acrid tang in the air, and, sniffing hard, the agent could feel the smoke in his nostrils.

The agent put the time-book in his pocket as the local passenger-train whistled at the yard limits. The rest of the mail he tied together, and sauntered out to put it on the baggage-car. As usual, all Missanaba was on hand for the daily train. He cast a swift glance at Frieda, but her mother was beside her, and the child was not looking his way. The pumper was always on hand to get his daily newspaper, and the agent passed the time of day with him.

vi.

When the train had gone, and all the people had disappeared, the agent summoned his resolution and walked to the section-house. His knock brought Frieda to the door. 'Oh, you,' she said, and, an effort to smile conflicting with curiosity, her mouth was wide open.

'I want to see your mom, Frieda,' he said.

'Mom!' called Frieda, dancing down the passage-way. 'Oh, mom, here's Mister Agent wants to see you.'

A severe voice came from upper regions. 'Send him away, Frieda. I don't want to see him. And don't you stand talking to him. Now mind me.'

The agent walked into the hall. 'This is pretty important, Mrs Muske,' he called. 'I'll wait for you down here in the front room.' He made his way within and seated himself.

Frieda tip-toed into the room, and stood in the middle of the carpet. 'You'll make her awful mad,' she conveyed to him in a muffled whisper. When she spoke she leaned over to him and put a finger to her lips; her fair hair framed her face and fell over her shoulders. 'She won't come down for a while yet; she ain't properly dressed.'

'Hush, Frieda,' he said, smiling at her. 'You may get in trouble if you wait and talk to me. You'd better run along.'

She tip-toed out of the room with a backward glance. 'I like you awful well, though,' she confessed.

When Mrs Muske came she was an impressive figure. Someone must have told her once that a gaudy red kimono was befitting. At all events, her flushed and wrathful face topped that garment, and her mouth and chin were set in unpromising lines. She did not sit, but stood looking down upon the agent. 'Now, what?' she asked shortly.

'See, Mrs Muske. This is the time-book for your husband's gang. If this goes in this way the company will pay these men for working the time that is shown. But you know, Mrs Muske, and your husband knows, and it happens that I know, that the men named in this book did not work for the company all the time that the book says.'

'You would be clever, Mr Agent—eh? And how do you know what time these men work—you who sleep in your office 'most every day?'

The agent emphasised his shot with a lunging forefinger. 'I know, because I see Mike Muscovitch and Pete Muscovitch cutting your wood all the afternoon the other day. The book gives them full time that day. You told your husband you wanted that wood cut, and because Fritz likes peace in his home he sent in two men to do it.'

'So you sneak, Mr Agent—eh? Maybe the superintendent not take much notice what you

say. Maybe he just shake his head and say, "Ah, well, that agent not much good, and this lady stop him swearing, so he mad."

'If I report this,' replied the agent, 'the truth will come out, you bet. Mike and Pete will have to say about it. But to tell you the truth, I don't want to report it. I ought to report it. That's my duty. But Fritz is not a bad chap, and I know he has trouble enough on his hands. Only it rests with you, Mrs Muske. If I don't report this, things have got to be more friendly around here. Come, there's not many of us living at Missanaba; we can't afford to be cranky with each other. Now, you let your little girl—'

'Oh!' said Mrs Muske, gasping wrathfully; 'so id's the liddle girl, is id? Ach, I thought so. You crawling, creeping worm, you. Ach!' In her anger she became more and more German. 'You go make your damn report,' she told him. 'Mine Frieda you leaf alone, understand? I let her haf to do with such a liar, und boaster, und lazy loafer! You that sleeps and crawls around der station all day with the shirt of last month; und you that shafes maybe twice a week! Ged oudt, and ged oudt quick!'

The agent took the last half of this tirade as he descended the steps and crossed the lawn to the tracks. Mrs Muske followed him and delivered the last sentences from the veranda. As he crossed the tracks a velocipede was speeding down from the west switch. The fire-ranger reached the platform almost at the same time as the agent.

VII.

Next morning Missanaba was thick with smoke. On all sides it rose, obscuring the sky, and flecks of ash came floating lazily down. There was only a sluggish breeze, but in the muskeg the fires were creeping along. The despatcher told the agent briefly that the situation was worse at other points, where fires had reached the track and were being fought by extra gangs.

The breeze freshened about ten o'clock, and by ten-thirty a strong wind was driving the smoke streaming before it. The agent went along the track to a point from which he could see flames growing before the wind. As he watched, a pine-tree suddenly flamed with a hiss; it flared, and the fire leaped to a companion tree, which blazed like a torch. A perturbed agent hastened back along the track. It was evident that the strong wind was driving a growing fire towards Missanaba. Near the west switch he saw Muske. The section foreman with his two men was trying to make a firebreak; he was digging a deep, wide trench, and flinging the excavated earth in front of the ditch. The heat where they worked was growing as much as they could bear.

Frieda, with an apron round her head, was standing in the station door. The agent thought

it was time children left Missanaba; and he asked her curtly if her mother was taking her away on the local. 'I don't know,' she said. 'Mom said for me to ask you if the fires was bad everywhere, and if you wanted to give pop back his time-book, because she said he'd made a mistake.'

The time-book. The agent had no thought of it for the present. 'I don't know, Frieda,' he said; 'I'm too busy now. You tell your mom to let you go out of here on the local, and to pack her own things to get out. And say, Frieda, did she ever hit you with a strap?'

'Sometimes,' confessed Frieda. 'She did the other day when you made her mad. Guess she heard me talkin' to you.' The child made a woe-begone mouth, but in doing so took a breath mixed with smoke. She coughed, and ran for her home.

VIII.

'Despatcher, Missanaba,' said the agent, curtly speaking into his telephone.

'Yes, Missanaba?'

'Bad fires and strong wind. Can you get a gang down here with a tank-car? Looks bad. I'm afraid of the section-house and the station.'

The voice from Kamleau sounded weary, as though tales of fire were being continually heard. 'Fraid all the tank-cars on the pike are busy. It's across the track in some places. The local may be a little late in your city. If necessary, tell everyone to get in on her. Better not miss her either, because ties are burning west of you, and Number Two may not get through to-night.'

The agent had heard enough. He was out to find Muske. It was a little easier now, for the wind had risen further, and the smoke was driven along in rolling clouds above his head. The north-west was fiery now. The daylight hardly seemed to exist, for a roof of smoke pressed down all over Missanaba. Sparks came sailing through the air; he watched several of them settle on the station-roof and expire. Fortunately he had drenched it well with the hose from the tank.

He met Muske and his men trudging down the track, carrying their shovels over their shoulders. The little German foreman broke into speech at the sight of him. 'Too damn 'ot,' he explained; 'she goes—woosh,' and he gave gestures suggesting the sudden flaming into fire of the pine-trees that flared and were burnt in an instant, to the accompaniment of a loud hiss as the sap bubbled. Pete and Mike Muscovitch shrugged their shoulders helplessly. 'No good,' muttered Mike. 'Train soon coming—eh?' They hastened on to the bunk-house to gather their bundles of worldly goods.

The agent looked around him, but the section-house only loomed dimly through the swirling smoke. 'See here, Fritz,' he suggested, 'we'll

get the hose out of the tank, and we'll keep it playing on your house and the station as long as there's an inch of water left. If the wind shifts just a point or two it looks to me she may drive right past. Your firebreak may check her a little. Then I've got some dynamite that the gang left here after the culvert work was finished. They thought they'd use it for the bridge work at 97-6, but by the time they get around to that they'll have another think coming. Come on, Fritz, I believe we can turn her round Missanaba.'

Fritz gazed uneasily at him. 'I'm getting out,' he asserted stubbornly.

'Nonsense. Get the woman out and the girl. I'll get Collins to stop and keep pumping, so the tank will keep us going with water. He'll be able to give us a hand with the hose.'

Fritz was not to be convinced or coerced. The agent himself could not have told what impulse swayed him. Perhaps it was the unexcited voice of the despatcher, which had seemed to consign Missanaba to perdition with the advice to him to get everybody away and not bother busy men. The agent, who had spent so many years at Missanaba, had come without reason to the determination to stay there; his life had, after all, been an ineffectual thing. He had fought a while in France without distinction; he had been agent at Missanaba a long while without distinction; but then, what distinction could ever come to an agent at Missanaba? Even more ineffectual was his obvious inability to save Frieda from her mother's strap. Why not—so he must have subconsciously reasoned—have one crowded hour of glorious life, and fight one fight to a finish?

He could not persuade Fritz. That sensible man was gathering things together even as the agent addressed his last arguments to him. Yet the general intention to go seemed to stiffen the agent's determination to stay.

IX.

The local passenger-train was heard long before it loomed through the driving smoke. When it pulled up at the platform all Missanaba awaited it with bundles and grips.

'Hurry up there,' shouted the conductor. 'There's bad fires ahead too—we ain't got all day.'

Muske and his wife came stumbling through the haze. The woman was dragging at his arm and talking. In the medley of noise, compounded of the panting of the engine, the clang of its bell, the crackling and roaring of the fire, and the shuffling of feet, the agent caught a few words as they passed him. 'Und we just finish the payments on the furniture,' she was insisting. 'Und the piano—sure, Fritz, you forget the piano we haf to save?' They passed on towards the train, and the agent stood calmly watching it start and gather speed. He was alone in

Missanaba—foolishly, fatuously, uselessly alone, but yet the agent was still feeling a thrill from the impulse which had made him stay.

When the tail of the train had vanished he sprang to action. The dynamite was in the tool-house, and he had taken several steps in that direction before he started in surprise at the sound of a voice hailing him.

'Hey, Mister Agent.'

He knew the voice, and presently he knew the heavy figure which seemed to wobble out of the drifting smoke. In his surprise he spoke aloud as he always thought of the woman. 'Mother Muske!' exclaimed the agent.

'Eferyting is in that house we haf got,' asserted Mrs Muske. 'Things we brought from home; efery furniture we buy; and now just three months Fritz and me we get a piano for Frieda so that kid learn to play. You tell Fritz how we save them. Just once I take this chance on you, Mister Agent. I stay und help.'

'Bully for you,' shouted the agent in a great joyous reaction from the dreary disgust which had left him in this desperate position. 'You and me, mother—we'll show the world.'

Then he took command. 'There's hose over on the platform,' he said. 'You'll have to turn on the water at the tank and let the nozzle kick till you get hold of it. Then souse the station again well. Then come over here and play on your house for all you're worth. Hold still a moment; let me fix that thing over your head better. Now I'll get the dynamite. I'll plant it over that ridge just north of the house—about three different shots will do it. That'll make a big firebreak, and if it gets us it will have something to leap. All right, mother, get along.'

X.

As these ill-assorted comrades turned to their tasks the heat had grown more intense, and sparks were showering down upon the threatened buildings. With smarting eyes and throat the agent forced himself towards the fire; he gathered strength from a vision—caught through a clearing in the swirling smoke—of Mother Muske stolidly playing the hose on the roof and walls of her house. He drew smoke-laden breaths, and pushed on to the limit of his endurance.

Then he planted his first charge, and a few moments later he exploded it. A piece of hummocky soil and rock leapt into the air, leaving a chasm of freshly upturned earth clear of wood or dried grasses. The agent was black by this time; his clothes were torn; he felt like a salamander.

Mother Muske turned the hose on him. He had almost fallen, and, staggering, clutched at the house. The rush of cold water revived him, and then she had him on the ground, while quite calmly she held him out of the smoke until he felt a man again.

The afternoon passed without waning light, for there had been no light to wane. Only as the evening fell the fire seemed to grow brighter and fiercer, more menacing, more grim. It threw a great redness into all overhead, and seemed to drift over their heads in lurid clouds.

But the wind had fallen. The agent's fire-breaks and Mrs Muske's hose had apparently prevented the red demon from approaching the buildings of Missanaba, or flying sparks from setting them ablaze. The two defenders, utterly spent, sat on the moist soil in front of the section-house; the lawn was still damp with the water that the valiant Mrs Muske had steadily played upon the house and its surroundings. Apathetically, wearily, almost indifferently, they now gazed upon the red glare that flickered and leapt in stabbing flame through the streaming smoke.

It seemed to the agent that the air was getting clearer. Dimly he sensed that delicious smokeless airs—fresh, cool, beautiful—were playing about his blackened face. With an effort he roused himself and saw, with amazed relief, the gentle Venus—that bright and early evening star—placidly shining in the sky. He turned his head and saw behind him great volumes of smoke that still ascended in a cloud to the heavens—only, it was a cloud that seemed to waver and lean *away* from him. He took a deep breath of the glorious tingling air, and shook Mother Muske with awakened vigour.

'Mother, wake up! The wind has changed. It's blowing the fire back on itself. It's putting it out.'

Then they both slept.

XI.

'Well, Frieda,' asked the agent, 'glad to get home?'

Frieda wriggled herself more securely onto the table in the agent's office. She liked to hear the chattering telegraph instruments. She smiled gravely at the agent as he tilted back his chair and read solemnly a document he had just taken from an envelope.

'I'm not sorry,' said Frieda. 'You bet we was worried about mom. You bet I was worried about you too, Mr Agent.'

'That was real kind of you, Frieda,' replied the agent. He rose and tacked the document to the wall beside another of the same shape and hue. Then he carefully re-read the new one. It was addressed to Leslie Lorne Wilson, Agent at Missanaba; and it said in part: 'You are awarded thirty merit marks for outstanding courage and devotion to duty in protecting the company's property during severe danger from fire on the twenty-fifth of August.'

'The company's property,' said the agent comically, and laughed in a short, sharp manner. Frieda did not quite see the joke, but she laughed too. When Frieda laughed, all kinds of lights seemed to twinkle in her blue eyes; her whole face became amazingly jolly and friendly.

Mrs Muske put her head in at the door. 'Now, Frieda,' she said, 'you come along now. Mine gracious, all the dishes from supper yet—'

'All right, mom.—Good-night, Mr Agent.'

'Good-night, Frieda.'

Mrs Muske watched, hands on hips, an exchange of frank kisses. Frieda stood on the table and offered her lips provokingly. The agent swung her to the floor.

'You be careful, Mr Agent,' warned Mother Muske; 'that small one, she tell me, "one time I marry that agent."'

'By the holy Doodlebug,' said the agent, 'I wouldn't be surprised if she did.'

THE KING OF THE ISLAND.

PART III.

VI.

FOUR days later Hurst stood on the rough stone jetty near the supply depot, watching a boat which was rowing towards him. Farther out the British surveying ship *Emerald* was lying at anchor. She had arrived for her annual inspection of the depot. Hurst had seen her hours ago, and had lighted his watch-fire, which he had prepared in readiness for such a visit. It was his good fortune that the visit had been almost due when he landed.

He had half-expected to see the body of his would-be murderer cast ashore somewhere, but there had been no sign of it. The deep sea had swallowed up that distraught being, and his giant frame would stalk about his little

kingdom no more. That same day of his death, Hurst had taken some of the stores from the cave and moved back to the empty hut, for the former place was now hateful to him. All the next four days he had spent pacing along the coast, eagerly seeking for a ship. And now one had come to him—the very one which he had hoped for.

The *Emerald's* boat came alongside the jetty and hooked on, whilst a young officer sprang ashore. Hurst ran eagerly to meet him, babbling out greetings and thanks.

'Shipwrecked, eh?' said the newcomer cheerily. 'Glad we turned up so opportunely. We saw your smoke soon after dawn. Well, you don't look much the worse for it, sir, at all events. That old depot seems to have justified its existence.'

'Yes,' said Hurst, with a queer laugh. 'Yes, it has. But you won't find many stores there now.'

'Indeed,' said the other. 'Been here long, then?'

Hurst gave him an outline of his experiences as a reply, and the naval man's eyes opened wider and wider.

'The devil!' he exclaimed. 'You seem to have had a moving time. A madman, eh? Well, you'd better get on board and see the skipper. He'll be wanting to know all about it. I'll stay and have a look round till the boat comes back.'

Half-an-hour later Hurst was sitting in the captain's cabin of the *Emerald*, with a whisky-and-soda in front of him, telling his tale anew to that ship's commander. Captain Corbin was no less interested than his subordinate.

'Extraordinary,' he said. 'You've had a narrow escape, Mr Hurst. As for that unfortunate fellow—it's as well he's dead. It meant an asylum for the rest of his life, or else the gallows. But what an amazing time he must have had of it here, with his dreams and his loneliness. Did you say he was called Everill—Henry Everill?'

'He told me that *had* been his name, sir,' said Hurst; 'before he assumed the crown and became King Henry.'

'Yes, he seemed very consistent,' said Captain Corbin, smiling. 'But I think I know the name as the commander of a steamer called the *Lancaster*. She was supposed to have been lost with all hands some six months ago. Yes—that was the man. Exposure and suffering did it all, one must suppose—poor devil. He was quite mad, you think?'

'No doubt of that, sir!' exclaimed Hurst emphatically. 'And consistent with it all, as you say. He even gave me some diamonds, as he called them, from his royal treasury. By Jove! I've got them here in my pocket, a lot of worthless pebbles.—I'd forgotten all about them.'

'You should keep them as a memento,' said the captain, laughing. 'Let us see them.'

Hurst took out the little bag and poured the stones on the cabin table. Now that he saw them in a good light, he was a little surprised at their appearance. They were dull-looking crystals apparently, regular in shape, unlike any pebbles he had seen.

But his surprise was as nothing to that of his companion. Captain Corbin stared in a bewildered fashion, then snatched up one of the stones and examined it closely. He took it to the porthole, still gazing at it fixedly.

'Good Heavens!' he muttered. 'It's not possible, and yet— Mr Hurst, do you know where he got these—these things from?'

Hurst had looked at the other's agitation in astonishment. 'Yes,' he replied wonderingly.

'He showed me the place, a sort of outcrop of bluish soapy-looking rock.'

The captain's excitement seemed to increase. 'That's it!' he cried. 'That's where you find them. Mr Hurst, my brother is a manager of one of the big diamond mines at Kimberley. I've been there, and I know what I'm talking about. And these are diamonds.'

Hurst sprang to his feet. 'What, sir!' he shouted. 'You're joking! They can't be diamonds.'

'That's what they are,' replied the other firmly. 'I'll stake my life on it. Magnificent stones, too. I know some diamond merchants in London, and you can go to one of them when we get home, if you want their opinion. But I don't need anyone to tell *me*.'

Hurst put a hand to his forehead. 'I feel as though I was off my head myself, sir,' he said feebly. 'Do you mean they are really valuable?'

The other laughed. 'Somewhat,' he said dryly. 'So much so that if I had twenty thousand pounds to spare I'd offer it you for that bagful, and think I had made a good stroke of business.'

The sailor fell into his seat again. 'Great Scott!' he gasped. 'It's incredible. Then there was some method in that blighter's madness . . . after all. He was a pretty smart king in his way.'

Three months later Hurst sailed from Plymouth on the steam-yacht *Enterprise*, together with his friend Captain Corbin, who had retired from the service. The sailor had disposed of his diamonds for thirty-one thousand pounds. And the pair were bound for Stoneland Island to see if the king's treasury was still unexhausted.

THE END.

TOUSSAINT.

THE door is open, and the feast is spread

With meats for those who know such needs no more;

Still, that they may not go discomforted,

The feast is whitely laid—and wide the door.

And with the midnight hour, at some far call

Familiar forms all faintly seem to flit

Across the sombre silence of the hall,

To that fair board where they were wont to sit.

And once again—as in the long ago—

Dear voices whisper through the yearning years;

Loved faces shine within the leaping glow

Upon the hearth, across a mist of tears.

Thus, at that board so white and strangely spread,

Love that grim Death did vainly importune

Leaps o'er the bar to her beloved dead,

And spirit deep with spirit doth commune.

MARY M. CURCHOD.

Algiers.

DARKENED WINDOWS.

By A. W. THOMSON.

A BRAVE human relationship is an extraordinarily clever thing to bring about: to get the utmost practical truth into the mixture is infinitely worse than a problem in physics. Mutual recognition is inextricably involved in something like an endless game of nap, for goods, love, money, power, everything else, or nothing at all; and the situation twines mankind into a seething evil of interminable mysteries. Circumspect though it be to hide your hand in much of the affairs and business of the Art of Living, the point can be overdone. In fact, many of the troubles of mankind are due to the difficulty of not overdoing it. To boggle with your neighbour over letting him see an occasional two of hearts is scarcely a healthy state of affairs. Yet the deplorable position of society is that quite a number of decent, pleasant folk are unlucky enough not to know their next-door neighbours, while others live cheek by jowl for twenty long years in a funereal silence punctuated by erratic Good-mornings.

There are people so deluded by themselves that their tempers are touchy as a snake's. Others are so sensitive and stubborn that they take offence where none is intended. From these temperish folk arise strange quarrels and distressing feuds, yet a few wise words rightly directed and generously accepted would dazzle both their windows like diamonds. Again, there are human bundles whose countenances are repellent, and whose manners are unattractive. The windows that cover their souls are most difficult to brighten. These are to be pitied because, in proportion as the exterior is hard, so very often is the core warm and soft. At those windows you can neither smile nor rage, but feel an infinite sadness. Again, some of us are bags of chronic suspicion, unceasingly poised in an attitude of self-defence, the rigidity of which only an earthquake can lessen. Alas! we are all so bemused by jealousies of self-interest and self-preservation as to render frank relationship a rose buried deeply in thorns. The gods alone witness all this ploy, and by much laughter while away the lamentable loneliness of their superiority. You and I do, indeed, witness a pilgrimage of sorry figures and capering antics of folly on the long, long road; but, curiously enough, we fail to see ourselves in the procession.

You will perceive that the difficulties of acquiring knowledge of and sympathy with one's neighbours, with a view to felicity rather than hob-nobbing like sentries in boxes, are not easily overcome. A quaint stupidity darkens the pageantry of life. Yet you are brave to rashness, and the amount of kindly feeling

that you use prodigally by giving, where it is neither asked for nor is of much real utility, is amazing. You love as you understand, but frequently you delude yourself that you understand, and cajole yourself into believing that you love. Or you err in the opposite direction, and deal out your heart as carefully as you do your money. And that is most pitiful, since to beget love we must give it, and to be miserly in human affections is to end in living death. The art of calculating how dark or how clear to keep our windows to suit varied occasions and different folk is troublesome and compromising, but you will be assisted in the matter if you will but keep in the forefront of your mind that the quality of mercy is not strained. Above all, you must guard against assuming that all the world is beautiful, and only man is vile.

According to King Solomon no man can understand the whole world, because the whole world is hidden within his own heart. Certainly the imperfections of man are thus largely accounted for, and the chief function of a liberal education appears to be to point the impossibility of carrying out the biblical injunction to man to know himself and his neighbours. You would say that we come to a bag's end. Happily mankind never recognises bags' ends of any kind, and so we tilt at the problem with courage and adroitness. We balance the conflicts of self-preservation as best we can. The more courageous and full-blooded still believe that two is good company, but there is a distinct inclination to fancy that ten or fifty may be safer company.

A good idea is the bridge party. Unfortunately no one attends these delightful functions to rub souls; you are expected to have thoughts for nothing but the game, and you may easily come away understanding others less than before. Receptions and at-homes make up other methods of attacking the problem, but these also leave something to be desired, being supported on the weaker fibres of the heart. At debating societies and psychological meetings you amuse yourself a good deal by tilting at the moon rather than by embracing each other. Dances are good, since much useful exercise of the heart has been born at these gatherings, but it is of a local rather than of a broad and practical character. Tea-parties are gossip-closets. Schools and colleges instil academic lore, but are apt to detract from human knowledge, since a box cannot be fuller than overflowing. Business conversaciones, social clubs, and cafés tend to present branch roads, one towards forgetting money by a strained

oblivion, the other towards ways and means of acquiring more.

An undertaking requiring wonderful skill is to gather gear and affection simultaneously. As a rule you lose the one in proportion as you gain the other. The job of keeping the Commandment that tells us not to covet our neighbours' goods would at times tax the gods themselves. Man's inhumanity to man, as Burns puts it, has some plausible excuses for itself, for, to speak truth is sometimes as difficult as speaking a lie may be easy. To live truthfully is often much more difficult than to speak truthfully. To live portending a possible lie knocks a lot of the heart out of things, and to have a reputation of being impossible to fathom is almost as bad as being told one portrays an eternal falsehood. To keep your windows continually dark is anything but truthful, and he who regards his tenure of living as a pondering over a mysterious card-table against sinister foes allows a lot of happiness to pass by without seeing it. If you will study the point you will perceive that the charm vaguely known as personality is an investment that should not be overlooked amongst the work of life. You can live so much to yourself as to become forgotten, and once you fall out of the race you are done for.

True relationship of feeling shines brightly in the young, and again in the aged. At dawn of manhood you face the world in roving bands cemented by the great adventure of a common endeavour to make good. When you are old you are once more care-free, for you have but one rampart left to scale, over which lies a place called Death. Nothing matters, and you feel you can lay all your cards on the table, you need scarcely hold up the meanest trump. Yet, strangely enough, you will at times still play the game of closing your blinds, while, alas! sitting at your window calling with quavering voice on the passers-by to come and love you. But at all periods of your life you know in your heart that there are heaps of love, for you know that what man really wants is not money, but his own way, and that his greatest needs are sympathy and the pageantry of life. You are but one of millions in a long march; the ability to keep your place in the ranks is the only justification for your existence; and the greater your love the more will be the delight of your fellows to lift you when you stumble. You realise that only the weak fail to peer through darkened windows, to be crowded back to the nothingness from which they emerged. They alone meet the swirling fog that takes them to its bosom.

THE MONTH: SCIENCE AND ARTS.

THE LARGEST BRITISH LOCOMOTIVE.

AMERICAN railway engines that are of interest owing to their size and power have been described in these notes from time to time. A locomotive has been recently built for an English railway which, although it does not compare with these leviathans, is by far the largest and most powerful in this country. One might reasonably suppose such an engine to have been built for hauling important expresses. This, however, is not the case, the locomotive in question being intended for pushing heavy coal trains up the steep incline between Wath and Penistone, which has for over two miles a gradient of 1 in 40. Hitherto these trains have been hauled by two engines in front with two or three more pushing behind. The new locomotive is to do the work of the rear engines. It is of what is known as the 'Garratt' articulated type, articulated meaning that there are two separate bogies or chassis with their own cylinders and driving wheels, which are connected through swivelling joints. The boiler is carried on a cradle suspended between the two engine bogies, thus forming the connecting link. The actual joints are similar to those on ordinary railway coaches and wagons. Being free to turn, all connections are provided with

flexible joints. The steam-pipes, for instance, have ball and socket joints. The most important feature of this new type of locomotive is the great increase of power made possible by the two engines and the much larger boiler. Before its advent British locomotives may be said to have reached their limits of power, which were dictated by the width between the wheels as regards the boiler, and the number of cylinders for the engine. With a fire grate having the unprecedented area of 56 square feet, the boiler has a barrel 7 feet in diameter, and measures 40 feet 8 inches between pivot centres, while it has 275 small and 45 large tubes through which the hot gases from the firebox pass on their way to the chimney. The working pressure is 180 pounds per square inch. Each chassis has ten wheels; two small ones in front in the case of the leading chassis and two behind in the trailer, and four pairs of driving wheels 56 inches in diameter coupled together on each side. This locomotive is also unique, so far as British railways are concerned, in having six cylinders, three to each set of driving wheels, the bore being $18\frac{1}{2}$ inches, while the stroke is 26 inches. The part of each chassis projecting beyond the boiler at each end serves the purpose of a tender, that at the rear carrying 2200 gallons of water and 7 tons of coal,

while a tank on the front chassis holds 2800 gallons of water. The total weight is 178 tons, of which $143\frac{1}{2}$ tons come on the driving wheels. With only 85 per cent. of the full working pressure the locomotive can pull or push with a force of 72,940 lb. The length over the buffers is not far short of 90 feet. This locomotive has been developed and built by Messrs Beyer, Peacock & Co., Limited, the sole licensees of the patent, to the designs of Mr H. N. Gresley, C.B.E., chief mechanical engineer of the London and North-Eastern Railway.

A RUSTLESS METAL WALL-CLIP FOR FRUIT-TREES.

For the amateur, and even for the professional gardener, nailing a fruit-tree or a creeper to a wall often leads to damaged fingers or thumbs. At the best it is a tedious operation, and the preparation of the cloth or leather strips takes an appreciable amount of time. These disadvantages are entirely eliminated by an ingenious wall-clip that has recently been brought out. Closely resembling a fish-hook in form, but without the barb, the clip is made of aluminium wire having an oval cross-section, so that there are no sharp edges to damage the branches. The nail passes through what would be the eye if the clip were a fish-hook. An important advantage of these clips is that the nails can be held in position for being hammered, the finger and thumb being well clear of the danger zone. When the clip is nailed to the wall in the correct position, the branch is placed in it, and one leg is bent inwards so as to hold it. Being of aluminium, the clips bend easily and do not rust, while the nails are galvanised. These clips and nails are made in two styles, one for walls and the other for wood fences, and each style is made in three sizes.

AN IMPROVED WINDMILL.

It must be admitted that windmills for the generation of electricity in any considerable quantity have not been very successful in this country up to the present, although many are used for this purpose in Denmark. But there was exhibited at this year's Royal Agricultural Show an example with important improvements on previous windmills which promises better results. This windmill is not of the disc type, but has five separate sails. These are made on the principle of an aeroplane wing, i.e. they have thickness and are hollow, while the surfaces are of the correct form to give the best results in the light of aeroplane propeller practice. Another important feature is the method of controlling the speed. This is done automatically by turning the sails on the arms that carry them. Each sail is built up on a tube which turns on a solid radial arm. At the root each sail tube is fitted with a toothed pinion which engages with one of five racks. These are mounted in a drum which slides endwise on the windmill shaft.

By moving this drum the sails can be turned edgewise to the wind, when the windmill will stop. If turned at an angle the mill will rotate at a speed varying with the wind velocity and the angle. Now we come to another important point, the position of the spindle in each sail. This does not pass through the middle, but nearer to the forward edge of the sail. The result is that the sails have a tendency to turn edgewise to the wind, because the surfaces to the rear of the spindles are bigger than those in front. This tendency is partially balanced by weights which are hung on a lever at the bottom of the tower, the lever being connected to the sliding drum by a rod with a bellcrank forked lever at the top which acts through a sliding collar. By adjusting the weight at the bottom of the tower the windmill can be regulated within sufficiently narrow limits of speed to charge the battery continuously when there is enough wind. A vertical shaft down the middle of the tower is driven by the windmill through bevel gear at the top, and drives the dynamo at the bottom through a similar gear, together with a belt or a chain for increasing the speed. The dynamo is wound to give the correct voltage for charging between 600 and 1300 revolutions per minute, within which limits the control gear already described easily regulates the speed. There is a platform about two-thirds of the way up the tower with a ladder up to it. Here, again, is a novel feature in the form of a ladder up to the mill mechanism, which goes round with it. This arrangement allows of adjusting and lubricating the gear while the mill is working. Two small, five-sailed mills at the rear operate the veering gear, which keeps the main windmill facing the wind. These windmills are made in six sizes, from 16 feet to 41 feet in diameter, which give powers varying from 1 h.p. for the smallest in a wind of 10 m.p.h. to 60 h.p. for the largest with a 25-mile-an-hour breeze. They can, of course, be used for pumping or for driving other machinery, as well as for generating electricity. On Danish farms and estates it is quite common to find all the machinery driven by windmills.

PASSENGER-PROPELLED, OARLESS LIFEBOATS.

In spite of the best life-saving equipment that can be devised, the sinking of a ship is always liable to be accompanied by the drowning of passengers or members of the crew. Bad weather may render the launching of the lifeboats an extremely hazardous operation notwithstanding periodical boat-drills. Among other difficulties is that of propelling the boats after they have been lowered into the water. Very few trained seamen are carried in a modern passenger liner. At the most two are available for each lifeboat, while few passengers have either the experience or the strength to handle the heavy

oars provided for ships' boats even in a smooth sea, let alone among big waves. A recently-devised hand-propelling gear that can be worked by men or by women without any practice goes a long way towards meeting this difficulty. With this apparatus one skilled seaman can handle a loaded boat. The essential feature of the mechanism is a number of vertical levers, usually eight in a full-sized lifeboat, which take the place of the oars. These are worked to and fro in a fore-and-aft direction by the occupants. Half the levers are arranged at each side of the boat, being fulcrumed on the vertical sides of the air-boxes under the side seats. The short lower ends of the levers on each side are pivoted to a horizontal bar. All the levers on each side, therefore, work in unison, and swing one bar to and fro. At its after end each bar is connected by a rod to a crank on a cross shaft, which works the propeller-shaft through bevel-toothed gear. The cranks are set at ninety degrees to each other, so that when one is on the dead centre, the other is in the best position for movement. Reversing for going astern is effected by a ratchet wheel with two opposite pawls, one of which is engaged while the other is free. By moving a control lever, which releases one and engages the other, the steersman can make the propeller turn in either direction. The mechanism is cased in, and the levers are hinged to fold down alongside the seats when out of use. One great advantage of this gear is that a loaded boat can proceed away from the ship's side the moment she reaches the water. Getting out oars to push off is a dangerous operation in a crowded boat, even when performed by skilled seamen. Again, if it be desired to manœuvre two boats alongside each other, this is much more easily done with the lever-propelling gear than with oars, which project from the sides of both boats. Finally, the apparatus is practically unbreakable, and no parts can be lost even if the boat capsizes. A speed of about $4\frac{1}{2}$ miles an hour can be maintained by relays of passengers in a full lifeboat, while something like 7 miles an hour can be made to get away quickly from the ship's side. The Board of Trade have not only approved of this hand-propelling gear, but they have agreed to allow lifeboats fitted with it to count instead of the motor-lifeboats demanded under the new rules for the safety of life at sea.

A SIMPLE ELECTRIC HOOTER FOR FACTORIES.

For notifying factory workers when to begin work, and when to 'knock off,' some form of sound signal is indispensable. Where steam is available a steam whistle is used. If the machinery is driven by electricity electric gongs or electric horns can be employed. The advantages for small factories of a recently brought-out horn are its low price and the fact that it can be sounded by either low-voltage current

from a battery or by current from D.C. or A.C. lighting mains having voltages up to 250. A loud note is produced by the usual electro-magnet, trembler, and sound disc. The mechanism is enclosed in a cast metal case with water-tight joints, while glands are provided for sealing the holes for the cables, thus rendering the whole of the apparatus incombustible. With the horn pointing downwards, therefore, the device is absolutely weather-proof. The case measures $6\frac{1}{2}$ ins. by $4\frac{1}{2}$ ins. by $3\frac{1}{2}$ ins., and the horn projects $9\frac{3}{4}$ ins. Accumulators, Leclanché cells, or dry cells give full power, even if electric current from supply mains is not available.

MAKING THE BEST USE OF COAL.

Every reader of *Chambers's Journal* must have heard of the low-temperature carbonisation of coal for abstracting the gas and the tar before it is burned in factory furnaces, in locomotives, in ships, or in domestic fires. It has been urged for years that instead of burning the raw coal, this carbonisation ought to be carried on at the coal pits, and the products distributed, the resulting coke and gas being used for fuel. But many difficulties have had to be overcome, such as the friability of the coke and the caking of the coal in the retorts. The chief problem, however, has been to bring down the cost to less than the difference in value between the coal before treatment and that of the products, which may be roughly stated as 13s. per ton. Two important developments towards the solution of these problems have taken place recently. One is the pulverising of the coal into fine powder before treatment, which allows of even coal-dust being used: the other, the perfection of devices for burning pulverised fuel under steam boilers and for other industrial purposes. It is easy to understand that the subjection of powdered coal to heat by dropping it through hot air liberates the gas and the tar much more quickly than if the coal were treated in lumps in retorts. The demonstration of the practicability of using the powdered coke which results overcomes the final difficulty so far as factories are concerned. No doubt devices for using this fuel for domestic fires will eventually be invented. The new method of low-temperature treatment, which is known as the 'McEwen-Runge' process, consists of pulverising the coal and delivering it to the top of a tower, whence it falls through an upward current of air heated to a temperature of 700 degrees F. when the air enters at the bottom. In a second tower, below the first, the temperature of the entering air is 1500 degrees F. In the upper tower the moisture is driven off, together with the CO₂ and other gases of no heating value, these being thrown away. It is in the lower tower that the valuable heating gas and the tar are driven off, while the powdered coal is converted into coke dust. This falls into a chamber where

its heat is transferred to the air supplied to the upper tower. An important effect of the first heating, even if the coal is of the caking variety, is to remove any tendency to cake and stick to the sides of the second tower when subjected to the carbonising temperature. In other processes caking has been a serious difficulty, to prevent which moving trays have been employed. There are no moving parts subjected to heat in the new process, but its outstanding feature is speed, the work being completed in six minutes. The cooling and the cleaning of the gas and the abstraction of the tar are carried out by well-known devices which are used in gasworks, while the tar is converted into valuable oils and spirits. Finally, the new process effects substantial savings where any considerable amount of power is generated, and this will ensure its extensive adoption in the near future. It may be added that another plant has been perfected to deal with small coal as delivered from the mines in such a way as to yield lumpy coke as the residual. This plant has been in operation commercially for the last eighteen months. It also appears sure of an extensive future, for the carbonised fuel is essentially a product suitable for household use.

AN ALL-METAL FLYING BOAT.

A remarkable flying boat, the manufacture of which is being carried on in this country by Messrs Wm. Beardmore & Co., the noted Scottish builders of warships, is of very unusual design, in addition to being of large size. The outstanding feature is the employment throughout, including the wing coverings, of an aluminium alloy known as 'duralumin,' which is nearly as light as aluminium, is incorrodible, and is comparable to steel for toughness and strength. The machine is a monoplane, and the wings are cantilevers without any stays to the boat body. Set at a big dihedral angle, they are of unusual construction, being lattice girders built up of angle sections and plated with thin sheets of duralumin. So well supported is the duralumin by the ribs and stringers that men can walk about on the wings without doing any damage. The leading and trailing edges of the wings are made separately and bolted on. Mounted on struts above the inner end of each wing is a Napier Lion engine with a propeller in the front of it. Each is enclosed in a barrel-shaped case with a streamlined tail. A large fuel tank is carried under each wing near the inner end, the petrol being pumped up to the engines by windmill pumps. There is no petrol inside the boat. The boat is plated with duralumin, which is stiffened by ribs and bulkheads. The joints are riveted, being made watertight by strips of treated fabric between the edges of the plates. The deck, sides, and bottom of the boat are flat, while a tapered nose, of a form which

enables the boat to ride safely over big waves, extends well in front of the wings. The rear end of the boat, of course, tapers towards the tail. Two steps are made in the bottom to enable the boat to plane over the water before rising. A float is fitted under each wing, well out from the body. Dimensions of this huge flying boat are not obtainable, but illustrations show that the head of an average man is about level with the top of one of the engines when he is standing on the wing beside it. With a weight when loaded of 14,000 lb., a speed of 120 miles an hour is obtained, and the machine can land at 65 miles an hour. In a calm it will rise off the water in less than half a minute. An important feature from the point of view of safety is provision for setting the tail to counteract the side pull of one engine running by itself if the other fails. Designed by a German, Dr Rohrbach, who was closely connected with the manufacture of Zeppelin airships during the War, this remarkable all-metal flying boat is already being made in Denmark. A new departure is a sailing-rig with masts and sails, which is said to have given the boat a speed of four knots, while the inventor claims that she will 'tack' to windward like a yacht. Being unaffected by the weather or the action of salt water, these flying boats should have a long life apart from accidents, while the permanent water-tightness of the hulls and their immunity from increased weight by the absorption of water are valuable advantages.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (a) a reply post-card, or (b) a stamped and addressed envelope or post-card, be sent to the Editor, Chambers's Journal, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

THE LOST LAND.

JUST as hard wakefulness grows dim, it seems
I'm slowly drawn into the net of dreams.
Softly, as though held in some master-hand,
It slips beneath to lift me gently, and
I am my own no longer. In that net
Of dreams I lie: drowsy, I half-forget
Loud things of day which loomed so large before.
Then, breathless—sudden, on a silent shore—
The net still glistening with opal rain—
I find myself in my lost land again.

And until dreams themselves in turn grow dim,
There may I stay in blissful interim.

ETHEL TALBOT.

* * TO CONTRIBUTORS.

All communications should be addressed to 'The Editor, Chambers's Journal, 339 High Street, Edinburgh.'

For its return in case of ineligibility, a stamped and directed envelope (or postage-stamps) should accompany every manuscript.

To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

[ALL RIGHTS RESERVED.]

Chambers's Journal

SEVENTH SERIES

OTHER PEOPLE'S WINDOWS.

By J. FREDERICK TILSLEY, Author of *Cheerio*.

PART I.

I.

GEORGE HENRY BERKLEY took up a firm position on the hearth-rug, squared his broad shoulders, and drew a deep breath. 'It's like this, Anne,' he began hoarsely, and then stopped, overcome with confusion.

Anne Carfax, with a perplexed smile, looked up from the jumper she was knitting. Her face, in repose, was grave and thoughtful, but her slightest smile startled dimples into her cheeks and made her blue eyes dance with fun. 'Yes, George,' she encouraged in a soft voice, and, lowering her eyes to the jumper again, waited for him to proceed.

George gasped a little, and then made another and more successful attempt to voice the subject which had been nearest his heart for some considerable time. 'I—I've been thinking,' he went on, very red in the face, 'that it wouldn't be a bad idea for us, you and me, I mean, to—to, well to—er—get married.'

It was done! He had proposed! Everything became very still. It seemed to George that the whole of the universe had been shocked into silence by his presumption. The idea had appeared rather a good one when it first occurred to him. George was not conceited, but Anne and he had known each other for so long that he had rather taken her for granted. Only now that the words were spoken did he realise their full import. He had asked this girl, this wonderful living, breathing, separate human being, to give herself to him, to put her happiness, her very life, into his hands. What a serious business was marriage! He was overcome with the sense of his own unworthiness. George Henry Berkley stood six feet two inches in his socks. He had a good square chin, and steady, rather stubborn blue eyes, but at that moment he felt that he could easily have left the room by crawling beneath the door, boots and all.

Anne Carfax laughed up at him. 'Do please take a seat, George,' she urged. 'You look frightfully uncomfortable standing there in that rigid attitude.'

The young man, secretly relieved that the

girl had taken so lenient a view of his impertinence, shook his head with a determined smile. 'My next movement depends on your answer,' he announced solemnly.

'Well, the answer is No,' she said calmly. 'Now will you sit down?'

In the event of the answer being in the negative, George had previously decided that he would stride proudly from the room and make an end of himself, or something of that sort. Now, however, he changed his plans—such plans usually are changed. Instead, he collapsed into the nearest chair and stared gloomily at the cat. 'Why not, Anne?' he grumbled. 'I know I'm a bit of an ass in many ways, but I'm not such a bad sort really. Easy tempered, easy going, and easy to get on with.'

'You see, George,' she answered, with an air of being very friendly and reasonable, 'you are such a boy, and much too young even to think of marriage at present.'

'I'm twenty-five,' he pointed out with dignity.

'I meant your age, not your years,' she said with a curious smile.

This fine distinction was incomprehensible to the simple George. He grappled with it in silence for a few moments, and then gave it up in despair.

'Besides,' she went on, 'you have no occupation, no profession, apart from driving your father's cars and playing rough games. Your life is wasted. You can do nothing useful—at least you carefully refrain from doing anything useful, which amounts to the same thing. A girl wants a husband who has made a place for himself, one she can trust to look after her if things go wrong.'

George stared at her in amazement. He was accustomed to hearing this sort of lecture from his father at frequent and regular intervals, but that such eccentric views should be held by a pretty girl like Anne Carfax rather shocked him. 'I thought I'd known Anne all my life,' he reflected, 'but I don't know her at all.'

'But why should I spend my life in a beastly

NOVEMBER 7, 1925.

office when it's absolutely unnecessary?' he asked resentfully.

Anne shook her head sadly. 'The fact that your father is very rich does not excuse you from doing your share of the world's work. A man should stand on his own feet, George.'

Another aspect of this question of work occurred to George. 'But look here, Anne,' he began eagerly, 'there isn't enough work to go round. Thousands of poor chaps are——'

'All the more reason you should be doing something, George—something big that will create employment. You ought to succeed; you have had the benefit of a first-class education.'

George smiled ruefully. 'I'm not exactly a brainy sort of chap,' he admitted frankly. 'I—I didn't do very well at school.'

Miss Carfax bent low over her knitting. 'I can quite believe that,' she answered in a low voice; 'but many a man has become famous after being given up in despair by his masters.'

II.

The one thing in all life that George took seriously was sport. He believed that if a man 'played the game,' little else mattered. He had not yet realised that work is the greatest game of all. At the approach of winter the various local amateur football clubs vied with each other to obtain George's services, and it was rumoured that more than one professional football team would be glad to enlist his support. Up to the time that his feelings for Anne Carfax developed into something deeper and more disturbing than ordinary friendship, the deepest shadow on George's pleasant life was the fact that there is only one Saturday afternoon in each week.

His father was rapidly losing patience with him. Old Mitchell Berkley believed that the possession of a rich parent did not necessarily entitle an able-bodied young man to fritter away his life uselessly. He pointed out frequently, and with increasing emphasis, that expensive and picturesque folly was but a poor substitute for honest toil.

From repairing bicycles Mitchell Berkley had, by sheer hard work and sacrifice, acquired a little shop of his own, where he not only repaired bicycles but also sold them and let them out for hire. Soon he became the recognised agent for all the best makes. A peculiar rumour, which began to go the round of North-towers soon after the little shop was opened, gave Mitchell's business a great deal of publicity. It was said that Mitchell Berkley, the young man who probably knew more about bicycles than anyone in the town, who lived and worked and ate and (quite possibly) slept amongst bicycles, could not ride one. The story may or may not have been true, but Mitchell was quick to see the value of the free

advertisement. When questioned by customers who permitted curiosity to get the better of good manners, he would wink solemnly and declare that he was kept too busy repairing and selling bicycles to learn to ride. Mitchell was still a young and energetic man when the automobile made its appearance. He was the owner of the first car in Northtowers, and builder of the first garage.

George, motherless from the tender age of two, was badly spoiled by the doting father, and lacking any real restraint, the boy grew into careless manhood. Useless at anything but games, generous to a fault, thoughtless and selfish without knowing it, he was lazy too, but his was the sort of laziness which requires a greater expenditure of energy than most forms of useful work.

George had inherited some of his father's genius for mechanics. Although this natural ability had never been trained to a definite end, he could, to use his father's expression, do wonders with anything that went on wheels, from a Rolls Royce to a roller-skate. Hoping that one day George would find his particular groove in life, old Mitchell had given him a free hand, but the spur of necessity was lacking, and George seemed more bent on stirring things up than on settling down. The recklessness of his driving, while endangering his own neck rather than the safety of the public, had made him the hero of every sporting male in Northtowers.

That streak of stubbornness in George's composition, which, combined with his unusual physical strength, enabled him to excel in most forms of sport, now asserted itself. He did everything in his power to make Anne change her mind, arguing, promising, and flattering with a glib fluency that amazed the girl almost as much as it amazed him. In once refusing a young man of George's type a girl more than doubles her original value in his eyes. There is nothing quite so desirable as that which seems just beyond our reach. Almost overwhelmed by this impassioned flood of oratory, Anne Carfax suggested a compromise.

'Very well,' she promised at last, 'I give you the answer you prefer, on one condition.'

George trembled. 'Name it,' he said eagerly—'any condition you like!'

She smiled at him with grave lips but mocking eyes. 'You must first get father's consent.'

'But I should have had to do that in any case, surely?'

Anne nodded, still smiling.

'Is your father in the house, Anne?'

'Yes, in the study. He always brings home one or two of the books from the office on Wednesday, and spends the afternoon checking them.'

George nodded, and went resolutely to the door.

III.

Alderman Carfax was the proprietor of the largest and most select drapery stores in Northtowers, and George secretly despised him for a sordid old money-grubber, who had never played a game in his life. The alderman was a small dried-up little man, with tiny black eyes which gleamed from either side of a large hooked nose. This nose was the explanation of the alderman's success in business. George, who was not at this period capable of seeing very far below the surface of things, always thought of Anne's father as a timid but hungry bird looking for worms, therefore he rapped briskly at the study door without misgivings. There was nothing diffident about George Henry Berkley when dealing with his own sex.

'What is it?' called an irritable voice. 'What d'you want?'

'I'd like a few words with you, Mr Carfax, if it's convenient,' explained George, raising his voice a little.

'Well, it isn't,' answered the occupant of the room, raising his voice a great deal. 'Never is on Wednesdays.—Good afternoon.'

George applied his knuckles again with great vigour. There was a miniature explosion on the other side of the door.

'Who is it this time?' shouted the alderman, now thoroughly angry.

'Still me,' answered George calmly.

'Oh, come in,' snarled the other.

George entered the study and discovered Alderman Carfax seated behind a large oak writing-table with an open ledger before him. George shuddered involuntarily; he hated figures. The room smelled strongly of tobacco smoke, and a fine gray layer of cigar ash powdered the table. The alderman was an inveterate and careless smoker. Match sticks and three cigar stumps, having missed the brass ash-tray by inches, disfigured a very fine piece of furniture.

George shut the door with careless violence and marched up to the desk. Although good-natured and anything but a bully, he was quite incapable of respecting a physical weakling. The insignificant he treated with good-humoured toleration. George settled himself negligently on the edge of the table and smiled at the alderman in a friendly manner.

Mr Carfax eyed his visitor suspiciously from under bushy brows. 'Well,' he demanded ungraciously, 'what d'you want? I can't imagine you having any very urgent business.'

The note of contempt in the harsh voice rather startled George. The hero of a hundred hard-fought games of the field, he was more accustomed to adulation than scorn. His blue eyes began to glint. 'I want to marry Anne,

Mr Carfax,' he declared bluntly. George was the reverse of tongue-tied when dealing with men.

The other laughed shortly. Keeping his eyes fixed on the young man's face, he fumbled blindly about the table for his half-smoked cigar. Failing to find it, he lighted a fresh one with great deliberation. 'Why disturb me during the busiest afternoon of the week to tell me something I've known for months?'

'Life's short,' explained George, keeping his temper with difficulty. 'I couldn't rest until I knew your views.'

'Well, it's Anne's business, but if she takes notice of me, she'll refuse absolutely to have anything whatever to do with you. Now that you know my views, I hope that you'll be able to rest in peace and leave me to get on with my work.'

It now occurred to George that the bird Alderman Carfax most resembled was a particularly aggressive eagle. 'What is it that you dislike about me?' he demanded.

'All of you,' answered the other without hesitation. 'Every single thing,' he went on, his voice becoming louder with every word. 'You're an idler. A young man of your physical strength ought to be doing his share of the world's work, not wasting his time chasing a silly ball about a muddy field.'

George stared at his accuser speechlessly.

'I had a talk with your father about you down at the club the other evening,' continued the alderman more calmly. 'He seems to have given you up in despair. He says that although you have marked ability in certain directions, you absolutely refuse to settle down to anything useful.'

'He wanted me to be a lawyer,' said George with some bitterness; 'as if there aren't enough of 'em already.'

The other shrugged. 'Make your own career, young man,' he snapped. 'Everything is in your favour. You are well educated; you are strong—in the arm at all events; and the fact that you want to marry my daughter argues a glimmering of intelligence somewhere. Anyhow, I shall never consent to Anne's marrying a man who is incapable of supporting her by his own efforts. I think you'll find she agrees with me too. Anne has her fair share of common-sense.'

George slid off the table and faced the alderman. He was very pale. 'I'm going out to look for a job,' he said quickly.

'When you've found it, you can come and see us again.'

George strode to the door. 'If ever I enter this house again, it will be at your request,' he answered grimly.

Alderman Carfax waved his cigar at the closing door. 'Then good-bye for ever!'

(Continued on page 795.)

A NIGHT AT ABBOTSFORD, 1830.

By Sir GEORGE DOUGLAS, Bart.

I.

BY the kindness of Miss Fergusson, a relative of the writer, I am permitted to print an abridgement of a hitherto unpublished account by John Elliot Shortreed of a visit paid by him to Sir Walter Scott at Abbotsford on 27th November 1830.

Arriving at Abbotsford at about half-past three, John Shortreed and his brother-in-law, David Brown, who accompanied him, found Sir Walter writing in his study, and, after being kindly welcomed, were pressed to stay and take a 'bachelor's dinner' with him, his daughter, Anne Scott, being absent in Edinburgh, and also to spend the night under his roof; to both of which hospitable proposals they readily consented. At the time of their arrival, Scott had been occupied in 'brushing up' the Chartulary of Melrose Abbey, or, in other words, revising it for publication as the Duke of Buccleuch's contribution to the Bannatyne Club: a presentation which, however, did not take place until seven years later. The documents composing it had, as would appear, been disposed of by the widow of the last Earl of Morton upon her husband's death; but Sir Walter produced a letter showing that in his present publication he had the entire concurrence of the Earl's successor.

Being unwilling to interrupt their host's labours, the visitors tactfully withdrew to the pleasure-grounds, where they spent an hour in examining various objects of interest, including the newly-installed gas-works. On returning to the house at about a quarter to five o'clock, they found the great man still writing, but he at once ceased work and entertained them until dinner was announced. Whether out of consideration for luggageless guests, or because such was his usual practice, Scott had not changed his dress, which consisted of a short single-breasted green jacket with metal buttons, a striped winter waistcoat, a pair of 'priest's gray' trousers, a black neck-cloth, a pair of much-worn black gaiters, and thick walking-shoes. 'I was sorry to observe,' continues Shortreed, 'that his lameness seems to have increased a good deal since I saw him last August. He is likewise less bulk than he used to be, and is paler and less healthy-like. His spirits, however, were excellent. He is almost constantly attended by three or four dogs: two large fellows, one a deerhound (a noble creature), the other a rough greyhound, and two little things, of what he considers, but I believe erroneously, the Dinmont breed.' But though himself a lover of the canine race, and though acknowledging that the two so-called Dandies were entitled

to some respect as having been mentioned in one of Scott's recent prefaces, Mr Shortreed found these quadrupeds as a body rather a nuisance, as over-indulged dogs always are to visitors. Not so Scott, however, who allowed them to follow him to study and dining-room, frequently caressing them, and even kissing Nimrod the deerhound.

The newspaper arriving about this time, and being placed in Shortreed's hands, he read out an account of the new Lord Chancellor's taking his seat in the Chancery Court, on which Scott exclaimed, 'Well, one lives to see strange things! Brougham Chancellor of England! I remember, Mr Shortreed, of his being as mad as a March Hare at a Jedburgh Circuit, when he drank nearly a bottle of your mother's cherry-brandy in the forenoon, to prime himself, as he said, for old Justice-Clerk Rae, against whom he had taken some spite in the Court. It was on the same occasion he cut the most eccentric figure you can well conceive, parading up and down Jedburgh streets dressed in a huge box-coat, with God knows how many capes, on a warm autumn day, cracking a gig-whip which he carried in his hand. And to think that that *outré* being is now Lord Chancellor of England—Good God!'

France and the disturbed state of the Continent generally were spoken of, Shortreed remarking that tranquillity in France was scarcely to be expected after 'so recent and extraordinary a change in her political state,' referring, of course, to the Revolution of July and the deposition and flight of Charles X. 'Oh!' said Sir Walter, 'that with them is out of the question! When an entire nation has been spun round like a tee-totum, as they have, we are not to expect that they will stand still all at once. 'Tis a thousand pities that there should have been such a sweeping change in our own Cabinet at a crisis like the present' (alluding to the fall of the Wellington Ministry, on 16th November, and the accession to office of Lord Grey). 'But the Duke of Wellington is unbending, and carries matters too much *militaire*, and in place of conciliating the High Tory party, seems always to have been making the breach between them and him wider. God knows what will be the end of all these changes! I wish they may be for our good.'

Shortreed goes on to say that Scott expressed over and over again great alarm at the state of the country, and seemed to think the recent change of Ministry the very worst thing that could have happened. 'It is quite clear,' he adds, 'from the whole tenor of his conversation, that Sir Walter is much inclined to maintain

the existing order of things, which, though doubtless faulty in many points, he considers better than anything we are likely to get by an alteration. Though ready to admit faults in a general way, I could not help observing how he combated any particular objection which is made by our modern reformers.' Well, there might be, and no doubt there was, something grievously amiss in the state of the country at this time. But it is no less apparent that the great man's powers were failing him, or that he was losing the faculty of reacting against current events!

Referring to a portrait that hung in the apartment, Scott remarked, 'Ay, that is Claverhouse! He is a handsome gentle creature to look at, but he was a devil in the inside, and was deaf to the call of mercy. By the way, I think the spirit of the Covenant never got into Liddesdale—even in my remembrance there was a wonderful indifference about these matters in that district.' In illustration of which, he narrated a story of a well-known local farmer crawling on hands and knees direct from the Communion Table to the ale-house.

II.

The friends dined together at a little after five o'clock, the dinner—which had been announced as a pot-luck affair—proving lavish to a degree which would be considered ridiculous nowadays, for it consisted of hare soup, roast mutton, a fillet of roast veal, sheep's kidneys, vegetables, and 'game, etc. for a remove.' During the soup Miss Scott made her appearance from Edinburgh, and after being affectionately saluted by her father, took her place at the table. The conversation was gay and unrestrained, and several glasses of Scott's excellent wine were drunk; but Shortreed remarks that his host was often absent-minded at table, and after inviting a guest to take wine with him, and filling his glass, would forget all about it until his memory was jogged.

Anne Scott was full of Edinburgh chit-chat, and displayed such unbounded faith in the newspapers that her father felt constrained to caution her by asking repeatedly, 'How did you learn *that*, Anne? Who told you such a thing?' 'I saw it in the papers, papa.' 'Ay, and like a wise person you always believe everything you read there! Now the newspapers are full of lies and all manner of falsehoods and misrepresentations.' He then inquired if she had seen anything of the French refugees in Edinburgh, to which she answered that she had seen the Duke of Bordeaux—better known as the Comte de Chambord, son of Charles X.'s assassinated son, the Duc de Berri—in Miller, the bookseller's shop, and might have seen the ex-king himself had she not felt a delicacy in lingering to gaze on him. 'Ay,' said Sir Walter, 'the last time we saw

him was in very different circumstances: at the head of a splendid Court going to mass, when he recognised us, and stopped and talked with us for a little in the most condescending way imaginable.' He then went on warmly to condemn the ex-king's conduct as 'worse than foolish—particularly in him, after all the misfortune of his early life, which seems to have taught him anything but wisdom,' thus either quoting or anticipating the first half of Talleyrand's epigram on the restored Bourbon dynasty; adding that he believed the obnoxious measures which had led to the king's deposition were his own, and that his Minister, Polignac, was decidedly opposed to them. That the young Duke of Bordeaux might yet be king of France, he thought by no means impossible.

Upon Miss Scott's mentioning a report that King William IV. was about to remove the Scottish regalia to London, 'It's not in his power!' cried Sir Walter. 'By the Articles of Union they must remain in Scotland.' Shortreed then asked if the late king had not expressed a similar intention to himself; to which Scott replied, 'He did; but, like the Archangel Michael with Satan, I withstood him to his face, telling him that, as the mountain could not come to see Mahomet, Mahomet would just have to come and see the mountain.'

Theodore Hook's novel *Maxwell* was spoken of, Miss Scott remarking that she, for her part, thought it vulgar, but that Lockhart had a high opinion of it, which brought the incisive answer, 'I don't always go by Lockhart's opinion!' Shortreed assures us that Scott seldom spoke of literature, seeming rather to avoid the subject and to turn the conversation to general topics. To-night, however, he spoke a good deal about Washington Irving and his writings, praising the beauty and elegance of his style, and describing his humour as 'chaste and engaging.' The *History of New York*, in particular, he characterised as one of the funniest and most delightful productions of our time. He also expressed satisfaction at having been able to be of use to Irving when he first visited this country, to which he had been sent by his father on a mere pleasure-trip. On landing in England, however, Irving received news of the failure of the business-house in which his father was a partner, by which means he was all at once thrown on his own resources for a subsistence. In these circumstances, Scott, who knew his value as an author, and had long ere this laughed over his *Knickerbocker*, befriended him by introducing him to Murray, and thus saved him from publishing his *Sketch Book* with an inferior house. Irving soon became a great favourite with the British public.

III.

Over the chimney-piece of the dining-room hung a striking portrait of Charles XII. of

Sweden, representing that fire-eating monarch nearly at full length, his head uncovered, his left hand grasping the hilt of his sword, in a manner so entirely in keeping with the resolute, but at the same time mad, expression of the contracted forehead and little peering, piercing eyes and compressed lips, that Shortreed was led to comment on its artistic propriety. Scott strongly agreed with him, and gave the following account of his purchase of the portrait, which was one by which he set great store. It had been brought to him by an old picture-dealer from Aberdeen, who at first asked £40 for it. Scott had heard of the painting before, but stoutly refused to give more than £10, and, after a keen bout at bargaining, which he seems to have enjoyed, beat the dealer down step by step to his own price—notwithstanding that he believed that price to be a 'mere trifle,' the picture being in his estimation 'very valuable.' He went on to tell the following characteristic anecdote of the person represented in the portrait. Charles had become separated from his train one day while hunting, and his horse had broken down. Putting the saddle on his own back, he arrived by-and-by at the stable of a gentleman of the neighbourhood; this he entered, and finding a horse standing ready, proceeded to saddle it. Whilst he was so engaged the owner made his appearance, and at once resented the audacity of the king, whom he failed to recognise, by striking him. Charles drew his sword, and a spirited encounter was in progress when the courtiers came upon the scene and revealed the king's identity. The owner of the steed was horrified at the thought of having assaulted his sovereign. But it was characteristic of Charles, who might have explained matters in a word, that he had deliberately risked his life rather than put himself to this trouble! Other portraits in the dining-room which came in for comment were one of Cromwell, taken early in life and lacking the harsh, careworn, and anxious expression which characterised him later in life; and one of the Duke of Monmouth, which, as being distinguished by softness and grace, unaccompanied by any trace of high intellect, energy, or resolution, was pronounced to be probably 'true to the original.'

Whilst the evening wore away over a few glasses of wine and two tumblers of whisky-punch, the conversation turned to the subject of sylviculture, of which Scott showed a knowledge as varied as that of Solomon, who spake of all manner of trees, 'from the cedar of Lebanon to the hyssop that springeth on the wall.' This led on to learned discussions on draining, top-dressing and bottom-dressing, 'runts,' stots and kye, on which subjects Shortreed's companion, Brown, was an expert, and in the course of which Scott informed his guests that he had got back into his service his old

overseer, William Laidlaw, who was no less valuable to him as a companion than as an estate-manager. 'We have just one bargain,' he added, 'that I am not to interfere in the farming department, nor he in the management of the woods; and, simple though this may seem, we have, nevertheless, considerable difficulty in keeping compact!'

Adjourning to Miss Scott's parlour at eight o'clock, the visitors had tea there, and enjoyed the frank and unaffected conversation of their hostess, whilst, at their suggestion, Scott returned to his interrupted literary labours. When he rejoined them, and until supper was served, conversation turned mainly upon the various beautiful little engravings and sketches with which the walls of the small and elegant room were hung. Speaking of Turner, whose work was well represented, Scott praised him highly as an artist; adding, however, that he was 'almost the only person of true genius he had ever known who was altogether unamiable.' From Turner they passed on to Hogarth, whom Scott also greatly admired, and this afforded him an opportunity of amusing his guests by the description of a ludicrous picture of Hogarth's, in which a seaman of high rank is represented seated in his cabin, where he is being sung to by a bawling street-singer, though giving all his attention to a monkey, on whose head he has placed his own wig. Meanwhile the monkey imitates the facial play of the vocalist; whilst a servant, who is bringing in a dish, is so diverted by the spectacle that he allows the gravy to drip down the neck of a lean and hungry individual who looks on unconcerned. This Scott described as an 'exquisite thing,' expressing surprise that it had never been engraved. And he also told how his father had regretfully denied himself the pleasure of possessing a copy of the engravings after Hogarth's works, priced at £30, which he deemed an extravagance, though the same volumes now fetched as much as £120. In further talk upon Hogarth's vein of satire, and his wonderful knowledge of life and character, the time then passed pleasantly away until supper was ready, at which meal Scott, in accordance with his usual practice, declined hot dishes, contenting himself with a bit of loaf and a tumbler of porter. At half-past ten o'clock, the usual hour for so doing at Abbotsford, the little company retired to rest. 'Although not the first time I had had the happiness,' writes Shortreed, 'to sleep under the roof of Sir Walter Scott, a tumult of pleasurable and exulting emotions hindered me of slumber for some hours after I lay down in my comfortable French bed in a neat gas-lit chamber.'

IV.

Breakfast next morning was at about ten o'clock, Scott having spent already more than

an hour in his study. His talk during the meal was of various subjects, but chiefly of foxes and field sports. It was characteristic of his feudal tastes to take a pride in such articles of household use as were produced either at home or in the neighbourhood, and this led to his praising some very sour and dingy bread which had been made at the neighbouring village of Darnick. He added, however, that he had found it a great disadvantage to sell wheat to a party from whom one bought bread, having on one occasion sold twelve bolls to a neighbouring baker, with the result that any fault found with the bread for twelve months after was invariably imputed to his own wheat!

Breakfast being finished, Scott conducted his visitors to the library, where, having a packet to despatch to his publishers, he left them for a while to their own devices, though not until he had impressed upon them as a 'Law of the Medes and Persians,' that every book taken from the shelves must be returned to its own particular place. Left to themselves, Shortreed and his friend sought out such books as they thought would be most likely to contain annotations by the owner, lighting, among others, on a collection of broadsides relating to the '15 and the '45, and on a copy of Lord Berners's *Froissart*, bearing the inscription, in the handwriting of Scott's early days, 'Gualteri Scott, liber carissimus.' A beautifully wrought silver urn, which stood in the library, contained the bones of some noble Athenians, which had been found in the Long Walk at Athens. This was the gift of Byron to Scott, but unfortunately the letter which had accompanied it had been abstracted, presumably by one of the innumerable visitors to Abbotsford; a theft which not unnaturally roused the indignation of host and guests.

A reference to the recent *Letters on Demonology and Witchcraft* turned the conversation to the subject of ghosts, Scott remarking that certain ladies of his acquaintance had professed their inability to sleep in their beds at night after reading it, and going on to observe that such a thing seemed almost incredible nowadays, though he well remembered when the belief in ghosts and goblins was quite common even among the educated classes. 'My mother,' he added, 'who was otherwise a person of very strong good sense, believed most devoutly in them. But it was the fashion of the age she lived in. For my own part, I am quite of opinion that no such thing as a ghost exists but in the disturbed brain of those who are inclined to see them.' The survival of the belief in ghosts he attributed largely to the precipitancy with which those who fancied they saw them took to their heels, when a slight further investigation would have served the purpose of dispelling or explaining the phantom. And he cited as an example the story of a most mis-

chievous and unruly ghost, which, in his own early days, had taken up its quarters in a deserted farmhouse near the Braid Hills, and kept the entire neighbourhood in alarm, until its capture exposed it as a masquerade on the part of a gamesome young countryman of the district.

The time had, however, now arrived when the best of friends must part. As Shortreed came out of the house to enter his gig, he found Sir Walter on the doorstep, singing at the top of his voice a verse of an old song ending with the line,

To a' good fellows remember me.

Then, with a chuckle at his own unmusical vocalisation and a hearty shake of his large hand, he bade his guests farewell, and they drove off, highly gratified with their visit. Shortreed concludes his rough notes with these words: 'To find this wonderful man so affable, so condescending, modest, and unassuming, one can hardly more admire at the greatness of his intellectual character than at the grace with which he bears himself under all the fame and honours which it has won him, or forbear from exclaiming, Is *this* the man with whose name the whole world is full?'

This aspect of Scott's character has often been portrayed before, and the real value of these notes consists rather in their helping to bridge the interval from 5th September to 20th December, during which there are no entries in his Diary. Scott was at this time only a few months over fifty-nine. In the previous July he had received a proposal of marriage from a 'woman of rank,' which he had very wisely and frankly declined (Diary, 13th July); in November he had obtained his release from the Court of Session, and, whilst struggling with the uncongenial task of his *Demonology*, there is no doubt whatever that he was greatly cheered by the excellent progress he was making in working himself clear of liabilities. So much for the credit side of the account. On the other hand, his health was seriously affected. For not only did he walk with pain and ride with difficulty, but his utterance was liable to be obstructed, and his writing exhibited errors which surprised himself. Worse than all, certain premonitory symptoms had filled him with anxiety as to his own condition, and with dread of a decline into imbecility such as he had read of in the case of Swift. Yet, in spite of these disabilities and haunting fears, he continues to perform his daily task with fair regularity, and to sacrifice his time and convenience to entertaining, I do not say an old and valued family friend such as Mr Shortreed was, but even an easy-going and inconsiderate stranger such as the American, Mr Daveis, or, indeed, almost anyone who might choose to ring his door-bell. For Abbots-

ford was in the strictest sense an open house, and I have yet to discover an instance when Sir Walter was 'not at home.' This was one phase of the large-heartedness which made the Waverley Novels possible, and it would be interesting to know whether Shakespeare's comprehensiveness also took this particular form.

Nor must we forget that Scott was a true patriot, and that the political discussions which racked his country at this period, together with his gloomy though mistaken anticipations for the future, were probably more directly responsible for his frequent dejection than any other single cause.

THIS WORLD OF OURS.

By H. C. CURWEN, F.R.G.S., M.R.G.S.

HOW many of us ever give a thought to this world on which we live? How was it formed, and of what is it composed?

These questions should be of absorbing interest to any thoughtful person, since it is inherent in nearly all types of people to inquire into the why and wherefore of things.

Let us take the first of the above questions.

All know that the earth rotates round the sun and that it also spins on its own axis, whilst a mysterious force, which we call gravity, keeps it to its path round the sun.

Supposing this force, or attraction, between the earth and the sun were to cease, then this planet would fly off into space at a tangent to its orbit, and in a few minutes at the most life would become extinct.

This is a startling idea, and may induce many to think a great deal more in the future than they have done in the past about the earth, its formation, and the powers governing its movements.

The second of the above two questions follows automatically. In order to view this in its proper light it is necessary to imagine: (a) that you are outside our solar system, and from some remote spot can watch its most intimate workings; and (b) that you are endowed with immortality.

Dim ages ago, in times that are beyond the comprehension of man, the earth began in the form of a spiral nebula, consisting of gases whirling round a centre spot, or nucleus.

As these gases contracted they became hotter, until at last the whole mass, which at first had been only luminous, became incandescent, and finally a flaming inferno.

The spiral nebula is something like a watch spring in shape. This body would be a centre of attraction for other bodies, such as those we now call meteorites, which are really the wreckage and refuse of other worlds long since dead and disintegrated; as these were absorbed in the main body of the nebula, the terrific heat would vaporise and resolve them into their simplest component parts.

By this means the earth would, during this hot period, gain a considerable proportion of its bulk, the heat being sufficient to vaporise any solid matter in space that came within the

radius of attraction of the earth and was drawn into the main body of it.

In the course of many thousands of years the earth, or rather the gaseous body from which the earth was to be formed, had cooled to a degree such that many of the metals having high melting points, as tungsten and platinum, would condense as liquids.

It was at this period, in all probability, that the moon was evolved from the earth, possibly by the attraction of some other planet or body which passed near the earth at that time.

The moon, being smaller than the earth, condensed very much more speedily, and lost its heat so rapidly that to-day it is a frozen body, devoid of animal life, though it is not improbable that some extremely low forms of vegetable life may exist.

After the first period of the liquefaction of the metals, as they cooled still further, compounds with nitrogen, carbon, and oxygen formed, and in addition the atmosphere consisted of water-vapour together with some metals of very low melting-point.

At a still later date all the metals would have been deposited in the form of compounds or in a pure state, the atmosphere consisting of water-vapour and air, the latter being a mechanical mixture of nitrogen four parts, and oxygen one part, and the former a compound produced by the union of hydrogen and oxygen.

The earth would now be covered with a thin crust, under which would exist a molten interior. This crust, at its thickest part, in those days might have been from twelve to fifty or sixty miles thick. To-day there is a skin forty miles thick; a first shell about a thousand miles deep and of basic composition; a second shell about a thousand miles deep, a mixture of ultra-basic minerals and metals; and lastly, a core of metal in composition nickel-iron.

In the first twelve miles exist all the metals of present-day commerce, and none of them is mined to greater depths than from seven thousand to nine thousand feet, the majority being found between the surface and two thousand to three thousand feet.

To-day the earth is as we know it. What changes will 500,000 or 1,000,000 years bring?

THE TRUE COURSE.

By L. G. W. WHITE.

I.

A BLACK wall-sided tramp steamer lay alongside the dock at Kidderpore awaiting the tug which was to tow her into the Hughli. In the brilliant afternoon sunshine she presented a depressing appearance, for she was an old ship, and, therefore, not in great demand. Owing to the state of the freight market she had been rusting at her Calcutta moorings for over ten months, but now, having secured a cargo and her certificate of sea-worthiness, she was about to sail for the West Indies. Ugly marks of neglect were evident from stem to stern; not an ounce of paint had been splashed on her upperworks since the last crew was paid off, neither had the sound of the chipping-hammer been heard along her decks. Everything aboard her was obsolete, and the glib-tongued cargo-wallahs had expressed their opinion of her deck-gear in lurid language.

Certainly the s.s. *Meronda* was not a ship to be proud of, yet Abdul Rehman, the quartermaster, leaned with folded arms on her lower bridge and surveyed her with appreciation. This was his ship, and he had never sailed in any other. Far away in the dim past which he could scarcely remember, Abdul had been plucked from the slums of Calcutta, on the death of his father, by his uncle, who was then bo'sun of the *Meronda*, and had been taken to sea as a deck-boy. That serang had died of beriberi between Havana and New York, and since then Abdul had made many trips as seaman and signed articles with many different crews, but always with the same ship. His character was regularly described as 'sober' on his discharge paper, and by making the most of occasional opportunities at the wheel he had learned to steer, and had now succeeded in obtaining a berth as quartermaster. Abdul was not, by any means, an ambitious man, but he was keenly alive to the dignities of his new position—would he not be on the bridge with the sahibs?

He carefully drew his discharge-book from the pocket of his new drill jacket and admired the cover, for although he could not read he knew the letters of his name by heart. If the *Meronda's* wheel were examined, the letters A B D U L might be found scratched in block capitals between two of the spokes. The shape of the letters would not pass muster at a mission school, but then mission scholars do not have to form their letters on hard teak with an iron nail.

The secuny replaced the discharge-book, and regarded his new white canvas shoes with pride. Only that morning they had been purchased

from Judu, who sold slops, together with a jacket and a sailor tam with s.s. *Kinross-shire* emblazoned in letters of gold upon the ribbon. Of course Abdul had never seen or even heard of the *Kinross-shire*, but as he could not read, the tam seemed much more appropriate to his new rank than the little red and white cap he had always affected.

It was a good thing for the new secuny that his ship had not remained longer in port, or hard necessity would have forced him to seek service in some other steamer. Ten months ashore and the aforementioned additions to his wardrobe had reduced Abdul's stock of pice almost to zero. But now, as he watched the hatches being battened down and the boats swung out, his sailor's heart was full of joy.

The tug fussed up, and Abdul went up to the wheel. The captain emerged from the chart-room and also ascended to the bridge. He ignored Abdul's polite 'Salam, Sahib.' Evidently this new captain sahib did not understand Hindustani.

The *Meronda* had always been a British ship, registered at Calcutta, but she had been purchased recently by a foreign combine, which had supplied her with a captain and officers who obviously were not British.

The captain wore his shore-going suit on the bridge, but he had exchanged his topi for a peaked cap with much gilt cord about the front. His cheeks were flabby and he had a heavy straw-coloured moustache. Quite a different type, this, from the keen-eyed, clean-shaven British officers to whom Abdul had always been accustomed. The Asiatic behind the wheel regarded his captain out of the corner of his eye, and instantly decided that he did not like him. He could not have told the reason why, but then, Abdul was not prone to self-analysis, and he liked and disliked without reason.

II.

It invariably happens that when a vessel carries three secunies their watches are divided so that each is on duty at the wheel for two hours and then enjoys four hours below. The watches from four o'clock till six, and again from ten till twelve, are the most fatiguing, and usually, therefore, these are relegated to the junior secuny. This was so aboard the *Meronda*, and by the time Abdul was relieved from his first watch at four bells (six o'clock), the ship was steaming down the river in charge of the pilot.

Already the nauseating Calcutta river-smell had drifted away astern, and the salt-laden breeze that draws men down to the sea from all

ports of the world, wafted along the *Meronda's* decks, crept in through the open port-holes and stirred the flimsy brown curtains of the bunks.

Abdul sniffed it gratefully as he went forward to the fo'c'sle, and having finished his curry and rice on the hatch, proceeded to make himself at home in the cabin which he now shared with the other secunies. Squatting on his heels on the deck, he carefully unpacked his belongings. They were not numerous and, with the exception of his straw mattress and umbrella, were all contained in a canvas bag, which was highly ornamented with coloured wools. This bag seemed to contain numerous empty cigarette tins, which were soon consigned to the corners of the bunk, but the chief treasures were hid at the bottom of the bag, and these demanded more careful handling.

First there emerged a patent cigar-lighter, of which Abdul did not know the use. It was years since it had contained any petrol, but it still made a pleasing spark when one pressed the catch. There followed a cardboard frame, advertising somebody's cigarettes, which portrayed the head and shoulders of a smiling lady under an ostrich feather hat. Her features could be altered in an alluring manner by the simple means of pressing the edges of the frame with thumb and finger.

After a British mercantile marine war medal had been produced and admired, there still remained one small object wrapped in a piece of blue check cloth—this was the most cherished possession. Abdul untied the cloth and gazed reverently at the fetish it contained. There was revealed a small metal image, about three inches high, which shone like copper. It was interesting and grotesque enough even to the European mind, for it was graven in the likeness of an eastern goddess, kneeling and with arms outstretched. The eyes were formed by two small red stones, which sometimes caught the light and glinted strangely. The outstretched arms were of iron. How he came by it its owner could not remember, but he knew that he had acquired it in the far-off days of his childhood, and it had been the only thing he had brought aboard the *Meronda* when he first joined, besides the cotton rags that had served to clothe him. Since then it had been his constant companion, and it provided for him a tangible emblem of Eternal Providence. He attributed everything for which he could not account to its agency. And there had been many things in the life of Abdul for which he could not account—especially during the war.

Mystery and awe surrounded the little goddess, and the years had given an added reverence. Neither was its power entirely of an abstract nature, for its iron arms were magnetised, and this caused them to attract small flakes of metal, needles, &c. A profound wonder, which, when demonstrated on the

forward hatch, had once inspired small coal-boys with admiration and respect. But lately the idol had grown too sacred for public exhibition.

The heart of Abdul Rehman, secuny, was full of thankfulness for his recent promotion as he reverently covered the goddess with the check cloth and laid it beneath his pillow.

III.

All went well. After dropping the pilot at Sandheads the *Meronda* was headed southwards. There was some delay at Durban, where she bunkered, owing to trouble with the main engines, but after being tinkered up the old ship succeeded in making slow passage to the West Indies, where she discharged at various ports, and was then ordered up to the States to load coal for Genoa.

The Atlantic Ocean does not always justify its bad reputation, and after leaving Hampton Roads the *Meronda* was fortunate in encountering no rough weather. Although well down to her load-marks, her engines gave no more trouble and, in spite of a slight list, she steered remarkably well. She was within a few days' run of Gibraltar when circumstances arose which caused an eruption in the peaceful monotony of Abdul's existence.

On a certain calm afternoon Abdul left his cabin to go on watch as usual. After strolling along the for'ard well-deck and ascending to the main deck he found it still required a few minutes to four o'clock, and he loitered under the bridge-deck until the stroke of eight bells should summon him up to the wheel. Abdul was always punctual. On this particular afternoon he stood watching the smoke curl lazily away from the funnel, when he gradually became aware of the sound of voices drifting through the open port-hole of the captain's cabin. He listened. Drawing nearer, he recognised the low tones of the chief engineer. Evidently a discussion of some importance was going on between him and the captain.

The two men were of different nationalities, and spoke English, not because it was the native tongue of either of them, but because it was common ground for conversation. The oriental had no qualms about eavesdropping, but it is doubtful whether he would have strained his ears to listen had not the following unusual question arrested his attention—

'You have all the boats quite ready?'

'Trust me,' answered the captain's voice. 'I looked to them myself this morning, even to the rope-ladders. Everything is correct. The wind's light, there's no current, and you have only to stand by—that's all.'

There was a pause, and then the chief's voice dropped yet lower.

'You are certain of the time we bump?'

'Eleven o'clock or very shortly after, certainly not a moment before,' answered the captain;

and then rather impatiently, 'Of course, you're an engineer, chief, and can't be expected to appreciate the niceties of navigation, but you may take it from me that I've left nothing to chance—I've checked the position many times to-day, and shall do so again by the stars. Have you settled about your fourth?'

The chief's reply was just audible. 'Yes, I shall be near the bilge-cocks, and as soon as we bump I'll send him on deck. He'll not return, as we shall be settling down within a few minutes of opening the bilges.'

Abdul strained his ears to catch the words as the chief's voice went on, 'Everything depends on our bumping the reef, for we dare not open the bilges otherwise—that trick is played out. As it is now, every man will feel the bump, and be prepared to witness that we sank after striking this uncharted reef. You are sure of it, though? Then it's certainly well thought out, captain.'

'Certainly,' agreed the other. 'And the glass stands high. After a short time in the boats—'

Eight bells clanged out above, and the secuny ascended the ladder to the bridge-deck.

IV.

Now Abdul had never been called upon to use his brain to any extent, and his thoughts came slowly. Furthermore, he was mentally staggered by the conclusions which were slowly forcing themselves upon his mind. He knew nothing of insurance money or underwriters, but while at the wheel on earlier voyages he had often listened to the conversation of the sahibs on the bridge, and one cannot listen to the unhurried yarning of ships' officers without learning many tales of the sea and picking up a certain amount of nautical lore. Abdul knew that under some circumstances bad captains had been known to sink their ships, and from the conversation he had heard he could not doubt but that his ship—the *Meronda*—would be sunk by that agency that very evening.

By the end of the watch this fact had impressed itself on him with awful intensity. He went for'ard and ate his curry and rice as one in a dream. About eight o'clock he turned in as usual—not to sleep, but to think.

What could he do? Besides the captain and the chief he was the only one who possessed the hideous knowledge, and yet he could think of no way to frustrate the plot. He explored several possibilities without success. In some circumstances he might have told his chief officer, but he dismissed the thought as soon as it entered his head, for obvious reasons.

Eleven o'clock, the captain had said! That would be during his watch, and his—Abdul Rehman's—would be the hands which would steer the ship—his ship, the *Meronda*—to destruction. Abdul regarded his hands with horror.

He could not, would not, do this thing. But, reason reminded him, if he disobeyed orders he would be sent for'ard in disgrace and one of the other secunies fetched up.

The light in the secunies' cabin faded and the curtain of night drew across the sea, very beautiful and still, but it brought no peace to Abdul. He lay with heavy heart and cold wet brows while the familiar noises of the fo'c'sle seemed dear to him, now that their continuance was threatened. The swish of the water sounded very distinctly as it purled away from the iron bow, and every now and then the raucous laugh of the serang from the direction of the carpenter's cabin broke in upon the dreary monotone in which a pious fireman was invoking Allah.

By the time Abdul was preparing to go on watch the position seemed as hopeless as ever. His thought turned to his goddess. He brought the treasure out into the light and stared at it, while his whole frightened soul went out towards it. He would rely on it as he had always done, even though the *Meronda* was steaming full ahead to destruction. The little red eyes glinted, and the outstretched hands seemed sympathetic. Certainly it understood.

Abdul slipped the idol in his pocket, for he had decided to take it up to the wheel with him. If the worst should happen—faithless thought!—he would at least have it with him.

As Abdul entered the wheel-house at four bells, the captain was on the bridge 'taking a star.' How Abdul hated the man with his sextant and cool calculations. The captain was still outside, and the officer of the watch was standing by the chronometers in the chart-room, when Abdul took the idol from his pocket and slipped it into the shadow of one of the flag lockers, which surrounded the wheel-house above his head, where he could just see it.

The officer of the watch came up, and paced up and down on the port side of the bridge, while the lights in the fo'c'sle died out, except for the wan halo cast on the iron deck by the shaded lamp in the alley-way. Abdul glanced at the clock. Quarter-past ten—he had been on watch only fifteen minutes, yet it seemed many hours. The captain had mentioned eleven o'clock—forty-five minutes more.

V.

The course was N. 72° E., and at half-past ten the captain ordered the helm to be put over to port and steadied at N. 89° E. Now fear nearly gripped Abdul, for he guessed, and guessed rightly, that the course was shaped directly toward the reef. Five minutes dragged by. The captain came and peered into the compass. The ship was dead on her course, and the face of the Asiatic at her wheel showed no sign of emotion, although, as his captain bent over the compass, a madness almost seized him, and his fingers tightened on the spokes of the

wheel—as they would have liked to fasten on the captain's throat. But that could do no good; he must keep control of himself.

The captain left the wheel-house and paced the starboard side of the bridge. Abdul felt sick and shivered, though the night was mild. Yet he braced himself up, for was he not a secuny? He would keep cool, and, when the fo'c'sle crowd came rushing aft, as he knew they would do when she bumped, he would behave like a sahib. But, he thought, his goddess would not let the *Meronda* finish. The Gates of Doom seemed to be opening just ahead, and Abdul's faith was sorely tried as he lifted the little idol down and gazed at it. The captain's step outside sounded nearer, and Abdul placed his treasure in the shadow of one of the big iron balls, close to the compass.

It was now twenty minutes to eleven, and the ship was moving steadily. The secuny peered out over the fo'c'sle. Ahead all was blackness. The sky was overcast and no stars were visible now.

His gaze returned to the compass and he started visibly. Could he believe his eyes? He looked for'ard again. The ship was steering directly ahead, and yet the compass card was swinging round. The tell-tale was slowly turning away from the set course. A phenomenon! Abdul sought no explanation, but slowly and gently he put the wheel over so that the captain should not hear the clank of the steering

gear. Five, ten, twenty, thirty, forty degrees the bow came round, until the tell-tale mark was once more over the course as indicated by the compass card.

After an interval that seemed like many watches the hands of the clock pointed to eleven and Abdul struck six bells. Two minutes later the captain entered the wheel-house and peered again into the compass.

His hand rested on the iron ball and his fingers almost touched the idol. As before, the ship appeared steady on the course he had chalked on the slate—N. 89° E. Great drops of sweat glistened on the captain's forehead by the light of the binnacle.

Down below in the engine-room, where the heavy atmosphere reeked of hot oil and the worn machinery thumped and clanged, an irritable chief engineer paced feverishly up and down within reach of his bilge-cocks—awaiting the bump which never came.

When the secuny of the second's watch came up to relieve the wheel at midnight the *Meronda* was still steady on her course and the reef lay safely astern.

Abdul did not know that the magnetism of the arms of the idol had deflected the sensitive compass needle—he only knew that in the hour of his greatest need his goddess had not failed him. He went for'ard, a supremely happy man, and drew the check cloth around his treasure with reverent brown hands.

MAINLY ABOUT ELEPHANTS.

By Major W. R. FORAN, F.R.G.S., F.Z.S., &c.

I.

ALTHOUGH most people in the world are familiar with the elephant, yet it is astonishing how little is really known about this pachyderm. Of all wild animals it is the best known, and at the same time the least known. Paradoxical as this may sound, nevertheless it is perfectly true. Most people have seen an elephant either in some zoological gardens or else in a circus—or, failing that, in pictures. And if you were to ask anyone at random what an African elephant looks like, he or she would imagine that it was a very simple question to answer. This wide-spread and popular impression, however, is erroneous except in its broadest aspect; so are most of the beliefs entertained about this huge animal of the forests and jungles.

In the first place, the elephants that we see in captivity in Europe are Asiatic specimens, and all are undersized—even the very largest of them. The two varieties—the African and the Asiatic—differ as much from each other as they do from the mammoth and similar extinct forms

that existed in the 'Stone Age.' A full-grown African elephant is nearly twice the size of any Asiatic elephant ever brought to Europe. I have shot several in Central Africa that must have weighed at least twice as much as any Indian elephant—possibly more; and they stood close upon thirteen feet in height. It was certainly very little short of that, and I am almost certain it was even more.

To anyone who is familiar at first hand with both varieties, the difference will at once become apparent. Those who have shot elephants in Africa, as well as in Asia, will be the very first to agree that those of the African species are both larger and more savage. In point of intelligence alone are they identical. But of this similarity more anon.

II.

Strangely enough, there exists a wide divergence of opinion amongst experts in big-game hunting as to the relative dangerous qualities possessed by the larger wild game. Few can be found to agree upon the correct order of precedence. I have known a number of past and

present eminent big-game hunters personally, and have often discussed this question with them; but I have seldom found any two who would agree upon the order of danger in regard to hunting the wildest and most ferocious of game. Each man has judged them in the light of his own personal experience—which, after all, is the only correct basis upon which to form any definite opinion. However, the majority of them appear to be agreed that the African elephant is the most dangerous of all big game to hunt; and, of the others, only a few have failed to class it as second on the list. The choice seems to lie between the elephant and the lion for the premier place. Personally—and my opinion is given only for what it is worth—I place them in the following order: the African elephant, the African buffalo, the tiger, the lion, the rhinoceros. There are, I feel sure, many big-game hunters who will not agree with me; but who can say that anyone else is wrong?

This wide divergence of opinion is interesting, but it does not settle the argument. It is just one of those problems which can never be decided with any degree of certainty. I have heard many hunters assert that the lion is by far the most dangerous animal to hunt; yet, in common with quite a number of others, I have ridden lions down on horseback and shot them with revolvers. The late Paul J. Rainey, the American millionaire, became world-famous by hunting down lions with a pack of hounds. It may also be stressed that the death-toll from lions is ever so much greater than from any other species of wild animals in the world; but this fact is attributable to acts of negligence committed by the hunters in ninety-nine cases out of every hundred. There are men who have been so foolhardy as to follow a wounded lion into long grass, when the chances were all against the hunters; but this fact does not tend to prove that the lion is the most dangerous. The late Colonel Theodore Roosevelt told me, when I accompanied him on his African expedition in 1909 to 1910, that his experience had forced him to the conclusion that the lion was normally more dangerous than any other animal. He placed them in the following order: lion, elephant, buffalo, rhinoceros. His two expert guides—the late R. J. Cunninghame and Leslie J. Tarlton—ranked elephant-hunting, in point of danger, as nearly on a level with lion-hunting. 'Jim' Sutherland, Africa's most famous elephant hunter, told me some years ago that the premier place belonged to the lion, and that the elephant ranked only third. He placed the buffalo in the second place. He has shot many hundreds of elephants, and so his views are worth careful consideration. The late Frederick Courteney Selous—the 'Grand Old Man' of African hunting—placed wild animals in still another order of precedence

as regards danger; and so the tale goes on. But this controversy is beyond all powers of settlement, so it may well be left where it is. Every one is correct in the light of his own experience. My object is neither to prove nor to disprove any known theory, but simply to place on record some very surprising facts about the African species of elephant—facts which are known to a very limited few.

III.

The ancient civilisation of India boasts as one of its many great achievements the taming of the Asiatic variety of elephant. In the ancient lore of that early form of civilisation this fact plays a very distinguished rôle. But the African variety has never yet been tamed, and it does not seem that this task will ever be accomplished. It has been attempted, but without any degree of success. No experiments in animal training have ever failed so signally as those practised on elephants in Central Africa. This failure is in no way due to lack of intelligence on the part of the elephant family who roam the forests of the 'Dark Continent.' They are not one whit less brainy than their cousins in Asia.

Next, perhaps, to the highest type of apes, the elephant is the wisest and most intelligent of all animals. This remark applies with equal force to all elephants, of no matter which variety. In many respects they surpass even the great intelligence of the higher apes or monkeys, which most nearly approximates to that enjoyed by human beings. For this reason we may claim quite justly that the elephant possesses the highest type of intelligence. Those who have seen the domesticated Asian elephants at work in the timber depots of Burma, India, and Siam will readily grant that they are most amazingly intelligent. Their wisdom is almost incredible, and certainly uncanny at times.

Another interesting feature about the two types of elephant is that they stand unique among the beasts of great bulk for the fact that with growth in size there has been a marked growth in brain power. In order to demonstrate this fact, we may draw comparisons between the elephant and the rhinoceros—for the latter is the nearest animal in point of size. The rhinoceros is found in the same regions as the African elephant, and in bulk is second only to the elephant among all terrestrial animals; but the elephant is the wisest and the rhinoceros the most stupid of all big mammals. Both animals wandered freely over the plains of East Africa less than fifty years ago; but such is not the case to-day. The elephant learns and profits by experience infinitely more readily than the rhinoceros. As a rule, therefore, it will be found that the former no longer lives in the open country; but the rhinoceros continues to dwell there and to risk being ex-

terminated. An elephant will generally cross the plains only at night-time, for he knows quite well that danger lies there during the hours of daylight. No elephant, in regions where they are being hunted regularly, would be so foolish as habitually to spend his days in the open plains; yet that is exactly what the stupid rhinoceros does. The former is wisdom personified; the latter an utterly brainless fathead.

Then again, the sight of both these animals is very indifferent; but the elephant has quickly learned to take refuge in those regions where sound and scent count for more than sight. Both animals depend almost entirely upon their noses and ears for protection against danger; and both sadly need a visit to the oculist. In many respects the African elephant surpasses the rhinoceros in powers of vision; but neither of them can boast of even fairly good eyesight. It is well for the hunter that they do not wear spectacles, though their powers of scent and hearing are so well developed as to compensate to a large extent for their disability in the matter of effective vision.

IV.

It is not widely realised that, in Africa, the bull elephants are rarely the fighters. They are more generally—the big fellows, I mean—to be found singly or in small parties by themselves. In the breeding season I have seen the cows and calves travelling in herds at some distance behind the bulls; and the latter were then to be found either alone or in small groups. However, one may occasionally see—especially in large herds—the big bulls mingling with the cows. On one occasion four bulls charged out from a herd of cows at a friend and myself, whilst the rest of the big herd of several hundred crashed away from us. It was a very awkward moment for both of us—but the four bulls met a gallant death with their faces to the enemy. On still another occasion I had a very nasty experience whilst trying to cut out a big bull from amongst a herd of cows, and had to crawl away to safety between the legs of several female elephants—all of whom were ready to stampede if they could only get my wind. However, I finally managed to shoot the old fellow a few days later, and his immense tusks—one of them weighed a hundred and sixty-nine pounds and stood over eleven feet high—were ample reward and compensation for my earlier terrors.

Carl Akeley, of the Field Museum of Natural History in Chicago, who has made a close and comprehensive study of African elephants in their native environment, discovered many new and interesting facts about them some years ago. He asserts that there is very little danger from a bull elephant. That, however, is far from being the experience of myself or of many

other hunters. I am of the opinion that you must judge the bull elephant just as you find him. He is a contrary fellow. Sometimes he is good, but more often he is bad—very bad indeed! The cows are, however, always more vicious than the bulls. Some years ago there was a large herd of elephants in the vicinity of Gondokoro on the Nile, which numbered several hundred. The herd consisted, for the most part, of cows and calves, with a sprinkling of small bulls. They were so dangerous that no one had the temerity to attack them in real earnest, despite the popular belief that there was one very big bull in the middle of the herd. They were quick to charge; and, on the only occasion I ever ventured near them, gave me a most unpleasant hour. Once was quite enough for me, and thereafter I left them severely alone.

The generally accepted theory that big bulls are not to be found in big herds is a fallacy, for they most certainly are. The bull elephants one may meet roaming about alone are almost invariably senile old gentlemen who have been cast off by a herd, or who have developed such a tropical liver as to make their company intolerable. I met one such old fellow in the forests below Kenya Mountain one morning some years ago. He charged me directly he got my wind or heard me; it all happened so suddenly that I was unable to say definitely what had really caused him to charge. I am only positive that he did charge, and it was with great difficulty that I ended his lonely life. He had been wounded on several occasions before we met without being formally introduced, and was what might be classed as a 'rogue.' There could be no mistake that he was very old, although his tusks—one of which was broken off at the base—did not weigh unusually high. The unbroken tusk was only one hundred pounds, and the stump weighed thirty pounds. On still another occasion—in the district which was formally the Lado Enclave of the Congo, but is now part of the Mongalla district of the Sudan—I was after a big bull reported to me by the natives. I had to abandon the chase; for the old fellow was in the middle of a herd of at least six hundred cows, and they would not let me approach near enough to get a head shot at him. I tried a number of times to do so, but could never get nearer to him than the outer fringe of cows guarding him—then they stampeded, and so did I.

V.

The cows normally guard the bulls from attack. The bulls found with the herds are generally in the prime of life, and usually have smallish tusks. All of these large herds of elephants have cow-leaders—or queen elephants—with extremely ugly dispositions. They are

mostly very old cows, these leaders of the herds. The moment they scent danger they crowd round the bulls in order to protect them; and it is next to impossible to get at them. If they can see, hear, or smell the hunters, they will charge at them, leaving enough of their number to safeguard the bulls from attack. Their sense of smell and hearing is very highly developed and incredibly acute. They can detect the presence of a human being from a distance of a thousand yards, if the wind is favourable for them; but unless he is moving they cannot see him, even if he is within a distance of a hundred yards. When they catch a whiff of wind tainted with man, the cows charge in that direction, and it is a hundred to one chance that they will succeed in locating the sportsman. Most hunters endeavour to get within twenty yards of their quarry, and so it can be imagined how exciting a sport elephant hunting is! I have not infrequently killed elephants in the midst of a herd from a distance of twenty yards or even less; and the going and coming have been *full* of excitement! On one occasion a cow elephant stood almost on top of me, with its massive stern within my reach. I was, at that time, endeavouring to get a big bull in the herd; but I could not resist the temptation of clouting it with a spear-shaft across the rump. The cow gave a shrill scream of mingled anger, amazement, and mortification at the indignity, and then departed hurriedly; and so did I! It was a most ungentlemanly act on my part; and I was well served, for I failed to get my big bull.

Some years ago there was a fair-sized herd of elephants on the German East African border, mostly cows but with a few good bulls. I told a soldier friend of mine about them, but advised him to leave them alone, as the grass was very tall—ten or more feet high—and it would be difficult to run in case of being charged. He had never shot an elephant before, and was eager to get the two bulls allowed on his license for shooting big game. Some days later I received a letter from him telling me he had gone after the herd and had been charged. 'I thought you said I couldn't run,' he ended his letter. I afterwards learned that he had beaten the world's record for the mile, despite the tall grass and the bad going.

A friend of mine once shot a bull elephant in a herd and only succeeded in wounding it very severely. Immediately some cows came to the assistance of the wounded mate; and, supporting him on either side, they helped him into the forest and safety. Some days later, after following up the herd without resting, my friend found the old bull lying dead, and the cows had departed. He was lucky! I once lost a fine bull in the same manner, and was never able to get it, despite some strenuous tracking for days on end.

VI.

Another amazing fact about African elephants is that they have many signals amongst themselves. For instance, when the cow gets the 'wind' of a hunter she signals to the herd 'on guard,' and immediately every elephant in the herd stops grazing and listens, with trunk to the ground. They remain as silent as the grave until the 'all clear' signal is given. Even when a shot among them causes a stampede and the forest resounds with the first crash of their moving, they can disappear from sight without making the slightest noise. I have met a whole herd moving through tall elephant-grass—sometimes six to ten feet high—and small acacia trees in Uganda, and yet never heard a sound more than what appeared to be a faint breeze stirring the grass, a sort of faint swish, swish noise. On a number of occasions, I have almost caught up with a herd on the move and then lost them, for they have disappeared so silently that I could not hear them. When one considers the immense bulk of an elephant, and remembers that there may be anything from fifty to three hundred or more in a herd, this is an astounding fact.

However, when an elephant desires to do so, he can make more noise than any known animal in the world. A herd of two to three hundred will trample down the entire farmlands of a native village with such noises as can only be compared to an earthquake. Elephants are inordinately fond of raiding the crops of the African villagers at night-time, and their inroads do terrible damage. So bad did this become in South Africa that the order went forth to exterminate every wild elephant.

The natives dig cunning traps for elephants, and sometimes drop loaded spears upon them as they pass under trees. When they have wounded an elephant by the latter means they follow it up until it drops dead, for the spear points are mostly poisoned. Their acute sense of smell and hearing makes it difficult to catch elephants in a hidden trap, and it is rare to find one captured by such means. I do not suppose that one elephant-pit in a hundred ever accomplishes its object. When elephants go through the forests they hold their trunks close to the ground; and, by tapping every few paces, they can detect any pit, no matter how ingeniously concealed, before stepping onto it. You may catch an elephant with a trick once—but *only* once. The moment they strike any ground that is the least bit suspicious they tap it carefully with their trunks, and then make a wide detour to avoid the danger. It is generally when they are stampeded that they are liable to fall into a pit, because then ordinary forms of caution are abandoned.

There is another fallacy that is commonly

believed, and it is that the calves are only to be found with the cows. As I have already said, the cows are the guards and fighters with a herd, so the bull elephants act as the nursemaids. Some hunters have actually seen bull elephants playing with the calves, while no cow was anywhere in sight. The late Colonel Roosevelt and his son Kermit, whilst in East Africa, managed to shoot a complete family group—bull, cow, and calf—for the Smithsonian Institute in America. But this was an exception—and exceptions are said to prove all rules.

It has been my experience that elephants, where generally undisturbed, rest and wander about at all times of the day and night; and they feed without much regard for fixed meal hours. Morning or evening, noon or midnight, the herds may be met on the move or else simply resting in the shade of the giant trees; yet during the hottest hours of the tropical noon I have never seen an elephant feeding—generally they were standing still and resting. In all my years of wandering about the African Continent I have never come across an elephant lying down to rest; but other hunters have told me that elephants do so when they are sick. In the Congo I noticed that the elephant herds generally moved on to new feeding grounds in the early hours of dawn; and this was the best time to choose for hunting, for one could then get close up when they stopped to rest or feed.

VII.

It would be a veritable and most tragic calamity if the lordly African elephant should be permitted to vanish from the face of the 'Dark Continent'; but I must admit, regretfully, that its ultimate doom appears to be sealed. Now that it is suspected of being a Sleeping Sickness carrier, that day cannot be so very far distant. Civilisation, on its relentless march forward, is driving elephants from their accustomed haunts, and they are becoming less easy to obtain. The big tuskers have nearly all gone the way of all flesh; and their smaller brothers are quickly following them. All lovers of the fauna of the British Empire must deeply regret that such is the case.

Those who have carefully followed this brief discourse on the African elephant will have discovered six somewhat surprising facts—if not more—about them and their habits that most people do not know. Firstly, a cow elephant is always the leader of a herd; secondly, bull elephants are always the nursemaids and mind the babies; thirdly, an elephant is one of the most intelligent of all living creatures; fourthly, elephant herds have a regular system of signals; fifthly, it is the cow and not the bull elephant that is the fighter of the family; and, lastly, it seems certain that the days of the elephant in Africa are numbered.

Unlike his Indian kinsman, he has never been tamed and trained to man's use. There are still some optimists who cherish the hope that the feat may yet be performed; but it receives little or no encouragement from those who know the African elephant. I am not a sceptic or a pessimist by nature, but I cannot join hopes with the optimists. Some years ago there was an elephant training-camp in the Congo, but all experiments made there proved utterly useless. They proved one fact, however, and that is, an African elephant of seven years of age is more tractable than at any other age; but as he grows old he becomes unmanageable.

Some years ago, I remember, the Government of Uganda sent to India for an elephant to use in capturing and training wild African elephants. He duly arrived at Entebbe with his *mahout*, and was installed, after much trouble and expense, in a stable near Government House. Unfortunately it was soon discovered that the elephant was a *shikar* elephant, and not a labour machine. He did perform one task—but only one—during all his period of stay as the guest of the Government of Uganda. He pulled a grand piano from the docks to Government House on a trolley. This effort proved none to his liking, and thenceforward nothing would induce him to work again.

For months and months, this elephant and his Indian *mahout* did nothing but eat, bathe in the Victoria Nyanza, and take gentle walking exercise. The Government of Uganda tried to sell him; but no one wanted him. One day a travelling circus arrived in Entebbe, and the elephant was offered to the proprietor of the show at cost price. The circus proprietor made inquiries and quickly discovered the real situation. He refused to buy. Then the Government of Uganda gave him the elephant. It was far cheaper to do this, for the elephant and his *mahout* had big and costly appetites.

He was an intelligent animal that elephant; but, then, so was the circus proprietor!

WINDS AND MEN.

I CLIMB again the wind-encircled hill,

Where he and I together looked on fields
Blessed by the sun. But now the day is chill,
And winter's bitter cold no comfort yields.
For he is dead; and I am here alone.

And under this wild sky and Heaven's space
I cannot grieve for him, but am as stone!

Yet, in the genial glow of summer's grace,
The world rejoiced, nor heeded that, above,

The blasts of everlasting cold blow keen.
Dull are the sons of men! We weep and love,

Because the skies are blue, and forests green!
Here, in the grasp of winds, I feel the slave

Of circumstance. Yet such I have not been!

SEVENTH SERIES

MEMORIES OF A SCOTTISH SALMON-RIVER.

By GEORGE SOUTHCOTE.

PART I.

I.

EUSTON STATION, London. Early morning. The station itself nearly empty, but echoing the sounds of the awakening city; the braying of motor-horns, a babel of human voices, and the roar of distant traffic. Those are the impressions that steal gradually upon my brain after a long journey from the extreme North of Scotland, the last few hours of it spent in restless sleep. Upon the brain only. In the heart, and in the inner consciousness, there still lingers the soothing trilling note of a nesting curlew, and the mournful pipe of an oyster-catcher disturbed a few days ago from her nest amongst the pebbles near the bank of a salmon-river which flows amongst the heather and birch-woods of a beautiful Scottish strath, known and loved, but seldom visited, during the quarter of a century which has passed since my first experience of such surroundings. Last year I saw it in March, frost-bound in a bitter blizzard, with deep snow on the hill-sides and deeper snow-drifts on the roads; the river itself below summer level, its streams filled with particles of floating ice; the best pools frozen over, some of them covered with snow and not distinguishable from the low-lying meadows. The only being taking the situation cheerily was a 'dipper,' quite undefeated and constantly breaking into song. In other years I have known it in April and in June. Never before had I had the good fortune to fish for salmon in Scotland in May. It is an experience not to be forgotten, partly on account of the magnificent sport itself, and partly on account of the surroundings.

'Feelings of delight,' according to the best writer on fly-fishing of my acquaintance, 'come unsought and without effort—when they are present they are everywhere about and in us like an atmosphere; when they are past it is almost as impossible to give an account of them as it is of "last year's clouds," and the attempt to analyse and reconstruct the sense of joy that has been and may be again, seems to result in rows of dead words.' And again: 'It may be that language lends itself more easily to forms of argument and thought than of feeling. An

argument is something which can be caught and held down and strapped into sentences, but, after reading an account of a day's fishing, it is continually borne in upon one that, when all has been said, the half has not been told.' And yet one more quotation, before embarking upon the almost hopeless task of putting feelings (as distinguished from thoughts) into adequate words: 'To any one who does share it' (a hobby), 'even a little imperfectly told becomes interesting, and weak words begin to stir kindred memories.' Let us then, in the hope of so doing, get back from the arrival at Euston station, refreshed by a holiday on a salmon-river in the North of Scotland, and ready for any amount of strenuous work, to the journey northward from the same station, worn out and wearied by a long spell of monotonous toil.

II.

Owing to the attentions of ticket-collectors I did not sleep until three-thirty. I was aroused once more before five, after which hour I did not sleep again. No traveller entered or left the coach in which I travelled from Euston to Perth, only those ticket-collectors, but northward of Perth the mountain scenery is so glorious that wakefulness is even more restful than sleep, and the new restaurant-cars provide compensation for those who miss those appetising Scottish breakfast-baskets which used to be obtainable at Kingussie. Then comes that wonderful journey northward of Inverness, with its coast scenery and view of the outlets to the sea of the best spring rivers in Scotland, sometimes (as with the Shin) of some of their best pools, and sometimes (as with the Helmsdale) of nearly the whole river, from sea to source.

'If we are to enter into the moods of Nature'—I quote again from the same author—'we must bring with us some vigour and elasticity of spirit. A feeble mind looking upon scenes with a languid eye will not feel the joy of them, and it is with Nature as with friendship—we cannot take all and bring nothing.' On my way to the taking of May salmon, I was fortunate in spending a blissful and restful week-end with friends of many years standing, whose dwelling

is perched on cliffs overlooking the sea. Impressions remain of a true Scottish welcome, as if the intervening years had never been; of green sheep-nibbled turf and blazing yellow whins crowning the cliffs; of clusters of primroses showing where the sun shone upon the clefts and grassy dells, the whole under a dappled sky throwing soft gray shadows on the sea-surface; of stillness in the night broken only by the occasional scream of a gull. That preparation gave the 'vigour and elasticity of spirit,' required for the full enjoyment of experiences to follow, and I now give them, as described in my diary:

- May 4 (Monday).* Fished one hour. 1 (14½ lb.). No. 2 size 'Jock Scott.' No. 2 Beat.
- May 5 (Tuesday).* 1 (13 lb.). No. 4 size 'Lady Caroline.' No. 1 Beat.
- May 6 (Wednesday).* 2 (10 lb., 7 lb.). No. 2 size 'Silver Doctor.' No. 6 Beat. Cuckoo. Curlew. Fished till 2 P.M.
- May 7 (Thursday).* Blank. Broken by big fish after ten minutes' play. Blue hare. Herd of deer. Grouse. Curlew. Plover. No. 5 Beat.
- May 8 (Friday).* Blank. Lovely wild country. No. 4 Beat.
- May 9 (Saturday).* Blank. Two rises. I think gut too stout. No. 3 Beat.
- May 10 (Sunday).* Watched the river (rising).
- May 11 (Monday).* Spate. No Fishing. Saw young plover. No. 2 Beat.
- May 12 (Tuesday).* 1 (12½ lb.). No. 2 'Black Doctor.' No. 1 Beat. Too high.
- May 13 (Wednesday).* 1 (11½ lbs.), early. No. 2 'Jock Scott.' No. 6 Beat. Played deep.
- May 14 (Thursday).* Blank. Hot sun. Hard sky. No. 5 Beat. Oyster-catcher, 3 eggs. Green Plover, 4 eggs. Ringed Plover, 4 eggs.
- May 15 (Friday).* Eight fish (of which I had three of 16 lb., 11 lb., 10½ lb.). Similar flies. Lost one—fly came away after long play. No. 4 Beat.
- May 16 (Saturday).* Blank. Tremendous battle with very big fish. Broke me after ten minutes' play. Small 'Jennie,' double hook. No. 3 Beat.

My total, nine fish landed and three lost in ten days' and one hour's fishing. Other rod, thirteen in same time. Total, twenty-two fish.

Those extracts can certainly be described with fairness as 'rows of dead words,' also of weak ones, not at all adequate to 'stir kindred memories,' so I will endeavour, however inadequately, to amplify and to improve upon them.

III.

On the afternoon of arrival I sat quietly in the Lodge, writing letters and awaiting the return of the rods from the river. They returned early, soon after four o'clock, and one of them—most unselfish of mortals—impressed upon me

that people do not write letters within sight of a salmon river, and urged me to change out of travelling clothing and repair to certain pools not yet fished upon that day. I did so, after some show of (imaginary) reluctance, without wasting valuable time in changing my garments. Let us then proceed (as fast as I did, by aid of motor-car) to the first pool that I fished, and to our immediate subject, spring salmon.

Leaving the road, we pass down a steep grassy slope, through a wood of stunted birch-trees with gnarled stems and with twigs just assuming that reddish-purple tint that foreshadows the delicate green to come. We cross an expanse of purple heather, not the 'bonny purple' of heather in bloom, but the purple of leafless heather which I infinitely prefer, as seen on wide sweeps on Scottish moorland when I have been in quest of fresh-river salmon on a spring day. And soon we come to 'it,' by which I mean the first glorious salmon-pool to be fished this year—the subject of thoughts and of dreams for many long weeks. Also, we hope, to 'him,' the first salmon. Will 'he' come, and, if so, where?

Surroundings are all forgotten. Thoughts and feelings are concentrated upon the surface of the current, and upon the question of where that pluck or gentle tug will be felt, when the line will tauten, and the raised rod will bend to the butt and thrill with vigorous life in a great combat between man and fish. 'Where do you think that he will come?' 'He may come anywhere in this water,' replies the gillie, a friend of long standing, who was with me nearly a quarter of a century ago when 'he' first took my fly in a pool not far away. 'I should begin with quite a short line at the top.' I do so, but let me here interpose a short description of the pool. It is narrow at the top, and rocky, the stream turbulent in the narrowed channel between the rocks. I swim the fly in it, easing the line down just enough to prevent the fly 'cutting,' or leaving a wake in the swift water. No result. Then the pool broadens, with still water beyond the main current, but a deep stream with a good 'pull' in it under the near bank to straighten the line well before its recovery after a cast—a great boon to the unpractised angler for salmon. The river-side rocky and difficult to negotiate. Above the rocks, bushes, their tops clipped off to help the angler. Above the bushes, grass and heather, and an easy foothold for the whole length of the pool, and away to the next.

The wind blows strongly up-stream (it generally does in these parts—of that more anon) and the gillie has advised the heaviest line that a light 14-foot rod enables me to lift from the water without undue strain. He knows my limitations when the wind blows strongly in my face. I get out more line gradually, the fly at each cast making a very little plop in the

still water just beyond the turbulence and then swinging round, like a pendulum, at the end of a straight line and cast, until it has approached the near bank, been 'hung' there for a while, and then withdrawn for the next cast; each little plop a foot or two farther down-stream than the last, until as much line was out as I could manage with comfort, and the process continued by walking down the bank a short step for each cast.

Then it happened. 'He' had come. The rod was bending double and I was seeking a firm foothold for the battle. Several better fishers than I can ever hope to become have written that the supreme moment in salmon-fishing is when the fly is taken. I have written the same myself. Never will I do so again, as applied to May salmon. The playing of this one I should compare, on a greatly magnified scale, with the playing of a lively 3-lb. trout in chalk-stream fishing, using 4 X gut. I was using the finest of salmon-gut. I suppose that the battle lasted for about ten or twelve minutes in that strong water. It seemed like an hour. I never felt sure of success for a single moment until the fish (a silver beauty) was in the net. That, not the hooking, was to me the supreme moment, and so it was for each of the May salmon which I landed, with one exception, which just pulled steadily until I got him into a backwater, where he swam into the net. To certain supreme disasters during the playing I shall refer later. They taught me never again, with May salmon, to imagine that the excitement concluded with the hooking. One more word about netting, instead of following the practice, universal on some rivers, of gaffing. As that first fish lay on the short green turf between the dark heather, the memory occurred to me of a remark by one of the truest sportsmen of my acquaintance. 'I would as soon gaff a beautiful girl as I would a spring salmon.' I agreed with his views.

That, then, is an expansion—I hope not too great a length—of the entry 'May 4 (Monday). Fished one hour. 1 (14½ lb.) &c.' from my diary. Lest it should sound un-English, I have not mentioned having broken into song from sheer joy of life during the exhilaration of that fishing battle, a joy which has been conspicuously absent from real battles in which it has been my lot to take part. Of the other incidents connected therewith I remember best having instructed the chauffeur to hide away my fish, which he was displaying prominently by the roadside, so as not to flaunt my wholly undeserved success before the other rod—a far better fisherman than myself—to whom fate had decreed a succession of about twenty-one blank days of salmon-fishing (a good example of the amazing differences of luck, the main factor in success in the sport), and the influence which this early

success had upon myself. It enabled me to face 'blanks' and to get full value in enjoyment out of my surroundings during several days and hours of hard work with no tangible result.

IV.

Let us, before expanding more of the diary, try to recall some features of those surroundings, which go so far towards making salmon-fishing in Scottish air and amongst Scottish scenery the grand sport that it is. To those who hold that the taking of salmon is the only, or even (under certain conditions) the chief, attraction of the sport, I suggest the taking of them, with a prawn, if numbers are wanted, from a river in the South of England. That also is sport, but the monotonous meadow-land and less invigorating air cannot be compared with the wild surroundings and fine atmosphere of a Scottish strath. What, then, are these surroundings, as I found them, for the first time, in the month of May? I will take out of the diary a sample blank day. Or rather let us, in order to economise in space and to compensate us for getting no fish, take several blank days and roll them into one. It is fair to do so, as the experiences, so tersely recorded in the diary, were repeated in most, if not in all, of them. Let us take May 7 (Thursday) to May 11 (Monday) inclusive, remembering that on May 6, early in the morning, I heard the first note of the cuckoo, that sounded within ear-shot of the Lodge as I hung out of my bedroom window, taking in the beauties of the scene: the soft outline of the red-purple birch-woods clothing the slopes on one side of the valley, and dark-purple of the grouse-moor on the other side; between them the gleam of water marking, here and there, the curve of the river, of streams and pools of infinite variety.

The beats which did not 'give a fish' at all on those blank days varied much, both in their surroundings and in their accessibility. Let us take one that involved a long drive by car and then a longish walk across the heather to the nearest pool. I once saw a wonderful cinematograph film of salmon-fishing, and since then I have taken every possible opportunity of seeing it again. It does not, I hope, smack of advertisement—the bane of the age—to mention that its name is 'Battles with Salmon,' and that the New Era Films Company control it. One of the earliest 'captions' (I think that is the right word) is 'Spring-time in Scotland,' and the picture shown is one of a sheep and a lamb. The producer was right. Sheep with lambs are the form of life most in evidence during our drive along the road to the beat, and careful driving is needed, as the lambs seem always, like the hens of England, to be on a different side of the road from that which they prefer when a motor-car comes on the scene.

Of other forms of life the green plovers are the most active, screaming and wheeling about as we pass. 'Their young ones have hatched out,' says one of the gillies, and sure enough they have. We succeed in spotting two of them, jolly little fluff-balls on stilts, and we stop the car to inspect and handle them, the parents violently protesting and apparently giving contradictory advice, as one little fluff-ball sprinted away on his long legs, tumbling constantly as he went. The other crouched and camouflaged, melting into its surroundings. When we leave the road a cock grouse explodes himself out of the heather close to our feet. 'The world's coming to an end!' says he (as Charles Kingsley tells us). 'Kuk! kuk! go and catch spiders! Kuk! kuk!' says his mate, busy with the cares of housekeeping for the little brood. Then a blue hare, still retaining parts of his white winter coat, lollops slowly away from us, occasionally stopping to examine the intruders. We come upon wide stretches of heather and moorland, and note a fine herd of deer afar off. Beyond again, miles away, are great mountains—'Bens'—with snow upon their summits. The whole air is trilling with the curlew's nesting-note—'The clear air vibrates with the most wonderful of all the notes of birds, the prolonged spring notes of curlews, the most healing sound that ever was, full of rest and joy.' Such words, used by Sir Edward Grey (as he then was) in his *Fly-fishing*, cannot fail to stir kindred memories; they form anything but a 'row of dead words.'

These are samples of the bird-notes to be heard on that wild moor, and to them I would add the mournful piping of oyster-catchers, disturbed from their nest (?) on a bank of smooth pebbles, on which (on another beat) we found also (within five yards) a green plover's and a ringed plover's nest, each with four eggs, the last-named nest a perfect specimen, both of camouflage and of beauty. The eggs were invisible amongst their surroundings, and the nest beneath them a cup-shaped declivity lined with sparkling little crystals, apparently collected for their beauty. The cock bird, quite tame, walked about within a few yards of us. Terns, the graceful sea-swallows, were also nesting on that beat, as were sandpipers, redshanks, ring-ouzel, and snipe; but I must really leave the birds and get to our subject of salmon, though I cannot do so without mentioning the opportunities that offered of studying the grace of bird-flight as you see it with white birds, like terns and oyster-catchers, against a background of dark heather. We are inclined to miss this beauty, when we are on the seashore, for want of a dark background.

v.

Salmon were 'jumping' everywhere on those blank days. There must have been thousands

of them in the river, wherein the mystery of their life and habits has never yet been solved. 'Jumping' is a word that can suitably be applied to a few, but not to the majority of them, as seen in May. Then they come out of the water and curve in again, full of purpose, moving fast in pursuance of that purpose, whatever it is—'running,' it may be, to the pools above. When they are doing that around you, and your fly is in the water, you can take the phenomenon in two ways, according to your temperament and to the degree of your exhaustion by much casting without result. You can view these 'jumping' fish with exasperation or with admiration. The success with which my holiday began enabled me to choose the latter course, and I thought again of Charles Kingsley, sitting on his old screw in the pinewoods near Sandhurst and rhapsodising about the grace of fox and hound, when he was unable to follow the chase. Then of his going home and writing the best of his prose idylls, *The Winter Garden*. There is nothing, to my mind, in the grace of movement of fox or of hound that comes near to the beauty and appearance of well-balanced strength of a May salmon speeding up-stream, sometimes showing the silver gleam of his side in a leap clear of the surface. And even if fish which show do not take (I believe that they seldom do), you fish on expectantly, in the hope that there are others in the pool that will. A blank day in May offers more impetus and encouragement to persistence (a better word than patience, a virtue constantly but erroneously applied to fly-fishers by their friends) than a blank day in March, when no fish are showing, and, exhausted beyond endurance, you are given to wondering whether salmon really do come into fresh water at all at that time of the year.

Even if one avoids exasperation at visible salmon that refuse to take a fly, on the plea that it destroys pleasure and contravenes Izaak Walton's (and St Paul's) great maxim, 'study to be quiet,' there is no avoiding speculation about better methods, if any, to induce them to do so, and so to improve one's sport. Having been out of touch with brother fly-fishers for a long time, it was not until I was just on the point of leaving for my holiday that I heard from one of them that fly-fishing for salmon had been revolutionised by new methods of casting. A skilled fisher on the Dee, he told me, had recently taken fifty spring fish, while the other rods had taken seven fish among them. This man used a 12-foot rod and very small flies (No. 9 size, I was told), even in Spring. He greased his line and part of his cast of gut. Instead of the traditional method of casting down-stream, he cast across and slightly up-stream, letting the fly come round without a trace of drag, lifting his floating line off the surface and switching it up-stream occasionally

to keep the line straight, without dragging the fly. He had enough mastery of rod and line to enable him to do this effectively. He proved the soundness of his method by his great successes. I soon found, in conversation with other rods and with gillies, that his fame had spread to various salmon-rivers, and that others had adopted the greased line, but not, so far as I could gather, with quite the same success. Maybe, with more practice, the method will

become universal, and revolution will be effected. Although I have not tested the new way personally, it is, I think, worth mentioning. I have not yet read about it anywhere, though I have read much about dry-fly fishing, in the usual way (up-stream), for salmon. The exponent of the new art to whom I have referred sinks his fly a few inches below the surface.

(Continued on page 811.)

THE CHRISTMAS GIFT.

By ELLA S. BOSWELL.

I.

THE motor drew up in front of Dechindarg House. Dr Brent stepped out, and then paused to let his town-tired eyes feast on the beauty that surrounded him. It was a typically Christmas scene, that glowed and sparkled in the clear sunshine. White snow, with its holy purity unsmirched. What a contrast to the mud and slush he had left behind! Forget-me-not-blue sky touched by the orange and crimson of coming sunset. A holly tree, on the lawn, covered with scarlet berries. It was just like a huge Christmas card. He loved the conventional appropriateness of it all. But though he drew in a breath of rapture he exhaled it as a sigh. 'Poor old Art! I don't suppose it's much consolation to him.' Then he turned towards the stately house with its Greek front of weather-stained sandstone and warmer coloured tower, of an earlier date, rising above it. In the doorway stood an elderly man-servant beaming a correctly restrained welcome.

'Ah, Kennedy, a happy Christmas!'

'The same to you, sir.'

Dr Brent stepped briskly from the glory outside into the gloomy house. The entrance-hall was rather dark, and the walls were adorned with sporting trophies and various kinds of weapons. Not a sprig of holly or evergreen relieved their grimness. Only a glowing fire struck a seasonable note.

'Carried out my instructions?' Dr Brent asked, as Kennedy helped him off with his thick travelling coat.

'Everything is all ready, sir; but what the colonel will say when he knows——' Kennedy shook his head despondingly.

Dr Brent laughed. 'He may kick me out—if there's kick enough left in him. I wish I thought there was! But there's one thing he won't do—and that's blame the wrong man. You'll be all right.'

'For acting without orders, sir? I'm taking the risk. It's my Christmas present to the colonel.'

'Nonsense, Kennedy. He can't do without you.'

'I'd have said he couldn't do without Miss Margaret—yet he's shut the door against her.'

'I hope he won't keep it shut much longer. I mean to have a straight talk with him about it.'

Again Kennedy shook his head. 'He won't let you, sir. Me and Mrs Kennedy have both tried, and nearly got dismissed. I know you're different, sir, from the like of us, but if he quarrels with you what's to happen to him? You're the only friend he cares to have come here.'

'Well, I'll go cautiously, and I promise you sha'n't be incriminated. Mind, if ever he does sack you, there's a place with me. I know it wouldn't be the same thing, but I'd be jolly glad to have you and Mrs Kennedy.' Dr Brent's charming smile, which had cheered so many stricken people, shone out and sent a wave of encouragement into the anxious Kennedy.

'Thank you, sir. Me and Mrs Kennedy are getting up in years, and wouldn't suit with new-fangled ways. I doubt London would be a bit strange after Dechindarg, but if things came to the worst here, we'd be glad to serve you.'

'Things aren't coming to the worst! I hope they'll take a turn for the better. By the way, how is the colonel? Pretty middling, I gathered from his letter.'

'He's breaking up fast, sir, and that's a fact! Since his accident he can't ride or shoot. What's he got to live for?'

'Plenty of things—as I mean to point out. Where is he?'

'The library, as usual. He comes down in the morning and goes up at night, with my help. He won't put in a lift. Said he'd be —— hem——' Kennedy gave an embarrassed cough. 'Said he wouldn't care to improve the house for a relative he's never seen and wouldn't like if he did.'

'I rather fancy that lift will go in. It's simple nonsense about unknown relatives when he has a grandson to succeed.'

'I'd be glad to think so, sir, and so would Mrs Kennedy. Miss Margaret losing her mother, and Mrs Kennedy having no little ones of her own, it's natural like she should have took up with the young mistress. I suppose the little boy will be a—a bit foreign-looking, so to speak, sir?'

'Not he. Takes after his mother. Maxwell inside and out.'

'That's good hearing, sir. The name's easy changed if he was coming into Dechindarg—but if he was a bit too dark the colonel would never get over that.'

'The colonel will be proud of him yet, and you'll have a share in bringing it about, if my plan succeeds. Now, I'd better get along to the library, or I may excite suspicion.'

II.

The library was a long, low room with oak beams across its ceiling. The books were shut away in cases with glass lattice-work doors, through which such names as Scott, Dickens, Thackeray, and Surtees, peeped out. The walls were hung with family portraits, and two rather small windows looked out on the snow-covered garden. Again, no holly or flowers suggested a remembrance of the season. The fire-place, at the far end of the room, had its old-fashioned grate piled with blazing logs. Two deep leather-covered armchairs were drawn up in front, and in one of them sat a tall, handsome, gray-haired man of about sixty. He had that perfect grooming which stamps a man as pre-war army—a relic of the days when the army was a social hall-mark rather than a heart-stirring distinction. Unfortunately red-tape and shibboleths had wrapped themselves round Colonel Maxwell's personality as tightly as the bindings of a Chinese woman's feet. Physically he was a fine man; beside him Dr Brent looked small and insignificant, but the little doctor's pleasant face had a tenderness and a strength that were lacking in the colonel's impassive features. The one had ripened and expanded with the passing years; the other had narrowed and hardened.

The mere sight of the kindly doctor brought a glow of comfort to the lonely, stricken man, but his greeting was ungracious: 'Hallo, Martin! Come to spoil another Christmas?'

Dr Brent laughed. 'That's about the most original welcome I've ever received—even from you.'

'Well, you'd have had a much better time at home—worshipped by adoring patients—wouldn't you?'

A sudden flicker of happiness shone in the doctor's gray eyes. 'I had my Christmas Eve at home, old man. I cut that off you, this year; so don't waste your pity. As to patients, the absence of their 'phoning is one of the joys of the holiday. You can't realise what a rest it is to know one won't be rung up. I'm sure

Mrs Kennedy has made my Christmas cake, and I don't believe even you would go the length of forbidding her to give me turkey and plum pudding.'

'You can have snapdragon and a bran pie as well—so long as you don't ask me to pump up fictitious jollity. This getting laid by the heels is the finish. You're a heart specialist; you couldn't give me a better present than the discovery that I've something fatally wrong with my heart.' The colonel's cold blue eyes sent a challenging glance to his cheerful friend.

'What a pity! for I'm giving you something very different,' the doctor answered, undismayed. 'Ah, here is tea and my cake.'

Kennedy stole an anxious glance at his fellow-conspirator as he set the tea-tray on the small table between the two chairs.

Dr Brent's lips formed a silent 'No' as he turned to the man. Then he said aloud.

'Tell Mrs Kennedy I was counting on my cake! What a beauty! Crystallised violets and angelica. "A Merry Christmas" and "M. B." It's a masterpiece! I hope there's plenty of almond icing underneath?'

'You can trust Mrs Kennedy for that, sir, and plenty of fruit, too.' Kennedy withdrew, highly gratified at the reception of the cake.

III.

'What an amazing fellow you are, Martin!' the colonel exclaimed, as the door closed. 'You live up against tragedy—hand out death sentences to terrified patients—yet you're as keen on that cake as a greedy little school-boy.'

'But that's the reason, my dear chap! If I couldn't make the most of every bit of pleasure that comes my way, I'd get hardened or dotty. There's more in this cake than icing, fruit, and all the rest of it—there's Mrs Kennedy's goodwill. It's a great mistake not to enjoy the little happinesses.'

The colonel emitted a scornful grunt. 'And now you've delivered your neat little sermonette you'll feel better, eh? I admit you caught me nicely.'

'You caught yourself, my friend! I wasn't thinking about you.'

'All the same you consider me a grouser. You can't deceive me, Martin.'

'I don't want to! You and I always see life from different angles, and usually fight about it. Worse, now, I fancy, than in the days when we hammered each other as kids—but the old friendship holds still, doesn't it?'

'Good lord, Martin! You don't expect our friendship to break? You're the last prop I've left. If anything happened to you I'd blow my brains out. Before this cursed accident I could say, "Twelfth of August; wonder if the birds will be plentiful." Then the partridges and pheasants took their turn till the hunting

season came to the rescue. Now when Christmas is past I shall say, "July, Martin's holiday;" and then again, "Christmas—Martin will be coming." Thank Heaven you're younger and tougher than I. India played the deuce with my liver, and the late war wasn't good for a man's health.'

Dr Brent rose and laid a hand on his friend's shoulder. 'That's all right, Art—I'll be here till you kick me out, or I kick the bucket.'

'I kick you out? I haven't a kick left in this confounded leg.'

'No; a badly fractured femur takes some mending, but you've plenty of kick in your heart, your old villain!'

'That's the trouble—makes me want to blow my brains out. Life has tried me too hard. To taste happiness and have it cut short; to build up consolation out of the ruins and have it stolen by a damned piano-thumping Dago. Oh, it won't bear thinking about!'

'At least you tasted happiness, Art—I hadn't even that, yet I'm not tempted to try an automatic. I haven't got one, anyway.'

Colonel Maxwell sat up and stared at his friend. 'So there was someone? I never knew—never guessed. You were always so keen on your work and your confounded little trivialities.'

'Because I missed the big happiness I made the most of what came my way. I commend that philosophy of life to you.'

'But who? Who? I can't think! You were such an all-round ladies' man. How you escaped matrimony always beats me.'

'There's safety in numbers.'

'So you envy me? I've always felt there was something queer under your friendship.'

'I'm sorry for that!'

'You're always critical.'

'Honestly, I'm not. I only think you make the road harder for yourself than need be—that's what troubles me, old man.'

'My road's been hard enough without my adding to it. When I lost my dear wife I was broken-hearted, but I bowed to the will of my Maker. My child grew up and became my companion. That she should desert me, and disgrace herself, by marrying Gonzales was an outrage I could not accept with resignation. I could only put her out of my life and try to crush down my unhappiness with sport. Now that's taken from me. What would you do in my place?'

'Send for your daughter.'

'I've no daughter. That—that woman made her choice between me and Gonzales when she eloped. I've done with her.'

'Very well. You can't ride and shoot, but you can teach your grandson to do both. He made no choice—'

'If you mention that Dago's brat to me I'll order the motor to take you to the station. I

never thought it would come to this between us.'

'All right! Just let me finish, then I'll ring the bell myself. You're spoiling your life, and I must make my protest. Little Martin's a chip of the old block—Maxwell inside and out. Think what he would mean to you.'

'You'll suggest I should invite that scoundrel Gonzales to come here and play the piano to cheer me up. Ugh!'

'He couldn't; the poor chap's dead.'

'Good job, too—damn him.'

'You never saw him; I did, and I say God rest his soul.'

'So that's it. Now he's gone *she's* tired of her husks and sends you as her ambassador. Say I've no fatted calf waiting.'

'My god-daughter—I won't call her "that woman," even as a Christmas concession to you—is neither homeless nor destitute. Gonzales died shortly before your accident. When I saw you in the nursing-home you were so ill that I considered it unwise to tell you. Now it is a plain duty to speak out. Make what you please of the information.' Dr Brent held out his hand. 'If I start at once I can get as far as Edinburgh to-night.'

Colonel Maxwell ignored the offered hand. 'Don't go, Martin. I—I'd feel it badly if you did. Forgive my temper; it gets the better of me at times, as you know.'

'Of course I'll stay. I want to, but I draw the line at being turned out. I promise not to worry you any more. Suppose I fetch my Christmas gift—I'm rather wondering if you'll like it.'

'Well, I know you'll like mine, because it's the same as usual. Your box of cigars is on that table.'

The doctor beamed. 'Good man! I always enjoy your cigars—I was thinking of them coming down in the train.'

'You old humbug! Some day I'll give you something impossible for the pleasure of hearing your nice remarks.' The colonel grinned. He felt very much relieved that the dear chap hadn't gone off in a huff.

IV.

Once outside the library door Dr Brent paused and drew his handkerchief over his damp forehead. 'Poor old Art—he's in a bad way! Got terribly cranky. Kennedy sized things up better than I did. Personal experience, I suppose. Well, I've lost the first round, but I'm not beaten yet—and perhaps I've paved the way for the next attempt. I think Gonzales's death made an impression. Queer things we human beings are! Art's letting pride and prejudice spoil what's left of his life—and imagines he's doing something fine. Poor old chap! What a Christmas he's handing out to me.'

At that moment Kennedy came into view.

The doctor had an idea that he had been hovering about the whole time.

'Just going for the wireless now,' he said cheerfully. It would be cruel to let Kennedy know how he was funking the reception of the gift. Together they unpacked the set.

Meanwhile the colonel had also been thinking. Gonzales dead! That was something. Didn't it alter the situation considerably? How he longed for Margaret—and the boy. The direct line following on at Dechindarg. Of course the little chap must take the name of Maxwell—if he made him heir. True, the boy was the son of a—a foreign pianist—a rank outsider, yet Martin had said 'a Maxwell inside and out.' Boys usually did take after their mothers. Besides, Martin's word could always be trusted. How beastly he'd been to poor old Martin!

At that moment the door opened and Dr Brent entered with his Christmas gift.

'Merciful powers—a gramophone!' Blank dismay swept away the welcoming smile from the colonel's face.

'No—better than that,' Dr Brent assured him.

'Well, it couldn't be worse, could it, now?'

'You old ruffian! I wish I *had* inflicted one on you. It's a wireless set.'

'Oh, is it? Thank you, Martin.'

'You're cut off from the world, so the world's coming to you. On cold days it'll warm you up to hear Bolshie speeches. Make you shake your fist like anything, and then think of the pleasure of clicking them off.'

'There's something in that—only I'll know they're still at it.'

'Church is a difficulty with that leg of yours: now you can hear sermons in comfort—better than my sermonettes, eh?'

'Sorry for the parsons if they weren't!'

'There'll be all the latest news, sport, society, murders, and money.'

'Yes, quite so—'

'And music. There's a concert starting now. I'll just switch on London first. You can have Brussels or Paris later.'

The loud-speaker brayed out 'The Mistletoe Bough.' For a moment or two the colonel endured it with mingled politeness and penitence, but it was too much for him. 'For heaven's sake, Martin, stop that damned row. Sorry, old man. Try and get the shop to take it back, won't you! I suppose these things are expensive?'

'I should just think so! But don't worry about that. I haven't got one yet—waited to see if it caught on with you. This will do for me—I like it. If you don't mind I'll have my Christmas concert.'

v.

Dr Brent adjusted the head-phones and sat down. Evidently the old chap didn't realise

Kennedy's share in the business. Now the receiving wires could be removed without any fuss. That was a blessing. Yes, Art was watching him with curiosity. There was still a chance. Evidently the silence puzzled him. The doctor set himself to act an enjoyment he was far too nervous to feel. He beat time to the music, smiled, and now and again closed his eyes. Each time he opened them he met the colonel's inquiring gaze. Was his acting all right, or was he overdoing it? The colonel moved impatiently. There—she was beginning! The loved voice reached him and he ceased to pretend. Margaret was with him—in spite of all the miles between. Here—though she was forbidden to enter Dechindarg. But this was more than even Margaret; some trick of the wireless changed the individuality slightly. It might have been the mother's voice, stealing across the years, instead of the daughter's over land and water. Dr Brent felt his lips quiver.

A hand touched his knee—now it was an impatient tapping, and the colonel pointed to the loud-speaker. Dr Brent turned it on again, and took off his head-phones.

'... Life for ever more.

Wind in the cedars proclaim the joyful story,

Waves of the sea the tidings bear afar;

To you this night is born He who will guide you

To paths of peace, to living waters clear.

Though poor be the chamber, come here, come and

adore,

Lo, the Lord of Heaven has to mortals given Life for evermore.'

The beautiful contralto voice sang the words very tenderly. As the song ceased, Dr Brent switched off. There must be no anti-climax, no other singer to break the spell. He knew his friend's face was working, because it was turned away and shaded by a hand.

'Who, Martin—who is it?' The colonel's voice shook.

'Ah, you feel the likeness too? It's Margaret.'

'Where is she?'

'The London Broadcasting Station.'

'No, no! I mean, where is she living? You're in touch with her—you must know.'

'She and the boy are living with me. Gonzales died at my house—hæmorrhage of the lungs. He walked into my consulting-room and told me he was done for. It was the thought of leaving Margaret and the boy destitute that broke down his overweening pride—he loved her all right, poor chap. Margaret and little Martin have been with me ever since. She takes engagements at the broadcasting station, and I think it comforts her to sing. Music was the bond between her and Gonzales, and, of course, when he came, the boy—she adores him. It's been a wonderful happiness for me. I'd have been a sneak to keep it all to myself.'

There was a pause during which the colonel fought for self-control, and when he spoke his

voice was not quite steady: 'Martin, old man, you've been a thundering good friend to me and mine. I think I know now who it was you loved—and I came home on leave and cut

into it, yet you never reproached me for my selfish blindness. We'll go shares in Margaret for her mother's sake. Words won't tell you what you've done for me to-day.'

A DESTROYER'S DAY.

By 'TAFFRAIL,' Author of *Pincher Martin, O.D.*; *Little Ships, &c.*

IT was blowing a full gale from the north-westward, and once round Duncansby Head and into the mad, wind-ripped welter which is the Pentland Firth, the sea had become heavier and steeper and more confused. There was land on both sides—to starboard, the rugged mass of Swona, with the surges beating tumultuously round its rock-fringed base, and beyond, stretching from right ahead to well abaft the starboard beam, Hoy and South Ronaldshay, the southern islands of the Orkney group. Their reddish cliffs and bleak, wind-swept hills, touched here and there with the dull green of young heather, were brilliant in the strong sunlight. On the port-bow lay the island of Stroma with its lighthouse, and behind it, terminating in the bold hummock of Dunnet Head, was the mainland of Scotland, the inhospitable northern coast of Caithness. The wind-lashed water broke in insensate fury against the rock-studded coast, the white passion of the gale seeming to blend austere with the rugged majesty of cliff and crag.

The Pentland Firth has an evil name among seamen, and well it deserves it. Its pent-up tides are strong and uncertain, its capricious eddies and currents snares for the unwary. Even great men-of-war have suddenly found themselves caught in an unexpected swirl and swung through a right angle or more off their course. But in heavy westerly weather its dangers are magnified a hundredfold, for the gale, blowing against a tidal stream which sometimes runs at ten knots, raises a heavy, toppling sea sufficient to overwhelm an ill-found ship. Its character must be seen to be believed; but during the war a battleship, struggling to the westward against a gale, had her bridge completely demolished by an enormous wave, which broke on board in a liquid avalanche and flooded the ship with hundreds of tons of water.

And as the destroyer steamed on she began to tumble and to pitch as only a small ship can. There was no ordered direction in the breaking seas, no regular cadence in their movement. Wind-driven, carried hither and thither by the tide, they rose and fell hap-hazardly in all directions—rose perpendicularly, toppled over, and fell in ruin, each in its smother of yeasty white. At times, rearing their ragged heads aloft, they charged furiously together like butting

rams, the spray of their impact hurtling to leeward in sheets of flying spindrift.

There was no avoiding them by a sudden twist of the helm. Without any chance of attuning her motion to that of the seas the ship adopted a violent and disconcerting corkscrew movement, which made it impossible to steer a steady course, impossible to stand upright on her reeling bridge without holding on. Sometimes her stern was flung clear of the water, until her propellers raced madly and the rudder was temporarily useless. One felt the bows lifting dizzily on the back of some mighty comber, then an appreciable pause as they hung poised, followed by a sickening plunge as they fell into the succeeding hollow. There came the usual thudding, quivering jar, while a great wall of gray-green water, streaked with a delicate lace-like pattern of white and tipped with yeasty foam, reared itself up in front of the stem. Sea after sea crashed on board and came surging aft along the forecastle. The wind-flung spray went hurtling in sheets high over bridge and funnels. Assailed simultaneously from all directions, the upper deck was often buried as waves leapt bodily on board and surged across it in a cataract. The dead-weight of water and the terrible trip-hammer blows when the bows fell seemed literally to stop the ship dead as she plunged and wallowed. She reminded one of a labouring horse. One could feel her straining, quivering, and bending to the mighty thrust of the seas.

Once clear of the narrow water between the Orkneys and the mainland, however, the sea became more regular. But the great moving hummocks, sweeping down from the westward with the full power of the gale and the weight of many leagues of open ocean behind them, seemed to overtop the masthead as the ship sank into the troughs. So steep were the waves that the destroyer, borne skywards on a boiling crest, leant over to an angle of fully forty-five degrees, and seemed to slide bodily down the next abyss. And always the forecastle and upper deck were overwhelmed in boiling cataracts.

The distance from the Pentland Firth to Cape Wrath is a bare sixty miles; but it was the longest sixty miles the little ship had ever gone. Reeling, plunging, staggering, and quivering, she steamed in turn past Brims Ness, Strathy

Point, Roan Island, the loch-indented coast of Sutherland, and so on to the north-western point of Scotland, the bold, irregular, honey-combed hummock of rock, with the white guardian lighthouse on its summit—which is Cape Wrath.

Great hillocks of water, dashing themselves at the base of its sheer cliffs, broke in upheavals which hurled the spray a full hundred feet into the air. The body of the waves, recoiling seaward after their fruitless efforts to breach the solid rock, impacted against the next advancing billow, so that for fully half a mile out from the shore there was a fringe of whitened, tumbling water leaping and playing in all directions. It was an awe-inspiring spectacle, and one could not help thinking of the awful fate in store for any unfortunate vessel helpless on that iron-bound shore. No wonder some long-forgotten mariner, clawing his way round the dread promontory in his crazy sailing-ship, in the teeth of a westerly gale, named it Cape Wrath.

The destroyer, altering course to the southward, made for the nearest convenient shelter. Swept constantly by the waves, wallowing heavily with the wind and sea now on the quarter, she steamed on, passing by a ten-fathom patch on which the sea, checked abruptly in its stride, broke in tumultuous fury—past Bulgie Island, its low rounded summit almost obliterated in sheets of flying spindrift. But she had little farther to go, for presently, altering course in towards the land, she was steaming past Eilean an Roin, the Island of the Seals, at the entrance to Loch Inchar. Once under its welcome lee the sea started to subside, and in a few minutes the ship was steaming smoothly up a narrow fiord.

'The loch is little used,' say the official Sailing Directions, 'partly in consequence of the entrance being difficult to make out from seaward.' Moreover, its average width is little more than six hundred yards, and within half a mile of the entrance, almost in mid-channel, lies the dreaded Bodha Ceann na Saile, a submerged rocky ledge with a least depth on it of no more than twelve feet. The leading marks are none too good, and the destroyer

drew fourteen and a half feet of water; but the loch provides a good anchorage sheltered from any wind that blows, and storm-beaten and damaged by the seas, her weary officers and men drenched to the skin, and hardly a dry place in the ship, she was compelled to make it. It was a matter of 'any port in a storm.'

It was a wild and a savage spot, a full forty miles from the nearest railway, with bleak, rocky hills patched with heather and coarse vegetation, and no signs of civilisation but a little cluster of gray stone cottages, whose inhabitants could be seen in their doorways staring at the unexpected apparition of a British man-of-war.

But here was peace and quietness, for as the ship steamed on up the narrow gully between the hills, hugging the shore on the port hand to avoid the rocks in mid-channel, the water was only ruffled as the squalls came driving down the valleys between the hills. The ship was on an even keel again. The awful motion had ceased, and the frenzied wallowing and staggering in the wild turmoil outside was a thing of the past.

Weary men, thankfully divesting themselves of their oilskins, appeared on the forecabin and busied themselves about the anchors. Hot food had long been out of the question, and presently the smell of cooking in the galley mingled with the clean scent coming off the land. A leadsmen in the chains twirled his lead and chanted the depth of water. A sharp order from the bridge, and with a splash and a rattle of cable the anchor went to the bottom.

Practically the only joy of a gale at sea in a small ship is the feeling of supreme thankfulness on arriving in harbour—the hot bath, the change of clothing, the warm meal, followed by a pipe and a blessed forty winks. And within an hour and a half the deck of that destroyer was untenanted save by the solitary, yawning quartermaster at the gangway, whose watch it was. Mess decks, wardroom, and cabins alike were occupied by sleeping men. Save for the shrilling of the wind, the hoarse chattering of gulls, an occasional snore, and the ceaseless lapping of water alongside, the silence was undisturbed.

Peace, blessed peace!

PAPER FROM PEAT.

IT was handed to the present writer as a curiosity. But with peat lying waste in multi-millions of acres both in Europe and North America, some go-ahead folks might do well for themselves and the world of commerce by applying modern research and methods to the discovery which M. Lallemand of Besançon made, and profitably utilised before

the use of wood-pulp, as a cheap and efficient material for paper.

There is peat of a fibrous, and also of a non-fibrous nature, and the fibrous alone will do for paper-making, producing a strong and excellent material, though not fine enough for printing or writing purposes. In the Lallemand process, all the earthy substance is washed from the

fibrous part of the peat. It is then soaked for many hours in a caustic lye; soaked again for a shorter time in weak hydrochloric acid; washed and steeped for a short period in a solution of alum; bleached with chlorine; then mixed with a small percentage of rag-pulp, or pulp obtained from old ropes and bagging; and with the resultant peat-pulp the Besançon expert made paper in the ordinary way. Previous to the introduction of pulpwood, Lallemand, and also Keller of Kuehnheide in Saxony, made a fortune in so manufacturing serviceable wrapping-papers from fibrous peat, as well as mill-board, paste-board, and papier-mâché.

With the conservation of timber already being seriously regarded in Canada and the United States, the practicability of producing paper from 'turf,' or peat, should not be overlooked—research in the products' laboratory and present-day methods of paper-making pointing the way toward greatly lessened costs of production.

In the praiseworthy endeavour to create Irish industries good ought to result if such a

manufacture can be started. Ireland possesses millions of acres of fibrous peat, which over-lies ground that in many parts might be utilised for agriculture. A substantial volume might be written on the repeated endeavours to make profitable use of Ireland's bogs. During last century many were the schemes which came to an end suddenly—several of them as 'wild-cat' as can be found on any gold-fields. There were plans for manufacturing peat charcoal, for producing sulphate of ammonia, acetate of lime; nay, naphtha, paraffin, volatile oil and fixed oil, by treating the peat with chemicals.

Indeed, utilising peat as the basis for making paper would be no new venture. Three generations ago, works were started at Clontahard and Tarbert in the county of Kerry for the preparation of wrapping-papers and mill-boards from the adjacent bog. This venture operated along the lines of Lallemand's method. Ill-management brought it soon to an end.

Nowadays the success of such a manufacture in Ireland would prove of more than national interest.

OTHER PEOPLE'S WINDOWS.

PART II.

IV.

IT was a very erect and tight-lipped George Henry Berkley who left, quite possibly for the last time, the Carfax's abode that fateful afternoon. He had taken his departure without pausing to speak with the object of his affections. In his present humour, he was inclined to place at Anne's door at least half the responsibility for his unpleasant ten minutes in the study. As he passed down the long garden-path, he saw from the corner of his eye the nearest curtain of the front-room window move ever so slightly, but setting his teeth, he kept resolutely on his way. George had already made up his mind not only to keep away from Anne's home, but also never to see or speak to Anne again until he had become one of the world's workers.

Coldly elated by his firmness in resisting another glance at that fluttering curtain, he strode on down the quiet tree-darkened avenue with his chin in the air and shoulders squared. However, his pace slackened a little as his thoughts began to take more coherent shape. Where was he to find work? What manner of work was he seeking? Was he capable of doing any sort of work? As well as being good at games, George really was a sportsman, two excellent qualities which unfortunately do not always go together. In his heart of hearts he was forced to admit the justice of the alderman's criticisms. After all, a man should

work. Of course his father could find him something to do, but for some reason which he could not at the moment explain, George strongly objected to working for his father. 'I must find my own job,' he reflected; 'make my own career.' Suddenly his meditations were interrupted by a shrill voice which came from somewhere above him. George glanced up and saw the upper half of a stout maid-servant, seated half-way out of a bedroom window. She was using a wash-leather with great vigour, and carrying on a spasmodic conversation with the servant next door, who was similarly occupied. Their remarks were destined to have far-reaching effects on George's fate, and change completely the whole course and structure of his life. The servants were merely grumbling because the professional window-cleaner had failed to appear at the stipulated time. Both seemed convinced that he was a most unreliable individual who took no interest in his work, and also that Northtowers was the worst town in the world, so far as window-cleaning was concerned.

The complaints of the servants suggested something to George, an idea so preposterous that it was worth considering, if only for the amusement afforded by thinking it over. He smiled and stopped. Then he chuckled outright and moved on again. 'Window-cleaning is just the sort of job that would suit me,' he muttered. 'Out in the open all day. On the move all the time. No terrific brain power

required. No night work, and Saturday afternoons free.'

The more he thought over the idea the less preposterous it became, and a spasm of self-disgust shook him. 'Here I've been wasting my life in this disgraceful fashion, when all the time I'm a born window-cleaner.'

He became reflective again. Judging from the remarks of the servants, the window-cleaning facilities of Northtowers left much to be desired. 'These slap-dash methods of cleaning other people's windows must cease,' George told himself sternly. 'This business must be organised and placed on a proper footing; also it must be made to pay.'

The idea of cleaning windows in the town where he was born did not dismay George in the least. He was no snob, and in any case his friends had long ceased to wonder at anything he did. The more he considered window-cleaning as a profession suited to his peculiar requirements, the more enamoured of it he became. The one big advantage about window-cleaning was that it did not require a great deal of previous experience. George felt quite sure that one would not be obliged to take a special course of study, or serve seven years' apprenticeship in order to become an efficient window-cleaner.

His interest in windows once awakened, George noted that he was in a veritable forest of glass. 'Windows,' he muttered exultingly—'windows everywhere, and they all require cleaning.' At the corner of the avenue, which opened into another and wider avenue, he stopped and lighted a cigarette, thus attracting the attention of another young man on the opposite pavement. Turning abruptly from his original course, the stranger moved towards George, making urgent signals with his right hand, which also grasped a small attaché case of peculiar shape. 'Keep it in!' he requested breathlessly, when only half-way across the road. 'Please keep it in!' Evidently he meant the match between George's fingers.

'Sorry, too far gone,' answered George. He produced his box again and handed it to the newcomer. 'Help yourself.'

'Thanks,' said the stranger gratefully; 'you're the first man, apart from a policeman, whom I've met for some time, and begging matches from policemen is a trifle beyond me.' He produced a crumpled cigarette from an inside pocket, and lowered the attaché case to the pavement. George eyed him with interest. The stranger was a pleasant-looking young man of about his own age, whose clothes, though well and fashionably cut, had been worn too long. His shoes, while surviving a cursory glance, would not bear a closer inspection, and the light socks above them showed occasional traces of amateurish mending. His linen, however, was beyond reproach. 'If ever I become wealthy,

I shall buy some matches of my own,' declared this young man, emitting a huge cloud of smoke and returning the match-box.

George laughed. 'Out of work?'

The other nodded. 'Practically.'

'So am I,' answered George. This statement, taken in conjunction with his expensive lounge suit, faultless headgear and neat shoes, seemed incongruous, but the newcomer did not appear to be greatly surprised. He shrugged philosophically.

'I was envying you just now—thought you were a millionaire.'

George laughed again. 'Doing a bit of travelling until something better comes along?' he asked, indicating the case with a nod.

The other nodded, and raised his property from the ground. 'The contents of this'—he gave the case a slight shake—'would make me a rich man if only I had the capital to advertise it. That's what I lack—capital.'

'Some sort of invention?' inquired George with sympathetic interest.

'My own invention,' answered the other with pride; 'absolutely the finest cleanser on the market. I'm selling the stuff from door to door. Begging people to give me sixpence a packet. If only I could get publicity, they would willingly pay the grocer twice as much for half the quantity. All profit, too, for the stuff costs practically nothing to manufacture.'

'Is it some sort of soap?'

'Hardly soap; any ordinary mop or brush, dipped in water which has been treated with my invention, will remove stains and absorb dirt as blotting-paper absorbs ink. No energy required, elbow grease absolutely unnecessary. I call it the crystal cleanser.'

'Will the stuff clean windows?' asked George eagerly.

The other smiled rather contemptuously. 'Think of something difficult,' he requested. 'Windows are too easy.'

'But still, have you tried it on windows?' persisted George.

'No,' admitted the inventor, 'I haven't tried it on windows; and to do so is quite unnecessary. I can assure you that my invention will enable you to clean a window in about the same length of time it would take you to break one.'

George drew a deep breath. 'If you are not mistaken about this invention of yours, your troubles are at an end,' he declared impressively. 'Did you happen to see a window-cleaner as you were coming along?'

'I saw a little cart with some ladders on it—about the third turning on this side. But look here, do you know someone who might be prepared to finance—'

'Several,' interrupted George, 'but they're not going to get the chance. I've got an idea that will not only give this cleanser a first-class advertisement, but also provide us with some working capital.'

The inventor stared at him with eyes that were at once incredulous and hopeful.

'There will be three of us ; you, me, and one other,' George further explained.

The inventor nodded and extended his hand. 'I shall be only too glad to work on equal terms. My name is Kemp. By the way—er—who is our third partner?'

'I don't know his name,' answered George, 'but he's the window-cleaner.'

V.

They found the little handcart and its burden of ladders drawn up against the side-walk half-way down Acacia Avenue. On each side of the cart the name P. G. Green was painted in large white letters.

As George and his companion approached, a tall and incredibly thin young man with a straggling straw-coloured moustache emerged from the gateway immediately opposite the cart. In his right hand he carried a bucket, and in his left a washleather. On his head he wore an ancient cloth cap, with the peak at the back instead of the front. The sides of his blue slop jacket bulged with dusters. George decided that this must be Mr P. G. Green himself. 'Excuse me,' he said without hesitation. 'We should like a few words with you.'

The window-cleaner hesitated for a moment, and then lowered his pail. 'Right-o!' he said at last, but with obvious reluctance. 'Be as brief as you can, mister ; I'm awfully busy.'

'Yes, I know ; more work than you can manage comfortably, haven't you?'

Mr Green nodded without enthusiasm. 'I shall have to get an assistant, though I can't afford one really. You see I have to cover such a large area in a place of this sort. More than half my time is spent in shoving this blessed cart from one place to another, and I don't get paid for that.'

'I suppose that's the reason there isn't more opposition?' suggested George.

'Somehow,' explained Mr Green, 'you can't keep to one area. Half-a-dozen customers here, and another half-dozen somewhere else. Window-cleaning would be all right if you could have all the windows placed in a nice row and get straight at 'em. I'm learning to drive a motor-car in my spare time. After this blessed handcart, I mean to shove the next vehicle I drive from the inside, and sit down to it, too. Now what is it you wanted to see me about, mister?'

'Mr Kemp and myself have a proposition which, if successful, will rob window-cleaning of its worst terrors, and eliminate to some extent this difficulty of distance. We won't detain you now, but will make an appointment for the near future. Perhaps you will be good enough to give us your address?'

VI.

That evening George sought out his father at the Northtowers Social Club. Old Mitchell Berkley had just been beaten by the club's worst billiard player, and he was in anything but a good temper when George arrived. 'Sorry to interrupt, dad, but can I have a few words with you? It's rather important.'

Mr Berkley nodded briefly, and disposing of his cue, resumed his jacket. He was a big man, whose broad nose and heavy, stubborn chin suggested harshness and intolerance. His ordinary manner, too, lent colour to this impression. However, this rough exterior covered a warm and kindly nature. Mitchell Berkley's bark was much worse than his bite. It so happened that the billiard-room was almost deserted, and most of those present were gathered about the tables. George placed an affectionate hand on his father's shoulder, and, leading him to the fireplace, pushed him gently into an easy-chair.

Berkley senior smiled. 'How much d'you want?' he asked.

George shook his head. 'I've begun to take life seriously. I'm going into business,' he declared.

His father eyed him incredulously. 'Motor bandit?' he inquired with gentle sarcasm.

George laughed. 'No ; window-cleaner,' he answered calmly.

Mr Berkley jerked forward in his chair. 'A what?'

'A window-cleaner.'

There was a long silence, and then Mr Berkley senior spoke again. His manner was serious and his voice grave. 'Now listen to me, my boy ; it's quite time we two had an understanding. I've put up with a great deal from you—and without over-much grumbling, too. At different times your follies have caused me a great deal of worry, not to mention the cost in hard cash. I've always consoled myself with the reflection that your fool pranks were the outcome of high spirits rather than any real desire to make mischief. You're a sportsman, even if you do sometimes act like an idiot, but I won't stand this window-cleaning business. Do you expect me to let you make a fool of yourself in the town where I've lived all my life, and where I am respected? You'll leave other people's windows alone. Now understand that.'

'I said a window-cleaner, dad, not a window breaker.'

His father was unconvinced. 'Your past record isn't good enough,' he answered with a stubborn shake of the head. 'The farther you keep away from glass the better it will be for everyone concerned.'

George leaned forward. 'But, look here, dad, this window-cleaning project isn't a joke.

I'm absolutely serious,' he declared earnestly. 'Something happened to-day which caused me to start looking about for suitable employment. I seized the first opening which offered, and I'm determined to go through with it—become one of the world's workers and all that sort of thing, you know.'

Berkley senior's expression relaxed a little. 'But why on earth clean other people's windows for a living?' he asked in a voice of perplexity.

'Why not?' asked George simply. 'Windows require cleaning, and in this town at least the present facilities for cleaning them are inadequate. I know, because I've been making inquiries.'

The old man sighed. 'I'm glad you've decided to work, my boy, but why can't you come into my business? There's room for you.'

'Just because it is your business, dad. You made it yourself, out of nothing, so to speak. Well, I want to build something, too, or at least help to build something—be in from the very start, if you understand me. You know quite well that there are a score of men who could run your business quite satisfactorily now they have the finished product to work on, but it takes genius to create.'

Old Mitchell smiled. He was proud of his life's work, and his son's tribute greatly pleased him. 'Do you think you have a genius for window-cleaning, George?' he asked.

George shook his head. 'I'll be perfectly frank with you, dad; the window-cleaning business is only a means to an end—an advertisement. We don't expect it to pay. Our firm has its genius already. He's invented the finest cleanser ever known, and we're going to put it on the market. I'm publicity manager and odd-job man.'

Mitchell Berkley rose to his feet. 'Very well, my boy; after all, there's nothing like making your own way in life, and perhaps window-cleaning is as good a way as any. I always hate to see a woman cleaning an upper room window. It looks dangerous to me. Now, if you are really serious about this business, I'll be glad to advance you anything in reason—'

George interrupted him quickly. 'Thanks, dad, but all I want from you is "Little 'Enry".'

VII.

The fact that the crystal polisher really carried out all that was claimed for it by the proud inventor rendered the success of the Crystal Express Window Cleaning Company a foregone conclusion. The problem of getting the polisher onto the market was, of course, both difficult and complicated, but the three young men went to work in an eminently business-like fashion. George belonged to every club in Northtowers and knew many

influential people. He spent a great deal of time in the company of prominent business men and with persons of importance in local politics, town councillors, &c. He ordered his life with a definite purpose, and his expression became anxious and preoccupied.

Meanwhile the residents of Northtowers were being sedulously cultivated by the energetic inventor of the crystal polisher. Smartly dressed, he moved about the suburbs and amongst the minor tradespeople, canvassing from door to door and shop to shop, frequently lighting cigarettes with a wonderful new automatic lighter. The third member of the company, the window-cleaner himself, was far too busy preserving the nucleus of the business to undertake additional duties. It was noticed, however, that he went about his work with greater zest, sometimes whistling loudly and even breaking into snatches of song. The moment 'Little 'Enry' was ready for the road the three would be working together as practical window-cleaners.

'Little 'Enry' was a light motor wagon of famous and reliable manufacture, which had been callously relegated to the darkest corner of the Berkley garage after long and faithful service. Now, however, he was brought forth from this inglorious retirement, thoroughly overhauled, and re-painted a startling red. Ladders and pails, and a large tank containing the priceless polisher, all painted in the same bright colour, were loaded on 'Little 'Enry,' and the Crystal Express Window Cleaning Company was ready to start business in good earnest.

No time was wasted, and, after a sort of grand tour of the principal thoroughfares, 'Little 'Enry' departed proudly for the suburbs. And his first stop was Anne's home. George, dressed like his companions in blue overalls and heavy boots, went quickly to the side entrance of the house, and touching the peak of his rather startling check cap to the servant, requested an interview with her mistress. The girl smiled at him in a puzzled fashion, and asked him to come in. George shook his head, and the servant, more puzzled than ever, went in search of Anne.

If the vision of George Henry Berkley, usually so immaculate, attired in the habiliments of toil caused Miss Carfax the least surprise, she permitted no outward indication of such feeling to escape her. She pretended not to know him. George imagined that her eyes were a little brighter, and the suggestion of dimples in her cheeks a little deeper, but she treated him exactly as she would have treated the butcher or the grocer or any other tradesman.

'Good morning,' she greeted pleasantly. 'What is it you wanted to see me about?'

George touched his cap respectfully. 'Morning, miss. I represent the Crystal Express Window Cleaning Company. I thought perhaps

you would like us to clean your windows. Our terms are very moderate.'

Anne pursed her lips thoughtfully. 'We have a window-cleaner,' she said at last, and then added with a smile, 'somewhere.'

George smiled too, but very respectfully.

'He's so unreliable,' she went on; 'sometimes he comes twice a week, and then we don't see him once in a month. It's most unsatisfactory.'

'The poor chap was overworked,' explained George, 'but we've taken the business over and re-organised it. We state a time and we're there to the second. Reliability is our watch-word.'

Miss Carfax looked away, biting a tremulous underlip.

'There is just one other consideration, Mr—er—Crystal,' she murmured in a stifled voice. 'Do you know how to clean windows? That's rather important, you know.'

George bowed gravely. 'We use the famous crystal polish, miss. Therefore we are able to guarantee complete satisfaction. The word "satisfaction" is printed on all our circulars and handbills, and is painted on all our ladders and pails. We also place the word satisfaction across your windows—in a metaphorical sense, of course. Satisfaction is our war-cry.'

'Very well,' said the girl in a small voice, 'you may clean the outside of all the windows, and if the result is satisfactory, I shall leave them in your hands in the future.'

George was very grateful. 'I'd like to speak to the alderman about the shop windows if he is about, miss.'

'He has just gone out,' answered the girl. 'You will find him at the shop any afternoon but Wednesday.'

'Thanks, miss; I'll call and see him.'

'Yes, do—go just as you are. Now,' she added, with a slightly malicious smile, 'I will leave you to get on with your work.'

In an incredibly short space of time, George, flushed and triumphant, was knocking at the side door again. In his inmost heart, he had believed that if Anne was the Crystal Company's first customer, success would smile upon the venture. He had gained his object, a good omen.

Anne was politely incredulous. She did not believe it possible that windows could be cleaned properly in such a short time. But inspection convinced her that the windows were not only clean, but cleaner than she had ever seen windows before. They shone like crystal, glittering and sparkling with that wonderful brilliance which was soon to make the Crystal Express famous. There was a peculiar expression in her eyes as she paid George. She closed the door without a word, and going into the front room, drew the curtain gently to one side and watched the somewhat ostentatious departure of 'Little 'Enry.'

AFRICAN SILHOUETTES.

III.—NAMITIE THE CARPENTER.

By C. M. M. PATERSON.

I.

IT seems extremely doubtful if Namitie, of the tribe of Wagishu, head of the estate carpenters, will ever again return to his happy home—and the reason for such a sad prophecy is based entirely on stomachic grounds.

Supplying neighbouring settlers, and the 'boys' of their estates, with a few of the necessities of life, there is, on the Central African farm where Namitie performs (or otherwise, as he feels inclined) his daily toil, a shop.

This emporium, in conjunction with Namitie's fanciful appetite, is the cause of years of absence from the bosom of his family. This big native's wages are mortgaged for months ahead, and have been so for years—through tinned herrings!

It is difficult to look on affection for that common fish of the sea as a vice, yet the cigarette habit fades into insignificance compared to the craving for tinned herrings with which this hefty Wagishu is cursed! Tinned herrings he

must have—the world, and many other things, are well lost for them!

There was, indeed, an historic occasion, now nearly two years ago, when, having by supreme effort denied himself his favourite diet, Namitie had saved enough almost to clear the shop debt, and to pay for the railway fare. The cause of such self-denial was an urgent one. News had filtered through, in the wonderful way it does in illiterate Africa, that one of Namitie's cousins was making love to his best wife. From that hour strenuous attempts were made to clear off the herring mortgage—an impulse to go and interview that cousin overpowering stomachic sentiments. But shop debts were heavy. Before our head carpenter could settle them, a message arrived from the lady herself to announce she had been run away with! Namitie promptly applied for leave. His reason was a justifiable one—urgent private affairs. Yet the situation apparently did not cause indignation against the erring spouse, which it would have

inspired in the breast of an ordinary European husband. The lady, he explained to his Bwana,¹ had no wish to cause matrimonial troubles. She loved him—him, Namitie—and had doubtless been forcibly persuaded otherwise! He must go to retrieve her.

His request being granted, the few remaining rupees still owing to the shop cancelled, Namitie, dressed magnificently in his master's cast-off clothing, bade adieu, and went off to recover his unwillingly erring wife.

But he never reached his happy home, or that sinful cousin! Half-way on the long trek to the station, Namitie dropped in at another farm to see some friends. He found them engaged in a merry little gambling game, and being a convivial soul, he stayed to join in the fun. Beyond that happy spot Namitie's footsteps did not pass! For three weeks he enjoyed the hospitality of these cheery acquaintances, until his last cent had disappeared, and even the Bwana's old clothes had gone in pawn for monetary losses. Later the 'boys' quarters on that farm were raided by the police, and the ring-leaders arrested—the place proving a veritable gambling hell—but this drastic action came too late to save Namitie, who returned, clad only in a dirty cotton loin-cloth, to his master—a sadder and perhaps wiser man. The wife still continued to send him S.O.S. signals, but, rescue being now impossible, Namitie, with that calm philosophy which seems to be inherent in his breed, resigned himself apparently to envisioning her in the arms of the perfidious cousin; and from that day to this has taken no further action in the matter.

II.

Cigarettes are another of the weaknesses of this quaint character. These are smoked with the fiery end in his mouth, being, he says, a more economical luxury if thus enjoyed.

The Bwana regards at times with consternation his tobacco bill, but he has no intention of venturing on the method of economy thus practised by his carpenter.

It is now many years since Namitie arrived on the farm—a practically naked savage, fresh from the Wagishu reserve. Work was desired, he stated, any sort of work, though how to set about any labour which the odd Wasungu² wanted, he had not a notion. To a most casual observer it was obvious that he had not exerted any energy in his home life, for this powerful man was then incapable of lifting a ten-pound weight! Now he can carry two hundred pounds on his back, and glories in such exhibition of his strength.

Accompanying him was a younger brother—Padi, a very plump naked boy, and one of the cheeriest of mortals. Padi looked on this escape

from the native reserve as a great adventure. Little did he know that shortly he was to embark on the greatest adventure of all. A few months only were his merry face and deep laugh allowed to brighten the farm life. Cerebro-spinal meningitis broke out among the labourers, and poor fat Padi was among the first victims. Perhaps his case was an abnormal one, but in forty-eight hours the body of this extremely plump native was reduced to a barely living skeleton—the fever of this terrifying disease literally burning him up.

Namitie took his brother's death with usual philosophical calm. 'Obviously,' he said, 'to die in such a hurry was certain manifestation that God needed Padi with much urgency.' Luckily, however, God did not want the wages Padi had earned and saved, and these, together with the dead boy's cooking-pots, Namitie annexed. The shop off-loaded tinned herrings with rapidity for some weeks after Padi's death.

III.

The passing of time, as recorded by days, months, and years, is immaterial to our carpenter. If one possesses no knowledge of the date one came into the world, obviously the advancing hour when we shall probably leave it loses somewhat of its menace. To Namitie Nature alone provides the chronicle of his migration. Outside the entrance gate of the master's home is a tall blue eucalyptus tree. It is also the farm calendar. Sometimes Namitie may be heard, in the vicinity of this tree, swaggering to raw labour recruits of the long age spent in the Bwana's service. 'You see that mighty tree,' he will say. 'When first I came to work on this farm it was only so high'—indicating with a huge black hand the height of two feet or so; and the new arrivals gape with awe and wonder.

But one day such boastfulness received a damping snub. Koski, the head cattleman, unfortunately chanced to pass by, just as Namitie was expounding to some fresh labourers the connection of the eucalyptus with his own honourable service.

The expression of contempt on old Koski's face would have made him a valuable 'find' could any film-producer have witnessed it. 'Pah!' he remarked, spitting, as was his wont, with a noise like a pistol-shot. 'You! You! Why, when I first came into the Bwana's service there was no tree here at all! I saw it planted!'

Namitie's powers of repartee rarely, however, fail him. 'That may or may not be true,' he replied, in a tone which conveyed to his listeners the impression that Koski was a habitual liar, 'but during the time this tree has been growing tall I have built many houses and mended scores of wagons, while you have but idled away the years watching cattle fill their stomachs.'

SEVENTH SERIES

MEDES AND PERSIANS.

By HILTON BROWN.

PART I.

'According to the law of the Medes and Persians, which altereth not.'

I.

THE Buhl clock on the drawing-room mantel-piece chimed sweetly: a quarter past eight. Mrs Lessing looked up at it with impatience.

'I do wish Mr Rossiter would not be quite so casual. When I say dinner at eight, I mean dinner at eight.'

Major Brander, who was leaning against the mantel, laughed with a tingle of irritation. It was odd to hear Mrs Lessing abusing the casual. Major Brander was going to marry her daughter, but that did not blind him to the fact that of all the haphazard, muddling, casual—yes, casual—households of his acquaintance, Mrs Lessing's was the worst. His mother had a descriptive word for such establishments—'through-other.' The major did not admire 'through-other' houses. His was a simple creed; you kept 'fit,' did things decently and in order, and went to church on Sunday mornings. If Mrs Lessing had any creed at all—which was doubtful—it was not that.

He shifted irritably from one foot to the other. 'Well, your own daughter isn't down yet.'

'Oh, Joyce!' said Mrs Lessing still crossly; 'Joyce can be down at any moment. She hates waiting about, just as I do.'

Major Brander mentally agreed, and added the rider that she was equally indifferent as to how long she kept others waiting when it happened to suit her. He wanted his dinner. 'Young Rossiter—' he began; but at that moment Joyce thought fit to appear. The major brightened; Joyce was very pleasant to look at.

'Hullo, Harold! I suppose Charlie hasn't come yet. He is a slacker.'

Mrs Lessing surveyed her daughter with less than her usual approval. 'My dear child, you've put on your amber earrings with your jade beads.'

'I know,' said Joyce calmly. 'I've lost one of the jade ones. I suppose it'll turn up.'

This time the major was conscious of real
No. 782.—Vol. XV.

annoyance. The jade earrings had been a present from himself; she shouldn't have just 'lost' them in that careless way. What annoyed him still more was to be reminded of Joyce's incomprehensible habit of losing things—valuable, useful things—wherever she went. During the last few months Major Brander had become acquainted with the ladies' cloakroom of almost every restaurant and theatre in London—during off hours, of course. He had even been to Scotland Yard in pursuit of a purse containing about ten pounds which Joyce had airily 'lost' at a dance at the Cecil. He had not found it, because in the course of the day Joyce had discovered that after all she had left it in her bedroom at home. That rankled. Major Brander was sufficiently Scottish to detest waste, to abominate this neglect and ill-treatment of possessions that had to be made good. It was really intolerable!

He frowned and said nothing. Joyce shot a sidelong glance at his lean upright figure, his stern face, the touches of gray in his exactly arranged hair. What a wonderful man to be engaged to! But she felt a little afraid of him.

'You're looking very solemn, Harold,' she ventured.

Major Brander's reply was drowned in the roar of a noisy motor-cycle in the street outside, followed by the whirr of an electric bell. Presently there blundered into the room a boyish young man, grinning happily out of a rosy, clean-shaven face—Charlie Rossiter.

'Charlie, old scout!' Joyce sprang up to greet him with dancing eyes.

Mrs Lessing met him with more dignity. 'Really, Charlie—twenty-five minutes past eight! This is too bad.'

'Sorry, sorry, sorry,' said Charlie, looking anything but sorry. 'Magneto got fed-up other side of Edgware.' He glanced cheerfully round the room, 'Hullo, major; very fit?' He held out two grimy hands towards Mrs Lessing. 'My paws. Can I go and ablute? I've got a tin of soap—wonderful stuff.'

'Please do,' said Mrs Lessing stiffly. Charlie went, quite unabashed.

NOVEMBER 21, 1925.

II.

Major Brander turned to poke the fire in order to cover his annoyance. Why on earth, he asked himself, did young Rossiter make him so cross? He was a good boy; he had done very well in the war, like all his type; and after the armistice he had settled down cheerfully to sell motors. He was slangy and superficial, perhaps, but that wasn't the cause of the crossness. Was it possibly—the major straightened his back—the least touch of envy? Rossiter's youth was perpetual; the major could never remember being young at all. The major was careful over many things; Rossiter happily careless of all. . . . And then there was that dancing, light-hearted look in Joyce's eyes when she greeted Charlie; that spontaneous 'Charlie, old scout!' The major did not particularly want to be called 'old scout,' yet he irrationally disliked the conviction that he never would be. Not by Joyce, anyway.

The major knew that Charlie had been his rival. He knew that Charlie had proposed at a certain dance. He even knew what he had said when Joyce had told him she was going to marry Brander.

'Well, well, old thing,' he had said, 'I'll fade away and eat worms. You'll have a Fizzer for a husband. That's that.'

What a way to talk! How could anyone seriously consider a grinning idiot, who degraded the most solemn occasions with the *clichés* of a war-story subaltern? . . . But neither Major Brander nor Joyce had seen, in the gray dawning after that dance, a young man with a dust-coat over his dinner-jacket driving a racing motor-bicycle round and round the suburbs of London. He sucked at an empty briar, and stared out over his handle-bars at the flying roads. His face was Charlie Rossiter's, but it bore no grin; neither was it particularly idiotic, nor careless, nor young.

The major turned back to Mrs Lessing's extravagant drawing-room. Charlie came crashing in, exhibiting the results of his 'ablute.' 'Whiter than snow!' he exclaimed, thrusting out his hands. 'The original of this testimonial may be seen at our office.' Why couldn't the young idiot speak without quotations?

'Oh come and feed, for heaven's sake,' said Joyce, and trailed off to the dining-room with Charlie chattering at her heels. The major offered a staid arm to Mrs Lessing; there were decencies . . .

III.

The dinner went through rather wearily. The major prided himself—not without reason—on his table-talk, but in this atmosphere he felt stupidly stiff and formal. It was impossible to speak like a normal being without feeling absurdly pedantic. Because one had some

respect for order and convention it wasn't necessary to feel like a pedantic grammarian presiding at a Lower Third tea-party. Yet that was how the major felt at Mrs Lessing's table.

The major knew he was in the right. He called to his aid mental visions of his friends—Colonel Barclay, Major Steele, Cavendish of the War Office. These all thought him a 'good fellow'; they wouldn't have known him if he had any taint of priggery. It was ridiculous to be so discomfited by a childish young ruffian who sold motors—what Barclay expressively called a 'bull-flapper.' It was intolerable.

Yet that 'Charlie, old scout!' rankled. And once or twice as Joyce bent towards Charlie he caught in her eyes that elfin look he himself could never arouse.

Soon after dinner Charlie did the decent thing; he went away. 'I'm Dee Trop,' he said humorously. 'I'm off to hit the Great Lone Trail. Cheeroh, major!'

'Good-bye,' said the major stiffly.

Joyce followed Charlie into the hall while he dragged on his leather coat. 'I've got to go to Edinburgh on Friday,' she said, 'to stay with Harold's people. Charlie, I'm rather in a funk.'

Charlie was lighting his pipe. 'Rot!' he said. 'What have you got to be in a funk for? They'll fall at your feet; if they don't, send for me and I'll chastise them.'

It was the merest ragging, no doubt, but somehow it was strangely comforting. Joyce took hold of one of the big buttons on his coat and fingered it nervously. 'Poor old Charlie!' she murmured.

Charlie breathed hard through his nose. 'You're never in a funk,' he said; 'never were, never will be. Besides, the major'll be there.'

'Oh yes,' said Joyce heartily, 'Harold'll be there.' But her enthusiasm was forced.

Presently the motor-bicycle roared away. Joyce stood a moment in the hall, and then turned to the drawing-room. And her step was not quite that of a maid going to her lover.

IV.

The long journey up to Edinburgh afforded Joyce much—too much—time for reflection. As she had frankly admitted to Charlie, she was in a funk; and in common with others in that condition she found that an idle interval in which to review the situation is not the best treatment. The journey seemed interminably long. Joyce gave way—a rare habit with her—to self-analysis. Harold was splendid—but she was the least thing in the world afraid of him. Charlie Rossiter had spoken only justly when he had said that funk and Joyce were strangers; and the novelty was disconcerting. A fine self-confidence was one of her principal assets. Now, for the first time, it began to fail her.

Harold came nearer her ideal man than any one she had ever hoped to meet; but—could she live up to him?

What would his mother be like? thought Joyce; and the forces of funk delivered a fresh attack. Harold spoke of her with affectionate admiration, praised her courage during her long years of widowhood, her great gifts of organising. But—what would the sort of woman Harold admired think of Joyce? She would certainly be very different from Mrs Lessing. Very. Joyce suddenly began to forget many petty annoyances, and to think of her mother as rather a dear.

If only Harold had stayed and travelled north with her! But for some reason it had seemed to him inevitably necessary that he should go on in advance, like a herald to prepare the way. Both Joyce and her mother had thought it an absurd manœuvre; but the way Harold had put it forward, it had seemed impossible to argue against him. It always did; in the language of Charlie, what Harold said 'went.'

The train toiled up the long dismal slopes of Shap. . . . Harold was a magnificent man, *very* near the ideal; but he took life terribly seriously. Could she live up to him? She could do it for the duration of this visit, of course; but over a long period of years—what then?

V.

Scotland met them with dark, sweeping clouds, which gradually thickened and descended till the imposing buttresses of Tinto stood sheeted in a soaking rain. The washed ochre of the Lanarkshire moors and the gray rain-pocked stretch of the Cobbinshaw reservoir depressed Joyce unbearably. She saw the Pentlands, and remembered that part of Harold's programme had been long walks on these hills. 'I often do ten miles across from Balerno just to keep fit.' 'Keeping fit'; Harold's creed! Could she, with her town-bred taxi-and-cushion-loving little soul, live up to that? Would he expect her to walk about those moors in weather like this? If he did, could she refuse to try? And if she tried, could she avoid disgracing herself for ever?

The train roared down an incline. The mountainous 'bings' of shale-pits loomed through the gloom. Joyce shuddered. 'I thought you said Edinburgh was such a beautiful place!' she said to her sole travelling-companion.

'So it is,' he snapped. 'It's the most beautiful place in the world—if you can appreciate it.'

Did that, Joyce wondered, apply to Harold and Harold's mother?

Princes Street Station at last; Joyce got to her feet rather shakily. Would Harold's mother have come down?

She had not; Harold was there alone. He

greeted her with his usual undemonstrative kindness, kissed her cheek. He looked very handsome, absolutely right, in his gray suit with a tie of his regimental colours. Joyce warmed to him. The wonderful, dear man that he was. And he was actually hers, her very own.

'Mother's waiting for you at the house,' he said in the taxi. 'I'm longing for you to meet her. She's a wonderful woman. Wonderful!'

'What about me?' thought Joyce with a touch of pique. 'Should I not be rather wonderful too?' But aloud she said, 'I'm so excited, Harold. I believe I'm quite funky.'

'Silly girl!' said Harold, and patted her hand.

Then, presently, there was Harold's mother.

Joyce saw her at first through a haze; then out of the blur emerged an exact replica of Harold—Harold twenty years older and changed in sex, tall, dignified, essentially correct and 'fit.' A cool, firm hand took Joyce's; after a moment's hesitation lips just brushed her cheek.

'Oh!' cried Joyce. 'I was so hoping you would do that!'

'Dear me!' said Mrs Brander with a smile. 'Surely! . . . What a lot of luggage you've got.'

Joyce, accustomed to Mrs Lessing's lavishness in trunks, thought she had very little.

'I brought as little as I could,' she said timidly. 'There—there's another box coming on by goods. In point of fact there were two; Joyce realised with a touch of irritation that the lie was her first concession to funk.

'Oh, really!' said Mrs Brander without expression. Joyce was damped.

VI.

She was powdering her face when a bell rang insistently, and for the second time. She hurried downstairs, and found Harold fidgeting in the hall.

'You didn't hear the first time?' he said.

Joyce felt unjustly reproved; they might have given her a minute. 'No,' she said shortly. Lie the second. Funk two, Joyce nothing.

After tea Harold proposed a stroll. Joyce, who was feeling tired and lazy, was dismayed.

'Has it stopped raining?' she asked.

'Oh, it's nothing much,' said Harold, peering from the window. 'Just a drizzle. You can stick on an old coat.'

'I haven't got an old coat,' said Joyce crossly.

'Harold always takes a turn between tea and dinner,' said Mrs Brander in her smooth voice, and as if that settled it.

Joyce tried once more. 'I haven't unpacked my walking-shoes yet.'

'Fish 'em out, then,' said Harold cheerfully. 'No good fugging in the house. A breath of air will do you good after sitting in the train all day.'

Joyce would have liked to curl up in a comfortable chair and eat chocolates. But apparently her point of view did not present itself, and somehow it seemed impossible to put it forward. She went.

Harold tramped her solemnly round the Blackford Hill. To Joyce it seemed a very long and weary walk through savage solitudes. Not so, apparently, to Harold. 'I hate wandering about these streets,' he said; 'to-morrow we'll have a decent walk.' Joyce thought she might have been consulted about that.

'We always dress for dinner,' said Mrs Brander when they came in, 'but we won't to-night.' Odd, thought Joyce, how she used the word 'always.' In Mrs Lessing's ménage you did not do things 'always.' Sometimes, 'any old time,' you did all sorts of things, but nothing 'always.'

Dinner was a rather trying meal of consciously sustained conversations. Only one item remained in Joyce's memory. It was when Mrs Brander asked her if she had had a comfortable journey.

'Oh, splendid,' said Joyce; adding guilelessly, 'mother made me go first class.'

'We always go third,' said Harold's mother. 'Really, the third is so comfortable nowadays—'

Again, with nothing said, Joyce felt that she and her mother stood rebuked.

VII.

After dinner they sat in the library and continued the sustained conversations. Joyce found the struggle getting more and more difficult. There seemed no prospect of Mrs Brander's going to bed and leaving the betrothed together. Was this tactlessness, Joyce wondered, or malice aforethought, or simply the practice of an older school? She felt herself dropping asleep, and grew weary of swallowing enormous yawns. She got up. 'If you'll excuse me,' she said, 'I think I'll go up now. It's past ten.'

Harold fidgeted. Mrs Brander's voice made its dispassionate reply. 'We never go to bed till eleven.' Again that chilling rebuke, unexpressed but painfully implicit.

'You'll excuse me, anyway?' Joyce said with an attempt at a smile.

'Oh, certainly, my dear,' said Mrs Brander; and 'Of course, of course,' said Harold, and got up to open the door for her. But Joyce felt that translation was needed. What Mrs Brander had really meant was, 'If a guest in my house chooses to indulge in such extraordinary practices, what *can* I do but excuse her?' And Harold's gruff 'Of course, of course,' could be rendered 'This is a let-down, but if you won't play up, you won't.'

What would Charlie have said? 'Time for a little shut-eye? Righto! You toddle up

and hit the hay, and pleasant dreams and all that.' Dear Charlie!

Up in her magnificent bedroom, Joyce reproved herself for these malicious thoughts. Harold was as splendid as ever; and yet—and yet—in this house he was somehow different. He was hers; but—but was he really hers or his mother's? Could she live up to this rigid code, this 'always'? . . . What was Charlie's mother like?

Brushing out her hair, Joyce wondered why she kept thinking of Persians; all the evening the word had been wandering into her mind. Had she seen a Persian cat? No, it wasn't that. Persian lamb? No . . . Ah, this was it—Medes and Persians. These were the people in the Bible or somewhere who had laws—laws that you couldn't alter. Never.

'Always.' . .

VIII.

Joyce woke in the morning late, and still sleepy. Sometime in the night a servant had knocked at the door and said 'Seven-thirty, please'; but Joyce had paid no attention. That happened regularly at home—except that the Lessing maid said 'eight-thirty'—but it was understood to call for no action. You went on sleeping till you really woke, and then called the servant again for fresh tea or fresh hot water or whatever it had been. Joyce adopted this procedure now, discovering a camouflaged bell with some difficulty. After an interval the maid came.

'Bring the tea now, please,' said Joyce.

The girl had a very pleasant Scottish face, but her expression was blank. Joyce was conscious of a terrible *faux pas*; in this incredible household, evidently, 'we never' had early tea.

'Tea, miss?' said the maid, gathering her forces after the shock. 'Please, miss, breakfast's ready. It's ten past eight.'

'Gracious!' said Joyce, with an attempt to cover her failure. 'I'd no idea it was so late. You'd better turn on the bath.'

The girl vanished, and Joyce struggled out of bed. It was ten past eight—nearly the quarter. And she had a vague recollection of having been told overnight that breakfast was at eight-fifteen. It had seemed too bad to be true.

'Oh well,' she reflected, 'I can't do it now. As well be hanged for a sheep as a lamb. I may as well have that bath.'

She had it—while a loud gong roared vindictively downstairs. But back in her room, while she struggled with clothes which were all somehow inside-out, there came a knock at her door. Mrs Brander's calm accents made themselves heard.

'Are you all right, my dear?'

'Perfectly, thanks,' gasped the guest; 'I'll be down in one minute.'

'Very well,' said the voice cheerfully; 'we'll wait for you.'

'Please don't,' said Joyce, but the voice was gone. Joyce knew with certainty that there was another black mark scored against her—that Mrs Brander had had to come upstairs because, unless in case of serious illness, 'we always' came down in time for breakfast, and expected 'our' guests to do the same. And Joyce wasn't at all ill. . . . Joyce loved the process of dressing—leisurely, with due attention to hair and nails; her present hurried toilet sent her down in a sulky temper.

Harold's greeting was kind, but he looked distressed. His eyes said, 'You've let me down again.'

'I'm afraid the sole is overdone,' said Mrs Brander. 'But we're later than usual.' Another veiled rebuke!

IX.

'What a lovely day!' said Joyce. 'I'm going down Princes Street immediately. I'm longing to see the Edinburgh shops, you know.'

There was a slight silence; instantly Joyce knew she had blundered again. She had collided with some pre-arranged programme.

Harold fidgeted, with that apologetic squirm she was coming to know. He looked sideways at his mother. 'I suppose we might do a little shopping?'

'Oh certainly, certainly!' Mrs Brander's voice was as devoid of definite expression as ever. 'Whatever Joyce likes.'

'Not—not if there's anything else,' floundered Joyce.

There was. Harold took her by bus to Lothianburn, and they walked round by the Stevensonian Mecca of Swanston and through Colinton Dell to Slateford. The route is by no means level, and though Harold was evidently holding in his strides, he had Joyce breathless more than once.

'You're not in training,' he said kindly. 'Never mind, you'll soon get into it.'

Joyce cast a downward glance at her light flimsy shoes—which would never be the same again. Her right foot was hurting cruelly. Would Harold expect her to keep 'in training,' if—*when!*—they were married? Manifestly, yes.

'You want some sensible shoes, you know,' said Harold, following her glance.

Sensible shoes! It would be sensible clothes next. Joyce was conscious that the keen wind off the Forth had been blowing through something very thin; but 'sensible' garments—never!

The morning having gone according to plan, Joyce was rewarded by a tranquil lunch. She thought she made headway with Mrs Brander, but at the close of the meal she was undeceived.

'By the way, Joyce dear,' said Mrs Brander in her smoothest tones, 'if you take the paper out of the library you might put it back there. We always keep it in the library till it goes down to the kitchen. If it's taken, out the servants don't understand.'

Joyce had a guilty vision of a huge chair in the drawing-room suddenly vacated at Harold's summons, and of a *Scotsman* treated *à la* Lessing; that is to say, reduced to its component sheets and distributed variously about the floor. She flushed with mortification.

The day went on—according to plan; the Princes Street shops remained unvisited. But there was a little, significant incident at tea. Harold had passed in his cup to be refilled.

'You've had your two cups, dear' said Mrs Brander.

'Oh well, then—' said Harold, and drew back his cup, and finished his cake dry.

'We always have two cups,' thought Joyce, and restrained a giggle with difficulty.

A MERRY BIOLOGICAL CHRISTMAS.

By JAMES DRUMMOND, F.L.S., F.Z.S.

IF bright flowers symbolise joy, New Zealand's two brilliant wild flowers, the pohutukawa and the scarlet mistletoe, are consistent with this season, in which they are at the height of their glory. According to the floral time-table, they should bloom through December and January. The dates are not strictly observed, but it is a very unusual season when they are not at their best in Christmas week. Early colonists named the pohutukawa the Christmas Tree. Although it has the clearest claim to the title, its Maori name is more in favour. The flower's glorious colour is supplied by scarlet stamens. These light up trees seventy

feet high, with massive, spreading branches, which often stretch out over banks and sea-cliffs, and steep the blooms in the water below.

New Zealand's characteristically gloomy forests are relieved in the spring by the pure white flowers of the clematis and by the golden drops of the yellow kowhai, which has been nominated as the Dominion's national flower. The scarlet mistletoe flames amongst forest leaves at Christmas time, more conspicuously in dark beech forests than anywhere else. Sentiment, which played an important part in the colonisation of New Zealand, led to the introduction of the English mistletoe. As it

has been acclimatised in only a few private gardens, kissing under it is not general in New Zealand. Apart from the scarlet mistletoe's auspicious time for blooming, it has no particular sentimental association to the New Zealand public. To most New Zealanders, it is merely a scarlet parasite, to be admired for its vivid beauty only. To gray-haired New Zealanders, who knew William Colenso, however, *Loranthus Colensoi* is the badge of an old missionary and botanist. He loved New Zealand flowers, and was loved by the settlers and the Maoris of his generation, and his memory, for many reasons, should not be a fading flower.

It is strange that Charles Darwin, after spending Christmas week in New Zealand ninety years ago, and attending Christmas service in a little missionary chapel in the Bay of Islands, mentions in his diary neither the *pohutukawa* nor the scarlet mistletoe, nor any other mid-summer wild flower. In front of the settlers' cottages he saw roses, honeysuckle, jasmine, and hedges of sweet-brier. The stately *kauri-pine* and the bracken fern are the only native plants that attracted his notice. The young naturalist—without pay—on *H.M.S. Beagle* saw New Zealand through a glass darkly. The scenery nowhere was beautiful to his eyes. 'In many places,' he wrote sourly, 'I saw several species of weeds, which, like the rats, I was forced to own as my countrymen.' He accepted the presence of the common dock as evidence of the rascality of an Englishman who sold dock seeds for seeds of the tobacco-plant. This explanation of the dock's introduction to New Zealand, probably, is apocryphal. At the time of Darwin's visit there was enmity between the missionaries and the traders, and Darwin, who was friendly with the missionaries, seems to have had the story from them. More feasibly, the dock, like the Scottish thistle and many other British weeds, came to New Zealand without design, a concomitant of the European coloniser.

In New Zealand, Christmas is the time of the singing of birds. Their plumages at this season are bright, their singing notes particularly sweet. Many nests are completed in September and October, and in November they contain complements of eggs. Owls and petrels are the waits who, on Christmas Eve, announce the

approach of Christmas Day. The common morepork owl is a forest bird. Its *whoo-whoo* is boding, but few sounds, to New Zealanders' ears, are more pleasing. Some petrels laugh mockingly as they fly overhead at night. The black petrel—as black as night itself—has a note that seems to combine a soft whistle with a deep whirr coming from the bottom of a husky throat, a loud and rasping note, utterly unmusical. Bellbirds, tuis, and other melodists on Christmas Day, from exquisitely-tuned throats, send forth a wild bewildering carol, long before a church bell has chimed, or a single human voice has sung 'O come, all ye Faithful.'

From trees and shrubs, when the sun shines on them, stridulating male cicadas fill the air with a loud monotonous drone. It is loudest in the middle of the day, when the birds usually are silent. This chorus, falling and swelling, sometimes is the only sound that breaks the cloister-like stillness of the forests. It symbolises dreamy inertia. It begins feebly before the Lady of the Light has touched the cicadas' habitations with her rosy fingers, and continues until the owls begin to hoot in the twilight. As the little instrumentalists are invisible, the sound seems to come from the leaves. Each tree is a singing-tree, like the singing-tree in the *Arabian Nights' Entertainments*. When Princess Perie-yadeh tried to please the Emperor of Persia, she conducted him to a tree, where he heard a concert different from any he had heard before. 'My daughter,' he said, 'where are the musicians whom I hear? Are they underground, or in the air? Such excellent performers will lose nothing by being seen; on the contrary, they would please me the more.' He went nearer, and was so entranced by the sweet harmony that he could never have been tired of hearing it. 'Sire,' the princess said, 'this tree is no other than the singing-tree; its history is connected with the golden water and the speaking bird.'

Christmas is the brightest season of the year under the Southern Cross. It is a fecund season, in which Nature throbs with life, a season for liberation from the prison-walls of shell and chrysalis to free and joyous days in the sunshine and the fresh air. Biologically, it is the merriest of all possible Christmases.

OTHER PEOPLE'S WINDOWS.

PART III.

VIII.

THE Crystal Express covered a great deal of ground and got through a tremendous amount of work that day. The labour-saving qualities of the new polisher had not been exaggerated,

and stood them in good stead. It was late in the afternoon before George could find time to visit Alderman Carfax at the big drapery establishment, but as business took 'Little 'Enry' in the vicinity of Bank Street, he was able to make the call with a minimum loss of

time. George had previously decided not to have the alderman canvassed until the Crystal Express was actually on a working basis.

A uniformed commissionaire, with obvious misgivings, directed George to the private office, and for his trouble received a tip which rendered him almost speechless. Muttering apologies, George wended his way through groups of fashionably-dressed ladies at long counters, and at last reaching the door marked 'private,' thrust it open and entered without ceremony.

'Good afternoon, sir,' he greeted, as Mr Carfax emerged from an inner and even more private office. 'I hope you'll excuse my abruptness, but there's something about a drapery establishment that unnerves the average man.'

The alderman ignored the greeting and removed his cigar. 'Well, what d'you want this time?' he asked grimly. 'If you've come to talk about Anne, you're wasting your time. That subject is closed, and likely to remain closed, so I should advise you to go to the pictures or something. I'm busy.'

George laughed. There were moments when he felt a sneaking regard for the irritable old man.

'There's another thing,' went on the alderman, angered by this unseemly mirth; 'I'll thank you to keep away from my—'

George interrupted him with upraised hand. 'Some other time, sir,' he said politely but firmly. 'I appreciate the honour you do me in discussing your private affairs with me. If my advice and sympathy can be of service to you, it is yours to command, but—some other time; this is my busy day. I have six busy days a week. I'm in business, you know.'

The older man was not without a sense of humour. His quick bright eyes travelled from the check cap in his visitor's hand, over the blue overalls, and finally to the young man's face. He smiled grimly. 'Burglary?' he inquired.

George started. 'Window-cleaning,' he answered coldly. 'I called to see if you would give me the contract for your shop.'

Alderman Carfax hesitated. He suspected that this window-cleaning, of which he had heard rumours, was an elaborate practical joke, of which he would in all probability turn out to be the ultimate victim. 'No, you can't,' he said at last. 'The windows are cleaned by my assistants.'

George smiled in a superior manner. 'A shop assistant is a shop assistant. Window-cleaning is a profession in itself—a separate art,' he declared, and proceeded to give rein to his imagination. 'We are expert window-cleaners; we have studied the subject from every angle, and read every manual ever written about window-cleaning—at all events I suppose

our Mr Green has read them. Our unique knowledge of the theory of window-cleaning, combined with many years of actual experience—our Mr Green has been cleaning windows for quite a long time now—has enabled us to bring this industry down to an exact science. The Crystal Express Window Cleaning Company, sir, positively guarantees speed, efficiency, and the absolute minimum of inconvenience to its customers. You simply cannot afford to clean your own windows, sir.'

Alderman Carfax eyed the flushed and slightly breathless George with reluctant admiration. 'A few weeks ago,' he said, removing his cigar, 'you didn't know the difference between cleaning a window and swilling a backyard. You didn't know whether windows were cleaned with a scrubbing-brush or a bar of soap and a towel, and now you pose as an authority on the subject—you stand there making speeches. I like your impertinence.'

George grinned. 'Quite right, sir,' he admitted cheerfully. 'One doesn't need to be an expert to clean windows or anything else with the crystal cleanser. It's wonderful stuff, and you'll hear more about it shortly. Possibly this list will induce you to give us the contract for the shop. Anyhow, it will prove to you that our business is a serious one.' He thrust his hand into an inside pocket and produced a crumpled sheet of paper. 'Just listen to this, sir; the cleaning of every window in the Empire and Paragon Mills has been entrusted to us. We have also been successful in securing several valuable municipal contracts. The Town Hall, the Public Library, and both the Council Schools. In addition to numerous private residences—your own amongst them—we are sole window-cleaners to St John's Church, St Mark's Church, St Mary's Church, The Farmer's Arms, The Red Lion, and the Vegetarian Restaurant in Bank Street.' He paused for breath, and then added impressively, 'Much of this is stained glass work.'

The alderman resumed his cigar. He was beginning to conceive a certain respect for George. 'So you are this Crystal Company I've been hearing about, eh? Well, look here, young man, you say my daughter let you clean the windows at home. I'll ask her to report on your work this evening. If she is satisfied, you can start on the shop windows.'

'We have already taken that liberty, sir. My partners set to work on the outside of these windows before I came into the office. Perhaps you will be good enough to inspect their work for yourself. There will, of course, be no charge—this is a free demonstration.'

IX.

From being rather silent and apprehensive about the window-cleaning project, old Mitchell

Berkley had suddenly become boastful. He discussed his son's plebeian business, and bragged to all and sundry about the flourishing condition of that business, until all but his most intimate friends began to avoid him.

'I knew the boy had it in him,' he said to Alderman Carfax one evening at the North-towers Social Club. 'He needed wakening up, that's all.'

The other smiled grimly. 'Somebody appears to have wakened him up pretty thoroughly,' he commented; and then added, after a slight pause, 'Wonder who it can be?'

The proud father winked heavily. 'Between you and me,' he said, lowering his voice to a confidential whisper, 'I think he's interested in some girl—there's usually a girl behind sudden transformations of this sort.'

The alderman did his best to appear politely incredulous. 'No, really?'

'Good thing, too,' went on Berkley senior, 'if only she's the right sort of girl. Marriage made me.'

'And me,' responded Alderman Carfax, his hard-lined face softening suddenly.

'By the way, how's your Anne keeping these days? It seems ages since I saw her. Little thing with a long plait and a big bow. Getting quite grown up now, eh?'

'Anne's quite well, thanks. We'll both be pleased to see you any time you like to call round.'

After a short silence Mitchell Berkley returned to the original topic. 'Between you and me, this window-cleaning is only the beginning,' he declared, becoming confidential again. 'If you knew the next move these three boys are contemplating, you would be surprised.'

Alderman Carfax smiled dryly. 'It is to be hoped they aren't surprised—unpleasantly so.'

X.

Later the same evening, Alderman Carfax surprised his daughter by voluntarily mentioning George's name in her hearing for the first time since that fateful Wednesday afternoon when he had practically ordered the young man out of the house for ever. Not only did the alderman mention the name—he even spoke of its owner with a certain guarded magnanimity. Belated enthusiasm of this sort is often infectious. It suddenly occurred to Anne that now George was making a serious and, from all accounts, successful attempt to justify his existence there could be no further objection to their friendship being resumed on the old footing.

When 'Little 'Enry' called again, Anne, looking even prettier than usual, contrived to be at the front gate, and George received a smile that made his heart race. He merely touched the peak of his cap and wished her a deferential 'good morning.' Evidently there

was no room in George's life for anything but window-cleaning. Damped by this unpromising attitude, Anne returned indoors, and waited patiently for that moment when, the work finished, the workman would be ready to receive the price of his hire. At last came a deferential tap at the side door. Anne hurried to answer it herself, anticipating the servant by inches only.

George was waiting, cap in hand.

'Well, Mr Crystal, how do you find business?' she asked with a rather nervous laugh.

'Can't grumble, miss,' he answered, with the ingratiating smile of a very small tradesman.

Anne lost patience with him suddenly. 'Oh, don't be ridiculous, George; this nonsense has gone far enough, surely?' George maintained an inscrutable silence. 'It is a long time since you came here as a friend,' she said softly.

He shuffled uncomfortably and looked down at his feet. 'Ye—es, we're awfully busy,' he answered, without looking up.

With a great effort, the girl refrained from boxing his ears. 'In that case, I'd better not keep you,' she said coldly.

'Will you please examine the windows, miss?'

'Your work is always satisfactory,' she told him in the same tone.

That evening Alderman Carfax persisted in discussing the activities of the Crystal Express Company. Anne's silence was so complete that at last her father began to suspect that there was something deeper than mere lack of interest in the subject of his conversation. On making a more or less tactful inquiry he was informed that George and all his works had ceased to interest her in the least.

'He used to be human once, but now he crawls, literally *crawls*.'

'He must save that attitude for the suburbs,' declared her father; 'he's curt enough when he calls at the office to be paid for the work at the shop—our agreement is weekly. He takes the money as though he had done me a personal favour. I must admit that our windows look better than they have ever looked before, and they are so quick with the work—get the job done in no time. I suppose he isn't likely to be—er—calling round here at any time, Anne?'

Anne lowered the magazine she was pretending to read and looked straight at her father. 'Have you invited him to call?' she asked calmly.

'Me invited him! Certainly not!'

'Then it is most unlikely that he will be calling here at any time.'

XI.

The following Wednesday afternoon 'Little 'Enry' was rolling majestically along High Street, when a sudden commotion among the pedestrians on the sidewalk attracted the atten-

tion of George and his companions. People everywhere were gazing northward and speaking excitedly. Many were pointing animatedly, and not a few were running. Away to the north a cloud of thick smoke was rising, column on column, into the blue heavens. The fire, which had evidently obtained a good hold, seemed about two miles away.

'It's the Mayflower Mills!' shouted George in a voice sufficiently loud to be heard above the roar of 'Little 'Enry's' engine. Then came the quick piercing clang of the fire-bell. 'Either the engines have been detained, or the fire has spread with amazing speed. One of our best customers, too. Listen, you chaps. Let's go. We might be of some use down there; it's hardly likely, but one never knows.'

The other two assented unanimously, Mr Green pointing out that the Crystal Express possessed some good long ladders, and Mr Kemp remarking that, for all he knew to the contrary, the great polisher might be capable of earning further laurels as a fire extinguisher. Deciding to cut through the suburbs and avoid the congested traffic of the busy thoroughfare, George turned out of High Street and then increased his speed. This route led them past Acacia Avenue, and just as they were approaching the scene of George's first commercial inspiration, a little hatless figure turned the corner and went speeding along the sidewalk ahead of them. It was Alderman Carfax, his coat-tails streaming out behind him as he ran. The alderman, as George well knew, was financially interested in the Mayflower Mills.

'Extend yourself, 'Enry!'

'Little 'Enry' extended himself gallantly. With creaking ladders and rattling pails he fled along the road like a regular fire-engine, but the Mayflower Mills were never reached. His burst of speed was short-lived. Hardly were they past the Avenue when George felt a sharp tug at his shoulder and heard an excited voice in his ear.

'Fire!' cried the voice of Kemp.

'I know,' George retorted irritably, without turning.

'In Acacia Avenue,' Kemp shouted back.

'Didn't you see the smoke? Turn back!'

XII.

That disaster which Alderman Carfax's daughter and servants had been predicting for years as the inevitable result of carelessness with matches had chosen this inopportune moment to fall on his house. When news of the fire at the Mayflower Mills was communicated to him over the telephone, the alderman had been lighting a cigar. Without troubling to remove the cigar, and with the match still burning in one hand, he took up the receiver in the other. Alderman Carfax had shares in the Mayflower Mills, and he never

waited to see where the match fell. Possibly there was, somewhere at the back of his mind, a subconscious belief that he had extinguished the match the moment its purpose was served. But his waste-paper basket was burning merrily even as he slammed the door behind him; smoke was curling out through the open window before he had rounded the corner of Acacia Avenue.

Anne had gone up to her bedroom and was looking pensively at a certain photograph, when a vague uneasiness began to trouble her. She hurriedly put down the photograph and rose from her chair. She was about to move to the window, when a choking cry outside brought her to a standstill. Then a fear-crazed servant flung open the door, shrieking that the house was on fire and that the whole of the lower floor was in flames. The acrid cloud of smoke which followed the girl into the room lent colour and odour to her not unpardonable exaggeration.

Anne acted promptly. 'That's father,' she said severely. 'Into the lumber-room with you, Martha! We can get onto the roof from there.'

The two girls fled up the stairs into the attic, and after some trouble with the heavy trap-door, which was reached from a chair placed on the top of a slightly insecure table, crawled through to the roof. George had experienced some difficulty in turning 'Little 'Enry,' and owing to this delay the two girls emerged from the trap-door just in time to see the Crystal Express Window Cleaning Company take the corner on two wheels.

'Mostly smoke, I think,' George shouted, as 'Little 'Enry' drew up with a clatter in front of the house. 'There's two girls on the roof. You get the pails down, and I'll get the long ladder into action.'

Fortunately, the writing-table was in the centre of the room, isolated from the rest of the furniture. While George was mounting to the roof, intent on a spectacular rescue, Mr Green and the intrepid inventor, a pail in each hand, had smashed the window and gained entry into the house. In a short space of time an almost continuous stream of water was being applied to the flames. Then the ingenious Mr Kemp had the idea of smothering the whole of the table in the thick carpet, which was hurriedly taken up and saturated. This proved entirely effective, and a few minutes later a pale but perfectly self-possessed young woman was thanking her rescuers.

In the afternoon of the following day, Alderman Carfax, hatless and wearing a black alpaca jacket, emerged from the magnificent main entrance to his shop and strode up to a young man in blue overalls and a check cap, who was cleaning a huge plate-glass window. 'When are you coming round to see us again, George?' he asked in a voice of constraint.

'We are very busy, sir,' the young man answered apologetically.

The alderman nodded submissively. The incidents of the previous day had robbed him of his customary belligerent self-assurance. 'Anne told me to ask you if you'd come,' he further explained.

'What about you?' asked the window-cleaner.

'Well, I'm asking you, aren't I?' he explained, with a touch of his old irritability.

George's eyes sparkled. 'Thanks; I'll be glad to come. Will to-morrow evening be convenient? I'd like Anne's opinion on some publicity matter I've been getting out for the new crystal cleaner. A woman is a better judge of such things than any man.'

THE END.

'BRUMBIES.'

By F. W. ALLEN.

THIS is the name by which Australia's wild horses are known. They are descended from the stock which came from the United Kingdom, India, Cape Colony, and Timor. The first-mentioned supplied thoroughbred blood, also pure Clydesdale and Shire animals, while India gave Australia some very fine Arab stallions. Cape Colony, being handier, provided Australia with useful grades for riding purposes. From Timor came many specimens of the diminutive thoroughbreds in the shape of Timor ponies.

The horse was one of the principal means by which settlement in the early days was made possible, and, as this progressed, riding animals became valuable, agriculture not having come upon the scene in what was known as the back-blocks. With immense open spaces extending for hundreds of miles without fences and with ample feed and water, occasionally animals escaped, and in this way formed wild or 'brumby' mobs, which consisted of mares and one lord of the harem. Bushrangers always stole the horses they required, which invariably were the best blood obtainable. Of these some escaped, others were discarded, and many joined the 'brumby' mobs. Directly the male foals in these mobs were a year old they were banished by the leaders. When travellers with riding-horses, or over-landing drovers who were opening up new country passed by the locality where a wild mob was known to graze, they had to keep a very sharp watch at night-time over their mares, otherwise the lords of the harem would come along and drive them off to their new homes, and that was the last their owners would know of them.

In this way some of the best foundations of Queensland's wild mobs were laid after the year 1840. It was remarkable how many of those wild mobs remained true to type and colour. In one that I knew well the piebald and skewbald colours predominated; while another had a majority of creamies, owing to circus animals having escaped at different times when travelling. Roan was another distinct colour; so was chestnut; and one fine large mob was composed

of bays and browns, showing a pronounced thoroughbred strain.

As regards the last mob, instead of having them shot down and exterminated for their hides and hair, the settler who squatted on their country turned them into an asset in another way. He was a young Highlander, born in the vicinity of Inverness, where he had become an accomplished rider and a splendid judge of horseflesh. Directly he had secured the license to occupy about a hundred square miles of this fine grazing land, his new home, he quickly located the above-mentioned mob of 'brumbies,' which, with the marsupials and emus, owned it. Noticing that the majority of them were thoroughbred animals, he captured two or three of the young ones, broke them in, and found that they were splendid animals to ride upon after stock. Thereupon he made up his mind to capture the lot. By degrees he had a ring fence built around their main haunt, where they were practically made prisoners, but not otherwise disturbed except when certain individuals were purposely shot to improve the mob.

It was not long before the settler's clips of merino wool had to be carried by teams to the nearest seaport, two hundred miles away. For obvious reasons oxen were principally used, one being the cheaper upkeep of equipment. Young Roderick at once decided to change his teams at the first opportunity. Fortunately he managed to obtain a good stamp of a stocky draught stallion, which was turned out among the wild mob. In a few years he had sufficient fine active draught animals to equip four teams, by which all of his wool and produce were quickly transported to the coast and station supplies brought back. From that day he never once looked back, and he became one of Australia's successful pioneers. In the meantime railways have been built, one of which runs close to pretty Terrica, whose fleets of motor lorries and cars have taken the place of the horse-teams and changed the time of transport from weeks into hours.

Recently, in another part of Australia where settlement is increasing, the manager of a large station decided to brand the young horses graz-

ing on it. The time was considered opportune owing to the effects of a drought, which had dried up much of the surface water, and on one corner the whole of it, the two mobs of 'brumbies' there being forced to drink at troughs, which were kept filled by a windmill from a well or bore. The animals were as fleet as deer over the rocks and stones, and defied all efforts of the stockmen or cowboys to yard them. To overcome this difficulty a strong yard, with two smaller ones adjoining, was quickly built of young trees (saplings) around the troughs, with but one main entrance, over which a strong trap-gate was suspended. Through this gate the thirsty animals were allowed to go undisturbed for a few nights, after which a trained scout was hidden at dusk one evening, whose duty was to pull the wire which would release the bolt and let the gate drop.

It was a beautiful moonlight night, so the remainder of the horsemen had to hide inside a scrub or jungle nearly a mile away. The silence was intense; they could hear the beating of their hearts, when presently came the Australian Coo-ee vibrating through the resonant night air. This time it was the signal of success. Horses were quickly mounted, and they raced to the yards,

where the members of one mob were prisoners. These 'brumbies' made frantic efforts to get out, but failed, and were driven by stockwhips into one of the smaller yards and locked in. The trap-gate was once more set, and riders and horses returned to their hiding-places in the scrub. While patiently waiting here they had time to watch the rocket flights of the luminous fire-flies around them, and enjoy the serenades of the curlews close by, till once more Coo-ee was heard. Again the sure-footed steeds carried their riders safely to the yards, to find another mob trapped. At daylight all hands were eager to inspect the 'brumbies,' and recognised several outlaws that were familiar to them.

After an enjoyable breakfast of corned meat, damper, and billy-can tea an anxious but busy forenoon followed, resulting in the pick of the young animals being drafted into a small yard. The remainder were branded and liberated. After the picked animals had been handled sufficiently, and the short lengths of green hide properly placed on their front feet, the captives were safely yarded at the head station to become properly broken in—a fine addition to the working plant of a very large cattle station.

MEMORIES OF A SCOTTISH SALMON-RIVER.

PART II.

VI.

'MAY 10, Sunday, &c.,' was a day of storm and rain. Miniature cascades showed white threads of water on the hill-sides, and indicated the certainty of a spate. On 'May 11, Monday, &c.' the river was up, surging and foam-flecked, and our boat too high to fish, though we did try it for a short time in the evening. 'May 12, Tuesday. 1 (12½ lb.)' calls for little comment. That was the fish that played normally, without exciting incident. On May 13 the 11½ lb. came within a few minutes of my beginning to fish the first pool. He came in a deep, swirling stream, just below where the whole river, confined between two rocks, comes roaring down a fall, where, as Arthur Clough puts it:

... over a ledge of granite
Into a granite basin the amber torrent descended ...
Beautiful there for the colour derived from green
rocks under;
Beautiful most of all, where beads of foam uprising
Mingle their clouds of white with the delicate hue of
the stillness ...
Cliff over cliff for its sides, with rowan and pendant
birch boughs.

Those words will, I am sure, awaken memories in the hearts of most fly-fishers, even of those in whom a public-school education of the early-Victorian type has caused an unfortunate aversion to the use of hexameters.

But let us return to that 12½ lb. that proved, on closer acquaintance, to be the most beautiful and gracefully made, small-headed, bright, silver-sided fish which it has ever been my good fortune to land. When 'he' came I was perched upon a rock near the head of the pool, to which stand I had dropped from a shelving ledge above. The fish worked down-stream, so I handed the rod to the gillie to hold while I negotiated the overhanging ledge. He left me in order to follow the fish. Having a rather badly disabled hand, I failed in my climb, and remained helpless over the deep swirling torrent until he came back to me, letting out line. The gillie gave me a helping hand while he played the fish with the other, and then he returned the rod. The fish kept very deep in the water, nearly the whole of the seven-foot cast of gut being submerged, and he 'jigged' excruciatingly, but was landed at last.

The rest of the day was blank. So was the whole of the next day, sufficiently described in the diary as 'May 14, Thursday. Hot sun. Hard sky, &c.' Then came a great experience, a day in a thousand, when sky, light, weather, and water were all in our favour, and fish came well throughout the day. 'May 15, &c.' (See diary.) My three fish (out of the eight that were borne across the long expanse of heather to the road) gave many thrills in the

playing. So did one from which the fly came away after a long struggle. There was a strong wind, so I 'backed' the pools, instead of fishing down-stream in the usual way. 'Backing,' of course, means casting at the bottom of the pool, down and across, and then walking slowly up the bank until the fly is on one's own side, and so on, *da capo*. Sometimes the most deadly procedure with an up-stream wind; and is it not written in that delightful little seventeenth-century pamphlet signed 'G. M.' for Gervase Markham, and called *The Young Sportsman's Delight and Instructor in Angling, Fowling, Hawking, Hunting, &c. &c.* (whereof the published price was sixpence, and the price paid for a copy at a sale in the year of the war 1916 was £57, 10s.) that 'Salmon bites best about 3 in the afternoon, especially from May to September, and when the water is clear, and a little wind, and the wind bloweth against the Stream'?

We had to leave the river early, or we might have made a bigger score. Personally, I was ready to leave, having had a grand day's sport, and both tops of my favourite rod having been broken—one by myself, by laying it carelessly down on the ground when running to see a particularly beautiful fish that had just been taken out in the net; the other top broken by someone else, who was trying the casting-power of the rod. I had had a really good day, and 'too much is enough,' as the Frenchman said when incited to help himself a third time to a favourite dish. And that takes us to the last day. 'May 16 (Saturday). Blank. Tremendous battle with very big fish, &c.'

VII.

Readers who have followed me so far in this recital may have noticed that a somewhat similar incident on May 7 has not been enlarged upon. I thought that one tragedy was enough. To have described two would have overloaded my account with a weight of gloom, and so given a false general impression of the happiest and most light-hearted fortnight in the experience of a lifetime. Figure to yourself a persistently hopeful angler fishing down a deep streamy run near the head of an open pool. The casting easy, from a low bank of pebbles which gave a good foothold. The opposite bank a miniature cliff of clay, topped with heather, and intercepted at one spot by an agricultural drain, of which more anon. Deep water under the bank, and a good steady stream to pull the fly. All other conditions adverse. Water considered too low for this particular spot to hold taking fish. A borrowed rod, to which I was unaccustomed, and a necessity to use trout-gut ('stout lake') and a very small fly.

Well, to cut the recital as short as possible, 'he' came, half-way down the pool. He came gently, just showing a fin and a broad back. Then followed ten mad delirious minutes, the

climax of many years of fly-fishing experience, and a supreme summit of adventure. It is not possible to describe all my impressions of the movement of that great thing beneath the water that were crowded into those few minutes of wild, but firmly repressed, excitement. A steady, rapid, irresistible procession to the pool some way above, spray spouting up from where the cast cut the water against the stream. A long run down-stream to the next pool below the one of hooking. A desperate effort to haul the head of the great leviathan out of the strong stream, where he found his strength, into a still back-water which might exhaust him, and the fear of putting an excessive strain upon the tackle. The feeling of helplessness on gaining no control whatever over the situation after what seemed to be long ages of conflict, but with it complete certainty of ultimate success, as the great fish was obviously well hooked, and I had no difficulty in following along the bank and keeping the rod up and level with him. What seemed to be a few years of anxiety followed, allayed by that feeling of confidence. Then the fish bored steadily up-stream, so close to the opposite bank that his side seemed to be rubbing along it, until he came to the spot where the agricultural drain entered the river. There the line seemed to stop, but curiously. It seemed to stop before the fish did, and the strain was no longer alive, but steady. I eased the line at once, thinking that the gut might be round a sunken snag. A despairing glance over my shoulder at the gillie told me that he was taking off his boots and socks, and turning his nether garments up to the thigh. He went down to a shallow run below the pool, taking the landing-net, and waded across. Came up the bank to the fateful spot, and reached out the net-handle to clear the line. It was round a sunken tree, probably washed down that drain in the last flood. Was the fish on?

I eased the line further to aid the gillie in clearing the gut from the tree, laid the borrowed rod down very gently on the pebbles, and sought a convenient seat on the heather, where I sat for some time, head in hands, pondering over my past as a fisherman, and thinking that, as such, I could have no future. Ichabod! By a curious mischance that tree was lying at an angle that caused the gut inevitably to slide down it and become fast, as it still was. The great fish had bored his way onward up-stream, without showing and without giving any indication of the break-away. When it occurred I do not know. Within half-an-hour I was fishing another pool, with keenness fully restored.

On my return to the Lodge, I visited, elsewhere, the stuffed corpse in a glass case of the heaviest fish ever taken in the river. Having ascertained privately (from the daughter of the house) that that fish weighed 45 lb., I sought

out its taker, and told him that I had just lost one of 46 lb. I told him the whole tale afterwards, but let us leave my (?) fish at that weight. It will serve as well as any other.

Such are the vicissitudes and the ups and downs of May salmon-fishing in the North of Scotland as I have known it. Treasured memories of every incident are recalled by the mind during the long journey southwards.

They will remain in the heart for years. And so we arrive, rejuvenated and ready for a strenuous spell of work, at the point from which we started. 'Euston Station. Early morning. . . . Echoing the sounds of awakening London; the braying of motor-horns, a babel of voices, and the roar of distant traffic.'

THE END.

THE CONVOY.

By ALEXANDER BIRD.

I.

'THE Spaniards are a nation of brigands,' said Sergeant Millefeux one night.

He was sitting in his accustomed place, in the Café Napoléon, and the talk had drifted—as it generally did when he was present—to the great days of the Empire.

'You can fight an army,' continued Sergeant Millefeux, 'for an army is something you can get hold of; and even if you lose your battle, at least you have had a chance, and that is always a satisfaction. But those Spanish guerillas never gave us a chance. They would shoot at us from behind rocks and trees where we couldn't see them. We only saw the puffs of smoke and heard the bullets whizzing past our ears, and when we rushed forward—pouf, they were gone, just as if the earth had swallowed them up. And then, while we stood wondering what to do next, the bullets would begin to whizz again, and men would fall down dead or wounded. Ah, the brigands!'

'Unhappily, the brigands are not all on the south side of the Pyrenees. There are one or two in France, for instance. It was one of those who nearly got the better of me when I was in charge of the convoy of silver. When I feel the sun rather warm, as it is sometimes in the summer, it always makes me think of the hot sun of Spain and of that day, thirty years ago, when I was a strong man and had charge of the convoy.'

'The silver was for the pay of the garrison in Trinidad, and it was all packed up very snugly in nine wine-casks. We had three wagons—those clumsy Spanish country carts—and there were three barrels, full of the silver, in each cart. Each of the wagons was drawn by four mules—obstinate, bad-tempered brutes they were, too, though, after all, it was not their fault, for they had been brought up in Spain all their lives, and had never known anybody better than those rascally Spaniards.'

'I had twenty-five men to escort those wagons and all that silver from Madrid to Trinidad. It was far too few, of course, but the French in those days had been doing the impossible

for so long that they couldn't break off the habit. Besides, the wagons were piled with hay, so it was thought that no one would know anything about the treasure. Anyone who saw us would fancy we were conveying forage to the next post. Also, for a wonder, the district we were travelling through had had no brigands up till then to its discredit.'

'The country was fairly open, and we bumped along in peace and quietness till we came within a matter of twenty miles from Trinidad, where we were to deliver up the silver. The day had been very hot, and the country was beginning to get hilly, and the roads were abominable. The mules, too, gave us no end of trouble. I have told you there were four to each wagon, and each one of the four wanted to pull in a different direction. There was only one at each wagon that would pull in the right way, and he only did so to spite the others. All day long we coaxed and cursed them alternately, and we were all very glad when at last we arrived at the small fort at Alcantara, which marked the end of the day's march.'

II.

'The fort was situated on one side of a range of hills, and on the other side, twenty miles away, was Trinidad. The village of Alcantara lay at the foot of a small hill, from the top of which the guns of the fort looked down upon the village and the scoundrels who formed its population.'

'As our wagons rolled and bumped over the cobble-stones of the detestable street, the villagers stood and stared at us from the doorways and windows; and I knew they were cursing us under their breath. That was the sort of people they were—those Spaniards. As we came out of the village, we entered on a fine broad road that rose in a gentle slope up to the gateway of the fort; and I noticed that another procession of wagons was moving on in front of us. Those wagons, like ours, were laden with wine-casks, but the casks were in open view, not hidden beneath a pile of hay as ours were. Also, they contained real wine, which the picturesque rascals who were in

charge would soon be selling to the commandant of the fort.

'It was just as I imagined, and by the time I had got my wagons drawn up for the night inside the protecting walls of the fort, the commandant, Captain France, had come out of his quarters to interview the wine-sellers. They haggled for some time over the price, but at length they were satisfied, and half-a-dozen soldiers began to roll some of the casks along to the captain's cellar. As the commandant was now at liberty, I stepped up to him and reported my arrival with the convoy.

"Convoy, ah, yes," he replied; "the silver, of course." Then he stopped short, as if he had just realised that the three Spaniards were within hearing. He shot a quick glance in their direction; and so did I, for that matter, but they appeared fully occupied helping the soldiers with the casks. "Follow me, sergeant," he said, and he marched off to the central building of the fort, where, of course, his quarters were.

'Very comfortable quarters they were, too, but his words were very disturbing.

"How many men have you, sergeant?" was his first question.

"Twenty-five, *mon capitaine*," I replied.

"Only twenty-five," he said. "That is far too few."

"But the district is quiet," I answered; "is it not?"

"It *was* quiet," said he; "but I know there are guerillas in the hills now over yonder." And, as he spoke, he glanced out of the window to where the high ridge of the Sierra Gerena rose up, with its peaks glowing in the setting sun.

"But the guerillas do not know anything of the silver," I replied. "They don't know even that I am going to Trinidad."

"I would not be too sure," he replied with a laugh. "Those messieurs have a very awkward talent for getting at our deepest secrets. And they can smell money as a cat smells fish. I shouldn't wonder if those guerillas have come round here solely for your benefit. It is very strange they should come just at this moment, anyway, for they have never been here before."

"If you will lend me another twenty-five men, captain—" I was beginning, when he broke in.

"Impossible, sergeant," he said. "My garrison is too small, and with the news of those guerillas in the neighbourhood, I cannot spare a single man."

"But it would only be for a couple of days," I remonstrated.

"*Parbleu*, and how much can happen in a couple of days!" returned the captain. "What is it that the Emperor always says? 'It is the last quarter of an hour that wins the battle.' So a couple of days might easily win this fort, sergeant."

'I remained silent, for it was clear there was no moving this man, and, besides, an idea had just flashed into my head. Moreover, there was something about this Captain France that made me very suspicious and uneasy.

"Well?" he asked, after waiting a minute. "What do you think?"

"I am sorry you cannot lend me a few more men, captain," I replied; "but, as I do not see how the guerillas can know anything about this silver, I shall risk it. After all, we will be on our guard."

"Very good!" said he. "Of course, it may be as you say. I hope those fellows did not hear me mention the word silver. I don't think they did, but I will try to find out. I'll send and have a word with them. You can go now, sergeant."

III.

'Accordingly, I went off with my head full of thoughts. The Spaniards, I found, had brought their wagons close to the place where mine were standing, and their mules, like mine, were all fastened by the head to a convenient wooden rail. The mules were all busy with their corn-bags, and all, therefore, at peace for once. It was getting dusk, and one of my men had already taken up his station as sentry beside our wagons. The three Spaniards were squatted on the ground. They appeared to be busy with their evening meal, but a French soldier soon appeared and, after a few words, they all went off in the direction of the captain's quarters.

'This was a rare chance, and, as soon as they were gone, I stepped up to the Spaniards' wagons. I noticed there were exactly the same number of casks in each of their carts as there were in mine.

"Pierre," I said, coming back to the sentry, "just slip up to the barracks and bring half-a-dozen of our fellows down here. Quietly, you know, no fuss."

'Pierre went off at once, and in a few minutes he came back with six of my men.

"Now, my lads" I said, "just get all our barrels out of the wagons."

'They needed no second bidding, but got to work at once; and, after they had pulled the trusses of hay off, they soon had the nine barrels of silver standing on the ground.

"Now for the wine-casks," was my next order. "Get them off the Spaniards' wagons, and be smart about it."

'The men looked a bit surprised, but, of course, they did at once as they had been told. I never fully realised before what a grand thing discipline is; but, all the same, I cast a very anxious glance towards the captain's quarters, where he was confabbing with the Spaniards.

'However, luck favoured us, and, in a few minutes more, the exchange had been very

neatly carried out. My nine barrels of silver were lying in the Spaniards' carts and the nine barrels of wine were reposing in my wagons, with the trusses of hay on the top of them.

"Now, my lads," I said to my astonished soldiery, "you can all go back to the canteen and enjoy yourselves. There is no need even for a sentry. But, mind, mum's the word. If one of you let's out what we have been doing I'll have him shot, hanged, and quartered."

"That night, I laughed to myself as I went to sleep, and I slept the sleep of a just man who has successfully cheated his neighbour. You see, the Spaniards were going to Trinidad to sell the remainder of their wine. And, if there were guerillas to fight, the wine-sellers, of course, would not be molested. *They* would go quietly through to Trinidad, and the brigands would attack us. So, however the fight went, the silver would arrive safely at its destination. And it was the idea of those innocent scoundrels taking my silver for me quite safely to Trinidad that made me laugh as I went to sleep that night.

"But I said nothing to the commandant of the fort. As I said before, there was something about him I distrusted. Nothing definite, of course—a something in his manner, in the look of his eye, in his way of speaking. It all came to this: that I had a vague feeling that he was after that quarter million of francs, and that he had something more to do with those three Spaniards than a mere buying of wine.

IV.

"Well, next morning, we were astir at an early hour, for we had twenty miles of hill and wood to get over before sunset.

"The captain came to see us depart, and he mentioned the guerillas again to me very earnestly. "There is a very good inn half-way at the top of the ridge," he added. "If the guerillas let you get as far as there you will be all right, I should think, and you will get some very fair refreshment at the inn."

"Thank you, *mon capitaine*," I replied. "I will not forget either the inn or the guerillas."

"Well, *bon voyage*, sergeant," he replied. "Best of luck!"

"Au revoir, *mon capitaine*," I returned.

"And then we were off. The Spaniards went on in front and we came lumbering behind.

"We were soon lost in the woods, and the mules had so much hard work pulling up the steep hilly road that they quite forgot to make trouble. We climbed higher and higher up the side of the great ridge. The woods grew thicker and darker, and the road was no better than the dried-up bed of a stream. I had a dozen of my men scouting through the woods to right and left, and the rest of us marched steadily along with the wagons.

"I had made my plans, of course. At the

first sign of trouble all my men were to take cover in the woods on either side of the road. "Every man to his tree," I had said to them, "and the devil can look after the wagons till the fight is over." So, as I chuckled to myself, I had arranged very well both for the silver and the guerillas.

"However, nothing happened, and in due course we came about noon to the inn of which the captain had spoken. The innkeeper stood smiling at the door, and that itself was a bad sign. But I was so happy at the way things had gone that I was not so suspicious as I ought to have been.

"We were all glad to make a halt, and, as the inn was too small to hold us all, my men sat down on the grass, and the innkeeper brought out his best wine and served it out to us with a great show of friendliness. The three Spaniards, however, went inside the inn to rejoice themselves with their eternal garlic and onions.

"Well, of course, our wine was drugged, as I ought to have foreseen. The smiling innkeeper did not go so far as to deal in poison, but he put something into the wine to make us sleep. And sleep we did, the whole twenty-five of us, for a solid three hours by the clock. We should probably have slept even longer, but I fancy the drug was weak. You see, twenty-five men need a good deal of wine, and the drug would lose its strength through being mixed with so much liquid.

"In spite of that, however, it was nearly four o'clock in the afternoon before I woke up. It was some time before I could shake off the drowsiness and realise what had happened. Then, I began to think fast enough. I tumbled to it at once that our wine had been tampered with, and I sent some of my men post-haste into the inn to arrest the innkeeper. But, of course, the bird had flown. Not a soul was in the place.

"I looked into the wagons to see if he had done anything with the barrels, which he would think were full of silver. However, there was no sign of their having been disturbed. Even the trusses of hay were just as we had placed them. Then I reflected that the innkeeper must have gone off to summon his friends the guerillas, while the wine-sellers had continued on their journey to Trinidad with their wine, or rather, what they thought was their wine, but which, of course, was my silver.

"I congratulated myself, and very heartily too, on the trick I had played, though I could not understand why the innkeeper had bungled things so badly as to give us time to waken up again before getting away with my treasure-wagons. However, that was his affair, and, as the guerillas might appear now at any moment, I quickly set the men in motion once more.

"The Spaniards, I reckoned, would by now be at Trinidad, so the silver was quite safe; but, as

they would be in a terrible state if they lost their wine, we brought the wagons along with us.

v.

'We marched steadily along, and, as you may imagine, we kept a very bright lookout for the innkeeper and his friends, but we were unmolested. No one appeared, and we bumped along in peace.

'It was nearly dark when we marched through the gate of the big fort at Trinidad, and, as soon as we had got safely inside the walls, I went off to report my arrival to the commandant.

'Ah!' he said, 'I am glad to see you, for the troops are a long time in arrears with their pay. I will have the silver brought up here at once.'

'*Mon colonel*,' I said, 'I have brought in the wagons that used to have the silver in them, but there is none in them now.'

'What!' he exclaimed; and I laughed to myself to see the flush of surprise on his old face. 'What do you mean, sergeant?'

'It was a piece of strategy, *mon colonel*,' I replied. And then I told him with great gusto how I had put the silver in the wine-sellers' wagons and made them the unconscious carriers of the treasure.

'If you go into your cellars, *mon colonel*,' I wound up, 'and open the barrels of wine they have sold you, you will find the silver safe enough.'

Instead of looking pleased, however, the colonel seemed frankly puzzled.

'I don't understand you, sergeant,' he replied at last. 'No wine-merchants have come here to-day, and there are no barrels of either wine or silver in my cellars.'

'What!' I exclaimed, astonished now in my turn, and very alarmed also, I must confess. 'No wine-sellers here to-day! But, *mon colonel*, there must have been; they had plenty of time to get here hours ago, and we did not overtake them on the road.'

'We stood staring at each other in silence for a full minute.

'My lad,' said the colonel at last, 'you have been done by those scoundrels—done, as brown as toast. You had better leave strategy to the Emperor after this. He may understand it, but it is very plain that sergeants do not.'

'I was overwhelmed with confusion and grief. To think I had lost the whole convoy of silver—a quarter million of francs in the hands of those devils, the wine-merchants! And what was even more painful, to think that my precious scheme had been turned so completely against myself! I ground my teeth as I thought of how it had all worked out. The three Spaniards had known somehow all along that the silver was in their own carts, and I remembered how they had gone into the inn and, no doubt, taken the innkeeper into their confidence and got him to put

us all to sleep, while they walked calmly off with the booty.

'That explained why *my* wagons had not been disturbed, and why no guerillas had appeared. It had never been a question of guerillas at all—only those three men and the innkeeper.

'But at that another thought flashed through my mind. The captain at Alcantara fort! The captain had talked so much about these same guerillas who had never shown themselves. And he had had a long confabulation with the three rascally wine-sellers after he had seen me. He was the leading spirit in the whole matter, I felt convinced. And all the doubt and suspicion I had had of him was now justified up to the hilt. And yet I could prove nothing against him. The cunning devil!

'Well,' said the colonel, breaking in on my sad meditations, 'it is no use crying over spilt milk. The silver is gone, but the wine remains. Let us, at least, have some of the wine you have convoyed so safely.'

'So I went off, gloomily enough, and my men soon brought a couple of the barrels up to the colonel's quarters.

'Now for a drink,' said the colonel. 'I haven't had a proper glass of wine for a month.'

'His servant brought out some glasses, and we knocked out the bung of one of the barrels.

'But no wine flowed.

'Why, what the devil!' exclaimed the colonel, angry at last. 'Have you neither brought silver nor wine, sergeant?'

'I can't understand it, colonel,' I replied. 'Perhaps it is an empty cask.'

'Well, try the other,' he said.

'So we tried the other cask, but it seemed empty as well, for not a drop of wine could we get out of it.

'Look here, sergeant,' said the colonel, 'there must be something in those barrels, for they have weight. Break them open.'

'So we got chisels and hammers, and, after a while, we prised open the top of one of the wine-casks. And then—! I could have dropped with amazement. The barrel was full of silver!

'Good Heavens, sergeant!' shouted the colonel. 'Whatever does all this mean? Bring up all the barrels!'

'So we got the whole cargo up to the colonel's room and opened them, and in them we found all the silver that I thought was lost for ever.

'We all stood staring in amazement, as you can well imagine, and for a time we could make nothing of it.

'Then, at last, I tumbled to the solution of the problem.

'*Mon colonel*,' I said, 'the matter is really very simple after all. Those Spaniards must have had the same idea as myself—the barrels were changed *twice* at Alcantara!'

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

KNOWING there were ghosts to be seen, real ghosts, and not the concocted invisibilities of amateur sensationalists, a certain man, one of our friends, took the train from London on an afternoon of the recent autumn to a lonely place in the north-west of our country, and arrived when it was dark. His object was to commune with these ghosts. The mood of the adventure was perhaps a little sombre, and yet natural. It was the mood of a man of departed youth, who, in a world that seems not to increase in loveliness or harmony, finds the problem of life and the future, the unknown, to be increasingly distressing, and, as is often the manner with such people, looks behind with soft and tender sentiments. Visitation upon scenes of the past, with which acquaintance has long been cut, is often done by men and women who think inwards with themselves. The countries of their inner lives are peopled with many intimate figures that no longer walk about outside, while the landscapes—the cottages and lanes, the hills and streams, the trees and the very individual flowering plants—have a peculiar vivid freshness, and a tender sympathy with the observer who was once part of them and is now, by right of mind and long attachment, their spiritual possessor. No person of sense and sensibility, stirred by these strange spiritual hankerings after the past, would venture upon any attempt to satisfy desire in the company of another, however sympathetic. If there are supreme moments for the enjoyment of solitude and silence, they are then. Time must be of no account; there must be lingering and loitering, searchings of remembrance and a pathetic meditation upon simple things, as upon a great oak tree which in forty years seems not to have added anything to its splendid stature, and, like the mountains, appears to have some arrangement with eternity; or upon a stream which, through weeds and siltings, has by a trifle changed its shape in the same period; or a footpath through the fields which is no more a footpath, since, by changes of labour and of persons, it is no longer needed, and the later farmer has grown thorns where stiles were once. In such moments the company of the dearest friend would be an intrusion almost

vulgar. What to him or her is that simple gate, which indeed may have the appearance of many other rickety gates grown old? To tell that you once or many times stood there, merely stood, does not assist to another's sympathy or understanding. The bend in the great white road, with a most ancient view of distant hills through some old fir trees that, as we know, have framed it for forty years, seems to hold no magic of recollection for a companion who, in striding by, might even think of politics. To him it is a simple turn in a plain old road, and not a spot where fairies used to play. As they need silence and solitude, the practised adventurers among the sweet sentiments of old remembrance include among their rules that the season should be the autumn, that the day should be still and not bright, for there is tragedy enough in this affair without the howling of the wind, and sunshine makes an irony we were better spared from. The hour is that of twilight.

* * *

This man had been sated with emotional experiences in abundance, and was tired. It seemed to him, morose, that even his frequent adventures among remembrance had lost much of their pristine charm, and that he needed stronger stuff. That is why, for him with an imagination and a soul to feed on, ghosts, real ghosts, were needed, and he went in search of them boldly. He had come to understand that old and beloved remembrance, embroidered with its delicate poignancy, cannot be stirred again to living reality in the light of day with all the sights and sounds, the people and animals, of another world about. Show Hamlet to us in golfing costume if it is desired, but yet I could not by any effort imagine a mimic presentation of Antony praising a dead Cæsar in Trafalgar Square; and less do I accept the anachronism of automobiles flashing and honking along the sacred roads of my early youth, or the incongruity of these new and thoughtless boys to whom it all seems so much less than it was to me—or as now I think it was. Then may not darkness restore the truth and life of a beloved scene? This may be an experiment not often planned. The man, a most intimate friend, was bent deliberately and carefully upon this experiment, and upon nothing else. He arrived at

the small country place in the dark. He left a few belongings at an inn, ate a small meal after a long journey, and then went out for hours of tramping over the countryside in the night, in the gloom, in the soft quietness. Good in its results was this adventure, and, sure that it has a personal application to each one of us who at this very season more than others are given to looking towards the hindmost years and dwelling upon remembrance, we have gathered from the general chronicle of our friend some points that, by their personal similarities, may prick the consciousness of those who read. Let them test the truth of it who sit late on Christmas nights by firesides, when the young and the old alike have gone upstairs and silent reveries begin—for then spring what we call reminders. The glorification of trivialities is the essence of all such meditations. Thus such a reverie as this is a nocturne of their tinklings which, to one who hurries heedless in the pace of youth, seem useless nothings; but to their elders they make up the patterns of a life that has been lived, and the materials of all our patterns is much the same. Each has its meaning and its essential.

* * *

The night was black when the man set out, and heavy clouds were drifting low. He left the little town behind, and struck out upon a high road full of twists and turns, whose every line and gate and bush he knew and remembered better than he could now recall many of the features of his home in the city in the south which he had left only that morning. Soon he was in the open country; it slept so still in the clamminess of the late autumnal night. At first it was a little difficult to discern and feel the way upon the footpath, which was certainly narrower and much more overgrown with grass and weeds than it used to be. Where once was a full yard width for walking there was now scarcely more than a foot. This was strange, a momentous change, and why was it? By the simplest reasoning the tramping of the country folk along this main road in a district of agriculture with a few collieries, once extensive, must have nearly ceased. That could not be a matter either of railways or of motor-cars. To skip the analysis of forty years of circumstance, the reasons are found to be these: a certain industrial decline of the country as against the town, fast increasing in recent years, and the shutting-down of collieries and works, resulting in less tramping of labourers between their places of toil and their homes; the great cheapening of cycles, and, with the economic improvement of the position of a large proportion of these country people, the plain fact that possession of them is common now, which seemed strange to this thinker in the night when he remembered how in his youth he rode upon these roads with the only tricycle

(and tricycles are now an almost extinct type) for ten miles round, and was sometimes accompanied by a schoolfellow on a high bicycle whose wheel was forty-eight inches in diameter, which was small, considering that the standard was fifty-two. A cyclist was a sight for the villagers in those days, and sometimes they beheld a company of them from a distant city proceeding in regimental or squadron style, in a dark blue uniform with tight breeches and a long-peaked cap like a huntsman's, a bugler at the head of them. Such were the first cycling clubs, the earliest departure from horse-locomotion along this country road. And now the sons of Giles have their cycles, and some indeed their motor-cycles, and those who loitered and lazied by the yard of path now flash along the miles, and their lives are quick, and their nerves sometimes a little thin. Another cause of the decay of footpaths was, of course, the war, with its disturbance of the country routine, and the further attraction to the towns. Yet the chiefest cause of all is the most recent, and may be unsuspected. It is country transport by motor-omnibuses, which now in regular services run along every country road where people ever walked in numbers. Only when he reaches these remote districts can the dweller in the big cities appreciate the great revolution made by the motor-omnibuses. They have caused the virtual abolition of country-walking, except the little that is done for pleasure, and to a large extent also the abolition of the pony and trap of the small proprietor, who is just above cottage rank. They have brought into intimate and regular association small towns whose ten or twenty miles of separation had once the effect of hundreds. Above all, they have placed the railways, with their few and inflexible routes and their stiff services, into a strange position of unregarded dispensability. In these places the railways are now often like a late reserve, and here is a giant fact for consideration by those who, because of their investments and for other reasons, consider the future of our railways. Labour troubles are not the only menace to their existence or prosperity. And so long grass and weeds bend over the narrowed footpath, brushing the shins of the haunter of old scenes, who would find here now by day that the modern god of speed, with his rush and rattle, has come to the countryside that was once so sweetly slow and placid. Progress must be served, and down go the idylls, the pastoral simplicities and green Nature herself. The modern lambs, used to their time, do not scamper off in fright when a petrol juggernaut thunders past their field. But such thoughts of mechanical things are only faintly related to the ghosts for which the man has come to search by night, intruding upon the scheme only because as yet he has scarcely entered into the full spirit of the country night, and the habit

of the town and the present still sticks upon his thought. . . . In greater loneliness the night spreads out. From the stillness come whisperings of Nature in her dreams. And the strange dead light of darkness increases to the vision of the nocturnal roamer, who becomes a part of this solemn scene. As he wanders on, a certain nervous expectation creeps into his mind. Might not some frightful fiend be treading close behind? This is the country of the past. This is the time for ghosts . . .

* * *

Within the space of two or three hundred yards along a bending road, overhung by many trees, arise three great remembrances, very different and yet possessing some association with each other. Fronting the highway is a splendid pair of tall black wrought-iron gates, fine and massive workmanship, standing for the entrance to a mansion among the trees up the hill beyond. Not in our time will the halls of squires be served by such gates again. The man when a boy must have passed these gates more than a thousand times, and commonly, as he recalls, a certain vague sense of awe—and yet not awe—respect—and yet not that, either, in any humble or craven sense—descended upon him as he entered the zone of road with the view of these gates, remaining until he passed out of it. And this, it is certain, was the faint emotion of all persons of the place possessed of any sensibility. That used to be a habit in the country. Peculiar traditions were attached to the gates, and the personage who dwelt in the hall was rarely if ever seen to pass through them, which made mystery. In those days, as will be remembered, plain men became immensely great to the thinking of country folk through some little imagined mystery like this. He dwelt mostly in London, it was believed, and his power was fancied to be immense, London then being, in the measurement of thought, quite a thousand miles away. Long afterwards, with romantic fancies gone, the fact was accepted that he was a successful tradesman, and with Olympus had no connection whatsoever, nor yet Parnassus. But, to pass from the personage, this entrance with the black gates had another attraction. On each side was, and is, a tiny lodge in smooth square stone, so small as to consist of only one most limited chamber, and the guardians, who dwelt and ate on the one side by day, had to cross over—let the storm be what it might—to the other side to sleep by night. Over the portal of the habitation on the left was an elaborate sculptured device of musical instruments, with a large violin upright in the middle of them; and over the portal of the habitation on the right were representations of things of war, such as a coat-of-mail to match the fiddle, and implements of slaughter round about it. Such as wish may pleasantly conjecture upon the state

and fancy of the original owner who had these emblems fashioned for him; but the remembrance of this wanderer, as he peered upon them through the gloom, went acutely back to the circumstance that all the folk of the country round had tales and legends to tell of them, and most especially called them, according to their tradition, Heaven and Hell: Heaven on the left, Hell on the right; Heaven with the sign of music, and Hell with the sign of war. It occurred to the man, only after forty years, how exactly the common country people of that time were right in their association of ideas, though they were insensible of any such association. At that time war was nothing, or, if anything, it was grand. The Crimea was long forgotten. There was only the Soudan and the battle of Abu Klea, and they called up no mothers' sons for that, nor cut down the meat to twice a week.

* * *

Now, near to the black gates, after a bend in the road, the wanderer, plodding along the grassy path, was confronted suddenly by a great sinister ghostly recollection. It was a tree, a small tree, that rose from the high hedge, and, with one long menacing arm, bent over the path as if to stop and challenge, upon a memory, him who might go sneaking past. This was a ghost of sorts, and so it looked. He remembered it. The tree had scarcely grown at all in those forty years; it was just the same, and well did the man remember that overhanging arm. For on that branch one morning a robin was singing pleasantly, and a boy had a catapult, made by himself of a fork of wood and some elastic. He put a stone into the catapult, aimed at the robin, and it fell dead at his feet. Now, he was not by nature a cruel boy—far from it. He sometimes played with a catapult because it was the youthful custom so to do, and in utter thoughtlessness he had many times aimed at birds because it was a custom, but never once till now had hit one. He was overwhelmed by this tragic surprise. The robin that was singing on a morn of May was dead, and he had killed it. That other people killed nearly everything except their kind, and sometimes even that, mattered nothing to the case. He cried, and for this time he was not ashamed to cry. Then, when he had buried the bird and his tears were dried, he vowed he would never again kill or try to kill any bird or animal whatsoever, in sport or play or in any way, and he has kept the vow. And yet after forty years—and the slaughter of the war—this old ghost tree lays its arm across the path, the arm upon which the robin sang, and sadly says, 'So you have come again!' The emotions of that long-past morning suddenly for a second flooded through him, and he was sad. The spirituality of this existence of ours, how darkly, deeply mysterious it seems, even in such trifling manifestations as this!

Now, the third of those great remembrances, enshrined within a small space upon a lonely country road, is a very different kind of thing. Only some fifty yards from the tree of tragedy the man came to a point in the road where a lane turns off, and the remembrance here is of something wholly and splendidly beautiful, with the ringing of wedding-bells, or emotional sounds as much like that as a boy's imagination might sometimes reach. For Gloria was here; he beheld her often here; and Gloria was the most heavenly girl that God had up to that time made. (Or so it seemed. Twelve or thirteen years had the man now walking in the night to his credit then, and Gloria had one less, or so he fancied, for he never really knew.) He was so shy and never came to the simplest talk. He worshipped her usually from a distance of many yards, but in the abounding purity of his boyish soul he would, had it belonged to him, have given the whole of that countryside for possession of her. Nothing that ever happened later has made him feel so much like Dante gazing upon the passing Beatrice. And Gloria was worth it all. In the straight line of his loves she was the successor to his little cousin, then a princess in a pantomime seen but once, next a farmer's daughter (whose regard was lost through his folly in releasing her pet doves from a cage at the instance of the farmer when in his cups), and once a real, if minor, princess of Hindoo blood, who was schooling somewhere there and spending holiday with this very farmer's daughter—both aged ten. But Gloria was quite the most splendid of them all. She was the daughter of the gamekeeper of the squire who lived up at the hall, and twice a day the boy, going to a distant school and returning, passed that end of the lane up which, among the trees, was her father's small white cottage. She was very good to look upon, and had a perfect foil to display her enchantments all the more by contrast, for she had a younger sister, Letty as they called her, often with her. Letty was little and shy, very meek and modest in her way, always looking to the side or down, and she was somewhat dark of countenance. But Gloria was a big upstanding golden thing. She held herself up high, all quivering life and vigour, all boldness and laughter, and yet, as the man remembers so well, a fine, defending, and challenging dignity about her always. Freckled and rosy was her face, and masses of hair of real auburn gold flowed about her shoulders. Never could Bond Street have done anything for the enhancement of that charm. Her simple little clothes were perfect for their part, and for private reasons, as the man supposes, they were nearly always just the same, a plain little frock reaching to the knees, and a black pinafore with an upper part rising nearly to the neck, with two wavy lines

of some plain embroidery near to the edge of it all round. This recollection is strangely precise. Letty was attired to match. The boy and this Gloria never once stopped and talked together in any friendly way. Once or twice she fired a phrase of challenge at him as he passed, and he stood for a moment dumb and abject, and then uneasily went on. Once by chance they stood facing each other, but did not speak. Humbler in the social scale she was supposed to be, but certainly he never thought of that. Then he went away into the world, and of course forgot. For thirty years or more he never once recalled that vision of young girlish brilliance and life, until at last one night out in a lonely desert, in all its utter solitude, it seemed suddenly in a reverie that the crest of life's hill had been mounted and the descent to death had at last begun. Then memories of the earliest times flooded through the mind, and among them came this of Gloria, and it flamed to a dazzling brilliance. Was her name truly Gloria? He was unsure; but he felt it must have been. He was certain of Letty, and Gloria—it must have been! What a trick was this remembrance after such a yawning gap of life! So in our aged philosophy do we ruminate upon the pretty ways of Nature, when, with a delicacy so infinitely pure, she comes first to flick with a feather upon the sense of boy and girl. In the desert the man was wondering if the romances—and the tragedies—of maturity holds more sweetness after all than those first affections when idealism storms the children's soul. And where may Gloria, that bounding, golden creature be? He does not know, and he knows it is better he does not know, for, if he knew and saw, perhaps the picture might be spoiled.

* * *

He came to a stone bridge, charmingly situated with tall firs at the approach, a line of sycamores and chestnuts bordering the road beyond. Even though it was dark, he knew that the trees were there, for he knew them forty years ago, and, though one forgets the war, such facts as these, gathered in youth, are not forgotten. But strangely, as he looked towards them, they seemed less lofty than in the olden days, though in such a case there could be no clipping. Again, around the bend two hundred yards ahead there was another well-remembered tree that surely, though big and fine, seemed smaller than before, and everywhere in this beloved country it was the same. The majestic oak in the park land near the home, the beech on the very lawn thereof, and a hundred more were at least no bigger than before. Their main branches spread forth to the same extent and at the same angle as before. They had stood still while time went on and men went withering with it. Only the saplings of those ancient days had risen. Yet, of course, the truth was that all had grown immensely as

trees must do, and here was one of the illusions of youth and age. To the child the tree, a monarch of Nature to which he feels so much akin, is immense and glorious, and more immense than a measurement by rule would make it. If he could think so much, the boy child would feel as Ruskin said of trees—what a great thought of God it was when He thought a tree! So much does this early emotion saturate the system, that in later life our thoughts wander backwards to the early scenes, the old trees we so worked upon by imagination, that they mount upwards to the sky and spread out thickly beyond all their natural broadness. Some idealising here again. Now, what a strange vitality there is in trees! Hardly any were missing. Only one majestic line had gone, one that bordered the orchard in which he played and drowsed, into the several trunks of which he had cut the initial letters of his name, and so taken those trees specially unto him. Those which had kept intact and clear the token for nearly thirty years fell in the war for sacrifice. Yet near by was a weakling little plum tree whose puny delicate limbs he had pinned against a wall, and whose life each winter had hung upon a frosty chance. Now, after more than half the period of a man's life, it leaned there still, so weak and frail, and hardly higher. From the bridge, along the line of sycamores and chestnuts, the summer singing of the trees in those distant days was in imagination heard again. Those who have lived only in the towns and never heard in their impressionable youth the murmur of the leaves of trees as zephyrs stir them on a sunny afternoon have not known the most soothing music Nature sings. Here at the bridge the most sweetly harmonious duet was made by the ripple over stones of the shallow stream beneath. With the twittering of birds there is thus the most delicious nature music, like that which Wagner tried to catch in the murmurings of the forest through which Siegfried wandered as a boy. Now, when the man leaned upon the bridge, and the big wide harvest moon broke a mystic light through banks of clouds, and fell into ruminations deep as Hamlet's, he heard only in reality the ripple of the dark stream below, but in fancy listened to the soft singing of the trees again. The ripple of this self-same stream, only a few miles nearer its mountain cradle, kindled once the inspiration of a great musician, for Mendelssohn, when visiting this country and idling here, heard it, and then he composed a wordless song which you may find with the label, 'Op. 30, No. 3.'

* * *

From the top of a brow the man looked down upon the village. This for him in reality at boyhood, and in the dreams of later life, had always been as the village of the world. Every man

and woman should carry on with them in their piling years the memory of some small village of this country, its structure, its character, and its life; for, let big cities and their 'call' be what they will, it is the villages that best show the simple goodness and strength of our homeland. Here time counts for little, and tradition is all. Communists that take their lead from Moscow have small chance in these villages, for each one is a commune to itself, established upon a system of human helpfulness and sympathy. Or so it was, for the squires, through taxation, are leaving now, and the social fabric of the village crumbles. By the light of the moon, however, the man can see and even hear all as it was those forty years ago. Here, on the right, is the village church, poplars surrounding its graveyard, while the thin tower rises over all. Nothing is changed, except the lych-gate for a war memorial. Here at half-past ten, in his Sunday clothes, came the boy on the Sabbath, spending an appreciable part of the service, ninety minutes, always in a vague contemplation of an adjacent window of stained glass in which were displayed figures to illustrate a very excellent and encouraging text—'Thou hast been faithful over a few things; I will make thee ruler over many things.' This text and the squire's daughter in an adjacent pew were nearly the only things the boy remembered afterwards of those Sabbath mornings in the church. Not a word of the sermons, though preached by the father of his closest chum. The text was the best thing to remember after all. The man passed into the churchyard, and in the night-light wandered among the tombs. Alas! Here, and here, and there, and everywhere, old friends of youth who had lived and worked their day, and resting now. Resting truly, for in the villages the belief in rest and resurrection holds faster than in the towns, and there is more happiness and contentment accordingly. Opposite to the church was the village inn, kept by an old widowed lady who was a young wife when the boy used to go that way. Beyond the church was the village school, where the children seemed to be singing half their time—singing hymns and songs, preparing catechisms for the coming of church examiners, and reciting in musical chorus the long stanzas of Scott's *Lady of the Lake*. Thinking upon all the modern problems and doubts of education, the man, as he leaned by the gates of the schoolyard, did not seem to find that there was much wrong with this. Are progress and improvement all? he asked. Are beauty and belief, with music, nearly nothing? Beyond the school, amid a clump of trees, was the parsonage, farther down the road the doctor's house, and after that a cluster of dwellings, a mill with motor wheel, and a big bridge and a cricket ground. Here was the complete village, and the life of it glowed round the church and the school. Its human elements

were joined in that perfect dependence that we find in one of Trollope's tales of Barsetshire. Humanity is here, weak and tender, often a little silly in its self-centred way, pathetic in its simplicity, but lovelier than humanity in the greater outer world. . . . Our friend in his chronicle asks leave to wait a while, for in this

journey he now came to the place of home, and of childhood's home it is easier to think than speak. In those days of all others we have known, with doubts and difficulties tightening upon the world, how sublime are thoughts of childhood's home, how sweet the word home—the simple, lovely name of home!

MEDES AND PERSIANS.

PART II.

X.

DINNER came on early—strange variation of routine!—because they were going to a rather dull play at the Lyceum. The theatre was part of Joyce's life; she loved it. In London it always meant, if not supper, at least a comfortable hour with drinks and sandwiches in front of a fire. Edinburgh did not indulge in theatre suppers, but Joyce counted on that pleasant aftermath—she and Harold alone. That would make up for a lot.

But no, it was not to be. 'We always go to bed at eleven.' If that meant 'we never go to bed till eleven,' it also meant, apparently, 'we never sit up after it.' They got back to the house at ten-forty-five, and there were no sandwiches. There was a bottle of lager for Harold, a glass of milk for Joyce, some careful conversation, a few well-timed yawns, and then inexorably, and on the tick of the clock—bed.

The next day was mostly calls; and calls, under the observantly merciless eye of Mrs Brander, were something of an ordeal. But Joyce bore with them, because the evening promised a real pleasure. She and Harold were to go with a party of friends to the Palais de Danse in Fountainbridge. Harold danced beautifully, Joyce was mad on it; and at any rate there would be no Mrs Brander.

The Palais de Danse was all that could be desired, but the party of friends was disappointing. Meeting his contemporaries, Joyce suddenly realised that Harold was a much older man than she had thought; there was hardly anyone in the party below forty. Male and female, they struck Joyce as stiff, cold, and critical. She did not understand that that was only Edinburgh, where people make friends cautiously and critically, and with no exotic effusiveness; and had a stupid suspicion that Mrs Brander had warned them against her. The jazz bands did their noble work, but produced no appreciable thaw; you could only get teetotal drinks, and the main idea in the minds of Harold's friends seemed to be 'how soon can we get home?' Two by two they drifted away, until at last only Harold and Joyce remained.

Harold looked at his big military wrist-watch with its network of protecting bars over the face.

'It's past eleven. We'd better get along after this dance!'

Joyce was utterly dismayed. 'Harold! It's just beginning to be nice, now all these stuffy people have gone. Just you and me.'

Harold allowed the compliment to himself to outweigh the disparaging reference to his friends. He smiled kindly.

'Well, but we can't keep the mater up all night, you know.'

Dismay turned to horror; Joyce was appalled. 'You don't mean to say she's sitting up for us?'

Harold smiled again, but rather less patiently.

'Oh yes, she is. She always does. She always insists on seeing everybody into bed.'

'Always,' thought Joyce. 'Always.'

'But—but, Harold,' she said shyly, 'sha'n't we even get a little while together—alone—you know—'

'I'm afraid not, goosie,' said Harold; 'not at this time of night. . . . Come on, let's have one more dance.'

XI.

In the cab going home Joyce sat silent for a little, then nerved herself to speak. 'Harold, dearest, don't think me horrid, but—but—do you always do things in your house according to rote?'

Harold was slightly annoyed. 'I don't think we do that more than any other people. You must have some order, you know. I think my mother runs the house uncommonly well.'

'Uncommonly,' thought Joyce, '—and far, far better than I shall ever do.' The tears crept into her eyes as she said piteously—'But mother's house is very nice, Harold. You always used to think so. And you know we don't worry about things like—like you do here.'

She felt the arm round her shoulders tighten.

'I know you don't. You know I'm fond of your mother'—oh scandalous falsehood!—'but I don't think I could live in a house run on those lines. If you want to be comfortable, Joyce, you must do things decently and in order, you know.'

'But, Harold, *always* to do so-and-so, *never* to vary! Even little things—'

'But what would you have, you baby?' said Harold kindly. 'You must have a plan, a

scheme of sorts. Otherwise you only get mess and muddle and discomfort. You keep losing things—you never get anything done. Anything's better than muddle.'

'Prisons aren't,' snapped Joyce, stung at last.

At the house she astonished Mrs Brander by refusing to sit down. She drank off her glass of milk standing. 'It's long past eleven,' she said with a touch of bitterness. 'We ought to be in bed.' And she went.

Mrs Brander rose and elaborately closed the door Joyce had left open. 'I hope Joyce isn't pettish, dear,' she said kindly.

XII.

In the morning Joyce was contrite. By dint of waking herself first at five-thirty, then six, then six-thirty, then permanently at seven, she contrived to be first down for breakfast. She remembered to close the bathroom door—there had been a remark about that—and to leave the sacred *Scotsman* unviolated in its place. She thought she had been really good.

But not good enough. After breakfast Mrs Brander called her into the drawing-room. With the air of a witch-doctor performing some elaborate ceremonial she found her keys and unlocked her bureau. From its keeping emerged Joyce's vanity-bag, looking idiotically frivolous among these business-like surroundings.

'You left this in the hall last night,' said Mrs Brander with patient suavity. 'It appeared to have some money in it, so I locked it away. One can't be too careful—'

'Oh thanks, so much,' said Joyce, fighting down a variety of rebellious and unsuitable expressions; 'I'm afraid I'm very careless.'

Mrs Brander took no notice of this overture. 'And this,' she said, 'was on the stairs.'

'This' was a tortoiseshell comb with brilliants. Joyce took it without a word.

She had just remembered that an embroidered silk bag with her best slippers was reposing in what the Palais de Danse, for unknown reasons, labelled the 'Dames' Boudoir.' The recollection silenced her.

XIII.

No fixed duration had officially been laid down for Joyce's visit to Edinburgh, but a general understanding, mysteriously arrived at, placed it at ten days. The understanding may have originated from Mrs Brander, and in Mrs Brander's well-ordered house, if a visit were timed for ten days, it was unlikely on any pretext to exceed that period. Nor, on the other hand, should it have failed to reach its scheduled date of termination. Yet, in the case of Joyce, a full two days before the ten, Mrs Lessing received a short telegram which seemed to afford her some annoyance. She threw the message in the fire (but the envelope littered various corners of the drawing-room for quite a considerable time).

Charlie Rossiter, sitting at his pretentious roll-top desk in his motor-selling office, received at the same time a similar telegram, but much longer. Perhaps this distinction accounted for the fact that he displayed no annoyance at all. Nor did he throw it in the fire. He read it very carefully twice, while a slow incredulous smile spread over his face, and then transferred it gently to his pocket-book.

This done, he seized his desk telephone in a business-like grasp.

'Hullo! . . . Is that Eugene? Mr Rossiter here. . . . No, Rossiter, man. Rossiter . . . Look here, book me the usual table for to-morrow night without fail. . . . And let some of the good stuff be waiting on the ice. Comprenny? Right!'

His partner, a staid young man in spectacles, entered suddenly, to find him dancing on the hearthrug. 'Been at it again?' said the staid young man. 'So early, too.'

'Love's young dream, old toad,' said Charlie. 'What did that biblical Johnny say?—"Hope deferred maketh the heart sick." Not when it comes off, it doesn't. Not much!'

XIV.

In the dining-car (first-class) Joyce, rather white of face, rather strained of eyes, was writing a letter, alternately biting the end and licking the point of the pencil she had borrowed from the attendant. The letter began bravely on a fine sheet of purple notepaper with a 'J.L.' monogram, but tailed off into two unmatched fragments, not scrupulously clean and bearing the name of the London Midland and Scottish Railway Company. These also Joyce owed to the kindness of the attendant; later they were the subject of a remark. . . . But Joyce had to write that letter then or never.

It was a long letter, for it was a confession of failure, which is ever apt to be a wordy business. It was also a difficult letter, for every sentence must inevitably hurt a friend. The gist of it—a condensed recapitulation of most of its points—came at the end.

'You see, Harold dear,' it said, 'I didn't realise till I stayed in your house just what you would expect your home to be like. I thought you liked ragging about—like me, but I see you don't. If we started to keep house together, I can see it would just become a place like your mother's, where we'd *always* have to do things at a certain time and never possibly at any other time, just like those Meads (*sic*) and Persians. I don't want to be a Mead and Persian. I couldn't. I don't say it's wrong or anything; I just could never do it. I couldn't live up to you at all. I see that now. I should just disappoint.'

There was much more to the same effect—a pathetic little document altogether. Later, the pathos of it, not less than the blow it delivered,

brought an unwonted lump into the major's throat.

Joyce crammed it into her last purple envelope (which it didn't at all fit) and rang for the attendant.

'Post this at Crewe, please,' she said. 'It's most important.'

The astonished attendant found himself surveying a half-crown. He weighed the bulky missive in his hand and sighed.

'Writin' love-letters! An' only left 'im a few hours back, I dessay. Gawd!'

Joyce went back to her compartment through

the other half of the dining-car. A pair of commercials eyed her appraisingly as she passed.

'Pretty kid!' said one of them. 'Looks worried, though. Strung-up, eh?'

'Excited, if you ask me,' said his friend. 'Looks as though she'd just got loose from somewhere. Off on the spree. Goin' to meet her boy, maybe. Escaped from mother and dad. Run away, I shouldn't wonder.'

'Aw, shut up!' said the other. 'You're always imaginin' things. . . . Now, what I was sayin' about them Manchester goods—'

THE END.

BRUSSELS, CHRISTMAS 1918.

By Major T. A. LOWE, D.S.O., M.C.

I.

EXCLUSION from the triumphal march of the allied armies to Germany, after the Armistice had been signed, was probably the greatest disappointment that an officer of the British Expeditionary Force—especially one who had spent the greater part of his service in France and Flanders—could be asked to endure. That triumphal march was a unique event in history; everyone had dreamed about it in the early, optimistic days, until the professional soldiers had confessed that it could only come to pass as a miracle. It was now a reality, an all-absorbing fact, which in the dazed weeks immediately following the Armistice seemed yet another 'sop' to help us to further zeal and further efforts to conquer physical weariness.

There were those who maintained that the first Army of Occupation should have been composed of troops who had fought for the longest time against Germany. This, of course, would have been impossible from an administrative point of view. Confusion would have been caused throughout the army by the withdrawal of individuals, and the units so formed would have consisted of a mere mob of eager sight-seers.

In sending those *divisions* that were fittest to move, the Commander-in-chief did the only thing which was rational under the circumstances. He was up against the fact that demobilisation, somewhat prematurely decreed by the politicians at home, had begun almost as soon as the Armistice was signed.

But every disappointment has its sedative. A great number of troops that had remained to be demobilised found themselves quartered in Belgium and Flanders. For the most part the industrial districts of Lille, Tourcoing, Mouscron, and Roubaix were chosen, because in these towns there was accommodation suitable to the possibilities of a severe winter, and this, incidentally, materialised. Protection against the elements is essential for troops which are not actively engaged in warlike operations,

and the industrial districts of Belgium and Flanders solved the problem—as they had previously done upon many historic occasions.

Also there was Brussels and its immediate surroundings, where many of the troops were billeted. They were the envy of all their comrades, for, next to Cologne, Brussels was at that time the mecca of every British soldier.

II.

There were many reasons why Brussels should be so considered. To begin with, the city is beautifully situated. It occupies the plain of the river Senne, and it is partly built upon a hill. Many cities of England and Scotland are built on hills, and natives of these enjoy the sensation of walking in streets where their muscles are brought into play, and where, should you halt before a shop, there is a feeling that part of that shop's frontage is on a higher plane than another. I cannot account for this feeling except that I have often (having been born in a city which was set upon a hill) experienced it myself. The plains of Flanders had become a nightmare after a time, *simply because they were flat!* Brussels was the first sign of a hill that many of us had experienced for months.

Apart from such absurd considerations, Brussels was a fair city to the war-weary eyes of the Briton. Everyone described the city as 'Paris in miniature,' and that was enough. We should have preferred London or Edinburgh, or Manchester or Birmingham, but they were postponed indefinitely, and no one could tell what the future held. The boulevards of Brussels were real; they were wide and clean, and the public buildings stately and beautiful and *tangible*; shops, hotels, and restaurants vied with each other for the small custom which we could bring them—the will, on our part, being greater than the deed, for after the rigours of the blockade they had literally nothing to sell.

Brussels had recently been delivered from the heel of an oppressor. Life under the Germans,

from what one could gather from those inhabitants who would discuss the matter at all, had been intolerable. Intolerable not so much from the point of view of 'Frightfulness,' as from the discipline which modern war conditions enforce, and from the petty restrictions which had been imposed upon every action of the civil population. The tragic sensation of imprisonment, the uncertainty of the future, and the threat—a very real one—of imminent starvation. To all outward appearances, especially where her enemy was concerned, Brussels had remained calm and dignified; inwardly her citizens were suffering untold hardships and privations.

The hasty departure of the Germans and the almost simultaneous arrival of the British was the most exciting event which had happened in Brussels since Waterloo. Actually, when the Armistice came, British cavalry were operating on the famous battlefield of Wellington and Napoleon. This in itself was a romance, and even the private soldier—seldom touched by sentiment, though often by sentimentality—was conscious that the ground over which he was marching had been of historical importance in bygone days. Later, when the troops had settled down in the billets allotted to them, and short leave was permitted, large numbers of British soldiers made the pilgrimage to Waterloo. This was their first instinct, and the theatres, picture-houses, and estaminets of Brussels were not considered until curiosity was satisfied regarding the appearance of battlefields more than a century old.

III.

There is much on the road from Brussels to Waterloo to engross the attention and to fire the imagination. A great drama had been enacted upon it, and it was extraordinarily easy to visualise the scenes of *Vanity Fair*. The galloping horsemen hurrying from the great ball at breakneck speed; the mad, unruly crowd of cowardly fugitives returning to their base at the sound of the first discharge, to spread rumours of alarm and despondency amongst the civil population—nothing new about this, for had we not experienced what the confusion of camp-followers was really like at Amiens that very year; the wild ride of Lady Smith of the Rifle Brigade when she rode out to search for the body of her husband, Sir Harry Smith, who, they told her (the camp-followers, I mean), had been killed in battle, but whom she found eventually, safe and well, marching at the head of his victorious battalion, when she herself had braved terrors unspeakable in the field. These things became almost a reality, and when we reached the Lion Monument, which was erected by the allied powers after Waterloo as a symbol of victory, everyone felt a real thrill.

The first sight which greeted me when I arrived at Waterloo was a Canadian battalion

paraded in review order to receive its newly-consecrated colours from an English corps commander. The ceremony was performed on the very spot where our Guards Brigade met and defeated the Imperial French Guard under Marshal Ney in 1815. This was a solemn and impressive sight, and I believe that parade helped every Canadian present to realise that he was an integral part of a great empire. Here, a hundred years ago, the youth and glory of Britain had fought for liberty and won it. After a similar and more deadly fight in the same cause, they had done it again and established their cause. It was a near thing on both occasions.

We climbed the Lion Monument, where the best view of the battlefield of Waterloo may be obtained. There are 226 steps to be climbed before the top is reached, and to do it without a halt was an interesting test of physical training which many youngsters were gaily attempting. Squads of private soldiers were grouped around the great lion which crowns the monument, and they were much more engrossed in carving their names, numbers, and regiments on the pedestal of the unfortunate beast than they were in viewing the battlefield. I was reminded of the story of the enthusiastic American officer just arrived in France some time in the dark days of 1917. He was filled with the usual intense desire of the newcomer, to fight for Belgium and 'Freedom,' and all was very new and interesting. As he neared the trenches he came upon a British soldier carrying rations on his back and tramping along slowly towards the front line. 'Say,' he questioned, 'this cause we're fighting for, it's just fine! How many Germans have you killed, Bo?' The private lowered his bundle in some amazement, and gaped at the American. 'I ain't killed no Bosches,' he replied. 'I'm C Company's cook, and I've lost a —y dug-out called "The Drop-Inn."' Then he picked up his bundle of rations and continued his forlorn way towards his hoped-for objective. Naturally the American couldn't understand it, nor would he have understood any better those groups of men solemnly carving their names and numbers on the face of the Lion Monument. But somehow I couldn't help feeling that the ghosts of their ancestors, who had died at Waterloo, looked on and approved. Probably the day before that battle most of them were playing 'House' or its equivalent.

At the foot of the monument is a little rotunda building, and in the centre of this one stands on a pedestal, around which is hung a huge circular picture representing the battle of Waterloo. French cavalymen in gorgeous uniform are depicted as charging solid squares of British red-coated infantry, while their own foot regiments manœuvre into position in rear in dense masses. In the far distance is Napoleon, seated on a horse and surrounded by a glittering

staff, and on the other side the Iron Duke himself can be seen, similarly situated. During the Great War the remark was often heard that fighting must have been a jolly affair a hundred years ago, in comparison to what it is now. As an infantryman I do not agree; the thought of being charged by cavalry was always a nightmare, and barbed wire had the advantage of saving one from that, if from nothing else. But to return to modern times.

IV.

In Brussels, after the first joyful surprise at the advent of the British troops, the inhabitants settled down to enjoy the novelty of freedom. Not for a century had the city witnessed such scenes of dazzling brilliance as now took place in the form of court levees (the King and Queen of the Belgians had returned to their palace), public receptions, state balls, balls given by Canadian and British divisions, &c. And to those of the Third Corps, who were actually stationed in Brussels and the surrounding area, the ball given by their own general officer will ever be a memorable one. But to these affairs only the selected were bidden, so that the bulk of the younger generation were dependent for amusement on the public entertainments of the city, and of these the claims of the Palace Hotel were outstanding.

My impressions of the Palace Hotel, Brussels, are still vivid. Its accommodation was enormous; its cuisine (in spite of the food shortage) superlative to palates which had tasted only the roughest of diets throughout months of hard campaigning. Its cosmopolitan population, the female portion of which fought for the honour of dancing with a British officer, could be studied with never-failing interest. Its spotless bedrooms had luxurious baths attached. Its dance bands played incessantly while a mass of people endeavoured to gyrate between tables in the main restaurant. In its long corridor-lounge, drinks could be discussed with comrades who turned up unexpectedly from the ends of the earth. To say the least of it, this was a cheery rendezvous. Rank mattered nothing, and general officers and subalterns disported themselves indiscriminately, in the comforting knowledge that the war was really over. Naturally prices were high, but what did that matter when everyone had pockets full of money? Also there was a sense abroad—which time, alas! failed to confirm—that the world was re-born, and that, the great task having been performed, such grim diseases as want, poverty, and depression were banished for ever. Looking back in the knowledge of the years that have passed, one wonders: would we have gone 'all out' with our purses at the Palace Hotel as we did, had there been even a suspicion that many of that gallant throng would be reduced to wheeling barrel-organs, selling matches, exhibiting pavement pictures,

and the other countless forms of exacting charity to which failure to find work in any other more useful capacity drove them? Failure!—the word had no meaning in those days, and the shadow of the 'ex-officer' problem was nowhere to be seen. Certainly the Palace Hotel boasted no such shadows. The talk was all of high ambitions and world-wide service; of comradeship which would become the greatest force in history; of an empire whose civilisation would dominate all nations.

High hopes and ambitions! It is easy to smile now, but were there not reasons for such ideals? Had we not visited the field of Waterloo and remembered gloatingly, with small attention to details, that great wars in the past had laid the foundation of Britain's prosperity? The years of want and distress which had followed Waterloo, as they must inevitably follow every campaign of great magnitude, were forgotten. That even small wars are expensive luxuries and have to be paid for by some one, and that the paying usually has to be done by the survivors, these were facts about which it was rather 'bad form' to think. Certainly the main fact which has emerged, namely, that a victorious nation, or nations, must groan under burdens almost as great as the vanquished, was not apparent at the Palace Hotel, Brussels, during that wonderful Christmas season of 1918. 'Let's go to the Palace and dance' was the motto, and the bands played and the glasses clinked, and the ghosts of our forefathers, who had died at Waterloo, looked on doubtless and muttered, 'Poor devils, let them enjoy themselves; we played the fool in just the same way, but the memory of it softened the awakening.'

V.

Not that life was entirely a matter of enjoyment in those extraordinary days. The Higher Command was quick to realise that demobilisation would take a long time, and that vast armies living in a friendly country must be employed, if trouble was to be avoided. Great military reviews were organised, and the work entailed produced a salutary effect. Drill, the acknowledged basis of all military discipline, was soon begun, and it was amazing with what speed the troops who had been fighting but a few weeks before under grim conditions began to take on the smart, finished appearance of the peace-time soldier. Competition became keen between the various divisions as to which could dress and drill the smartest, and parties of officers made rapid journeys to the depots of their regiments at home, to return triumphant with the sacred colours which had been so long in custody. The writer will always remember what a joyous sight the Third Corps presented when it marched past the King of the Belgians in review order. The Prince of Wales was there, mounted beside the Belgian king, and a great company of the

civilian population of Brussels had forgathered to witness the scene. It had been snowing and freezing intermittently, and the wide boulevard outside the palace presented a fairy picture, each tree covered with shiny particles of frost, and the horses at the saluting base blowing the air through their nostrils like smoke, and stamping impatiently on the slippery surface. Perhaps it was a finer sight to witness than to take part in, because riders and drivers alike were hard put to it to keep their horses upright, but the pageant passed, in spite of this, in perfect alignment.

First the corps commander accompanied by his staff, and then a vast array of cavalry, infantry, and guns. The infantry marched eight abreast (a somewhat unusual but impressive formation); the guns in sections, with horses groomed and saddlery polished. Every man looked bronzed and fit, and passed the king with a proud look in his eye. Division after division at full war strength saluted the monarch under whose command many of them had fought, until, after three hours' steady movement, the last unit faded into the distance. The sun had disappeared an hour ago, and the snow was falling in steady, silent flakes, but King Albert and our prince sat on, watching intently. And when they turned at last to ride through the huzzahing crowds to the palace, I wondered if I should ever see a British Army Corps at full war strength again. Forty or fifty thousand men, at least, must have been present on that great parade, an army of tried veterans such as not even the great Napoleon had commanded. Not three per cent. are with the colours to-day! 'Why did we let them go? Could not the pick of them have been retained?' sighed the professional soldiers, left at a future date to cope with the rigours of an Irish conflict. A tiny conflict, perhaps, in comparison to what had gone before, but one which quickly found the joints in the armour of the newly-joined.

VI.

After dinner that night we sallied forth to the theatre. A revue entitled *Flotte, Petit Drapeau*, was billed—a disappointing affair, but the Opera was booked for weeks—and, being a revue, was welcome, for who among us had ever thought to see such things again? The theme seemed to be entirely concerned with the German occupation of Brussels, and one scene at least was a vivid one. This depicted a prisoners' camp in which were interned Belgian, French, and British soldiers, apparently living under conditions of squalor and hardship, so much so, in fact, that many of the audience burst into tears at the spectacle. When a German sentry arrived and proceeded to flog a Belgian soldier who persisted in singing patriotic songs, the tears changed to shouts of anger. The auditorium of the theatre reminded me of a scene witnessed in Dublin

years before the war, when an acrobat at a music-hall, standing on his head at the piano, proceeded to play 'God Save the King' with his toes. His intentions were of the best, but the emotion displayed by the audience was such that he was obliged to conclude his performance somewhat hurriedly. However, as the motive underlying these two examples of public emotion is by no means the same, perhaps it is unfair to the Belgians to mention it. The audience in this instance was certainly the most entertaining part of the revue, and the way the crowd laughed at six performers calling themselves 'Les Rois Dégommés,' or 'The Ungummed Kings,' who endeavoured to interpret their feelings with regard to the Kaiser and all his works, was refreshing in the light of subsequent history. But theatres, even in Brussels at times of patriotic fervency, become monotonous when the audience is continually standing to attention while national anthems are being played. There were so many gallant allies engaged before the war came to a victorious conclusion!

Probably the outstanding picture of the Great War from the point of view of propaganda, was the cartoon in *Punch* which depicted the King of the Belgians being tempted by the Kaiser, and refusing to sell him his soul. The idea was so simple that it made a profound impression in Europe and America. Somehow copies of this cartoon had got into Brussels, and they were a source of great encouragement to the inhabitants throughout the weary years of occupation which they had to suffer.

They kept their Christmas of 1918 with their monarch again in their midst. It was like a family party, a reunion, and the father of the nation was at home once more. The children gathered round the fireside and lit their candles and exchanged their gifts, and wished each other well.

Fortunate were those of the outer circle, who were privileged to look on and rejoice at their happiness.

SONG OF HOPE.

HOPE on, nor let the demon of Despair
Within your bosom make himself a lair;
Look for the sweet and lovely things that are—
No sky too black, but somewhere shines a star.
Hope on!

Hope on; cast all your doubts and fears away,
To-morrow must be better than to-day;
While Hope's bright rainbow spans this 'vale of tears'
With courage you can meet the coming years.
Hope on!

Hope on, hope on, your eyes fixed on the goal—
The issue lies in your own conquering soul;
The while you strive, learn to 'be still' and wait;
Know he who masters self has master'd fate.
Hope on!

M. HEDDERWICK BROWNE.

AMONG THE CROCODILES OF MADAGASCAR.

By JAMES SIBREE, D.D.

OF the few wild animals to be found in Madagascar, the crocodile is certainly the most prominent and the most formidable. It is also exceedingly abundant, for it is to be seen in all the rivers and lakes of the great island, and indeed in pieces of water which are not larger than good-sized ponds. Occasionally it has been seen even in the rice-fields, when these have been flooded through the river-banks giving way in a specially heavy rainy season.

It is therefore greatly dreaded by the Malagasy, and they have charms which they trust in to protect them when fording the rivers. Yet they are very unwilling to kill it, for they believe that the companions of the dead crocodile will, sooner or later, avenge its death by killing some man or woman. Some years ago two Frenchmen spent a short time on and around Lake Itasy in Central Madagascar, and besides shooting water-fowl, they also shot two or three crocodiles. The people around the lake were greatly alarmed by this act, and were so afraid that the reptiles would retaliate on them that the strangers found it expedient to get away from the place as quickly as possible.

I was one morning crossing by canoe a small but rather deep stream, and while waiting for my bearers to get over with my palanquin and baggage, I strolled along the bank, and was presently startled to come across one of these very 'ugly customers,' a good-sized one, enjoying the sunshine. He was as much surprised as myself, and shuffled off into the water with a great splash. A few minutes later I watched a large party of Malagasy fording the little river in a body, making a great shouting and beating the water to frighten away the crocodiles. A native saying is: 'Cross in a crowd, and the crocodile won't catch you.'

Some years ago, when travelling along the south-east coast of Madagascar, and having to cross and travel along many of the rivers, I noticed that wherever there was a village on the bank of a river, a space of several yards square was enclosed with strong stakes, so that the women and children could draw water without fear of being seized by the jaws, or swept off by the tail, of the ferocious reptiles.

A friend of mine had a servant called Moosa, who, while cutting some arums in a marsh, had his foot suddenly seized by a crocodile which was lying in wait close by. In the first moment of alarm he punched the creature's head. But as that was considerably harder than his own, he bent down and caught hold of the enemy by one of its forepaws. Then commenced a real tug-of-war. The crocodile pulled for his dinner,

but the man for his life! and the former being fortunately a rather small animal, and the latter a big strong man, Moosa began to prevail. Then, to his astonishment, the crocodile opened his jaws and allowed the poor fellow to escape.

Such escapes are, however, very rare, for, as the Malagasy proverb puts it: 'Once in the jaws of a crocodile, there's no getting out!' Many native sayings—some score, in fact—refer to this dreaded creature and its prey. One of these is: 'An angler carried off by a crocodile: each takes what he likes'—that is, the fisher takes the fishes, and the crocodile takes him! Another is: 'A dog hunted a crocodile, and then the latter had his turn.'

The eggs of the crocodile are collected and sold for food in the markets, and are said to be perfectly good eating; but I confess I never brought myself to try one. They are nearly as large as a goose's egg, but have a very rough shell.

The Malagasy have two names for the crocodile: one is *màmba*, a word derived from the Swahili, and the other is *voày*, a Malayan word, slightly altered from its original form of *body*. So a native saying is: 'The *màmba* is gone, but the *voày* comes'—that is, 'One trouble is followed by another.'

When returning to England on furlough many years ago, we had to travel part of the way to the north-west coast of Madagascar by canoe for four days down the river Ikôpa. We saw about twenty to thirty crocodiles each day, some on the sandy islands in the middle of the stream, and some basking in the sunshine on the banks, and near enough to be splashed by the paddles of the rowers as we passed along. They were generally lying with their jaws wide open. Most of them were light-gray in colour, but others like dark slate, and others again spotted with black. They varied in length from seven or eight to fourteen or fifteen feet. The head is rather small, and the back and tail are serrated like a great pit-saw.

A year or two earlier than our canoe voyage three friends took the same journey, and the crocodiles they saw were far greater in number than those we came across. The late Rev. Dr Mullens, one of that party, said that they must have seen at least a thousand of the reptiles during their three days' voyage on the river.

It is a rather curious fact that the crocodile existing in the great lake Alaotra is a different species from those in all other Madagascar waters, and is identical with a species found in a fossil state, together with the remains of an extinct hippopotamus and extinct lemurs and gigantic birds.

A crocodile's tooth used to be worn as an amulet or charm, and silver ornaments made in that shape formed part of the adornment of the Malagasy in former times; while one in gold was the central object in the royal crown.

Among the Tanàla, or forest people of the south-east, there was (perhaps still is) an 'ordeal by crocodile.' In this test, the person accused of wrong-doing—chiefly witchcraft—was taken to a river known to be full of these reptiles. Before the people assembled to witness the proceedings, a diviner stood by the accused, and struck the water thrice, and, addressing

the crocodiles, begged them to show whether the accused person was guilty or innocent. The culprit was then obliged to swim a certain distance and back again; and if he accomplished this and took no harm, the accuser was fined four oxen. Of these, the swimmer received two, the king one, and his counsellors one. Probably few people escaped this ordeal with life; and if the accused was seized and killed, he was supposed to have merited his fate. A romantic story, founded on this Malagasy custom, may be found in *Chambers's Journal* of 1849.¹

THE MONTH: SCIENCE AND ARTS.

A REVOLUTIONARY INVENTION IN WINDMILLS.

A STARTLING novelty in windmills has been invented by a Finn, Engineer-Captain Sigurd J. Savonius, of Helsingfors. The form of the device may be understood by imagining a hollow vertical cylinder which is cut in half down a plane parallel with its axis. Now, suppose that the halves are displaced sideways on the plane of the cut until one edge of the one half meets the opposite edge of the other, making an S in section. It is easy to understand that the inside of the S would offer more resistance to the wind than the outside; hence, if the device were mounted on a spindle, it would rotate. In principle it would be similar to the rotating-cup instrument for measuring the speed of the wind, the hollow sides of the cups offering more resistance than the convex sides. But the cups are mounted upon arms and widely separated. This plan was tried with the half cylinders, but the results in power were not so good as when they were close together. Now we come to the revolutionary feature of the invention, which is the placing of the half cylinders so that each overlaps the other by a radius; i.e., the edge of each is halfway between the two edges of the other. This arrangement gives an S-shaped channel between the two half cylinders, through which the wind passes. The results in power are three times those attained by the first arrangement, while the peripheral speed of the rotor is 1.7 times that of the wind. The top and bottom of the half cylinders are covered by discs which overlap the greatest width by one quarter to one-third. Compared with an ordinary windmill this device is very simple, since it needs no tail to keep it facing into the wind, and no toothed gear at the top, as it is mounted directly on the vertical shaft which transmits the power to the ground level. The only accessory needed, apart from the shaft and its bearings, is a brake to stop the rotation. This new windmill has been applied to pumping

water with what are claimed to be satisfactory results. It has been found also that the device has a Magnus effect similar to that of the rotating cylinders used in the rotor ship described in our April issue. Two tried in a 16-foot boat gave a speed of nearly 6 miles an hour with a breeze of 15 miles an hour, while the speed increased to 7 miles an hour in a wind of $21\frac{1}{2}$ miles an hour. Their combined projected area was about 36 sq. ft., and their effect equal to that of a sail with an area of 100 sq. ft. The 'wingrotor,' as the new invention is called, has not so great a Magnus effect as the Flettner plain cylinder, which is rotated by mechanical power; but the elimination of the driving motor and mechanism is a great advantage. Like the Flettner towers, wingrotors have to be reversed each time a vessel fitted with them is 'put about' when 'tacking to windward.' This is done by mounting each half-cylinder or wing on a spindle, through which it can be given a half-turn. Means are provided also for closing up the wings in strong winds, the effect being similar to that produced by reefing a sail. When it is desired to stop the vessel, this operation is continued until the wings are opposite each other and form a complete cylinder, in which condition they have no propulsive effect, and offer very little resistance to the wind. A development forecasted by the inventor is the application of wingrotors to the rotation of Flettner towers, thereby combining the advantages of both.

AN AUSTRALIAN ENCYCLOPEDIA.

All the Dominions of the British Empire have their Year Books, crammed full of statistical and other information in the most compact form. Invaluable as these are to those seeking details regarding this, that, or the other department of overseas life and progress, they seldom supply either the student or the general reader with a

¹ 'The Trial by Caiman,' by Percy B. St John, *Chambers's Edinburgh Journal*, No. 309; 1st December 1849.

connected and satisfying account of the matter in question, which may be relatively of insufficient importance to command much space in any of the standard encyclopædias. Hence the value of a purely Colonial encyclopædia, such as that now being brought out in Australia. The *Illustrated Australian Encyclopædia* (Sydney: Angus & Robertson, 2 vols.), both by its size and by its character, is an impressive token of Australian advancement. Its general editor is Captain Arthur Jose, the well-known author of *A History of Australia from the Earliest Times*, and contributor of Australian articles to *Chambers's Encyclopædia*, to which the *Australian Encyclopædia* makes a fitting companion, its format and arrangement being much the same. An army of Australian experts has been enlisted for the preparation of the work, which contains over two thousand articles, relating to Australian history and discovery, farming and manufactures, birds and beasts, trees and flowers, literature, art, and sport—indeed, every aspect of national conditions and progress. The Commonwealth may well be proud of this encyclopædia, 'conceived, written, edited, printed, and produced' entirely within its own bounds. The Briton at home who, for intellectual or business purposes, would keep in touch with the general development and special potentialities—agricultural, industrial, and what not—of the great Australian continent will find the *Australian Encyclopædia* not only an indispensable but a delectable book of reference.

SOUNDING BY ECHOES.

Several devices have been brought out to enable the navigator of a ship to take soundings at frequent intervals without resorting to the slow and cumbersome process of 'heaving the lead.' One was described in these pages in October 1923. Another, which is based upon the time taken for sound to reach the bottom of the sea and for the echo to return, has been invented recently. A sharp, quick sound is made by a steel diaphragm which is vibrated at the rate of 1050 times a second by an electromagnet through which an alternating current is passed. The result, a musical note, is cut off instantaneously with the current. The echo is received underwater by a hydrophone, or what may be described as a 'watertight telephone transmitter.' The faint electric waves thus produced are passed to an amplifying filter circuit connected to a relay, the current from the latter giving flashes which indicate the depth on a scale. To simplify the description of how this is done we will confine our attention for the moment to depths of under 100 fathoms. These are marked round a glass dial making a complete circular scale. At the back of the dial is a disc which is turned by a motor at four revolutions a second. A Geissler tube is fixed behind a narrow radial slot in the disc. When

the slot is at the zero mark on the scale, a cam on the disc spindle makes an electric contact which passes current through the magnet and causes it to vibrate the diaphragm for a few thousandths of a second. The resulting sound vibrates the receiver and produces a red flash in the Geissler tube, this flash appearing exactly at zero on the scale. The receiver is vibrated by the echo a trifle later, and the position of the flash on the scale indicates the depth. Of course the slot moves round too fast for the eye to follow it (240 r.p.m.), but the recurring flashes leave a stationary impression which is easily read. Greater depths, up to 600 fathoms, are taken with the same apparatus, but with the disc turning at only forty revolutions a minute. At this speed the eye can follow round an illuminated pointer, formed by another slot in the disc with a tiny incandescent lamp behind it. The slot is opposite that for the Geissler tube, and the 600 fathom scale is outside that for 100 fathoms, but with the zero at the bottom instead of the top. With these arrangements the sound is produced when the slot is passing the zero mark. But there are no flashes; the sound and the echo are heard through telephone receivers, and the position of the slot on the scale is noted when the echo occurs. For greater depths than 600 fathoms the magnet circuit is broken after one sound has been made, and 600 fathoms is added to the reading when the echo is heard for each complete revolution of the disc. A box with a glass front, on which the scales are marked, contains the revolving disc, the cam contact device, and a tiny electric motor to drive them. This box is connected by insulated wires to the sound producer and to the hydrophone. It can be fixed on the bridge or in the chart room, where the navigating officer can set it to work at any time by pressing a button.

RECENT DEVELOPMENTS IN SHIP PROPULSION.

As citizens of the predominant maritime nation, developments in ships should interest us all. At the present time there is keen competition between the steamship and the motor-ship. From 1912, when the first big motor-ship was sent to sea, until now, this type of vessel has been increasing in numbers; and although steamships still form the bulk of our merchant fleet, we have reached a stage when more motor-ships than steamships are in course of construction. Among them are passenger liners up to the limits of size now considered to be profitable, the building of vessels such as the *Majestic* and the *Leviathan* being no longer deemed a paying proposition. The largest motor vessel, an Italian liner, has a gross tonnage of about 30,000. She is driven by four screws, each of which is turned by an engine of 10,000 horse-power, the result expected being a speed of 22 knots. These engines work on

similar principles to those in motor-cars, but they burn low-priced heavy oil instead of petrol, and use far less of it for every horse-power produced. The most arresting feature is their double-acting pistons, the undersides being pushed up as well as the tops being pushed down. This means, of course, valves for the bottom of the cylinders, which are closed in, while the pistons are worked by rods which pass through stuffing-boxes. The eight cylinders in each engine have a bore of 33 inches and a stroke of 59 inches, while the total height from the underside of the crank case to the valve gear at the tops of the cylinders is about 36 feet. Full power is given at 115 revolutions a minute, but by increasing this speed and by making some modifications, this size of engine could be made to give 15,000 horse-power, which is enough for the biggest and fastest passenger liners likely to be built for some years to come. But it is by no means certain that this type of engine will last. What is known as the two-stroke engine is much simpler, because no valves are needed, while a charge is fired at the top of every down stroke. Two-stroke engines have been used in cars, but in the smaller sizes they are very extravagant in petrol, and have other drawbacks. These have been overcome in the big marine engine, and there is little doubt that the two-stroke is the engine of the future. Those interested in the making of steam turbines are not taking the above-stated position 'lying down.' Important developments are taking place, of which the chief are the increase in steam pressures, the use of powdered coal, and the reduction in the size of boilers. To demonstrate the economy of higher pressures a steamer is to be built shortly which will be fitted with Parsons turbines of 4000 horse-power. The boiler pressure in this vessel is to be 550 lb. per square inch, and the consumption of coal is estimated at .98 lb. per horse-power per hour. Unfortunately for the steam interests, the handling of coal involves extra labour, and powdered coal cannot be used, because the pulverising machinery is too bulky, and spontaneous combustion would take place if it were stored in bunkers. When the powdered coke resulting from the new carbonisation process described in our last month's issue is available, it can be safely stored in bunkers, and supplied to the boiler furnaces without labour. But even with these advantages it is not certain that steam will be able to compete with the Diesel engine.

A NOVEL KETTLE.

Two faults in the domestic kettle have been patiently endured by housewives for centuries. One is the liability to scald the hand when removing the lid of a kettle containing boiling water: the other, the tendency of water to come out under the lid when a full kettle is tipped for pouring. Both of these drawbacks have

been eliminated in a kettle which has been recently patented. The new design may be visualised by imagining an ordinary kettle with the rear half of the handle cut off, and with the front half of the lid permanently fixed on with a water-tight joint. The unsupported end of the handle is connected to this fixed half of the lid by a vertical tube, and the handle is cane-covered. Where the back half of the lid would be there is a flap which is hinged to the front half. At the middle of the hinge, and fixed to the flap, is a small toothed pinion which engages with a rack in the tube, the rack terminating in a knob that projects above the rear end of the handle. When this knob is pressed down by the thumb, the rack tips up the flap by partially turning the pinion fixed to it. By these means the hand is kept clear of the scalding steam, the kettle can be tipped without causing leakage of water from the front of the lid, and the lid cannot tumble off. These kettles are British-made of stout aluminium.

A FOOL-PROOF WIRELESS ACCUMULATOR CHARGER FOR ALTERNATING CURRENT CIRCUITS.

Electrical accumulators or storage batteries have come into widespread use in connection with valve wireless sets, and these accessories have to be charged at intervals. If this can be done at home, money is saved, as well as the trouble of taking heavy cells to and from the nearest garage or the local electric generating station. If the householder has a direct-current supply, charging is a simple operation, although it may be very slow or exceedingly wasteful of current. If, as is more common, only alternating current is available, it must be changed, or 'rectified,' as it is called, into direct current. Rectifiers are of the chemical, the mechanical, or the valve type. The last-named is becoming increasingly popular among the owners of wireless sets for charging their accumulators; indeed, the most competent experts are of opinion that charging from alternating current mains by means of valve rectifiers is not only the most economical, but is also the simplest way. Alternating current changes its direction at least fifty times a second, and may do so two hundred times or more, rising from zero to a maximum pressure and then falling again each time. The essential feature of every rectifier is that it will pass current only one way. Two electrodes of different materials, such as aluminium and iron, or aluminium and carbon, if immersed in a solution of ammonium-phosphate or some similar salt, meet this requirement. So also does the two-electrode valve. Anyone who makes a diagram for charging an accumulator from an alternating current circuit will find that four rectifiers are needed, besides a transformer to reduce the voltage. In an instrument of the valve type which has been lately perfected only two

rectifiers are used. The secondary of the transformer is split into two coils, which are wound in opposite directions, the inner end of each being connected to the negative terminal of the accumulator, and the outer ends connected through rectifiers to the positive terminal. Readers who are accustomed to wireless apparatus will have no difficulty in making a diagram from this description. In the actual device, the arrangements are still further simplified by combining the two rectifiers in one bulb, this being achieved by providing two plates in the valve, one at each side of the filament. A most important feature of this rectifier is a second bulb with a wire filament in two parts, each of which is connected between one of the secondary transformer coils and the negative terminal of the accumulator. This device regulates the current automatically from 1.12 amperes for charging six cells in series to 1.35 amperes for only one. No ammeter is needed, and the instrument is practically fool-proof. The two bulbs and the transformer are mounted on a base of insulating material and housed in a cylindrical perforated aluminium case.

A MOTOR DUST-CART.

All who try to avoid the passing of dust-carts when engaged in their germ-diffusing operations of collecting refuse will agree that there is room for improvement in this department of municipal activity. Although the motor dust-carts recently introduced do not eliminate every objectionable feature of the horse-drawn variety, the covers with which they are fitted minimise the escape of dust and their low bodies facilitate the emptying of the bins. Other advantages over the older vehicles include much higher speeds and much greater capacities. The bottom of a recent model is only 20 inches above the ground, and the top edge of the side is within easy tipping reach of even a small man. The roof is curved to a big rise in the middle, and is in two sections from front to rear. Each section has a curved sliding-door of sheet steel at each side, which is pushed back when a bin is to be tipped. As in a railway truck the body is of wood, with steel bindings and fittings. A hydraulic ram and pump can be fitted if desired for tipping the body. The pump, which is worked by the engine, forces the oil under the ram until the body is tipped to an angle of 45 degrees, when the rear doors automatically open and allow the contents to slide out. With a wheel-base of only 9 feet, the motor and the chassis are of the usual lorry type, apart from the low height and the small-diameter wheels. The capacity of the body is 2 tons.

A NEW METHOD OF CLEANING SILVER.

As all housewives know, silver or silver-plated articles standing on the sideboard or in

common use quickly become tarnished, especially in a smoke-laden atmosphere, or in a house lit by gas. This is due to the fact that the sulphur of the atmosphere unites with the silver to form a substance, dark in colour, known to the chemist as sulphide of silver. To get rid of this sulphide—in other words, to clean the silver—it is customary to use some form of silver-cleaning powder. However soft and smooth this may be, it has of necessity an abrasive effect, and in course of time all the silver is worn away, and the base metal beneath is exposed to view. An alternative method of cleaning the tarnished vessels avoids this evil. A sufficient number of pints of water to cover the article or articles to be cleaned are put into a large saucepan or other suitable vessel, and an equal number of tablespoonfuls of ordinary washing soda (carbonate of soda) and a strip of aluminium are added. The water is boiled for a few minutes, and the work of cleansing is complete, the silver being rendered bright and shining once more. The secret of the operation is that the aluminium so acts upon the carbonate of soda and the water as to form bicarbonate of soda and a compound of sodium and aluminium, thus setting hydrogen free. This nascent or new-born hydrogen, eager to unite itself with something, seizes upon the sulphur of the sulphide of silver to form (with itself) hydrogen sulphide, and liberates the silver, which thus remains behind. It is obvious, of course, that this method can only be used for articles which are wholly silver or silver-plated.

A CORRECTION.

We greatly regret that in the article on London Government in our September issue the administrative area of the county of London was given as 116,000 square miles instead of 116,000, i.e., 116 square miles; and that the amount of sewage dealt with yearly was stated as a hundred million gallons instead of a hundred thousand million gallons.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (a) a reply post-card, or (b) a stamped and addressed envelope or post-card, be sent to the Editor, *Chambers's Journal*, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

CHRISTMAS 1925.

HOW CHRISTMAS CAME TO THE HONEYBUNS.

By HAROLD SPENDER.

CHAPTER I.

TRISTRAM ASKS A QUESTION.

'DO you believe in Christmas?' asked Tristram Honeybun, aged eighteen, and home from school for the holidays, as he looked out through one of the large dining-room windows of his parents' town house in Bayswater, watching the shadows of night creeping down the long street, and the sudden twinkling of the street lights as they were turned on to meet the invasion of darkness. It was the 20th of December, and so there were very few days left before the blessed feast-day of the birth of Christ. The weather had turned very cold; and at that moment flakes of snow were beginning to fall, lit up by the street lamps into a curious distinctness of detail, so that one could watch their magical starry shapes as they drifted slowly through the windless air down onto the pavement.

Iris Honeybun, aged sixteen, and still with her hair down her back, was gazing at these snow-flakes with such concentrated attention of fascinated admiration that, for the moment, she did not hear her brother's question. The young girl was perhaps dreaming of some far-off happiness associated with those white flakes and with those twinkling street lamps—of the Christmas parties of her childhood; of presents and candles, of Christmas trees and crackers,

of cosy fires and brightly-lighted rooms. But at any rate her mind was far away, for she did not answer at once. She turned with that baffling vagueness of youth to her brother, and asked with a disarming softness of voice, 'What did you say, Triss?'

'I said "Do you believe in Christmas?"' the boy repeated insistently, with a youthful sense of the extreme importance of his question.

Iris Honeybun sighed, and, throwing herself into an arm-chair, embraced her right knee with both her arms, proceeding to rock herself to and fro with a vigour which seemed to become a positive peril. 'I used to,' she said suddenly, 'until mother and father quarrelled.'

'I don't see what that's got to do with it!' exclaimed Tristram, pulling at the window-cord with a violence that would have appalled the family butler if he had happened to be present. 'I don't see what that's got to do with it! I mean all the old chatter about Christmas boxes, and kindness, and all that sort of thing. It seems to me just a bit played out.'

Iris gave a little laugh. 'Pretty well played out in this house,' she said.

Tristram moved impatiently and dug his hands deep in his trousers pockets. 'I know

what you mean, Iris,' he said. 'But you know my views about that. It's a pity we can't talk without always getting back to it.'

'Yes, I know!' said Iris. 'You always side with mother, whatever she does.'

'Because she happens to be always in the right,' said Tristram, kicking a footstool with wholly undeserved severity.

'That's what you always say!' said Iris. 'But I don't think she understands father in the least. She doesn't even try to! I think father is awfully good to her.'

'Well, we shall never agree about that,' said Tristram. 'Let's get back to my question—Do you believe in Christmas?'

Iris rocked herself to and fro with a greater energy than ever. Her eyes were getting suspiciously moist, and she was blinking a good deal. 'I try to,' she said—'though it's most awfully difficult, with father living in one part of the house and mother in the other, and us a sort of go-betweens. I don't think it's fair on us at all.'

'Well, at any rate they are honest!' cried Tristram. 'They don't pretend to care for one another when they don't. That's what I call so rotten about this old Christmas idea. Once a year everybody's got to pretend, just like a lot of kids! They all meet and play at loving one another, waste money over presents, and Christmas puddings and mince pies, and crackers and all that bally rot. Why, do you remember Uncle John last Christmas with a granny's cap on his head? It made me feel fairly sick, I can tell you, Iris.'

Iris's lips closed just a little obstinately; and she stopped rocking herself for at least ten seconds. 'I thought it was the first time I had ever seen Uncle John look nice!' she cried. 'He gave me a ten-shilling note that evening, which shows there's something in it that changes people, anyway. He'd never done that before!'

'I expect he knocked it off a charity next day,' said Tristram. 'The weak point about all that sort of thing is that it never lasts. I've been looking at a book of that chap Dickens, called *A Christmas Carol*, which grandmother used to boost so much. I call it stale stuff, quite out of date, not fit for these strenuous days, eh what?' and the boy ended with a laugh, half-cynical and half-jovial, so that you could not quite tell whether he was speaking seriously.

Iris had stopped rocking herself again, and her eyes had grown large with a kind of wonder. She did not seem to be listening to her brother's last words. 'I think it is a marvellous book,' she said slowly. 'A sort of wonderland book; and yet it seems all so true. Last time I read it I couldn't help thinking that—perhaps—'

'Perhaps what?' cried Tristram impatiently. 'What do you mean? You always stop just when you're getting interesting.'

'Why, perhaps that it all might happen again.'

'Happen again!' cried Tristram. 'Why, what do you mean?'

'Why, happen again here—between mother and father. You know what I mean?'

'Oh, I see!' shouted Tristram. 'I grasp the idea! The Christmas spirit bringing father and mother together again! That only shows what a back-number you are, Iris. You forget that they have made a legal agreement. People are not so silly and sentimental nowadays. This is the age of commonsense. If people don't agree, why, they just part, and there they stay, and that's much better than the old shams,' repeated Tristram, again kicking the unfortunate footstool until it slid across the room.

'Yes,' said Iris slowly. 'That's just what Scrooge thought. He thought that he was fixed for ever in his way of life; and then there came the Christmas spirit and everything was changed. Why, he became the dearest old thing—he gave his nephew money—he looked after Tiny Tim. Why, don't you remember, Triss? Even you must love that part of the story.'

Tristram stood erect and spoke with a curious heat. 'All mush and sentiment!' he cried. 'Food for girls! Why, don't you know what happened afterwards? Once at school some of us fellows wrote a sequel to *A Christmas Carol* just for fun. Do you know what took place in my version? Why, Scrooge got over that attack; and afterwards he was harder than ever. His doctor explained to him that his Christmas dreams had been due entirely to bad diet; especially that gruel he took on the night of Christmas Eve. So he cut down his clerk's salary again; took out of his will what he had given to his nephew; and let Tiny Tim die. After that he was more successful than ever; and finally he became Sir Ebenezer Scrooge, Bart., M.P. He had just given his money to the whips to get a peerage when he suddenly died, and was mourned desperately by the whole nation.'

The boy shouted with laughter over his own grim jest, and really he seemed as pleased as a happy author after the production of a successful play.

But Iris's eyes grew still larger, and she sat quite silent, seeming to be looking into the far distance.

At that moment the sound of singing was wafted through the still air; for the falling snow had laid its gentle carpet along the roadway and muffled the rival rumbling of the traffic—

While shepherds watch'd their flocks by night,
All seated on the ground,
The Angel of the Lord came down,
And glory shone around.

[*Christmas Number*]

'Fear not,' said he; for mighty dread
Had seized their troubled mind;
'Glad tidings of great joy I bring
To you and all mankind.'

Tristram stopped quite suddenly in his laughter, and for a few moments stood listening to the singing. Then he raised both hands and stuck a finger in each of his ears. 'Oh, it's those beastly waits!' he cried. 'Tell Dennis to go and stop them. Why do you sit there like a dolt, Iris? I can't stand it! They get on my nerves. I call it a perfect shame that the police should allow them to go round blackmailing people with their noise. It ought to be stopped by law. Look here, I'm going to stop it, if you aren't!'

Taking his fingers out of his ears, Tristram moved passionately to the electric bell-push at the side of a big marble mantel-piece and stood pushing it for all he was worth with his released thumb. In a few moments the door opened slowly; and there stood in the opening, his left hand still on the door-handle, a man dressed in the old-fashioned costume of the butler—dark swallow-tailed coat and high black waist-coat; with that air of correctitude which marks the well-conducted steward. This was Dennis, the one man in this establishment who knew precisely what he wanted.

Dennis stood there quite silently, a certain dignity and confidence marking both his attitude and the well-controlled features of his determined face. Dennis had been too long in the family to be frightened by these young people. He had known them as children, ever since the days they were carried in arms, and he was not to be upset by their wayward pranks.

Under Dennis's fixed inquiring gaze Tristram Honeybun visibly wilted. He seemed to grow less arrogant and impulsive; less assured of himself. He looked at Dennis hesitatingly, and then at Iris, as if he now wished that his sister would take over the task.

'Did you ring, sir?' asked Dennis quietly, but rather with a tone and manner as if he were making an accusation.

'Yes, I did; didn't I, Iris?' replied Tristram weakly. 'You see it's those beastly carollers. I—I can't stand them. It's too much for my nerves. Can't you go and stop them, Dennis?'

'Am I to give them any money, sir?' said Dennis, still respectfully but firmly.

'No, no! Not a penny, Dennis! Why, if you do that they will only come again to-morrow night. We shall never hear the end of them. Besides, you know that giving money always does harm. I have learnt that at school, and it's about the only thing I ever have learnt! But why don't you go, Dennis?'

Dennis still paused, and then, slowly closing the door behind him, came into the room. 'Well, you see, sir,' he said slowly, 'it's just a little difficult. The fact is that Mr Honeybun

likes them, but Mrs Honeybun don't. So if I send them away I get into trouble with the master, and if I don't I get into trouble with the mistress. That's how it stands, sir. Now, what would you do under those circumstances, sir?' He put the problem quite impartially, as if he were posing Tristram with a new conundrum from a weekly paper.

'Why, obey me, of course!' said Tristram, laughing at his own jest.

But at that moment Iris jumped up from her chair. 'That's just where I come in!' cried Iris. 'I don't agree with Tristram at all. I like the carollers. I dote on them. I won't have them sent away. I'll have them asked in, Dennis. Do you hear me? If you are going to obey Tristram, you ought to obey me too. I'm only two years younger.'

As she finished, the voices sounded clearly from outside, down the street, as if in answer to her speech—

All glory be to God on high,
And to the earth be peace;
Good-will henceforth from heaven to men
Begin and never cease.

Dennis stood for a moment quite still, and then made a half-turn towards the door. 'Well, you see, sir, it is a bit difficult for a man to know what to do in this house. But as the young mistress puts it in that way I think, on the whole—I'll do nothing.'

So saying, he turned and left the room.

CHAPTER II.

MRS HONEYBUN DINES ALONE.

MEANWHILE, upstairs in the little boudoir-study, picked out in blue and gold, which she had designed for herself twenty years ago in happier days, Mrs Arthur Honeybun was sitting, tired with her work and indulging in a few moments of reflection.

The flap of her bureau was piled with letters which she had written that afternoon—thick letters, and long letters. For Mrs Honeybun was nothing if not a public woman; it was impossible to exhaust on your ten fingers the number of committees to which she belonged. It was currently rumoured among her friends that Mrs Honeybun would certainly stand for parliament if it were not for the unfortunate domestic entanglements in which she was involved. But right across all her ambitions stood the formidable figure of Mr Honeybun, who actually threatened that if she stood for parliament he would appear on her platform and publicly oppose her. That was the rather capacious fly in the ointment of Mrs Honeybun's public life.

This evening Mrs Honeybun was rather more

tired than usual, for she had had a hard day's work. During the morning she had written two articles for the Press. During the afternoon she had attended three committees; and since tea she had written nearly twenty letters. She was an active champion of the rights of her sex, and even now, when women had the franchise, there were many wrongs to be righted. For Mrs Honeybun had a most extraordinarily keen scent for all wrongs outside her own household. She was now engaged in a great crusade for giving the franchise to the women of India, and her thoughts were already ranging towards the Malay Archipelago. It seemed highly probable that if Mrs Honeybun had her way, man would soon become a subject animal on the planet Earth. But it certainly was a most unfortunate spot on the sun of this feminist Millennium that a revolt should have taken place in the very citadel of the crusader herself. For it most miserably happened that her lawful husband, Mr Arthur Honeybun, successful merchant in the City of London, and concerned in affairs on which the sun never set, was most manfully determined to assert the supremacy of his own sex in his own home. That was the little rift in the lute which, slowly widening, had made this domestic music mute. Probably it was this dominant fact which had now once more invaded the peace of Mrs Honeybun's mind, for she had laid aside her pen, leaned back in her chair, and looked around her pretty room. Then she gave a deep sigh; it was as if to say that all was vanity.

She rose slowly, and moving rather wearily towards an arm-chair in front of the fire, picked out a cigarette from a little silver box on the ormolu table that stood by the elbow of her chair, lit it, took a deep puff of smoke, blew it into the air, leaned back, and sighed again.

Perhaps as she looked up at those beautiful rings of smoke, which she knew so well how to blow, she saw through them, in a vista, some picture of that earlier life of hers when her children were young and the disturbing trumpet of fame had not yet sounded in her ears. Perhaps she saw again her young husband romping across the room with a child on his shoulder, or the Christmas tree with the candles lit up and the little people dancing around. For in the midst of her public life Mrs Honeybun had moods of hunger, and these memories would come back.

In any case, her eyes seemed full of sadness as she looked into the fire. But suddenly she pulled herself together, sat up in her chair, leaned across for the evening newspaper lying on the settee, and opened it with a little toss of her head as if defying the memories of the past.

Then at that precise moment there came a knock on the door, and instantly there entered a young parlour-maid, pretty and quick in her movements, and with a curious look of amused

interest in her eyes, now carrying a note on a silver salver.

'Yes, Alice?' said Mrs Honeybun, wearily dropping her paper onto her lap.

'If you please, madam, it's a note from Mr Honeybun,' said the servant.

Mrs Honeybun took the note from the salver and opened it with a sigh. Why did he write so many notes? It was really a very troublesome thing about Mr Honeybun that he had an itch for writing notes, otherwise this arrangement of theirs might be working so much better! For it saved the trouble of two houses; and it suggested a new use for those colossal Bayswater mansions, which are the white elephants of modern London. But every time that Mrs Honeybun received one of her husband's letters she saw the weak points in the plan. These letters shook her peace. They shattered the dream of independence which was so pleasant to her feminine pride. They seemed to carry with them the menace of invasion.

A slight frown passed over her face as she read the note. The frown deepened as she looked up quickly and caught a glimpse of the maid's eager eyes and half-opened mouth, clearly perceiving in a glance that the girl was trying to read the letter over her shoulder.

'Tell Mr Honeybun that I cannot dine with him to-night,' said Mrs Honeybun, a little fretfully. 'I have to address a meeting in Paddington.'

'Yes, madam,' said the servant primly. 'At what time do you wish your dinner served?'

'At seven o'clock, please,' said Mrs Honeybun. 'And I wish Master Tristram and Miss Iris to dine with me.'

'I am sorry, madam,' said the servant, 'but I think the master has asked them to dine with him.'

For the first time there was a flash of anger in Mrs Honeybun's eye. She seemed about to speak. Then she looked up at the maid and saw something in her face that silenced her. No, above all, she must keep her dignity. Arthur had scored a point. She must give it to him. So she seemed to swallow her feelings with a sort of gulp, and looking up with a new serenity, she said quite calmly, 'Very well, Alice, you may go.'

Mrs Honeybun watched the maid leave the room; and then she leaned forward and, gazing into the fire, gave full play to her reflections. Ah, there was the weak point! After that fearful quarrel, in which Arthur Honeybun had told his wife that she must choose between him and her public life, and she had frankly preferred her public life, they had sat down with a frigid calmness which was worse than fury and attempted to plan out their new existence. Instantly they had bumped up against the question of the children. It had been the chief thing that had kept them together; it still

[Christmas Number.]

entangled and involved the separation, for amid all their differences they were both devoted to the children. So they soon found that neither was willing to leave the house where the children lived. And as neither had the heart to separate the children it followed that they must all live in the same house. Why not? It was a large house, with an embarrassing number of rooms; it was possible to provide each of them with a separate suite. So it was planned; and so it was arranged.

The next trouble was the children themselves. They made it quite clear that they were not going to be divided up like a parcel of groceries. The first idea was that they should dine alternately with their father or mother when they were at home. But there they both absolutely rebelled. They claimed the right of choice. So it came about that in some subtle way the division of the parents seemed to hand over the rule of the family from them to the children. There was a shifting of moral authority to the younger generation. Now the parents had to rely upon pleadings and coaxings; they had gradually to become rival suppliants for the favours of their own offspring, for parents cannot have it both ways. If the guardians of youth cannot bridle themselves, vainly will they hope to ride the Pegasus of latter-day youth.

At this point in her eddying thought there was a sudden tempest of steps on the stairs, the door burst open, and in rushed Tristram with flushed and heated face. He paused, and then moved rapidly towards his mother, leaving the door wide open behind him. 'Oh, I say, mother, I'm most awfully sorry about it!'

Mrs Honeybun turned in her chair towards her boy, and as she looked at him a new expression of pride and sweetness came over her face. 'My dear boy! What are you sorry about?'

'Oh, that I have promised father that I would dine with him to-night. If I'd only known——'

'Of course you must dine with your father when he asks you,' said Mrs Honeybun firmly, though her face flushed and she turned her eyes away from her boy to the fire. 'It's most important for boys to obey their father,' she ended, her voice seeming to drop as if the sentiment belonged to her past life.

'Well, you see, it's like this,' said the boy nervously and gently. 'Father's going to take us to a theatre to-night, and I haven't been to a theatre since last hols. Are you awfully cut up about it, mother?'

'No, of course not,' she said, with just a quaver in her voice. 'My only wish is that you should be happy. Is Iris going too?'

'Oh yes! Rather! What do you think?' shouted Tristram.

There it was again! The father bidding

against the mother for the love of the children, and always able to outbid her because he had his evenings free and she had her meetings. How unjust the world was! How cruel to women! What little reward to the true workers of the world!

All this passed through Mrs Honeybun's mind like a flash, and then there came back the old restraint of keeping up a good presence in the face of her children. 'All I wish, dear, is that you both should be happy,' she went on, almost mechanically. 'I wish I could come with you, but I have to go to a meeting.'

The boy looked at his mother with glowing admiration on his face. 'You're absolutely topping, mother! Always at meetings! It makes one feel quite low down. I shall tell father about it to-night. I don't hold with his line of life. It's too soft! I shall tell him so. You can always rely on me, mother, if it comes to that.'

Mrs Honeybun looked up with a little flush of surprise on her face. The tone of the boy was so strangely masterful. His attitude towards her was so much that of a father; she felt for the moment that she and her husband were just two naughty children. 'Your father has a right to his own view,' she said quickly, 'just as I have a right to mine. Always remember that.'

'Top-hole, mother! Now that's just what I want father to say. Shall I try and have a word with him to-night?'

Mrs Honeybun's face quivered. The one thing she flinched from in all these troubles was lest her children should be drawn into the quarrel. How little the boy understood his father. She foresaw in a moment the angry rebukes that would descend on the boy's head. It was splendid of the lad, but it would not do.

'No, Tristram, dear. Just leave it alone, and be happy. That's the best thing for you and Iris. I do so want you both to be happy this Christmas.'

She might well have been taken aback by the look on the boy's face and the shout of laughter that broke from him.

'A happy Christmas, mother, with you and father going on like this? Why, I call that the limit! The very thought of it puts me off my food. I've just been telling Iris how sick it makes me. No, mother, that's one thing I'll back you in. No Christmas for us this year!'

'Back me in?' said his mother, astounded at the phrase.

'Yes, back you!' cried the boy. 'If there's anything I loathe it's shams! What's the good of talkin' of lovin' with you and father sitting like a couple of icicles at each end of the house. Why, those waits have been singing about 'peace and good-will'; and I tell you I couldn't stand it. I asked Dennis to go

and stop them, but he wouldn't. But now I must be going, or else dad'll be baity with me. So long, mother. Cheer up and keep moving!'

Tristram leaned down and kissed his mother hastily, and then, turning, rushed out of the room as quickly as he had come in.

As Tristram rushed away Mrs Honeybun rose to her feet and stood gazing at the door which he had banged to behind him. Her face had grown white and her eyes were glistening. For a moment or two she stood quite still. Then she sighed a deep sigh. 'God forgive us!' she whispered. 'God forgive us!'

CHAPTER III.

MR HONEYBUN SCORES.

WHEN the Honeybun young people joined their father at dinner that evening, in the room which was set apart for his meals, they found him in anything but a pleasant mood. Mr Arthur Honeybun was not one of those men who like being crossed. Least of all did he like being crossed by his own wife. He had been brought up to the absolute belief that a man should be master in his own household. His father had believed in it, and his grandfather before him. It was a continual grievance with him that he had been unable to carry on the family tradition.

He was one of those men who are not so strong as they look. His big nose and clean-cut lips gave little clue to the real texture of the will within. He certainly looked a formidable man. He was that type that figures in books and on posters as the 'business' man. But, as a matter of fact, behind that broad brow there gathered a great variety of emotions—some strong, some weak, some generous, some selfish, some even mean and revengeful.

To-night it was certainly not his better nature that had the upper hand. He was very angry at Mrs Honeybun's refusal to dine with him. He regarded the offer as a great act of generosity. It was the first overture of that kind that he had made since the division of their lives. He had made up his mind to this step very slowly and painfully. It had, indeed, been a kind of move towards surrender—just a glimpse of the white flag.

For you must not suppose that Arthur Honeybun was really happy in his loneliness—or hugged his solitude. On the contrary, he detested it. He was a very sociable man, and he did not at all care for his own company. As a matter of fact he had consented to the act of division only because he regarded it as a kind of punishment for his wife which would quickly bring her round to his point of view. For Mr Honeybun, with it

all, had a high notion of his own attractiveness, and he had fully expected that his wife would soon tire of her detachment. So for several weeks he had waited expectant for an approach from the other side; and it was only when none came that he had sent the maid with his overture.

No wonder that he was somewhat amazed that this approach of his should have received so abrupt a reply.

He was perhaps all the more annoyed at his wife because he had been very successful in the city during the previous fortnight. He had carried out some good strokes of business. Trade at that moment was reviving, and he had risen on a rising market. He had plenty of money at his bank, and he wished to spend it. It was all the more annoying, therefore, to find that he could not make peace at home and enjoy himself after his own fashion.

Now, at this moment, one idea had fully possessed him. It was to win over both the children to his side. He was deeply devoted to his children; but at this moment love was almost merged in revenge. He wanted to gain allies. He knew that Iris was on his side; but Iris was only a girl. It was part of Mr Honeybun's philosophy—the very philosophy that had got him into all his trouble, a philosophy that clashed with the spirit of the age—to regard women as an inferior race of beings. He wanted to win over the boy. He knew that it would be difficult. Tristram puzzled him; he was so independent, so defiant. He could scarcely realise that Tristram was his son. He put it down to the schoolmasters. He was sorry that he had sent Tristram away to school. But now the thing was to win him over; and Mr Honeybun was willing at this moment to go almost any length in spoiling the boy to achieve that object.

So when the two children appeared, Honeybun greeted them heartily and jovially, and successfully concealed his vexation of spirit. Iris responded cordially to this mood, but Tristram was sulky and silent.

'Why, Tristram, my lad,' cried his father to him, 'what's the matter with the boy? You mustn't forget it's Christmas time! No sulky faces at this time of the year.'

'I loathe Christmas,' said Tristram.

'Yes, that's the way he's been talking all the afternoon,' cried Iris. 'I wish you'd tell him to cheer up, father. It makes us all so melancholy.'

'Oh, we'll soon cure him,' cried Mr Honeybun. 'He wants feeding up! That's what's wrong with him.—Take another helping, my boy,' he ended, proceeding to hew a drum-stick from the fat goose which had been sent up from the country especially for that occasion.

'I'm fed up already!' murmured Tristram.

Mr Honeybun stopped in his task, knife and

[Christmas Number]

fork in the air, and looked at his son rather sternly. 'That's not the way to talk,' he said. 'Very well, then,' said Tristram, 'I'll not talk at all.'

Mr Honeybun paused, with an angry expression on his lips. He suddenly realised that he was losing control of himself.

He could see what had happened. The boy had been talking to his mother. He had come to dinner with his mind already set against his father. It was clear that to quarrel would be to play into his wife's hands. He must take the other line. So Arthur Honeybun gulped down his passion, and decided to play the diplomat—not an easy task for a prosperous city man. He finished the helping, laid the knife and fork on the dish, and leaned back in his chair with a forced smile on his lips. 'Ah, Tristram,' he said, 'I can see what's wrong with you. I believe that you feel this situation as much as I do.'

'How do you mean, father?' said the boy eagerly, not quite understanding the change in his father's mood, and feeling a sudden relenting towards him. For, after all, the soft answer still, even in these modern days, turns away wrath.

'Yes, my boy,' Mr Honeybun said, 'you're quite right. It's not in the spirit of Christmas—not at all in the spirit of Christmas. I feel that myself. That is why I asked your mother to join us at dinner to-night.'

'But she had to go to a meeting!' cried the boy, aflame on behalf of his mother, but already a little on the defensive.

Mr Honeybun swallowed down a gust of anger. Those meetings—always those meetings! 'It is a pity,' he said quietly.

At this point Iris cut in. 'I hate them! I hate those meetings!' she cried. 'I shall never go to meetings when I am grown up. I shall stay at home with my husband and my children!'

'Wait till you've got a husband, old thing!' cried the boy irreverently. 'They're not found on every bush at the present day!'

'I think it was very nice of Iris to say that,' said Mr Honeybun, still on the soft pedal. 'Perhaps if he knows that Iris will stay at home with him the husband will come all the sooner!'

'He'll have a pretty tough job on his hands,' said Tristram with true brotherly candour.

So the talk passed off in boisterous laughter and an interchange of rough, school-life amenities between brother and sister. But Mr Honeybun felt on the whole that he had made progress. His son grew more friendly towards him, for when the talk veered inevitably back to the family crisis Tristram was feverishly apologetic for his mother, pouring out a torrent of excuses.

'I think it's so jolly fine of mother,'
1925.]

he bubbled, 'wearing herself out for people; especially as I don't suppose anybody cares very much. Still, it's jolly sporting of her. I wish you'd look at it in that light, father.'

'I like to hear a lad speak up for his mother,' said Mr Honeybun, still quietly. 'It's exactly the part I want you to play, my lad. There's more of Christmas in you than you think.'

'Dear old Father Christmas,' cried Iris. 'You'd dress splendidly for the part, old thing. Why not, Triss?'

Tristram threatened to throw a banana at his sister, and once more the family table was dissolved in the easy boisterous merriment which had been in the old days the note of the house.

So Mr Honeybun very gently and cleverly coaxed his son away from his defiant championship of his mother; and by the end of the evening, after they had gone to the theatre and thoroughly enjoyed themselves over a merry farce, and come back in a taxi-cab and found hot soup waiting for them, Tristram had begun to feel that his mother was a rather unreasonable person to stand apart from a life so varied and satisfying. She began to figure in his mind as a little of a 'kill-joy,' and his father began to take on a more amiable shape as the generous source of so many attractive pleasures. When he called to mind the descriptions of their fathers given to him by boys, his own father began to stand out rather well. In other words, the process of relenting had gone a considerable stage further; and a vague feeling had begun to creep into Tristram's young mind that if this sort of thing meant Christmas, why, there was something in Christmas after all.

So when the time came for a move to bed father and son parted most amiably.

'It was ripping, father!' cried the boy. 'Quite ripping!' And that meant a great deal from Tristram.

'Didn't I tell you so?' cried Iris, with glowing cheeks, as they mounted the stairs. 'Why, he's simply splendid!'

Mr Honeybun sat on in his room smoking a big cigar, quite alone, but with a gentle smile playing round his lips. The grim look of the earlier evening had passed off, and Mr Honeybun was feeling more at home with himself.

Probably Mildred, his wife, would soon come round when she found that both the children were following him.

Meanwhile Mildred had let herself in about an hour earlier with her latch-key and crept slowly up to her room. She felt very weary. She had had a long troublesome meeting, with much heckling and considerable opposition. She had been advocating a scheme of pensions for all spinsters over thirty. For Mildred never did things by halves. She had the fierce logic of her womanhood, and approached politics with

a free and open mind, which is the perilous quality of these new invaders of our franchise.

'Why not?' she said very simply to her audience.

But a large part of the audience had, with equal simplicity, replied 'Why?' The men had been openly hostile, and the women passive. The British Fascisti had put in a stormy appearance, and a group of ex-soldiers had made a confused and noisy appeal that whatever pensions were going should be given to them. Altogether it had not been a very successful gathering.

But now would come her sole evening relief. For since he had come back from school, Tristram had always come to see her after her work was over, and had regaled her with his school-boy talk. She looked forward to that visit with a great hunger, and she did not know herself how deep that hunger was. But Tristram did not come. She waited. Now she read a book; then she smoked a cigarette. So she whiled away the time, now and again smiling at the thought of his coming. Still he did not come.

Then she heard the front door open and close, and the sound of steps on the stairs. She knew that the party had come back from their theatre. She laid down her book, and sat up with eager, expectant eyes. Tristram would surely come in and tell her all about it.

But still she waited and no one came. Then she heard another door open and close; and then steps going up the stairs; and she knew that the children were going to bed. But none of the steps stopped at her door, they still went on up the stairs. Then she caught her breath for one moment. Her eyes closed and her mouth half-opened; and at last, with a sudden surrender of all her courage, she leaned her face in her hands, and burst into a passion of tears.

CHAPTER IV.

MRS HONEYBUN DREAMS.

MRS HONEYBUN went on weeping for some little time. She found relief in her tears. When she had once begun she did not want to stop. It seemed to be the thing she had yearned to do for some time past. No one came to stop her, and that made her cry all the more. She cried because she was lonely, and she felt less lonely for crying, as if the very tears gave her company. There is much virtue in a 'good cry.'

Thus she gradually tired herself, and the very fatigue seemed to comfort her. She felt better for being tired. It was with a kind of luxury of restfulness that she leaned back in her deeply-cushioned chair and snuggled herself

into its soft recesses. Then her hands fell limply onto her lap, and her eyes gradually closed. She ceased crying and lay quiet. As she lay quiet her breathing came more slowly and regularly, and she fell asleep.

As she slept she dreamed, and she did not know that she was dreaming. It was as if her spirit was carried back far across the years; far away from the murk of Bayswater, away from the fog and darkness, into the early spring sunshine of the country and the west.

She was walking in one of those deeply-cut lanes which run between the meadows of Devonshire, and her first delight was the sight of the flowers that covered the great green grassy banks on either side. The flowers formed one mass of colour—blue, gold, yellow, and scarlet; the violets and primroses, the celandines and the scarlet campions, all massed together in their wild, tangled growth. Yet there seemed some kind of system in their beauty, for she noted that the violets formed a carpet out of which the primroses sprang. And what primroses! Great, wide-eyed beauties, grouped in such thick clusters that they seemed to crowd one another, like birds in their nests, with a sweet, cuddling rivalry, lying in their cups of green leaves. Above her was the pale-blue sky of spring, and on her cheeks the warm air from the south.

She was about to pick some primroses, when she realised that her arm was resting in that of a young man, who was looking down at her with deep devotion in his eyes. Then she looked up and saw the reflection of herself in those eyes of his. They were dark-blue eyes; and how well she knew them! For it was young Arthur Honeybun, her newly-plighted lover.

It was a happy thing, perhaps, that her dream was too deep for contrast or comparison. She did not compare this young man with the Honeybun of to-day, for she had forgotten all about her present life. It had disappeared in a mist, and she was back in the happy past. All she knew was that this young Arthur Honeybun—slim, handsome, and keen-eyed—loved her, and she loved him; two very simple things, but they filled her life at that moment, and there was nothing more she wanted to know.

Nature seemed to be there with only one object—just to fill the measure of her joy. It was the pride of her love to believe that all those flowers were smiling at her, that the blue sky was blue to provide a canopy for their happiness, and that the sun was shining just to welcome their joy. For it is of the nature of lovers to harbour such vain fancies. It is their fond habit to regard themselves as the centre of the universe; to imagine that all things are revolving round the sun of their joy. Happy fancies! Happy hours! Would that men had no fancies less harmful, and spent no hours less innocent!

[Christmas Number.]

They sauntered gently down the lane; and then she knew, without anyone telling her, that he was going to say something to her of the utmost importance. Her heart was beating quickly, and she felt her cheek hot. Her gaze was absorbed with looking at the flowers, but all the time she knew that he was looking down at her. Now she heard his voice—that young, rich voice of the youth Honeybun, not the husky, petulant accents of the successful city merchant.

‘I want to ask you something, dearest,’ he was saying.

‘Ask away,’ she said, with an assumed lightness.

‘I want to ask you whether you think you could ever cease to love me.’

‘How can you ask such a thing?’ she cooed back.

Arthur Honeybun gave a laugh, but there was a tremble in his voice. ‘Oh, I don’t know,’ he said. ‘I was staying the other day with an old uncle of mine. He has quarrelled with his wife, and it gave me the hump to look at them. They scarcely ever speak to one another. You’ll think me an awful idiot, but after a few days of it I got an idea that I could not get rid of.’

‘What sort of idea?’

‘Why, that possibly once they too were in love with one another.’ And he laughed uneasily.

So happy was she that she could scarcely follow the winding of his thoughts. She did not connect the idea of an old uncle and aunt with their own happiness. Old people were—old people! But they were young, and youth—is youth; and to itself something immortal.

‘You dear old thing!’ she said. ‘What are you puzzling your silly old head about? Why worry yourself about an old uncle and aunt? Such dull and stupid people! Why, of course, they never could really have cared for one another!’

‘Do you really think so?’ he said.

‘Yes, of course,’ she went on. ‘Because if you really care for one another you never cease caring. “Love once, love for ever!” That’s what I think about it.’

‘How sweet to hear you!’ he said, and, bending down, he kissed her on the forehead. ‘But still, I want you to make me a promise.’

‘What promise?’ she said.

‘That you will always go on loving me, whatever may come between us.’

‘Of course I’ll promise,’ she said lightly. ‘As if anything ever could come between us! You silly old boy! We’re so different from them! They’re old and frowsy, and we—why, we—’ She paused as if nothing could quite equal the vision she saw in her mirror of life.

1925.]

But he took her up with a little laugh. ‘Why, we,’ he said, ‘are like the flowers of spring. But then, dearest, the flowers fade, and spring passes, and autumn comes, and winter.’

‘Oh, don’t talk like that!’ she cried, leaning her head on his arm. ‘Why, we’re always going to have spring, you and I!’

‘Of course we are, dear. You’re quite right,’ he said. ‘Always the spring. Spring in our hearts, if not in the sky. Light in our home, even when the skies are gray.’

She listened; and then, somehow or other, the voice faded, the banks grew dim, the light darkened, and Mrs Honeybun woke with a start. ‘Oh dear,’ she cried, ‘it was only a dream!’

She looked round, saw her open desk and the papers on it, the fire burning low in the grate, the pretty, painted boudoir, and realised that she was alone.

For a few moments she sat quite still, gazing into the waning fire. She was desperately trying to clutch the dream before it faded away—trying to rescue from growing oblivion the fragments of that bright vision of youth and hope. But even as she sat there it was rapidly vanishing back into the darkness: and only now and again, as through breaks in the clouds, seen looking down from a great height, did she get glimpses of that radiant sunlight of her youth. But, even so, enough remained to recall to her those happier days, before the shocks of life had battered their hope and faith in one another.

The memories brought to her a great longing and a great hunger. With the longing and the hunger there came for the first time to Mrs Honeybun a faint doubt as to whether she had always been in the right—the first break in her own complacent self-confidence.

She sat there quite still, with open eyes. She did not wish to surrender herself again to sleep. She was thinking hard and trying to remember. She was passing her life in review, and attempting to recall the incidents which had first divided them.

Although her eyes were open, the effort seemed to produce something in the nature of a walking vision. Scenes in her life passed before her, like those moving-pictures which are the triumph of this age.

Gradually, as this process worked, her eyes closed again, and she was back in another scene of her past.

It was Christmas Day in her early married life. She could see again the tall Christmas tree, covered with the little presents and lighted with candles. She could see her two little children, still toddling infants, Tristram and Iris, skipping round the tree in wild delight. What dear little children they were! How

trustfully they looked up to her! How they smiled and laughed at her! How utter and complete their love and confidence! How different from their moods of to-day! Iris was in a little white frock with a scarlet sash, and Tristram in those neat little brown corduroys which his mother remembered so well.

Tristram suddenly stood quite still and cried, 'Where's my daddy?'

The mother smiled, and there was a twinkle in her eye. 'I expect he's very busy to-day,' she said. 'Perhaps Father Christmas will come instead.'

'Father Christmas? Why, I love Father Christmas!' cried Iris. 'I seed him last Christmas, and he was so like daddy except for the whiskers.'

'I think it was daddy,' said Tristram stoutly; 'cos they never come together.'

'Little boys are so clever nowadays,' laughed the mother. 'Sometimes too clever.'

'I don't like clever people,' said Iris. 'I like believing things.'

'That's just like girls,' said Tristram. 'Boys like finding out.'

'Oh you silly dears!' cried the mother, picking them up each in turn and kissing them. 'You mustn't grow up! You mustn't grow up!'

'Oh yes, I shall grow up,' cried Tristram, after he had disentangled himself from his mother's embraces. 'I want to be a man like daddy.'

'If it was always Christmas I'd like to stay little always,' said Iris.

So the infant prattle went on, each vying with the other; Tristram already with the beginnings of that touch of defiance which had now grown over his nature like a tangled creeper; Iris, soft and clinging, anxious to please, loving and large-eyed, grasping in her arms a large ugly doll with one eye knocked out, a few fragments of wispy hair, and a broken nose.

Suddenly there was a loud rapping at the door, and both the children shouted with delight and danced about, for they knew it was Father Christmas. The door opened and Father Christmas came in, very tall and rather stiff in his gait, and dragging after him a sack full of presents. Both the children shrank back for a few moments, surprised and startled, and then Iris laughingly ran towards the old man. Tristram stood quite still, with an angry little look on his small face, and his right hand tightly closed, and cried, 'Why, Father Christmas has got my daddy's boots on!'

The whole scene dissolved in laughter. Father Christmas threw off his mask and revealed Arthur Honeybun, now a little more lined than in the Devonshire lane, and with a little less hair on his head; but the same merry, joyous, confident look in his eyes.

The scene faded. Mrs Honeybun sat upright in her chair, now wide-awake, and she looked round to realise that once more she was alone.

Restlessly she rose and walked towards the door. A mood of repentance was on her. It was absurd that they two should quarrel so. She would go to Arthur at once and make it up. The whole thing was too ridiculous!

She went outside to the top of the stairs. The house was darkened.

She went down to her husband's study. That, too, was in darkness. No light was coming from any of the rooms.

They had all gone to bed without giving her a thought!

She returned slowly up the stairs.

It was cruel of them! Her mood of relenting was already passing away.

A passion of resentment swept through her. She was in the right. They were leagued against her.

Steeped in such sombre thoughts, she crept upstairs to her lonely bedroom.

CHAPTER V.

THE MOGSOMS COME TO BAYSWATER.

LIKE most self-made men, Mr Arthur Honeybun had poor relations; and among the poorest was his sister, generally called Mary by himself and his wife, but known to her own neighbours and friends as Mrs Alpheus Mogsom. The name scarcely did her justice; it was certainly a poor exchange for the title of Mary Honeybun, under which she had passed so many serene and happy maiden days.

Arthur Honeybun did not approve of his sister's marriage. He did not like the name of her husband. 'Mogsom' seemed to him about the limit of the name to which a Christian woman should submit, even as a payment for the protection of marriage; but, apart from that, he always thought that his sister Mary could have done better. In his view all that she had to do was to wait, and then she would have risen with his rising fortunes. He would have been willing to act generously towards her. For Arthur Honeybun carried in his own breast a picture of himself as an extraordinarily kind and benevolent person, pouring out benefits widecast over an ungrateful world. It was a continual pain to him that the world did not seem to recognise the beauty of this picture.

Mary was one of those who most signally failed to rise to this height of appreciation. After living on her brother's bounty for some years, she actually grew tired of the position. It was not that he was hard on her, or exacting in return. But Mary was a sensitive woman; and she always imagined that she saw in his

[Christmas Number]

eye a sense of the bountiful part that he was playing. That seemed to her to upset the relations of sister to brother. She craved for independence.

She was slow to go against her brother's will, and she held out for a long time. It was not until she had turned thirty that Mary came to the conclusion that it was better to wait no longer. Waiting, too, had its dangers.

So it was that when Mr Alpheus Mogsom presented himself, and made his proposal in due and respectful fashion—though perhaps in a tone somewhat devoid of poetry, and rather too business-like in its expression—Mary Honeybun rapidly came to terms. For Alpheus Mogsom at that time bade fair to be a prosperous man. He was a small jobbing builder, and he gave the family to understand that there were no limits to his ambition or his capacity. Now, builders sometimes build fortunes as well as houses. After all, there is a romance in building. The very word raises visions of castles not merely in Spain, but also nearer home. We have all known builders who have risen to greatness; and although some of them have crashed again, we think rather of those who have risen than of those who have fallen. It is an amiable preference.

Now, hope is the very atmosphere of courtship; and so while Alpheus Mogsom was courting Mary Honeybun, he was extraordinarily hopeful—so hopeful that Mary was infected with his hope; she too, for the moment, had firmly believed in palaces and castles. The little house in Fulham to which he asked her to come as his bride seemed to her in those days only the gray forecourt to the lordly mansion which she hoped to inhabit later on.

Arthur Honeybun allowed his resistance to be gradually sapped and overcome. He did not like it; but, after all, we cannot get everything we want in this world, and it looked as if he might be saved his annual allowance to his sister. It was in those earlier days when Mildred left matters to her husband, and, after all, it was his affair. So Arthur and Mildred gave their blessing to the match, sent along a silver crumb-scoop as a wedding-present, and gave them a wedding-breakfast in a Bayswater hotel. While Arthur Honeybun fidgeted uneasily on an uncomfortable seat in the church at Lancaster Gate, Mildred sat reflecting in silent misery on the sacrifice of so handsome a sister-in-law to a man with such large hands, and clad in such an ill-fitting suit of clothes.

But that was all very long ago, and now the Mogsom family had multiplied exceedingly; and all the visions of castles and palaces had long since disappeared. Building had not flourished of recent years; and it had turned out that, after all, Alpheus Mogsom was not a genius or a master-builder. Like many builders, he had

'fancied himself' as an architect, and many of his subsequent tenants had most unreasonably complained of the shape of his rooms and of the situation of his staircases. He had been accused during the proceedings of the local borough council of being a 'coffin-builder,' and that had not done him so much good as some might have expected. For there was growing up an unreasonable feeling against people who built cheap and sold dear. Yet, as Alpheus Mogsom often bitterly remarked, his critics did not seem to build anything at all, whether cheap or dear.

'They may say what they like about my 'ouses,' he said confidentially one day to a fellow-builder, 'but I reckon a rabbit 'utch is better than no 'ouse at all.'

The sad thing was that the great British public did not seem to agree with his view; and so this Christmas the Mogsom family was by no means in a very good way. There were six children, ranging in age from sixteen to two; and the little house in the little street off the King's Road was very crowded and very noisy. It was the tragedy of the Mogsom children that they would have been far happier if they had not cherished hopes of benefits from rich relations. Charlie and John, for instance, the two elder boys, of sixteen and fourteen years respectively, had always been encouraged to expect that they were going into their uncle's office. But when Arthur Honeybun had heard of this he had coldly remarked that he had no use for relations in his business. So the lives of these two boys had been soured by the excess of their early hopes. Otherwise John would have been quite happy enough in the drapery shop in which he was working, and Charlie in the little lawyer's office in Gray's Inn. But both had dreamed larger dreams; both now found themselves 'cabin'd, cribb'd, confined' by the limits of their actual life. That was not a very happy element in the household.

Thus it was that the Mogsom family gravitated round the central star of the Honeybuns, perpetually distracted by its attraction. They were sometimes deeply disturbed by some sudden interposition of Arthur Honeybun, some tyrannical beneficence; but more often sulky and angry because he did not seem to take any interest in them at all.

Already, at this Christmas time, the effect of this disturbance was visible in their preparations for the feast. There was the question always fascinatingly absorbing as Christmas drew near—up to how much Uncle Arthur would remember them in his presents; or whether he would forget them altogether. For experience had shown that Arthur Honeybun could not be exactly relied on either way. Sometimes he would send every child a 'tip'—a pound for the elders, and ten shillings for the youngers. But at other times he would send nothing. It

would all depend on his mood and his memory. This uncertainty affected the whole family. It would have been better, perhaps, if no 'Uncle Arthur' had existed at all. His very presence on the planet seemed to create in their minds a vague unrest, a fever of uncertainty. For such is our life here that a haunting possibility of good luck seems more torturing than an ever-present certainty of trouble.

'If I was quite certain sure,' said Charlie, fingering his extremely dirty purse, and counting out the little store of sixpences that had been hoarded out of his pocket-money for his Christmas presents—'if I was quite sure for absolute certain that uncle would remember us, then I could buy mother that silver brooch she looked at in the jeweller's window the other day. But as I am not certain, I can't—and that's all there is to it!'

John was more daring, ignoring the fact that on a previous Christmas he had banked on a present which had never come. 'Well, I shall take it for actual granted,' he said. 'Then I feel sure that it will come for exact certain.'

The four smaller children danced round the room, shouting at the top of their voices, 'Hurrah for Uncle Arthur!' For they had a vague idea that he might possibly hear them, and that that jubilant and friendly outcry might somehow help them.

Their mother sat sewing, looking on rather sadly, and wondering whether she could really dare to go up to the big house in Bayswater and tell her brother Arthur how great their hopes were and how beautiful they looked. Then her heart sank, for she remembered how she had been snubbed when once she had opened the subject with him, and drawn the conversation towards Christmas. She had told him in a moment of indiscretion how much they were looking forward to it.

'I don't like children to take things for granted,' he said curtly, and there the matter ended.

She had felt hurt to her very soul; and yet she remembered that afterwards some big presents had come that Christmas, and so her pain had been worth the while. But Mary Mogsom was as proud as she was poor, and she did not feel that, for the wealth of all the Indies, she could open the subject again with her brother.

Alpheus Mogsom had done very badly that autumn, and this was a very lean Christmas for the Mogsoms generally. Mary did not talk much about it, but she sighed as she watched her children. It was very doubtful whether she would be able to afford a plum-pudding for Christmas Day; and certainly she could not buy them a Christmas tree, much less waste money on all those glittering little spangly ornaments in which the children's hearts delighted. Holly was dear that year, and she did not see how she

could get any for them, although they prattled about it incessantly, and kept telling her how they had seen the scarlet berries in the fruiterer's shop over the way, and the silver mistletoe, and the almonds, and the apples, and the oranges, and all the other little delights of the Christmas season. No; she would have to cut up some strips of coloured paper, and perhaps she might be able to make them a few mince-pies. For, indeed, it was difficult enough to feed them anyhow. There were those two growing children, Bobby and Ethel, aged ten and eight, who came mid-way in the family; and the two toddling babies, Brideen, aged four, and David, aged two. How much they ate! She had got into the way of looking at them anxiously at tea-time, and wondering whether their appetites would ever be satisfied. Then their clothes and their boots! Why, they seemed to grow out of them as soon as they were bought; and the method of handing on from one child to another, though so obvious an expedient, never appeared quite to result in a proper fit. Luck always seemed to be against it. The boots that pained the feet of John were too large for the feet of Bobby; while the frock that made Ethel look spindle-legged reached the ground with Brideen.

So matters might have gone on, and that Christmas might have passed like any other Christmas, with a deeper gulf slowly widening between these two families, if it had not been that on that very evening, three days before Christmas, little David had come running to his mother all hot and fevered, and laid his flushed cheek languidly against her bosom. Full of alarm, Mary Mogsom had carried the boy up to his little cot, secured a doctor after infinite hurrying to and fro, and within two hours had come to know that the child was seriously ill. The doctor shook his head. He could not yet tell what it was. But it was probably something infectious; and he strongly advised Mary to send the other children away from the house. He might as well have advised her to send them to the planet Mars.

When Alpheus Mogsom himself came in, with that hang-dog look which he wore in times of adversity, the news seemed to break some spring of patience within the man.

'What about that brother of yours?' he said roughly. 'Isn't it near time he did something!'

'Oh, Arthur's always very good,' said Mary; for she would not hear a word against her brother.

'I daresay,' said Alpheus. 'And now's his chance of being even better.'

'What do you mean?' asked the poor, harassed mother.

'Hasn't he got a blessed palace up Bayswater way, just for him and his wife and the two young 'uns?' growled Mr Mogsom. 'Isn't there room for the kids there, I should like to know!'

[Christmas Number.]

'If Arthur knew, I'm sure he'd help,' said Mary, plunging with fear and trembling, but still faithful to her brother's reputation for benevolence.

'Well, why not go and tell him? Isn't there a telephone across the way? What's the good of sittin' there with your hands in your lap?'

Mary Mogsom rose, her cheeks flushed. 'Certainly, Alpheus, I'll tell him, right away,' she said, and she moved towards the door.

There was a curious defiance about her attitude; as if she was determined to show that her husband was wrong and she was right about her own brother.

But it was not Arthur Honeybun who was speaking at the other end of the telephone when she at last got on to the number. It was the voice of her sister-in-law, Mildred, and Mary at once became very nervous. For she knew little of Mildred, except that she was a great lady and had always seemed very splendidly dressed when she met her, and extraordinarily anxious to get her a vote when she really wanted something more substantial.

So it was that with much trembling and doubtfulness Mary poured forth her pitiful story of the child's illness and the doctor's orders and her powerlessness to carry them out. She did not even dare to make any proposal as to their going into the Bayswater house. She only asked Mildred, as woman to woman, what she could do? Could she give her any advice?

Then, to her immense surprise, came an astonishing reply. 'Oh, do let me have them!' Mildred cried. 'It's just what I want! Send the whole five! If they haven't been with David, there's no danger of infection. I'll get beds for them,' she hurried on. 'We'll manage somehow. Ask Arthur? Oh, he's out at business. It's no good worrying him. I'll send the motor for them. Get them ready at once. What a happy Christmas we shall all have!'

As Mrs Mogsom put back the receiver, and leaned back from the telephone, she almost gasped from sheer amazement.

Surely the world was really far better than she had ever imagined!

CHAPTER VI.

BRIDEEN EXPLORES.

IT was Christmas Eve.

Mr Arthur Honeybun had returned home from the city; he was enjoying his lonely evening meal. On the whole he was fairly well satisfied with life. The children, it was true, had gone out that evening to a party of their own—a dance. They had asserted their independence, and would not be back till late. But, 1925.]

on the other hand, they were not dining with Mildred. That was one point scored. He had, at any rate, detached them from their mother.

Strange that such an achievement should give pleasure. But so closely are our feelings intertwined that if we will not derive satisfaction from love we must draw our water from the other well. Hate becomes very rapidly a kind of nourishment.

Arthur Honeybun put down his knife and fork, leaned back in his chair, and gave a sigh of satisfaction. Dennis the butler moved noiselessly to a position behind his master's chair, and silently refilled the emptied glass. Honeybun had not wished for any more wine; but, finding his glass filled with his own best Madeira, he drank it. He now felt warmer and more amiable.

He began to reflect.

How unreasonable women were! Here was Mildred, the luckiest of wives and most fortunate of mothers, a woman whom most of her sex would envy. Yet how she had wrecked her life!

He had asked only one thing of Mildred. She was to give up her public life. Why not? She had plenty to do at home. Lonely women—spinsters and widows—they could do what they liked with their lives. But wives? Clearly their first duty was to their husbands. Mildred, for instance, had promised to obey him. She had disobeyed him. She had broken her word.

'*This freedom!*' Why, this was not freedom, it was license! It was sheer neglect of obvious duty; at any rate he could not be accounted an accomplice. The children could not accuse their father.

He looked up at the index figure of the date displayed in large lettering capitals on the mantel-piece calendar—DECEMBER 24. Yes, it was Christmas Eve. The date somehow made him uncomfortable. 'Peace and Goodwill.' Shepherds watching their flocks!

He could not wholly banish from his mind that unpleasant speech of Tristram's—'I loathe Christmas!'

Yes, the children did accuse. They accused both. It was very awkward—and very unfair of them. But there it was. It was just like this new generation. They had no proper respect for their elders.

Whose fault was it? Certainly not his. Entirely Mildred's. How obstinate she was! Why did she not give way? It would, of course, be gross weakness for him to give way. He would be sacrificing a principle. He could never do that. Nothing could make him do that. Women never understood principles.

So Honeybun sat there over his wine, feeding his hungry heart on hatred; telling evil with every assurance that it was really his good;

hugging to his breast the tempest of his soul. How laboriously we strive to make havoc! How eagerly we embrace ruin!

Arthur Honeybun took a cigar out of his case and slowly lit it. As the pleasant fumes rose to his brain he began to see life a little more cheerfully. After all there was something to be said for independence. He was master of the house—or at any rate of his own side of it. He could call his soul his own. He could, for instance, sit here and smoke in peace. His eye shifted lazily round the large warm room. Since his wife's secession he had risked some changes. He had, for example, shifted some pictures to new places. There was that little Corot. He had given it a place on the sunny side of the wall. Little fancies of an emancipated manhood. Slight in extent—but how precious!

He turned his eyes towards the door. Something was always going wrong with that door. It would never remain shut for long. Now, for instance, it was slowly swinging open. Yet he could swear that it had been fast shut only a few minutes before. He must get the carpenter to see to it.

But now it had swung completely open, and into the room there stepped a very small figure—a little girl in bright blue pyjamas, carrying a large doll with staring eyes. She stood and gazed at Honeybun. 'Hullo! It's Uncle Arthur!' she said very slowly.

Thus addressed, Arthur Honeybun leaned back in his chair and blew a cloud of smoke, for all the world as if he had seen an enemy and wished to interpose a smoke-screen.

'I'se Brideen!' said the figure in blue pyjamas by way of explanation—as if her uncle did not know only too well. Then she came nearer to him. 'I want 'oo to see my doll, what Auntie Mildred's gived me.' She confidently laid on his lap the very large meditative object that she was carrying.

Honeybun had at last achieved some slight recovery of dignity. 'And what on earth may you be doing here?' he gasped.

'May I get on your lap?' was the only reply; and there was no arguing with a command so courteously framed as a request.

'But I thought you were in Fulham with all your brothers and sisters?' fairly groaned Honeybun.

'We're all here!' responded Brideen with a comforting nod.

'All here!' It was a cry of the heart.

'Yes, ain't it fun?'

The Mogsom children were often sadly guilty of such vulgarities of speech—and Arthur wincingly recognised this one as a final proof of identity.

'Yes, David got the fever—and so mummy rang up auntie—and auntie says, "Come 'long." So we comed.'

She capped this veracious summary with a

reassuring nod, which almost seemed about to remove her large head from her little body.

'All in this house?' cried the hapless master of his own house, fresh from a survey of his own sovereignty.

'Yes; there's Charlie and John in one room, and Ethel in another, and Bobbie and me in another. And it's all so clean you can't think.'

But Honeybun could think.

His great life scheme—to keep the Mogsom family down in Fulham—had been shattered all at once.

So this was Mildred's counter-stroke!

Here they were, a garrison in this citadel; already established and entrenched. Doubtless supported by Mildred.

'But what are you doing down in the dining-room?' he now faintly asked.

The young thing was totally unconscious of any note of wrath in his voice. She nodded to him confidentially, and dropped her voice to a whisper. 'Just explorin'.

'Exploring what?'

'Auntie's house.'

'But it's my house!'

'Yours? I thought you was dead.'

'Me dead?' he inquired, regardless of grammar. For the idea seemed to him atrocious, insolent. He dead! And the world going on as usual?

'Aren't you really dead?' She spoke with a flattering air of personal interest, as if the subject really interested her. She stroked him with her hand.

'Can't you see I'm alive?' He now spoke with some irritation.

'What do people look like when they're dead?' was the little person's slow inquiry, delivered with scientific calmness.

'Why did you think I was dead?' he replied evasively. For it suddenly occurred to him that this was a part of Mildred's infernal plot.

'Well, nobody said nothing about you. That generally means people's dead.'

Honeybun gasped. There were two sides to this life of independence.

'But if I was dead, why did you want to see me?'

'Don't dead people like to be seen?'

'How should I know? I'm not dead!' He spoke defiantly.

Brideen began to straighten out her little body with a view to descending from his lap.

'Then I must go and wake up Ethel and Charlie, and John and Bobbie, and tell them all about it.'

'But why?'

'Because they all think you're dead, and they were very sorry about it.'

Well, I'm glad to hear that at any rate.'

'It was all 'cos of their Christmas presents.'

'What?'

[Christmas Number.]

'They said you couldn't give them Christmas presents 'cos you was dead.'

'But I'm not dead!'

'That's what I want to tell them. So dood-bye.'

She began to move towards the door.

'Are you going to leave me?' he said. For somehow, on seeing her go, a great sense of loneliness and desolation swept over him. After all, the child was company.

'You see, I'm really in bed,' said the child.

'How's that?'

'Well, I slipped out and comed down here. But they all think I'm in bed.'

'How on earth have you managed to escape?'

'Cos of Christmas stockings. They're all filling the Santa Claus stockings in the kitchen.'

'How do you know?'

'Cos I peeped!'

'How on earth——'

'I slipped downstairs just to see if Santa Claus was really and truly comin'—and then I seed them in the kitchen, through a chink. So I comed back—and then I seed a light here, and comed in. That's how it was.' She nodded reassuringly.

'Really, I must scold auntie——' he began, but the words died on his lips.

The little person leaped with joy. 'Oh do! Do come and scold auntie! I do want to see you scold auntie!'

He gazed at her in astonishment and perplexity. It was certainly a strange desire.

'But you mustn't really,' she went on gravely, 'cos it's my fault, not auntie's.'

Brideen took one step outside the door—and then suddenly she turned and ran back across the room to him. She buried her head in his lap and began crying. 'I'se frightened,' she said. 'The stairs is all black. Brideen can't go up alone.'

'Be a brave child.'

'Carry me, uncle. Carry me upstairs. Like as you did at home, last time you come.'

Deplorable precedent! Miserable weakness!

But there was nothing for it but to go with Brideen. For Arthur Honeybun had a very soft spot for children; and this child was now thoroughly frightened. She clung to him and sobbed convulsively.

'Oh, uncle! Do carry me! Do carry me! It's 'cos of Santa Claus. I don't want to meet him!'

'But he is a dear old gentleman.'

'Auntie says he don't like naughty girls; and I've been so naughty!'

'It was a bit naughty of you to get out of bed.'

'Yes; that's why you've got to carry me.'

So he carried her, pickaback, in the old, old fashion of carrying, very slowly and gently up the stairs.

1925.]

There was a light at the top of the stairs. They could see it glimmering; it sent a faint sheen down the dark well of the staircase, where the electric lights had been shut off by careful hands.

They could hear voices. Brideen's little body trembled.

'I'm sure it's Santa Claus. He'll be so cross wiv me.'

The voices grew louder. Brideen began to supplicate. 'Please, Santa Claus, I'm so sorry!'

'All right, old girl,' sang out Honeybun, 'he'll forgive you.'

His voice was quite changed. It had a new ring. He crept up the last staircase on tip-toe. The voices were coming from one of the bedrooms at the top, and one was shrill with fear. It was Mildred's.

'Oh! Where is she? Where is she? I left her comfortably in bed! Oh! What shall I say to her mother?'

Before Honeybun could say anything, Brideen piped a reply. 'I'm tumming; I'm tumming. Uncle Arthur's bringing me!'

They were at the door of the room. Arthur Honeybun paused with his burden, and stood gazing at the scene.

Mildred and Alice were standing at the foot of one of the little cots. In the other, by the window, little Bobbie, aged ten, was slumbering peacefully.

Alice, who had been enlisted for Santa Claus, was standing with her arms full of portentous stockings, fat and swelling, like amputated legs afflicted with monstrous tumours. She and Mildred were evidently at the first stage of their Santa Claus pilgrimage.

Then Mildred suddenly caught sight of her husband carrying Brideen. She turned and eyed him fiercely and angrily. 'Oh, Arthur! Why did you take her away? How cruel of you—how cruel!'

Arthur let the child slide down from his back, and stood facing his wife, smiling, but still defiant. He was too proud to defend himself.

But Brideen in her little blue pyjamas tripped across to Mildred, and began fondling one of her hands. 'Please, auntie, don't be cross with uncle. Please!' She clung to her aunt. 'Please, I did it myself—all by myself,' went on Brideen, as if she was reluctant to lose the credit of so bold a deed. 'I wanted to explore,' she explained. 'That's why I gotted out of bed.'

'Take it as you like, Mildred,' said Arthur doggedly. 'The kid's right.'

'Really and truly?' asked Mildred, looking down at her with eyes that were now less hard.

'Oh, do just what you like about it,' he said. But insensibly his voice seemed to be returning

to the old notes of their early wedded years. 'She came hunting for me in the dining-room—just like Iris in the old days.'

'Like Iris,' repeated Mildred more softly.

A silence fell on the nursery, while Mildred slowly picked up the little thing and kissed her. Brideen opened her little arms and threw them round Mildred's neck. 'Kiss him too, auntie,' she said; 'he's not been naughty, like me.'

'Hasn't he?' said Mildred, slowly leaning to the child. 'Are you quite sure?'

'No. And he isn't dead; least he says he's not.'

'Dead!' echoed Mildred with a cry of fear. 'Who taught you to say such dreadful things?'

'You never told me he was alive.'

Arthur Honeybun moved a step nearer to the two. His eyes were just a little moist. 'Would you mind very much if I was dead, Mildred?' he asked.

'Oh, Arthur!' she cried, and hugged the child more closely.

'Give him a tiss, too,' echoed Brideen; and her voice was already muffled with sleep. 'Give him a tiss, too; he's very good.'

Arthur was quite near now. He was stroking one of Mildred's hands. 'We've been great fools, Mildred. Children teach one a lot.'

Mildred slowly carried the child across the room and put her in her cot. She covered her up with the little blanket. Then she stretched out a hand behind to Arthur. 'Come—look!'

she said. 'Isn't she like Iris when—when—she was little?'

'Yes; and when—when—we were young.'

She turned towards him with both hands stretched out. 'Arthur!' she cried, 'we are still young enough to love one another.'

She slid into his arms.

Then, as they stood there, the voices of the Christmas carollers came up from the street:

'Fear not,' said he; for mighty dread
Had seized their troubled mind;
'Glad tidings of great joy I bring
To you and all mankind.'

There were voices on the stairs.

'Do you like that song any better to-night, Triss?'

'It's pretty rotten.'

'Oh, Triss; let's look in and have a peep at the children.'

'I don't mind.'

They were at the door of Brideen's room. There they stopped quite still, gazing in wonderment at the scene before them—their father and mother so lost in this new discovery of one another that they were unconscious of their children's presence.

Tristram was the first to move. 'Let's go down,' he whispered; 'they'll like to be alone at first.'

'Do you like the song now, Triss?'

'I could sing it myself.'

THE CALL—NEW YEAR'S EVE.

BUGLER, what is the call ye sound

Through the mystic hush of the air?

Stir not the depths of the brooding calm

That hallows the earth like a prayer.

'I sound for the days that shall come no more,
For a ship that drifts from its mooring shore;
I sound for the fights that were nobly won,
For the good complete, and the good begun.
I sound for the hopes that have conquered
fears,

For the joys that memory still endears;
And I sound for the failure, the sin, the
wrong,

That silenced ever earth's triumph song;
For the waste of days, and the petty aims,
And the self that deafened the finer claims.
'Tis the 'Last Post' rings through the
midnight gloom,

While the dead year slips to the past's gray
tomb,

And I sound for the time that has ceased
to be,

And is gathered into eternity.'

Bugler, sound ye a call again,

Through the quiv'ring hush of the night.

Shatter the depths of the holy calm,

And awaken the utmost height.

Sound for the days that are yet to be,
For a ship that starts on an unknown sea;
Oh! sound for a quest that shall seek and
dare,

For a will to conquer earth's weight of care.
And tell of a vision, newly born,
That shall pierce the mists, to the waiting
morn.

Sound for the breaking of cankering chains;
For a brother love scorning the ancient
gains;

For a purpose, knitted through all the hours,
In union finding unbounded powers.

'Tis 'Reveille' now ye shall call to earth,
Till our hearts awake to a strange, new
birth;

Ye shall sound for a time that is yet to be,
That shall lift us nearer eternity.

G. HADGRAFT.

[Christmas Number.]

THE FAN-SHAPED COACH.

By G. APPLEBY TERRILL.

CHAPTER I.

I CONFESS that I should have been pleased enough if the Chevalier de St George had ascended the throne of Great Britain as the result of the risings in arms, of the late year 1715, which were made for the purpose of putting him there. For when I was a boy I was taught to have affection for his House (and I was presented both to his uncle, King Charles, and to his father, King James); and, although I had never set eyes on the Chevalier by 1715, and, in the busy, voyaging life that I pursued in the years when he was changing from a little child to a man past twenty, had given but the scantiest thought to him and to the question of whether he was like ever to be called home from abroad to wear the crown that had been his father's, I yet had heard sufficient of him, from divers of the many persons I met with, to set me very much in his favour.

From temperately-speaking men (as distinct from frothy fellows) who were friendly to him, I learnt that he was a prince of much true piety, of most excellent honour, and of the very finest bravery in battle, which three qualities would ever incline me to wish success to any gentleman possessing them. And from like temperately-speaking men among his opponents I seemed never to hear worse of him, as a man, than that his understanding was very dull and slow, and his humour very silent, oft melancholy. Now, since a man doth not choose his headpiece and his humour for himself, I saw no reason why I should feel aggrieved against the Chevalier for possessing the kind which he had. And as for politics arguments against him being our King, well, I never took heed of politics—even when, with my voyaging finished, I was settled down upon my estate of Blore March, in Staffordshire, and was become, somewhat to my surprise, a Justice of the Peace.

I did not ride out to strike a blow for the Chevalier in the events which have made the closing months of 1715 months to be remembered. I deemed myself bound in honour not to raise hand against the King who was on the throne, George of Hanover. Whether I should have rode out, had I been free, I very honestly cannot say. I think that I should have. Yet two things, when I reflect, make me doubt of it to this day. One thing is that, from first to last, I had not much belief that the risings could accomplish anything, save the ruin of the gentlemen engaged in them. The other thing (which, I fear me, hath a very selfish
1925.]

look) is this. In 1715, by the September of which I was forty-five years of age, I lacked any true appetite for a perilous enterprise of insurrection, being come to pleasant days of ease and comfort, after a life that had been pretty full of hardship and danger.

I was put to the sea in 1682, when I was twelve years old, and orphan of my parents, being taken into the King's ship *Robert* (then in commission), a first-rate of the fleet, commanded by my uncle Assheton. In due time I passed through two fairly notable battles with the French, that near Beachy Head in '90, and that of Cape de la Hogue in '92. Some months after the latter, having no liking to fight against our driven-forth King, James, which I was doing by fighting the *monsieurs*, I gave in my officer's commission, and joined a private discovery voyage to the coasts of Patagonia. Being arrived back from this in November '95, after twice coming very near to losing my life—once from a sickness, and the second time from our vessel being wrecked on its passage home, at St Jago, Cape de Verde—I turned to merchant-trading. And for the next seventeen or eighteen years I made divers long voyages in one and another of the ships which I had an interest in, being a capable ship's master, and thinking to help my affairs to prosper by voyaging thus—though, what with the wrecking of several ships under other masters during the period, and with other losses, I had made little profit by the end.

In 1700 I myself was shipwrecked again—upon one of the islands of the *Ladrones*, where I and those that lived of my ship's company stayed three parts of a year before we were taken off by a Portuguese vessel. In July 1704 I came to extremely bad feeling with the Chinese at Canton over a question of harbour duties (which species of tax, I confess, would sometimes put me in a hot temper); and, they seizing me when I was ashore, I was thrown into one of their prisons, and kept in this captivity for five months, never knowing but that I should be killed by these people within an hour. The offices of those excellent friends of mine, the Portuguese—they of Macao—eventually procured my release.

I was in other dangers and difficulties besides these; wherefore it will not be hard to understand that by the time I was come to the year 1713, in which I inherited the great estate of Blore March, and a considerable fortune with

it, from my uncle Alost (died February 6th, 1712-13), I had had more than enough of that thing which the romance books and novels do call 'adventure.'

'Twas in the latest summer of '13, I being but recently landed from (as it proved) my final voyage to Chinese seas and back, that I walked into the house of Blore March as its possessor. I sat me down to smoke a first pipe beneath my roof; and, having given some grave thought to my uncle, who had sat here before me, I reflected, then, that I was come into a strange, quiet world, very different from the world of sea-tempests and wranglings, with a little fighting thrown in, which was all that I was accustomed to.

Reflecting thus, with my land around me, and my youth gone, I felt, of a sudden, inexpressibly glad that everything pertaining to turmoil and danger seemed fallen behind me, and that only quietness seemed before me. I felt that all I desired from life, to maintain me happily content, was to pass my years in walking and riding about my land, learning of tillage and such unknown matters from my men, and perfecting my knowledge of such, and seeing my estate prosper as under my predecessors, with my tenants—whereof, counting the wives and children, there were above an hundred and fifty—happy in their lives. And—except for a very considerable particular that I shall come to anon (and save that I maintained, and even greatly increased, my holdings in certain ships—also to be spoke of later)—I was enjoying the fullest content in following my existence thus, when, towards the end of September 1715, the first breath of what was afoot for the Chevalier drifted to us in Staffordshire.

To begin with, it was nothing more than a report that a nobleman in Scotland, the Earl of Mar, had banded certain of his friends together and very boldly declared for the Chevalier—and sundry of my neighbours with whom I had formed acquaintance (some of them not unfavourable to the Chevalier, some much against him) and I conversing of the new-come report, we all had no other opinion than that the Earl of Mar had acted in the maddest way, disast'ring himself and his friends together.

When, however, in the course of days, the news came in hot-pace that my Lord Mar, from being at the head of a fistful of friends, was now at the head of a big army (thus 'twas said), and had took Perth and divers other Scottish towns; together with which news were bruits that various English gentlemen (they who subsequently were commanded by Mr T. Forster, of Ederstone) were *rendezvousing*, or already had formed a force for the Chevalier, in Northumberland or Cumberland, or a little beyond the Border—when such news and bruits came in, then, as I suppose was natural enough, it was thought by the more susceptible of my neigh-

bours that there was vastly more in the business than we could even yet estimate, and that we might well expect to see all Scotland and England flame up for the Chevalier, and King George go sailing off for Hanover. But I and many others did not alter much from our opinion that the Government was sure to prove too strong, soon or in a little while, for its adversaries. And even when, after an interval, there came the extraordinary intelligence that Mr Forster, with a much smaller force, had routed, in wildest disorder, somewhere near Penrith, a Government army of above fifteen thousand men ('twas declared), under Lord Lonsdale; whereby matters looked to assume a pretty rosy colour for the Chevalier—even then, I (with others agreeing with me) could not get it out of my pate that the risings were but an untrustworthy flame that the Government would presently tread out. And—no need to say—I was not weakened in my misgiving by later tidings that my Lord Lonsdale's army—so called—was an army of constables rather than anything else; since, though it contained some troops of militia, it was made up largely of honest *Posse Comitatus* folk, who, with extreme good sense, took to their heels upon seeing some of Mr Forster's men draw their swords.

Ay, I have some doubt that, had I been free, I should have rode forth and put a bit of white in my hat, and cried 'Hey-y-y-za! for King James!' (the Chevalier), as more than one of my neighbours did upon sure news of Mr Forster having a force in the field, and having the Earl of Derwentwater and various such considerable gentlemen with him. Ay, I doubt. None the less, I verily was unrestful and chafing through the long weeks of it all.

I would move about my fields, striving to employ my thoughts with the good harvest crop lately taken from this one; and with the question of whether I should plough up yonder one (twelve acres of grass) against next spring—but my thoughts would go falling-off to the gentlemen who, more like than not, had cast away *their* fields (that the Government would sequester), and probably their lives, by being out for the Chevalier. I truly had no wish to cast away my life or my fields. But it was not my habit to keep out of danger when persons who were of my way of thinking anent the matter concerned might be very pleased to have my help in the danger. And—whether I should have entered the game or no—I chafed vastly at not being able to please myself in the business. Yet I had only to look back upon certain meetings which I had had with King George—upon one meeting in particular—to see most clearly that I should be the shabbiest fellow in the world to please myself—if pleasing myself meant that I should fight against him.

Long before this disturbed year of 1715, in 1680, when I was a child of ten, I was taken

[Christmas Number.]

by my uncle Assheton, one December day, murky and very rainy, into King Charles's palace of Whitehall. My uncle told me that he wished to present me to a young stranger Prince—then visiting the King—with whom he, my uncle, had some acquaintance. And in one of the presence chambers Mr Assheton led me to a short, smiling young man of about twenty, who, when I had kneeled and kissed his hand, took me gaily by the ear and said something foreign, that I knew not the meaning of; but afterwards my uncle told me that this pleasant young Prince, after saying that I looked a rogue, had asked me, for fun, whether my schoolmaster or my uncle Assheton did beat me the harder.

Now this Prince, who received me thus amiably, was Prince George Louis of Hanover, who, some four-and-thirty years later, became George the First, King of Great Britain.

I was to meet with him again ere that—though long after our first meeting. In the autumn of 1707, having occasion to see a German banker, and learning that he was gone to the higher Rhine country, to the army commanded by the Elector of Hanover, I journeyed thither, reflecting idly on my road that this Elector of Hanover was that Prince George Louis who, many years ago, had nipped my ear in Whitehall.

At the very end of my journey I came to dispute with a Hanoverian military officer, over the stabling of our horses, at an inn. He being of vigorous temper, and I much the same, he slashed my cheek with his riding-rod, and I his with a stirrup-leather, almost in unison. Whereat he pulled out his sword, and I my sea-hanger (which in those days I carried in preference to a more polite blade); and I doubt not that we should have made the sparks fly prettily in that Rhenish stable-yard had not our intentions been stopped by the sudden entering of some considerable officer, accompanied by numerous attendant soldiers, who, in a very fury, had us instantly arrested.

Pondering, in the next hour, that things might go very uglily for me, and being able by this period to speak the ordinary German tongue well, I spoke with the officer of the soldier-jailers who had charge of me, telling him that I was known to His Serene Highness, the Elector, his commander—and broadly hinting that I was a person of much more distinction than was disclosed by my passport. Of which the immediate effect was that I was given paper and pen, that I had asked for; and the officer undertook to deliver to George of Hanover the letter that I purposed to write—which thereon I wrote, begging to recall to His Serene Highness my uncle Assheton, and myself as a child that His Serene Highness had received in Whitehall.

Within two hours I was conducted very
1925.]

civilly to the Elector, in a house not far away, finding him very changed in appearance from the young man of twenty-seven years before, whose smiling face I remembered plainly—his face now being pouched and lined and vastly ill-tempered looking, plump enough withal, yet much older seeming than I had expected.

Looking at me, a tall, burly man, very browned, he—as was natural—knew me from no one. But he had some recollection of my uncle Assheton having brought his boy nephew to him at Whitehall; and when I asked, under favour, to recall to him that he had held my ear and named me for a rogue, he nodded after a moment, with some slight good-humour about his mouth, saying that now he quite remembered this, and that the rain was beating hard upon the windows at the time—which verily it had been.

Then, asking me of Mr Assheton, and moving his head sadly when I told him that he was two years dead, he turned to my affair, and said that I must not strike any officer of his, because it 'was not good,' but that, this time, he was very pleased to free me from arrest. With which, shaking his head, not unamiably, to stop my thanks, he dismissed me.

Knowing what sharp fate may come to a man, especially if he hath but a citizen's coat on his back, for drawing on an officer in war-time, I considered that, as like as not, George of Hanover had stood between me and death.

When, as King George of Great Britain, he came to London in 1714, I failed not, in gratitude, to ride down from Staffordshire and procure a new presentation to him at one of his early levées. And he remembered me well over the seven years that had passed, giving me several pleasant words in German before I bowed from him to make room for another.

Within a few weeks—though I scarce can think that King George had any finger-tip in so small a matter—I was appointed one of the Justices of his Peace in Staffordshire.

I might have proved myself a very breaker of his peace, but for that matter in the Rhine country. Because of that, I truly could not go out against him.

Moving about in my fields in October, and then in November, days, perhaps keeping my eyes at times upon the vast, lovely prospect that I had to the west, by south, of me, showing the hills of Wales, I would much occupy myself with wondering what latest news evening might bring of my Lord Mar's and Mr Forster's campaigning to the north—news that would be sent by some of my neighbours, or brought to me by some of my tenants, or, most copious and untrustworthy channel of all, would be carried to me by my stablemen on their return from the alehouse. Faring about in my fields thus, I had little expectation that I should be drawn

any closer to the events that were on than I was then.

CHAPTER II.

THERE was a girl—a young Spanish lady—at Cheripe, near Panama, that I had thought to wed when I was a young man.

She died.

I never cared two nails for a woman after that—for very many years. Indeed, what from memory of the one that was gone from the world, and, anon, from reaching a time of life when an unmarried man is apt to consider himself of the sort that goes through life unwed, I never gave thought to the subject of caring for another woman—until I had been some three months at Blore March. Then, commencing a little before Christmastide, 1713, the thought manifested itself, and steadily increased, in my mind.

'Twas this thought (being the 'particular' that I said just now that I would come to) which prevented me from deriving full content from my life at Blore March. To be honest, had I not deemed, through the best part of two years, that the thought (seeing what lady was concerned in it) could lead to nothing—wherefore, I told myself, I should be as foolish, if I let it sorely trouble me, as though I let myself be troubled by yearnings for some paper maid in some romance book—had I not deemed this, the thought would have distracted me very completely and very anxiously from my fields.

But before Christmastide '13 I was three-and-forty; and the lady whose face had fastened in my mind was of most considerable youth, not above seventeen, I would have said.

I confess to have stopped and looked at myself in a long mirror soon after I had seen her—with a sense, as I stopped, of it being plainly unfitting that, in this great house of mine, there was no lady to gaze into this mirror, far more suited for her diversion than for mine.

I saw myself as a spare-faced man despite the burliness of shoulder that I carried with my tallness. My hair, which was my own, unpowdered and fastened in tiewig manner—for I hated perukes and such fancies—was pretty dark still; only here and there was a thin line of silver. My face had the brown from sun and sea that I think 'twill never lose; and my eyes were somewhat markedly bright blue—the which had caused several persons to ask me ere this whether, pray, it was indeed true that following the sea did turn a man's eyes sea-colour, since mine were 'most extreme blue.' (And I believe that there is something in this supposition; for I think that my eyes were more gray than blue when I was a child.) Looking at myself, I debated

that, with Blore March and my money behind me, I doubtless carried guns enough for most women's hearts, providing these ladies were not rich, or over young. But—and I shook my head decisively—I carried no armament for bringing down the flag of the young lady I had begun to think of; who would look for some brilliant young spark to come into her life, and would not care, in her youthfulness, whether he were rich or no (unless, in the latter case, her relatives forced her from him to a rich man; a thing I would never countenance). This young lady, moreover, was unfriendly to me, to begin with.

She was the sister of my immediate neighbour, young Sir Charles Brueton de Haye, of North March, baronet—whose lands and mine touched with so indefinite a boundary line at one place, on the north edge of Blore March, that, in my first conversation with my late uncle's attorneys, upon my inheriting, I was told of a roadway and a field that were disputed between the two estates, which road and field I might lose to Sir Charles Brueton de Haye, did I take the situation too easily.

With a very reasonable wish to lose no territory, if 'twere mine, and knowing nothing then of my neighbours, I instantly asked the attorneys to test the matter at law, and to make a sharp fight of it (unless this might prove foolishly wasteful of money). This course they entered upon, and the fight was but in its early stage when I had my first sight of my neighbours, who came only at intervals from London to Sir Charles's seat of North March.

'Twas near the disputed roadway, of a dull December afternoon, that I saw them—I coming out of a wood on my land, they standing on a field of their own, looking at the roadway, and speaking of the enemy, I doubted not.

I stood and pulled off my hat. Sir Charles, after a hint of hesitation, pulled off his hat fairly civilly. Then, since he offered not to speak, I went on my way, carrying my hat for a little. Before me, in the dimness of another wood that I soon entered, I saw the picture of the two very plainly as they had faced me from their field—he a youth of twenty-one or so, slight, personable of feature, with a heavily-powdered peruke and a delicate straw-hued coat, a cloak on his shoulders, and black boots on his legs; she, Mistress Brueton de Haye, looking of the youthful years that I have told of; slight, dark-cloaked and neck-scarved against the cold humidity of the afternoon; her hat black and unlooped; her eyes and face and hair all colour and beauty below her black hat; the face slender, pink of cheek; the hair red-gold colour, much nearer gold than red, and of the bright, clear look of the very metal when 'tis polished; her eyes—whereof I had noted the sweet hue before anything, though she stood eighteen or twenty yards from me—of a rare

[Christmas Number.]

colour, that I had seen but once or twice before, with all my wanderings. They were the blue of that little viola flower which is often called the violet.

They, for all their sweet hue, looked at me with very level unfriendliness. For, of course, though this young lady and her brother had never before seen me, both knew me at once—as I knew them—and had not I attacked them at law? I reflected of that with considerable regret whilst I made my way down a wet woodland path, seeing the picture of my young antagonists as I walked; but I felt 'twould be the better course not to interfere with my attorneys, but to have the matter fought out. Afterwards—if I won—I could go to the extreme length of making a gift of the field and the roadway to Sir Charles if I cared to. So no harm need be done.

I met them again that week—on the road to Drayton; they being on horseback, two more ladies and a gentleman with them; all making a company pleasant to see, the ladies being most prettily garbed in riding-coats and laced, looped hats—her hat being well-nigh all black, though, showing the brightness of her hair. I, on foot, uncovered and stood aside for them, Sir Charles saluting me. But she, though knowing 'twas for the ladies, and especially for her, that I stood at the road edge, looked before her as though I was not there. My only other sight of her in that December was outside the church at Drayton on Christmas Day. But I knew then that she did not see me—she being about to enter into Sir Charles's great coach with the two ladies and the gentleman that had been with her previously. Sir Charles, however, who had lingered to speak with the Parson, met me face to face, and, saluting me, spoke a word of the weather with very decent mien.

Some mornings after, one of my men told me that Sir Charles and 'the young lady his sister, Mistress Henrietta,' had drove away to London, where they were like to remain for the rest of the winter. The tidings gave me a little blow of disappointment. Indeed, they so took from the pleasure with which—as ordinarily—I was facing the affairs of the day, that they gloomed this day for me. For even at this early time of my acquaintance with the face of Sir Charles Brueton's sister I had begun to think very frequently of her, verily.

In the evenings, pacing up and down, smoking my pipe, in front of one of the big fires which warmed my house, I would ponder for a space on matters of my estate; and perhaps, for a little, on bygone December nights that I had passed at sea—cold, tempestful nights, or warm and calm, much according to the latitude—I would ponder thus; and then, very surely, I would think for a time of Sir Charles Brueton's sister, with her eyes of violet hue, and her red-gold hair, shown bright against a black, or well-nigh black, hat. I would think of her

with her brother and their guests—whereof, doubtless, several were with them—a happy-spirited society, I could be sure, in North March house now, separated from me by woods and fields and darkness, yet but two straight miles from me. I would wonder what diversions they were at; would wonder whether Sir Charles and I would soon fall into such acquaintance that (with each of us ignoring the law matter) he would invite me to his house, and present me to his sister.

Thus the sudden news of their setting out for London, which postponed for months the chance of a closer, neighbourly acquaintance, rendered me quite shrewdly disappointed. During the next ensuing day or so I could have found it in my heart to leave Blore March for a little while and visit London myself. But there, where doubtless Sir Charles's sister and he would be in a very sparkling and modish circle, I should find it extremely difficult to advance my acquaintance with him. My elderly self—roughened of manner, of voice, of visage, by many adventuring years—standing amid the delicate and youthful company that he would favour, would verily prove of no interest to him. Besides, what good if it did—since his sister, Mistress Henrietta, as my man had called her, was so near being a child, compared with me, and so rich of beauty, that every one must laugh at the drift of my thoughts anent her, did these thoughts become known?

So I stayed at Blore March.

In the early spring of '14 they came back to North March—the news of their intent to arrive by a certain day preceding them by some weeks, and setting me to look eagerly enough for the day. But their visit was a short one—perhaps because of the considerable rains. I saw her but once—in a coach; she looking from the window, and knowing me from no one, or making as though she knew not who I was and even knew not that she saw me.

I saw her brother thrice or four times, on his land, near the edge of which I confess I often went. And the last time, facing each other across the disputed roadway, but making no reference to it, with each of us careful, I think, not to put boot on it, for fear of assuming proprietorship, we spoke for above ten minutes—of spaniels, whereof four were with him, of horses, and of the quality of the soil in this part of Staffordshire; parting with amicable salutes.

Two days after, to my great regret, I was told that he and his sister were set out for London—though they were like to be many days in getting there, from the roads being soft. Sir Charles did intend, I was told also, to buy a very light little flying-coach for these journeys. And later I heard that he had done this.

Before they returned to North March, in the summer, the law matter was decided in my favour; and 'twas plain when I met them, all

of us on horse on the Drayton road, that they felt bitterly of this. As I passed her—I hat in hand, ahov in my saddle, with no air of victory, forsooth!—her eyes, of such violet blue, gazed straight and angrily into mine, not knowing me in a manner, yet challenging me as to which of us should look in steadiest enmity. Perceiving which, I verily would not fight her at it, but looked before me, knowing withal that her brother had given me the very coldest of acknowledgments, that scarce amounted to a notice of me.

I had debated, since winning my ground, that an offer to Sir Charles to divide it equally with him would be an excellent way to settle the matter between ourselves, with no sting left on either side. But after that cold greeting, I thrust the project from my mind. I was not going to seem vastly accommodating to a lad of half my age, who showed himself unrespectful, whether I was deep in love with his sister's face or no. That was no habit of mine.

And—though I wished otherwise—I gave him but a short, clipped salute on the ensuing occasions when our paths met; on some of which occasions his sister was with him, with perhaps a company of others; she unseeing of my bow. His salute would match mine—and I know not when our greetings would have improved in warmth, had I not encountered him, after a space, in a street in London, whither I had gone to wait upon King George at his levée which I have spoke of. Upon this meeting, as is the habit of persons when they encounter where they did not look to, he and I recognised each other with more heartiness than customarily (which our case certainly needed); and we stopped and spoke for a minute of the aspect of the town, very full.

From London I journeyed west to Bristol to see an old friend, the master of one of the vessels that I had an interest in. I cared nothing for sea-trading by now; but, as I have said before, I had increased my holdings in ships—having even totally bought one extremely fine vessel, the *Adela*; though my present journey was not to her master, she being, indeed, on the other side of the world. The reason why I, wearied of sea things, had money in ships was—if 't be worth telling—that thereby I thought to aid sundry long-known friends, merchants and sea-masters, to better their fortunes—and I thought that I should not lose much by the business.

From Bristol I rode by easy stages back to Blore March; and very enjoyingly I trod my fields and my wood paths after many weeks' absence from them, within which weeks I had trod, in Bristol river, a ship's deck, and smelled pitch and salt cordage, and thus had come very close to my late life—and had felt very happy that I was done with it.

My satisfaction to be home was much added

to by my learning that Sir Charles and his sister were expected to be soon at North March—and when they came, and he and I encountered, ahorse on a road, we pulled up our horses and conversed with very reasonable civility.

From then, and onward through the year '15 down to the time when all was becoming astir with the risings, my acquaintance with Sir Charles Brueton continued much thus—a minute or so of civil converse on occasions, and nothing more. My acquaintance with his sister was little nearer a beginning. Midway through the summer of '15—most of which season they passed at North March—she took to noting my bow, when she rode by me with her brother, by a little bend of her head. But never did Sir Charles, when she was with him thus, rein in to speak with me. And should I be near the road-way against his land, to which I very often walked for a sight of her, for a word with him, which I sought because of her (though verily I could find no hope that anything would be led to)—and should she and her brother presently approach, with spaniels about them, she, ere her brother came to pass a word with me, would saunter aside, as though she had said to him, 'I will leave you two to speak together.'

Thus—and very purposely, I could not help deeming—was a presenting of me avoided.

Since the avoidance seemed wilful, I did not ask Sir Charles to take me to his sister—considering that anon he would find himself bound to, unless he would assume the position of very openly affronting me. Moreover, I had no wish that, at this time of semi-affront regarding her, he should guess the colour of my thoughts anent her—whrch would make me look a very baffled figure.

But it happened that on a sunny July day, when I met him riding alone, and should have expected his sister to be with him, I asked him, in natural manner, of her health. And thenceforward—believing that I disclosed nothing more than common courtesy—I inquired of her when she was not with him; he replying in ordinary fashion. I suppose, withal; that on the several days when she sauntered apart, leaving him to speak with me, my eyes drifted towards her when they should have been on Sir Charles's face; and it may be that my words to him were a little absent at moments because my mind was engaged with her—who, in this summer of 1715, had reached nineteen years of age (so my friend, old Squire Oliff had told me—proving me right to the year in my first appraising of her years). At this age of nineteen she seemed, in a way, less separated from me by years than when I first saw her—she scarce out of childhood then. But I had no hope, that I could see.

I must suppose, then, that in various ways I revealed something of my thoughts; for the matter came up, to my very astonishment, amid
[Christmas Number.

kindred matters which Squire Oliff told me one evening, late in August, when he had rode across to smoke a pipe and drink some of last year's October ale with me.

I discovered that Oliff was much set against the Bruetons on my account; and he told me things that I certainly had not suspected of—which things, however, having the bright colour of youthful raileries, caused me none of the anger which Oliff had looked for.

Oliff, indignant-faced above his ale-cup, had questioned me in this manner. Pray, was it not time that some one told 'Mr' Brueton (Oliff's loose, country term for Sir Charles) and his pretty sister that I, their neighbour Assheton, had not been the sort of merchant that sat tight in his shop all his days—which they, though they easily could have learned differently, did appear to think—from what Oliff had lately heard? Was it not time—asked he—that they were told that I, who had fought as a sea-officer, had passed all my days as a sailor rather than anything else? Whereas—quoth Oliff—it had come to his ears that Mr Brueton and his sister did laughingly call me 'Tom the Teaman,' and wondered whether I did always give good weight of tea.

At this—to Oliff's own surprise—I laughed. 'Twas such a pretty, youthful, unkind quip! I could see the faces of the two—hers with its eyes of violet, and its red-gold hair about it—laughing, maliciously (because of my law victory), merrily, over the quip. And what grave faces they had kept before me!

It was strange, if a fact, that they should believe I had seen no more of the world than from my shop or warehouse door. Yet I could much understand this; for I had talked not of myself to Brueton, and very little of myself to other neighbours (save Oliff) whom I was more intimate with; which other neighbours, moreover, were no close acquaintances of the Bruetons. No one in Staffordshire knew much concerning me, except old Oliff, who had known me when I was a boy, and had seen me at intervals of years in London—and he rarely visited the young Bruetons; finding (he was wont to say) their house sad without their father, who had been one of his friends.

Ay, I laughed—seeing the laughing young faces, so straight-featured, and generally cold, to me.

Then cried Oliff, somewhat ill-pleased with me for my unlooked-for laughing: pray, was it not time that the Bruetons, who thus snuffed me for a teaman that pinched weight, were told—if they had never heard it—that I stood better than they for family, seeing that my mother was the Lady Bridget Alost (married the Honourable Francis Assheton), daughter of the second Earl of Dereham, whose forefathers, and Mr Assheton's, too, were full barons long before any Brueton de Haye was a baronet?

1925.]

Said I, baronets were not made in England in those early days, I did believe.

Which, together with the warm strength of the October, put Oliff in a hotter fume, so that he inquired without ado: pray, did I know that Mr Brueton had said to more than one person that he believed 'Tom the Teaman' was after his sister, but verily 'Tom' shouldn't have her if he were thrice as rich as he was; for, though he (Mr Brueton) called his sister 'Mrs Teaman,' to anger her for frolic, he meant to see her make the greatest match, for her face was worth it?

This was truly a pulling aside of the curtain!

I turned my eyes from Oliff, and stared through an open window at a space of grass in the yellow light of the low evening sun, and marvelled that my young neighbours had so fathomed me, and so composed their demeanour before me that I little guessed of 'Tom the Teaman,' or, verily, of 'Mrs Teaman.'

And then, for one or two reasons, I felt extremely glad that I had been found out. Here was the scene finely cleared for action—mused I, turning a clay pipe in my fingers. The young lady was even used to being named 'Mrs Teaman,' and there seemed some advantage to me in that, despite that the name angered her, and that, doubtless, she laughed very much in her anger. And then (and I straitly questioned Oliff on this) it seemed that Sir Charles, in fleeing that I should not have his sister, had not set my age as a mark against me. Something in my favour, that! And actually, on this evening which might have dismayed some men, I experienced my first little, though 'twas but little, hope of Mistress Brueton . . . I would give the young twain action, now that the decks were cleared for it! I would speak in very direct fashion to Sir Charles when next I met with him; would bid him ask me anything of myself that he cared to know; and would ask him whether he found any reason which should justly keep him from presenting me to his sister.

But on the next three occasions that I saw him (his sister with him twice) he was riding with sundry persons that were his guests at North March. And then came the news of the uprising for the Chevalier; and soon I heard that Sir Charles, being a captain of the North Staffordshire Horse Militia, had ridden with his troop to join one of the forces that the Government was raising.

CHAPTER III.

MOVING about in my fields in October, and then in November, days, I had (as I have told) little expectation to be drawn any closer to the events which were on.

The first occurrence of anything contrary to

my anticipations (though it counted for nothing at the time) was the arrival to me, on Sunday afternoon, November 6th, of a warrant, with which, I found, I, as a Justice of the Peace, was to have conducted the arrest of a near neighbour, Mr Sabine Thorntoun, 'in case he should join with the conspiring persons in arms in Cumberland'—some of the Chevalier's people, no need to say.

The warrant was well-nigh a month late in getting to me—through the bearer of it having had a most grievous fall with his horse, from which he had lain without his senses in a cottage for above three weeks, he told me, appearing very sick yet. And Mr Thorntoun had slipped away to join Mr Forster's army many days before I saw the warrant, I was extremely pleased to know.

There had been many preventive warrants of this nature flying about the country, but this was the first that had come to me; and I examined it with some curiosity, noting that I could have called upon the nearest militia to aid me in the arrest, and could have taken Mr Thorntoun to 'any convenient jail.' Then I put the warrant in my pocket, and anon laid it away in my writing-case.

And during the ensuing days, in which, hot-pace and persistently, by far the most important news yet came to us in Staffordshire; namely, that Mr Forster, Lord Derwentwater, and various lords, and others, with a Scots-English army of excellent numbers, were marching into Lancashire, and like to fight a pitched battle with one of the King's generals (Mr Wills, 'twas believed) at any hour—during those days I thought at times with considerable envy of Mr Sabine Thorntoun, who was playing his part in these brave matters—brave matters, however they should end.

On Friday, a little before dinner, some of my men, labourers and stablemen, ran to tell me that a clamour was everywhere that the 'rebels,' as they called them, had beat the King's men, and burned Manchester; and in a little while Oliff, who had hand-galoped over to give me much the same tidings, was telling me that the actual report was that Forster had swept to the winds five or six strong horse regiments and Preston's crack regiment of foot, all under Mr Wills, and had carried Manchester by one vast assault, led by a Scots gentleman, Lord Charles Murray.

Oliff and I drank a glass of wine to Murray and Forster. 'To brave men, and hang politics—and Whigs!' quoth Oliff.

But soon after dark there came a new report, denying everything.

And on the next day, Saturday, some very different news reached us; it being that Mr Forster's army, which ('twas said) did not amount to two thousand men, was gone for refuge into the town of Preston, with everything looking very black for it, since the King's generals were

chasing after it like hounds. ('And no bad name for them—meaning no more than that,' quoth Oliff, who was with me for an hour.)

Thinking very heavily on this news—though truly I never had expected much better—I walked that afternoon to the roadway by Brueton's land, though with very little hope of seeing his sister, for sight of whom I went there. I had not seen her since Brueton left; but I knew that she was at the house still; with her aunt, a Lady Nair, dwelling with her for company, I had been told.

I have not expressly said yet that throughout the days I was passing in my fields, pondering of the campaigning, she held her great place in my thoughts—for this, if it needed telling, could be better understood at this stage of what I am saying. In my fields, whether I was labouring to fix my thoughts upon my land, or letting them pay off to the wide prospect and the Welsh hills, or letting them have their drift and fall right off to the campaigning, she, with her eyes of violet hue, with all the sweet qualities of her face, was moving here and there with my thoughts, now showing herself clearly, now dimly, now clearly again—always with them.

Well-nigh daily I went to the roadway—finding the great field beyond, with woods at the far edges of it, across the grass of which she and her brother had frequently walked with their spaniels, empty and desolate. I looked to find it desolate this afternoon as I set out for the roadway.

It was a dull, most cheerless afternoon—cold, silent, with the atmosphere so motionless as I rarely had known it to be. Mists were hanging over the ground in places, and specks of moisture, very near to snow specks, settled upon my cloak at times.

Thinking of Preston town, and of the gallant back-to-the-wall fight that Mr Forster's men doubtless would choose to finish themselves by, I could have wished very easily that I was with them—foolish, well-nigh sinful, though the wish had been. It were much prettier to end thus, thought I, than to live to be mocked of a young lady, who with little doubt would continue to mock me, however hard I might strive to change her mood—and presently would wed with some youth that she would liefer speak love to than mock!

Truly, what with Preston, and Mistress Brueton, and (maybe) the curiously gloomful weather, I was very out of spirit on that Saturday afternoon.

And then, when I had been by the roadway but a moment, I saw her. She came from the skirt of a wood, and began to pass along the field. She had two very young spaniels on a string; and they, straining and crawling to follow some scent, were drawing her aside as she walked—drawing her towards the roadway; she not looking at this, but to a distance, as in

[Christmas Number.]

thought, and seeming not to heed that she was being drawn.

When she was not far away I moved with a scrape of my heavy boot, lest she, who was unaware of me, with her face much from me, should be startled to discover me when close. She looked, and, though gathering the dogs somewhat, continued on, so that she would pass me. She bent her head to my bow, and then looked directly at me from not many yards off. And a complete new turn to my thoughts—astoundment and the veriest consternation for her—was caused by the aspect of her face, as I saw it now. Her pretty colour of cheek was so nearly gone that she looked white. Indeed, methought that the only pinkness in her face was that close under her eyes, which, I was instantly convinced, had come from heavy weeping. Her eyes, of their sweet violetness, regarding me for an instant, looked larger in her face than I had ever noted; and her lips had a similitude of a droop, strangely like that of an old woman's lips, though verily they looked young enough.

She hesitated in a step—I was sure—while our eyes were meeting. She had meditated to ask me whether I could give her latest tidings from Preston, I knew. But she thought better of it; and, firmly drawing the spaniels to a straighter path, she passed me, holding her cliin cocked a little, as though to inform me that if I believed to have discerned misery in her face I was vastly mistook.

That her misery was for her brother, who had seemed so much her companion, I could not doubt. Yet I felt sure that he was not killed, or even wounded. For 'twas understood in our neighbourhood that the North Staffordshire Horse Militia had not yet been within miles of a shot—whereof there was some laughing. 'Twas possible that they would be sent against the enemy at Preston—and I supposed that this was the cause of her suffering. I looked after her, wishing that I might speak some comfort to her, but not daring to go to her to tell her that I deemed foot rather than horse soldiers would be employed to storm Preston—which was a very reasonable belief.

Presently—she gone from my sight—I turned homeward, feeling that (sheerly for her sake) I ought to have spoke with her, assuring her that she grieved much beyond cause. For, whether Horse Militia were employed or no in the assault on Preston, which must be looked for, the King's soldiers were like (alack!) to overpower Mr Forster's men by force of numbers and of better equipment with no great trouble, and consequently with little loss of men.

Through Sunday, the next day, November 13th, I scarce remembered Mistress Brueton as the young lady who laughed, or was angered, anent 'Tom the Teaman.' That was too inconsiderable a thing to be thought of beside her
1925.]

face as I last had seen it, with its pink clouds by the eyes, and its drooped lips; and when, very late at night, some of my men brought me news of Preston—that there had been the desperatest battle during the past night, with the King's soldiers beaten back, and part of the town afire—I hoped with all my heart that none would bear the news to her to wreck her night's sleep.

Then, lighting my pipe, and drinking a glass of wine to the brave boys at Preston (with the intensest hope, though, that they had not hurt Brueton), I gave deep thought to the position of these same lads and their leader, Forster, wondering whether, and trusting that, they had now made a chance for themselves to cut their way through to, say, Scotland, to find safety with Mar's army (this very day engaged in a big, muddled battle, though I could not know this).

Ah, also I did not know that by this hour 'twas *actum est* with Forster and his lads—that, during this Sunday, their surrender had been agreed on, and that within a few hours all, save those who had escaped out of Preston, would be prisoners of Mr Wills, King George's general!

I knew nothing of this till I was roused from sleep, a little better than three o'clock, on the Tuesday morning following, by my butler, whom someone had waked with the tidings. Being verily in no mood to sleep after this, I dressed in part; and presently drank a little ale and ate a crust; then smoked, and, in my sorrow for Forster's people, hurled bitter maledictions at Mr Wills. Then, with the commencing of daylight, I pulled on my boots, and, with my head aching, walked forth into the cold, still grayness of the day.

Anon—though with no object at this hour—I turned to make for the roadway by Brueton's land. I had gone not many paces towards it, when I stopped sharply, lifting my head. I had thought that I heard something most strange on that little road (private, and rarely used)—the rolling beat of several horses' hoofs. Ay! 'twas that I did hear now. Three or four horses—and—? Ay, there was a cart or a light coach behind them. I could plainly catch the sound of it. I stood, hearkening. Those nags were covering the ground!—thought I. Fast voyaging—but the road was pretty hard. Fast voyaging!—thought I, vastly perplexed. And then there was a thin, far-travelling 'crack!' with a great jarring, dragging sound; and a woman had shrieked—very clearly.

Swiftly, despite my boots, I ran to the road.

CHAPTER IV.

THE first thing that I was conscious of seeing as I stepped out of some bush-border on to the road was a coach, which was by far the prettiest I ever had beheld. Quite small, with its

curved roof seeming to stretch to twice the length of its lowest base; with its front and back sloping deftly, prettily inward all the way down from roof edges to base, it looked, sideways to me, for all the world like a part-opened, thick-stemmed fan standing against the sky, leaning a little because—as I saw next—its back wheel-bar was broken, with the wheels tipped towards each other.

Painted a deep blue colour, with red here and there, as the daylight was fully broad enough to show, this little coach was, I knew, one of the kind built for match-racing. Marvelling, in my first instant or so of seeing it, as to how it had got upon my roadway, I did not connect it with the little flying-coach that I once heard Sir Charles Brueton had bought, and, sometimes since, had heard of the speed of, though I never had seen it. Now, however, looking past two horseboys in jockey-caps, who were busied with the traces and reins of four horses which they had freed from the coach, I saw, beyond, Mistress Brueton standing, and her brother with her.

Between my stepping into the road and my seeing them, scarce any time had passed—and in the moment that I first looked towards them it seemed to me that Sir Charles suddenly moved in a most queer way, as though to go behind a horse out of my sight. Then—perhaps from knowing that I had seen him—he moved from the horse rather than to it, and gave me a nod of his head, drawing off his hat for an instant in honour of his sister.

He was not in militia clothes, as I should have expected, but in a simple, dark journeying-garb, with a tiwig on his head. I noted that his face appeared somewhat curiously pale; and then, looking rather at his sister than at him, I descried, with much inward astonishment, that she was well-nigh as white and unhappy of face as on Saturday afternoon last past—despite that here she had her brother back from the war. I instantly discovered myself thinking that no coach mishap could, of itself, distress her to this degree—and withal, methought, in her gaze at me, which was very long, there was something . . . ay, verily there was! . . . something of great apprehension—as though 'twas an ill thing, and she knew not how ill, that I had discovered her brother and her.

Now, I had seen uneasy situations and apprehension in many parts of the world—and perhaps I was swifter to perceive signs of such, and to appraise the signs, than most men. Whether or no, I knew confidently now that much more than the coach was amiss here—that something else was pretty wrong indeed. It was so hard to think of any circumstance that should render Mistress Brueton alarmed to see me, and make her brother minded to dodge behind a horse, that all I could hit on (and it seemed just possible) was that Sir Charles, being new to war, had followed the

cautious example of my Lord Lonsdale's men, some short time since, and had run on sight of the enemy—which conduct in a militia officer brigaded with an army was like to bring very bad punishment on him.

It was very difficult to credit that my young neighbour—always proper enough in bearing heretofore—should mislike musket fire and sword cuts to such an unlucky extent. Yet, in the moment's reflection that I gave to the matter, I could strike on nothing else to account for the signs I had discerned. Sir Charles—thought I—was in mind to make haste to London to get under the protection of powerful friends who would take his side against the military people, who perhaps already had sent in pursuit of him—and, being brought to a stop for a time, he, and his sister, too, had no taste to see me, who, for all they could tell, might already have come by knowledge of his case.

Thought I, these young persons might be no worse for an older pate to advise them—and I went very readily towards them; though, so far from snatching at this chance to meet with the lady that I so long had desired to speak with, I would rather have slipped off among the trees; for I wore no neckbands—only a kind of foot-pad's scarf; and I had no hat, and my hair, uncombed from my pillow, was part out of its riband, and about my eyes. And, worst of all, I was not shaved.

I perceived—and secretly smiled a little, thinking on how these twain had formerly masked their thoughts before me—that Mistress Brueton's and her brother's faces went very straight and calm and careless before I was quite reached to them. But she was breathing markedly beneath her cloak; and in her cheek, as she looked aside at a horse that had stamped, I saw a little beating movement, which no one could have misread the uneasiness of.

Sir Charles met my eyes with a touch of a smile on his lips, though it was no happy one. When he spoke I found that his voice had a queer, quiet sound. A weakness from fatigue, perhaps from sickness, too, thought I—for his face, at close quarters, looked utterly weary; sick also.

'Here are intruders on your road, Mr Assheton,' said he, trying to be light.

'Oh nay,' I answered. 'Did not I ask you to use it as your own? I wish it had served you better than to break you.' I moved some paces with a careless air and surveyed the broken wheel-bar. 'You have no other light coach?' I asked.

'No,' replied he.

'And I have nought but a thing heavy as a ship, that was my uncle's,' I said. 'So you were best go ahorse, if you are in any haste—and do go alone.' (By which last I made reference to his sister.)

'Ay, I think it must be horse—if I can

[Christmas Number.]

master him,' he said. 'My arm and leg are hurt—and turned stiff since I rode in this morning. But it may be I can master him.' He spoke, however, with a plain reluctance which seemed more than hurt limbs did warrant. And his sister, thinking me intent with the wheel-bar—and verily I had no thought to spy on her—looked swiftly at him, shaking her head and moving her lips, for no, he must not go ahorse.

At once turning my eyes from her, and seeking to occupy them for a moment, I brought them to the coach doorway. The door being some inches open, I saw part of the coach's interior.

I was surprised to discern a curious plenty of lady's cloaks—Mistress Brueton's pretty cloaks, of course—lying in a heap with a number of small, silk-covered ladies' boxes, violet of hue, sewn with silver; the whole being mixed with some heavy travel-wrappings, and all taking up some space in the little coach. I was surprised but for an instant, though. Then I recognised a trick that I had seen played before—and played with astonishing success more than once. Mistress Brueton—who wished not her brother to go ahorse—had intended to journey with him; and presently she would have covered him with the cloaks and wrappings, belike setting some of her pretty boxes atop of these, and opening them, and playing with her ribands and her letters which they would contain. And should any soldiers or constables, or road-watching persons of any sort, look into the coach, they would see but a lady voyaging alone thus; and—doubtless with the horseboys primed to say easily that only a lady was there—they probably would be content, unless (if actually they were looking for Brueton) they recognised his sister. Then, indeed, 'twould be *actum est*.

Thought I, this mode of travel made things look deadly wrong—though it might only mean that Brueton had no road-pass (without which a man travelling, in these suspicious days, was like to be hindered, and even arrested, on his journey); or that, if he had a pass, he wished to leave no trace of his road by showing his name to the constables or the magistrate's *posse* that would be pretty sure to stop a horseman at places.

I looked at Brueton. I was not inclined to hang in the wind over this morning's matter. If young Brueton was in bad difficulty, the sooner things were advanced to a clear understanding, the better. I moved nearer to him. There was no need for the horseboys (who had gradually gone some little way off with the horses, and still were busied with them, and moving on) to hear our converse—however much they knew.

'Have you a pass?' I asked. 'They'll question a horseman.'

It was very plain that my words hit him. His face, by his eyes, twitched. He answered

my look as though to inquire what business this was of mine. Then he changed his intention, and played light, with a touch of a smile again. 'No,' he said. 'And I got home very amusingly without one.' 'Twas the gayest thing, Mr Assheton. We were four times barred of our road, called on for passes—I and they that were with me. And we rode the pigs over into the ditch every of the four times, man! We were half-a-score strong, you see.' And then, quite of a sudden, he lost his smile—as though he deemed to have spoken too much. He looked along the little road, glanced at his sister, then slowly pulled a long, laced kerchief from his pocket, and touched at his face with it. I saw that there was something of sweat on his face, despite the considerable cold of the morning. This sweat seemed extreme evidence of his uneasy state, for all that fatigue and some pain might have helped to it. And, apart from a very natural eagerness that I felt to serve his sister through him, I at once felt a vastly increased wish to serve *him* in his distress—this lad of a neighbour of mine, who had been a sorry fool in some manner.

I determined to advance things at fastest pace. If, in the strangest fashion, I had read signs all wrongly—well, 'twould only mean that I should look a very fool. I was quite pleased to run the hazard of that. 'I think you are in no condition now to ride men over, Sir Charles,' I said; 'since you are alone and stiff from hurts. I can write a pass for you—I've that authority. But I well-nigh think it will be better if I get on a horse and share your road with you—and do the talking to those we meet with.'

I saw amazement in his face. His lips were parted with amazement at my unlooked-for words. Yet there was much in his face that seemed to tell me that I had not misread any signs, but was in the right channel. 'Look you,' I said, 'I am a Justice of the Peace—and I am very ready to oblige a neighbour, and a lady, his sister, whom perhaps I should oblige thus.' I took not my eyes from Brueton, though I had spoken of his sister. 'Look you,' I said, 'you can do much worse than to have a Justice riding with you, helping your road.'

I had heard his sister—close to us—take breath very sharply, in surprise, when first I spoke of riding with him. Soon thereafter I heard her take another, sharper breath, with plainest apprehension in it—because I had said (perhaps with marked weight) 'Justice of the Peace.' I *knew* 'twas because of that—and knew that she, believing now that I was aware of everything, did think that I was leading up to say that I did intend to hold her brother under arrest. And from seeing in Brueton's face a hint of dismay, and then a look as though he would spring upon me, taking the place of his first amazement, I knew that his thoughts

were the same. So, very wary for a spring, or even for a pulled-out pistol, I kept my eyes on him and strove to shape my words more assuringly. 'You can trust me for a true neighbour in this,' I said. 'I'll force a road through for you if't can be done—which I think should be easy enough.'

I saw his mien turn a little better. He scanned me—thinking in a way, I could perceive, of a certain helpfulness that might come from my height and breadth of shoulder, and face—which was no softer than most sea-captains'. But he scanned me very doubtingly, and then gave a sudden show of that peevishness which you will find in a tired, hurt man.

'Pray, why should I need you to force a road for me?' he asked.

I shrugged my shoulders; looked aside at the coach, leaning like some strange great blue-and-red fan athwart the cold morning sky; then looked again at him. 'I scarce know the best way to say it,' I said; 'but to my eyes there is some trouble that may make you glad of a swift, unhindered road.'

He moved an arm quickly, with a very angry light in his eyes. 'On my word, neighbour Assheton, you're a vastly peeping, unwanted fellow!' said he, breathing fast.

'Oh ay; we'll speak of that later,' I said easily. 'How long can you afford to stay anchored on this road? Let's think of that.'

He eyed me, still very angrily. Then he put his kerchief to his face again, whereon was new sweat visible. I moved my lips to bid him sit for a minute on the grass by us, but ere I could speak he looked at his sister; and doubtless her eyes gave him some message, for he pulled off his hat, and, going back a pace and making his bow to her, said, 'Mistress Brueton de Haye, pray give me leave to lead my neighbour, Mr Assheton, to you.'

I made my bow, lacking hat, lacking neck-bands, lacking all seemingly tidiness, with my heart feeling to beat harder than ever before in my life. I was forty-five years old; but in this moment I was being made known to the lady whose sweet face had been in my thoughts for well-nigh exactly two years; whose voice—save that a few minutes since I had heard it cry out—I might say that I never had heard.

Verily, as I lifted from my bow, and she, rising from her courtesy and lifting her eyes from roadward as she rose, looked full into my eyes when she stood—verily, then, with us two giving each other our first acquainted gaze, I felt glad as a boy. And answering—though with no rude boldness, truly—the straight, natural gaze of her eyes, of their lovely violet hue, I could almost have forgot the affairs of her brother, standing near us, had not her eyes, for all their naturalness, contained a distress and other qualities that told of her thoughts of her brother.

Very fully she looked at me, seeming to choose what her first words to me should be. And then, with a little beat, such as I had noted in her cheek, visible by her mouth now, she said, sweet-voiced, very simply, 'Sir, my brother is in extremest peril of his life.'

'Madame, by your favour,' I said, and smiled a little for her reassurance, 'tis a very common thing for a young man. I can't think it ever does much harm to him, if he will but ride fast and lie quiet till the cloud is blown over. I have asked your brother to carry me with him on his road. I believe 'twill be best. Would not you advise him to this, madame?'

I had seen her face show much surprise at my easy speaking; had seen—I verily believed—the littlest gleam of new-born comfort in her eyes. But upon my question, her eyes, looking at me, became very troubled and doubting; and I was aware that she drew breath in an unhappy way. She looked, with her red-gold curls agloss below her black hat, at her brother, who stood, frowning a little towards the horse-boys and horses (now at a stand forty yards off), saying nothing. Then her head moved again; and her eyes, in her well-nigh white, sweet face, were meeting mine once more; and there was that straining little beat by her mouth, as though soon she must burst out into wildest tears—though her voice was admirably steady.

'Sir, 'tis so hard for me to say,' she said. 'If I do say wrong, if I do say "let my brother go with you," and you are stopped on your horses, and he is took—his life *can't* be saved!' She shook her head for that, looking at me the while; then looked along the road, her eyelashes (dark as if her curls had been black) moving.

I nodded my chin pensively. In truth, things seemed deadly wrong. And I was silent for a moment, reflecting on my Justice of the Peace *status*, wondering what 'twas worth to help me bully my road through to London with young Brueton. I deemed it was worth a lot; and, verily, I was no new hand to bullying my road to places, having found much practice in bygone years, when my passport lacked sanctions that should have been writ on it. Besides, thought I—and I whistled under my breath—I would horse a dozen of my men as a kind of *posse*, that need be no more gentle, if necessary, than Brueton's late companions, which he spake of, had been. (These companions, I presumed, had bolted with him from Mr Forster's muskets.) . . . Ay, with my Justice ship and my *posse*, I should get Brueton through.

'Madame,' I said; 'Sir Charles, also. By your favours, have you any other way left for the journey than by a big, slow-paced coach, in which Sir Charles would lie hid under cloaks'—the breath of surprise, which was well-nigh a speaking, which she drew at that, and a mutter from Sir Charles, paused me for an

[Christmas Number.

instant—'than by coach,' said I, 'or by Sir Charles going ahorse—taking some of his landmen with him, if you like—but liable to be stopped at that? Have you any other way?'

'No,' I heard Sir Charles say. And she shook her head to me for no. At which, 'Madame,' I said to her, 'you have shown me truly that 'tis hard for you to advise; and I think 'twould be little fair of two men to seek an answer from you. So, if I may have your leave, I will settle this with your brother.' Whereon, turning my face to him, I said, 'Brueton, your life is hanging on it. That card is shown—plain. Come you down to my house, and I'll horse you and a dozen of my lads, and we'll set off. And,' said I very hearteningly, 'I can't think we shall be the easiest people in the world to stop.'

He was regarding me with certainly no anger in his face now—with friendliness, so far as his indecision and uneasiness would let him show it. Holding his hat, with his tie-wig pushed to one side, he was wiping his forehead and temple with the kerchief, his arm giving a nasty, quick tremble twice or thrice as he did this. I knew it was his unhurt arm, from the other, which he had not used for drawing off his hat, being held with noticeable awkwardness—so 'twas plain from the twitching that he was very broke; so broke that doubtless our converse itself was telling on him badly.

'I am very obliged to you, Assheton,' he said, low-voiced, with a hint of a smile. 'I deem you are vastly honest, and unbelievable kind to Mistress Brueton and me. But—but——' and then, just as an ague will take a man, his peevishness took him. 'But this is no better than windy talk when you're safe on your own ground, man! Don't you know there's blackest danger for *you* in this, if you go, like a thick-pated fool? Why, if some of them which are bent to lay me—Wills's soldiers—are got in front of us—but I believe not a man of them is—they'll be like to hang you up to a tree, and hazard it, for finding you aiding me! There's death-danger in this, my dear Assheton. How would you shape when you saw that coming at you, horrid—looking certain death—making your vitals seem *being pulled out of your mouth* . . . and your body seem being pulled to the ground . . . so that you scarce could stand? . . . How'd you shape? You don't know what *that's* like—I doubt? I do!' He moved a little, limping of his foot, and leaned his back against the coach. 'I do!' he said, brokenly, peevishly, almost in anger with me, one of his arms and a leg twitching badly.

I smiled. I could not help it, for all his suffering; and maybe something in my mind was telling me that a smile would help to steady him. 'Sir Charles Brueton, man!' I

said. 'Why, you're not hesitating from me for that, are you? For fear I'll not shape well in a stiff pass? Oh come, man,' I said, with some impatience; 'I was getting my hat blown off by French cannon bullets before ever you were born. And I don't think there was a year 'twixt then and my coming here to Blore March when I didn't meet some sort of danger, asea or ashore, in some part of the world—uglier danger than cannon bullets, of times. So I can't think that I'll run away and leave you to shift for yourself if we see a redcoat—if that's what you're mistrusting of!'

He was giving me the veriest stare of astonishment. Yet I could see that he was tending to believe me fully—perhaps because it was suddenly plain to him that there were imprints about me (apart from my sun-darkened, sea-browned complexion) which vouched for my words. 'But, Assheton,' said he—'I thought—'twas said—. The lawyers—over this road—and some other people—said you were a merchant. I *have* heard it thought, and said by some, that you have been on sea-passages. Ay, I have. . . . But I knew not how true . . . or how far . . . or thought of danger.' He wiped his face, very weakly; then smiled at me with some brightness. 'On my word, you look a man for danger, Assheton!' said he.

'I am no man to stay on this road looking for danger, when I know not what's coming behind you, Brueton,' said I. 'You've delayed here enough—and so have I, if I am to be with you. Now, come to the business. Will you try for it with me and my men?'

He looked past me to his sister. Then, looking at me, he moved from against the coach, nodding. 'Ay,' said he; 'and I hope you may get me through.' Then turning, and opening the coach door wide, he took out a little leather box, that could go behind his saddle—his money and such things in it, doubtless.

'Tis from my house that we'll set off,' I said. 'I've horses enough—no need to say. Yet call to those boys of yours to go home and saddle a horse for you against your coming there. No harm in their not seeing too far past their noses.'

Which order he gave (meaning not to go back to his house, of course); and I faced his sister, her eyes coming to me at once. 'Madame,' I said, 'will you make your farewell with your brother here? Or will you most greatly honour me by coming with us to my house to see him up in the saddle?'

'I will come, sir,' she answered.

And forthwith we stepped from the roadway and made across a little space of grass, heading for the wood, through which a path led down to Blore March house—I instantly discovering that Brueton limped most sorely; whereon I took his box from him and set my arm beneath

his to aid him, finding him very ashake. 'What are the hurts?' I asked.

'Carbine balls,' said he. 'I think one is still in this other arm. I don't know. I've had no leisure for a surgeon.' He smiled a shade. 'It doth ache extremely—perhaps 'tis bound too tight.'

'I'll look to it before we're away,' I said. 'Better a half-hour's delay for that than to ride any slower from you being in pain.'

But verily I was nearer to whistling than to speaking, for his saying 'carbine balls.' Twice hit—that had not quite the sound of running from the enemy.

'You know of wounds?' he asked, looking curiously at me. 'Ay, but I suppose you would, from what you told me a minute past.'

I nodded, aware that his sister, on my other side, also was looking at me. 'Ay, I've played surgeon—and wounded man, by way of a change,' I said. And then I turned my thoughts to two points that were best cleared up with no more waste of time. 'Where do we ride for—London?' I asked.

'London? Nay! What good is London?' he said, his arm giving a kind of impatient quiver in mine. 'I must get over the sea. From Hull, or from some Lincoln harbour where I can find a ship. For the coast there, by the Humber, we were making.'

'Brueton!' I said, well-nigh angry, for his sake and his sister's, 'twould have been the maddest thing, man! You would have been stopped and held till any one that wanted you could find you—if you had asked for a passage in a ship. Don't you know that every east England port down to London is sure to be stopped tight now that the Chevalier's things have exploded up—to catch any of Forster's men that have got clear of Preston? Some are clear, I was told—and they'd all go east, to get to sea, knowing that the Lancashire ports, and all the nearest Wales harbours, are stopped beyond any hope.'

'Nay, I had not looked for that,' he said, his arm twitching in mine. And I was conscious of having heard his sister, by me, take a sharp breath such as she had more than once taken this morning. 'Then I cannot tell where to go!' Brueton said, in a half-hopeless way.

'I can better tell if I know the state of your matters,' said I, thus coming to my second point. 'To London, if you have high friends there, may be the right course. But see, I know nothing, Brueton—save I think you left your regiment without leave. I must know the whole to act my best for you.'

He gave me a queer stare, his eyes strangely dismayed. 'Why, I think I have believed that you saw all of it, since you saw so much,' he said. 'If you haven't seen—why, I expect you'll turn against me for knowing!'

'Fiddle-faddle, boy!' answered I.

He wrinkled his forehead—hesitated; and then his sister spoke. 'Sir, my brother put off King George's coat and went across to the Chevalier's side—to Mr Forster. My brother is one such as you spake of—that escaped out of Preston. He escaped out on Sunday evening—and Mr Wills, that was his general before, will greatly hope to have him caught, and then killed, for changing his coat.'

'Twas a pretty surprise indeed that she gave me by these words—and twice as dangerous as ever before did Brueton's state appear. And yet, in a way, all seemed very plain and easy sailing now. 'By your leave, madame,' I said, 'Mr Wills is welcome to his hopes, for I think he will get nothing beyond them. I think we shall beat him—and there's no man I should be happier to disoblige than that fellow. But truly it must be sea, not London, for your brother—and the farther to sea the better, perhaps.'

'I thought to go to France, or to wherever I shall find the Chevalier himself,' said Brueton.

'Oh nay,' I said. 'Strive to save North March. The Government will take it from you if you go to join with him. If you keep from him there's a bare chance that you'll save it. . . . And since 'tis sea for your brother, madame,' I said, turning my face to her, 'here is the fortunatest thing that could be. I have a ship, all cleared for sailing to America, and thence to the China seas, in a port that will scarce be watched. This very week, madame, I was to write a letter to her master bidding him sail. No need for a letter now, since I shall take your brother to her and put him aboard.'

I felt Brueton pressing my arm against his body in a glad, trembling way, which moved me very considerably by the piteousness of it. 'Assheton, you are a very friend to me!' he said. And his sister, giving me a sight of her eyes for an instant, then passing me to walk before us—for the wood path, which we had entered upon, had narrowed—said, 'I do thank you more truly than I can tell. . . . I had thought to have my brother near; but now I am glad that it will be far—America—China seas; for he will seem very secure from enemies. . . . I thought him no better than dead when the tidings came—was't Saturday?—that Mr Forster was in Preston with small hope left; for I knew my brother was with him.' (Whereby she made me think of her face as she walked with the spaniels that afternoon.) 'I believe I have scarce slept since. I believe I have had no true hope till in these last minutes.'

'All is true hope now, madame,' I said, gazing in the dim light of the wood, at the red-gold gleam of her hair betwixt her black hat and her slim dark-cloaked shoulders as she walked before me. 'By to-morrow night I should get your brother to the port and into my ship. Then

[Christmas Number.]

away to the wide seas—fair seas that he will enjoy to look on, madame; and, beyond them, he can go to land and dwell in one of the towns that I will tell him of, while you do write to him of what is being done for him here. 'Tis a fair prospect, madame.'

I saw her head move in assent; felt Brueton's arm hold mine the tighter. Then asked she, 'What is the port that you ride to?'

'By your great favour, I will not tell you, madame,' I answered; 'so that, if any persons come to North March asking for your brother, you can say, untroubled, that you know not whither he is gone.'

She turned her head the veriest shade, looking through the trees. 'I deem you do think very wonderfully for my brother and me,' she said; and then held on her way silently whilst Brueton told me a little of Preston.

He had been in the regiment of a Scottish gentleman, one of the many with Mr Forster—the Brigadier MacIntosh. And through Saturday night, defending (it seemed) a kind of barricado across a street, he had been in as intense a fight as any man could wish for, getting his two wounds and caring no whit, with Wills's men, who were striving to carry the streets of the town, being beaten back everywhere, and accomplishing nothing save setting fire to houses—and drawing out of the town at last. But on Sunday morning, with another of King George's generals, one Carpenter, joining Wills, with some strong dragoon regiments, Forster and several of his lieutenants had no thoughts but to parley anent surrender, though 'there were hundreds of Scots men and many English (Brueton among them) that would have fought on to the last.' Brueton knew well enough that surrender meant his death—within a few minutes of Wills getting him; and 'twas the long parleying of that Sunday which 'put the trembles' into him. But towards evening he and others spoke with 'some honest Preston girls,' who later 'got them out,' telling them where to go to look for horses—which presently they found. And he, with the others sharing many miles of his road (after which they scattered), rode for North March.

CHAPTER V.

IN the library at Blore March Mistress Brueton chose to remain with her brother, rather than go to another room, whilst I looked to his arm—which matter, having given him a strong cordial, I swiftly worked at, finding the wound very simple, with the carbine ball gone from it.

I most thoroughly vinegared the place (for all Brueton's wincings), stopped it, and bound it, and withal saw to his leg, which had nothing worse than a ball-chipped ankle, in not above eighteen minutes—during most of which time

1925.]

his sister sat away in the window, very white, with a little glass of wine by her that she would not touch; she looking sometimes down at the horses gathering outside, sometimes at her brother, and sometimes at the sea-shells and weapons and pieces of China ware (very delicate and pretty) which were about the library; I having brought these things back from my voyages.

She spoke no word for a long space, wiping her eyes with her kerchief every now and again—by which 'twas very evident that now her brother seemed, in a manner, safe, his going far from her did begin to weigh upon her hard.

Therefore in my talk of distant lands to Brueton—which he led me to by asking, betwixt digging his teeth into his lip, where this weapon and that, which his eyes rested on, came from—I strove to bring in little tales that were droll and to be laughed at—and she, listening, presently brightened (I knew without looking much—which I could not); and once I saw her smile, holding back her tears. And by the time that I had put the sponge and bowl out of sight, and Brueton was in his coat and both stockings again, she was standing near us, much happier, looking down at a little China basin which was between her finger-tips—one of some that I had begged she would accept for her own.

And 'twas then that, in speaking of a laughable coming to blows that I had had with some of the East India Company's people, near Canton, who accused me of intruding on their rights, I said, verily with no proper heed of what I was saying, 'It was a matter of tea. I was playing the teaman then, true enough.'

Whereat her cheeks coloured to a great spreading pink, and thence to deepest pink; and her eyes, lifting from the China basin to me for the briefest moment, had, methought, some reproach in their sweet violetness—as though I, after befriending her brother and her, had seemed to back-stab. Whereon I, suddenly fearful that she should bethink her that she was 'Mrs Teaman,' turned my eyes in considerable consternation to her brother, finding in his face the first colour that I had seen in it that day; and a very flame-cheek red it was—up to his temples. Upon which, deeming openness best, and laughing, I said, 'Oh ay, man, I did hear of "Tom the Teaman," and what of it—save 'tis a merry name that I hope you'll stick to? Why,' quoth I, catching view of myself in a very bright silver bowl on the table beside him, 'why, with my face so brown that I might have washed in it, I think "Teaman" no bad description for me.'

At which I heard her speak, she seeming now to have some reproach in her voice—though a very strange, unlooked-for reproach, it being as if she did slightly censure me for appearing to speak ill of my face. 'Pray, sir,' said she, 'is the saying true that following the sea doth change

one's eyes to sea-colour? For I have always thought your eyes very sea-blue.'

'Oh, nicely turned!' said Brueton, his lips laughing, his face much comforted. 'Assheton,' said he, looking up at me, 'you'll find we're swordsmen enough in wit—when we're not too frightened to show it. You have only spoke with Mistress Brueton when she is frightened.'

'Nay, brave enough now,' I said, going to my escritoire and taking from it a bag of money and some papers that would prove me a Justice. And, with a swift thought coming to me that it might not be ill for Brueton to pass as a prisoner (though not in his own name) at times on our journey, I took from my writing-case the warrant, prescribing 'any convenient jail,' which had been sent to me for arresting Mr Sabine Thorntoun.

Then, having learnt from Mistress Brueton that she would remain for a time at North March, since her aunt Nair was lying somewhat sick there—and having advised her to send express for her uncle, Sir Moreton Nair, baronet, then in London, in case she should be much disturbed at North March by persons coming to question her of her brother—I left her for brief moments with Brueton whilst I ran to my bed-chamber to thrust my face into a bowl of water (with no time to shave), to drag a comb through my hair, to swathe on a fair white cravat, and to get into a good coat—that, on the road, I should seem more like a Justice than a pirate (which Brueton, when I had hurt his arm smartly a little since, had vowed in jest I had been).

CHAPTER VI.

BRISTOL was my port. My ship the one I have spoke of, the *Adela*, 1400 tons, her master, Captain James Nagle, a faithful man—who, moreover, owed me a thousand pounds. Of my ride to Bristol with Brueton there is very little to tell—which means that it had all the fair fortune that I had believed 'twould have. Yet, anent my belief of this, I can but confess that during the first ten miles which we covered after leaving Blore March I found myself with an anxious heaviness which verily I would not have let Brueton perceive, for fear of depressing him badly. It had come to me that, under Providence, it was utterly my doing that he was out here with me on the road for Bristol, and that if anything befell—which easily might be—I must take all the blame for it. If he were caught and shot, I must stand (if I lived) before his sister as the man who had persuaded her brother to his death.

But after these early miles, since folk were proving very ready to look on us as a *posse* with a prisoner, my spirits rose steadily. I had eight lads with me (deeming that more might arouse suspicion), each with a stout cudgel behind his

saddle and the secret of the business in his noddle—for I thought it best to tell them all; and from the first I had played—and I meant to continue playing—on my idea to make Brueton look a prisoner. I tied not his hands; but a rope went from his horse's neck to the hand of one of my men; and we bound a big scarf about his face, causing him to look to have been cudgelled, and concealing his face very nicely. Indeed, so suitable an appearance did we make, with Brueton thus prepared, that, towards evening, as my company rode slow, climbing a hill, three country women, standing to watch us, said loudly of Brueton: 'Poor fellow!' and anon, presuming on their sex, sent a generous hiss after me, which did make my lads grin mightily.

The roads were not bad; and, though the gray sky threatened heavy snow, little came down; and I thought that, by riding clean through the night, we easily should reach Bristol by next afternoon or evening (Wednesday). But we discovered the greatest difficulty in getting a change of horses—the more so from that I steered aside from larger towns—and could change but two or three of our horses at a time, which spoilt our pace. With this, and with deeming that I should give Brueton some rest—at an alehouse a little below Tewkesbury—for part of Wednesday night, 'twas Thursday morning before we were come within striking distance of Bristol. And 'twas soon after daylight of this morning (up to when the mere showing of a paper bearing my title of Justice had brought us, with extraordinary ease, through every demand for passes) that I deemed it advisable to make use of Mr Thorntoun's arrest warrant that was in my pocket.

We had come into sight of thirty or forty horses grouped about outside an alehouse, with the equal number of soldiers, some of these sitting on benches, drinking and shouting, others walking idly here and there on the road—horse militia, Brueton told me at once, but he believed they would not know him, even if they saw his face, for they were not a Staffordshire troop—Gloucestershire men, 'twas very probable. We discerned two officers—nearer us than any—standing in the middle of the road laughing with a serving-girl, and seeming pretty far in their cups by this hour; and they, upon some word from their men, looked very straight at us (being steady enough in a way). And then—partly, I was sure, because of their cups, and of a wish to show the girl what rare bullies they were when they had the sword on—they acted in a manner which was needlessly aggressive, and no less awkward for us for that. One of them gave an order to some of the troopers, who therewith turned several horses across the road to bar us—and he stayed by the girl. The other officer walked to a horse and mounted it, and, two of his men also mounting

[Christmas Number.

their horses, they rode at walking pace towards us as we came.

Now I, that had been a King's sea-officer (and no disrespected one, I believe), was verily not the man to be awed by a half-tipsy militia officer that I had disturbed from fooling some humble girl. And, swiftly deciding on my action, and telling my people to halt in a cool manner in a moment, and moving my horse forward, I looked pretty unwinkingly at this officer (a young one) as we drew in our horses, facing each other—pretty unwinkingly, for all that I should be forced to adopt an unpleasant ruse of war, and lie to him.

'You, sir,' I said sharply—and his face went a very crimson at my tone—'I don't know who you are, sir, but if you've any men sober I shall be obliged by four of them and a corporal to go with me to Bristol.'

He gazed at me in blankest surprise, his mouth half-open, his tongue twittering rapidly behind his teeth—all formidability and upstirred anger blown clean out of him. 'I can't give you men of my troop, sir,' he said, with much of a stammer.

'You can,' I said—and I meant to try for them; for, in the moment when it had occurred to me to make the boldest front by asking for soldiers, I had seen also that if I could get them they would look a fine guaranty of my company being above all possible suspicion, in case we met with other soldiers 'twixt here and Bristol. 'You can,' I said. 'Look you, I am a Justice with a prisoner.' I took some papers from my pocket, pulled the warrant for Mr Thorntoun from them, shook it open, and thrust it to the militia officer, with a very ill-tempered mien, which implied that he should have perceived all this without proof, he taking the warrant obediently enough, and setting his eyes to it. 'It hath come to my ears,' I said, 'that the prisoner's friends may try to take him from me before I reach Bristol. My lads have cudgels, but I should be far the better for five armed soldiers.'

'I've no standing to give them. I should have to answer to my colonel for't,' he said, very doubtfully, eyes on warrant.

'What of that, save he will tell you 'twas proper to give them, on demandment, to a Justice?' I said angrily. 'Surely you do see that far? I will give you a receipt for them, victual them, victual them for their road back to you, which they can take to-day. Whither shall I send them?'

'Tewkesbury,' said he. He looked from the warrant to my company, halted a short distance away, then looked at me, then at the warrant again. 'Why do you bring him from Staffordshire to Bristol?' he asked (the warrant showing that Mr Thorntoun and I were of Staffordshire).

'I did not chase him down and break his head in Staffordshire,' said I (which was pretty

true). 'I think, sir, a man may run out of Staffordshire, and Bristol seem no bad place to take him to when he is caught. . . . Well, sir,' I said then, 'I think, in addition, that I am not used to be questioned by young officers, so I will say no more than this: I shall be obliged if you will give me the soldiers. If you won't, I shall be vastly obliged by your name. For I shall see to it later which of us is right in this matter.'

He tightened his lips, very mixed in temper and mind; drummed on his saddle with his fingers, frowning at the warrant, and then said: 'Perhaps you were best have your way, sir. So write me a receipt.'

Which I did, without getting from my horse, writing upon part of a letter with a leaden pencil.

And from then I rode free enough of anxiety—keeping the pace good, with my troopers and corporal ahead of me, and my lads and Brueton behind me (for verily I risked not that one of my lads should, with no meaning to, let slip anything to a trooper)—and I had the satisfaction to find myself militarily saluted, instead of stopped, by sundry officers of two more troops of militia, which might have been very dangerous, that we passed on our road—these various militia (I afterwards learned) being come up from Devonshire, where trouble had been looked for.

We reached Bristol (old city of church steeples and cramped streets that I always have had great affection for, and used as a port whenever I could) at half after three in the afternoon. Immediately I gave quittance of service, and money, to my corporal and troopers, putting them into a comfortable tavern, whence they were not like to stir to follow the rest of us with curiosity. Many streets beyond them I took a similar precaution with my own lads (honest though they were); and at a third inn Brueton and I stabled our horses. The rope had been taken from his horse's neck before we entered Bristol, and the scarf from his face so soon as we had put a street between ourselves and the soldiers—so that we came to this inn looking most ordinary. And from it we sauntered in the coolest manner to the quays—I receiving recognition from several persons that knew me; being, indeed, twice forced to stop to shake a man's hand; though none of this conceivably could hurt us—and we took a waterman's boat, and were away in the comfortablest fashion down the river to the *Adela*, up the side of which we presently climbed. She could have been dressed for sailing within two hours—she was so ready. But, with darkness now falling, with little wind, and with the tide soon to be against her, neither Nagle, her master, nor I dared face the hazard of her setting-out—even though we should bribe the best pilot in Bristol to help her.

But the next day, very memorable to me,

as marking the successful conclusion of the business—Friday, November 18th, 1715—she was away, with the sweetest breeze freshening for her, by ten of the morning—bearing Brueton, incomparably more fortunate than several poor soldier lads that changed their coats, and were found in Preston by Wills; and anon to be very fortunate again, seeing that, by the exertions of his relatives, he was allowed back into England after five years, with no more punishment than a fine of twelve thousand pounds.

I went seaward in a sail-boat to watch the *Adela* fair away down the Bristol Channel, presently seeing Nagle clap on her top-gallants, for all the fast-freshening breeze, and her pace become very pretty. And verily, in my interest for her, I brought two honest sail-boat men into considerable danger—for we, in our sail-boat, had a very sharp hour or two beating back to shore.

Having sent an express to Mistress Brueton with tidings, I passed Saturday and Sunday in Bristol, my ears alert for any sound of the arrival of pursuers that might have got upon the track of Brueton and me—though I could not think that any harm could ever be done him now. I was well-nigh sure that the Government would not go to the business of sending a ship after him.

For part of Sunday I took a holiday from my alertness—believing from the nature of this holiday, that Brueton would not suffer by it. I passed some hours in the interior beauty of that church which I, who have seen churches in many parts of the world, do always hold is the fairest, loveliest church that a man can be in—the church of St Mary Redcliff, Bristol.

On Monday afternoon, with nothing heard, I set off with my lads for Blore March—and, strange though this may seem, it was not until I was on the road thus that I gave any really grave thought to the circumstance that, although I had not gone out to fight for the Chevalier, I had put myself so deep in the business by what I had lately done that I could look, with considerable reason, to be punished as badly as any man in the Chevalier's affairs, if my conducting of Brueton's escape was found out—which was a very possible thing to happen.

My lads, for all their goodwill towards me, and towards their own safety (which I had impressed on them they were risking in the business), would be sure to talk when they got back to their cronies. More serious than that was the receipt which I had given to the militia officer, pretending that I had Mr Thorntoun—who was I knew not where. That receipt might start an inquiry which would lead to my death. I was very sure that by law I could be put to death with no trouble for helping Brueton; and verily I knew not whether the Government would be eager to have this done, or would be inclined to leave me my life. That little else would be

left me, if I were apprehended and put to trial, I could be very convinced. I should be sent to imprisonment, or, most like, sent abroad and sold as a slave; and Blore March and my fortune would be taken from me.

Though I had given little heed to these things when they edged at my mind during the kind of excitement which I felt on my journey to Bristol with Brueton, and during the great satisfaction which I experienced in the immediate days after he was got to sea—now, when the excitement was past, and I was become used to satisfaction, a sober view of my situation sent my spirits very low and dark. A passing thought that, since I had been a very dishonest Justice to King George in my late actions, the best thing for my honour, and probably for my neck, would be to write His Majesty a letter of the facts before aught came out, I let pass, and quickly. The letter might start some sort of a dogging chase after Brueton. Moreover, it might never reach the King, but be stopped by some of his ministers—who would look to me. By it I might throw away my life, when perhaps I could have saved everything by keeping quiet. This matter was too black for playing carelessly with.

Too black!—thought I, riding along, some way behind my men. Ay, too black! For some miles my spirits were more low and sombre than they had been for many years. Black suffering seemed before me—with all the fairness of life irretrievably thrown away. And then, knowing full well that the real meaning of my thoughts was that, if the Government took hold of me, I should be dragged away from Mistress Brueton—never more see her in this life; knowing this, and studying her face with its sweetness, her eyes with their violetness—she seeming to be before me, against the black horizon of menace—I suddenly found myself rallying fast from my hideous lowness of spirits—from my cowardice, as I called it now. I had served her, who loved her brother, very well in this business. I had put the pink back into her cheeks—I could be sure; had made her happy again. Therefore I was very glad I had done the perilous thing which I had—and I'd do it again for her, happily! With which, telling myself that there were many odds that the receipt would lead to nothing, and that my lads' talk would reach no dangerous ears, I shook up my horse, and rode very pleasantly.

CHAPTER VII.

I WAITED upon Mistress Brueton, straight from my horse, riding to North March house before going to Blore March, on my return—finding her very happy to see me for her brother's sake, of whose putting to sea she fain would hear fullest news from me—finding her

[Christmas Number.]

looking, indeed, the happiest young lady in the world as she listened to all that I told her; and finding anon, in a moment of quietness that came to us after my speaking, that her eyes were set on my face with such deep gratefulness and kindness, because of what I had done, as I could not have expected to see, though I had known that her face would be grateful—finding, withal, her words of me verily kind when she presented me to her uncle Nair, who presently came in from riding. That I let slip not a word to her of my doubt of my own safety, there is no need to say.

The next afternoon, with no intent to go to her house that day, lest I should seem to return thither over-quickly, I walked near the roadway which so often I have spoke of; presently perceiving her coming, a dark figure against the snow which powdered the grass, with divers spaniels. She was a dark figure at first—but soon her face, its pink all come back in these days of her brother's safety, was very discernible—with the hue of her eyes, and her smile which was telling me that she readily would speak with me.

We talked, I walking with her; she telling me that certain men from some county Lord-lieutenant had visited North March that morning searching for her brother ('twas the fourth searching-party that had come there since I took him off). But, said she, she had not sent for me, since her uncle Nair had sent them away fairly easily. And then, she asking me of what part of the seas I did think her brother was got to now, we spoke much of his voyage, and then conversed a little of various things; she telling me of when she was at school, I telling her of where I was in those years; so that I walked with her much above an hour.

The next afternoon we met in this manner, and on each afternoon that followed; so that—though I scarce could let myself believe so much—it began to be as though we both did look to see each other thus, without either of us saying that we would meet. Twice I walked with her to North March house, and on the second of these times I chanced to speak to her uncle Nair—she having left us together for a little—on my prospects of being arrested and put on trial, which I had no cause to think diminished by lapse of a few days. Whereat Nair, a big, hearty, often plain-speaking gentleman—after saying that it already had been in his mind that the outlook was like to take an awkward aspect for me, though he had seen no good to fidget me by telling me what I surely knew—turned his eyes on my face, and asked with complete suddenness, 'Do you look to marry her, man?'

'Man, I've loved the sight of her for two years,' I said. 'But I can't think she would ever look at me in earnest.'

'Nay, I'm not so sure,' said he. 'The women
1925.]

of her family have a way to look where they fancy for a husband, and they have a way to take some stout fellow that's no weak reed—as her aunt (that I run off with) took me. So I'm not so sure. And see, man, here's the point of it. If you are seized on to be tried for your neck for aiding Brueton, it may help you vastly if 'tis shown that you but aided the brother of the lady you are to marry—which any proper man would do. See you that, man?'

Whilst I was silent, pondering for an answer, she returned to us, wherefore, no need to tell, no more was said. But I was to discover next day that Nair had spoken of the matter to her after I was gone. On this next day, at afternoon, it was snowing somewhat, with a very cold wind, so that, as I stood by the roadway, I could not be sure that she would come. But she came—came quickly with the spaniels, through the grayness and the slight falling snow, as I hurried to meet her. She smiled, but I found that her face, sweeter than ever, had something strange about it—her cheeks going deepest crimson when we were near; and then, in the course of a minute, changing from crimson to pink, then well-nigh to whiteness, then back to crimson again; and her eyes with their sweet violetness, with their sweet look of familiar acquaintance with me, which the last few afternoons had given them, were, none the less, very troubled. And I found that she was not ready to talk, and that she knew not whether she would go a little way with me or no. And, verily, I was mystified and troubled. And then, of a sudden, looking at me, with a little beat by her mouth (that I had seen one day before), she said, 'Mr Assheton, my uncle hath told me all that you may suffer for helping my brother. . . . I had not thought of this since you came home. I think because you have made all seem secure, and danger passed—since you came. . . . My uncle hath told me that if you are took, and do say that you are to marry me—that may help you much. . . . I pray you say that. Why, I would not have you think to say other than that, to help you. I would not . . . for mine own happiness. I could not be happy any more if you suffered great ill for aiding my brother and me. So I pray you say *that* instantly if there is occasion.' She turned from me—little white specks of snow on her red-gold curls—drawing at one of the youngest of the spaniels, which was on a string.

'Madame,' I said, going a step to her.

'No, I pray you! No words of it,' she said very quietly. She looked back at me, tears in her eyes, smiling a little with trembling lips, the beat most plain by her mouth. 'I should fall down in the snow and cry, from what I have said, if you did keep me to talk now,' she said, very earnestly. 'I pray you let me go home alone—coming no step with me.'

I bowed my obedience to her; then stood,

holding my hat, while she went, the spaniels moving this way and that on the snow as they went with her, and looking very dark against the snow. 'Only a word after you—by your kindest favour, madame,' I said. 'You will speak with me a little here, or at North March, to-morrow? I humbly beg that.'

She moved her head—a gleam from her curls lighting in the winter grayness—in assent; and I stood till she and her spaniels were passed beyond trees and quite hidden. [And of the matter which had led her to speak as she had spoken, unhappy-cheeked, ready to cry, this afternoon, I can say here—though I think 'tis known well enough—that I never came into any questioning or trouble for my helping of Brueton. That my men's talk—if they talked—reached no dangerous ears is plain; and with regard to the militia officer and the receipt, there was a very strange circumstance, which came to my knowledge after a while; namely, that Mr Sabine Thorntoun, whose name I had made such use of, having been one of the sundry persons who escaped from Preston, fled to his brother's house in Herefordshire; and, being captured there very soon, and taken to London (where he was sentenced to the American plantations), was actually led, on his way from Herefordshire to London, over some miles of the road that Brueton and I traversed, a few days previously, on our journey to Bristol. Whether this circumstance had something to do with my immunity, by muddling any inquiry which the militia officer may have set going, I cannot say. But I think it not unlikely. In any event, I must look upon my experience, anent this dangerous matter, as being a curious example of the bare-faced hazard a man may run—the better, I deem, if his cause be rather good than bad—and come off scot-free.]

There was snow again on the afternoon following that which I have just told of—not much; only a little floating-down of flecks from a misty gray sky; and since there had been but little fall in the night, and none in the morning, the

snow was not deep on the ground, to hinder a lady from walking. And I, going to the roadway, believed that I should see her—which presently I did; a slight, dark figure, with the spaniels, which came from beyond the trees . . . and knew of me being on the roadway, but came not to me—moving instead slowly on the skirt of the trees, stopping now and then to watch the spaniels scraping eagerly for some creature they could not get—nor would she wish them to get it, I knew—well knowing her nature by now.

I went very quickly to her. She looked from me into the trees when I was close, her cheek gone crimson as yesterday, her mien as though—for all that she had come—she would she had not, and would readily cry for yesterday's words. I knelt down in my boots in the snow to her, taking her hand which held the smallest spaniel's string—he getting away from us. And forthwith I told her of my thoughts of her, that had been with me these two years, and were such, now that I had spoken with her and walked with her, that I knew not what I should do to pass my life, for the loneliness and wretchedness that would be in it, if she would not be with me for my life. I made entreaty that she would let her words of yesterday be real—that she would tell me, in very truth, that I should marry her.

I held firm—though, verily, with no unkind hardness—to her hand in mine. And, having spoke swiftly, I looked at her—pausing on a breath, my heart beating to a wild tune now that I had asked her this and was facing her answer. For, though she had seemed kind to me, it might all have been for the service I had done her brother and her—and she could not be looked to to pay the price I was asking her now, unless she had some little wish to pay it. She looked down at me, her face all pinkness rather than crimson, her eyes, of their wondrous violet hue, having tears. But her face and her eyes were happy; and, with the littlest, sweet smile, she nodded for that she wished that I should marry her.

CHRISTMAS BLOSSOMS.

THE year is a-dying, and droops on the wing,
Yet the boughs are in blossom as though it were
Spring;

The snow by its magic hath fashioned a spray
On each twig that was barren and bare till to-day.

The bowers of Spring-time all blossom anew
'Midst the rigours of Yule, with the frost for their
dew;

Old Winter doth garland our woods in a night,
And we dream of the orchards in Summery white.

Though frail in their beauty these petals of snow;
Though they scatter before the first breeze that
shall blow;

These flakes, by the zephyrs so easily spilt,
Will provide Mother Earth with a flowery quilt.

O transient beauties we mourned in the fall,
Ye are living and warm 'neath the snow of your pall;
The year is a-dying, and droops on the wing,
But the boughs are in blossom with promise of
Spring.

FRED W. BAYLISS.
[Christmas Number.]

THE PARROT.

By H. GLYNN-WARD.

PHASE I.

I.

'I HAVE seen,' said the captain, 'many beautiful things. The sun setting behind the Golden Gate of San Francisco; the reflection of a flight of flamingoes flying over a lake in South America; the colours of the Buddhist temples along the Irrawaddy; the jungle back of Sierra Leone as it looks after the rains. But never, no never, in all my travels have I seen anything one-half so beautiful as the garden at Templeton Manor in June!'

And he looked at Marianna as he spoke, which was not surprising considering he had come all the way home from foreign parts to look at her. Marianna blushed, as she had been brought up to do when young men looked at her—and this happened whenever a young man came within hail; and an old one, too, for that matter, for she was a sight worth looking at, with her rose-leaf complexion, her deep-set sparkling eyes, and her dark, glossy ringlets falling so primly, early-Victorian fashion, on each side of her demure little early-Victorian face.

She sat on the chintz-covered settle by the window, sewing at her embroidery, with the wide skirts of her prettiest summer dress spread out all around her, a lavender-sprigged muslin, much flounced, a fichu across her bosom fastened in front with a large cameo brooch. Captain Richard Allardyce sat in a straight-backed chair opposite, watching her, and her aunt, Miss Jane Templeton, played propriety, and watched them both.

The captain was right about the garden. From the window in the parlour, where he and the ladies sat, you could see straight down a gravel-path bordered with flowers and apple-trees behind them, and at the end of the path, which had rose-covered arches over it here and there, was a green lawn with a mossy old sundial in the middle.

So you had an impression of looking down a vista of brown and yellow gillyflowers, late daff-a-down-dillies and narcissus, polyanthus, apple-blossom, and over all the scent of lilac, from the great bush to one side of the window, flooding the room; the drowsy hum of bees in the air, and the sunlight making patches on the new red carpet with the flowered border that had been obtained through Uncle William Simon, who was a high-up official in the East India Company.

1925.]

The captain looked across the patch of sunlight at Marianna and said, with that quizzical uplift of the right eyebrow which was peculiar to him, 'I have brought you home a present, Miss Marianna, something that has been with me through many a voyage, and which I hope and trust that you will prize as dearly as I do myself.'

With that he went out of the room to fetch it, leaving the ladies all agog with expectation.

'Oh, Marianna, my love, what a fortunate girl you are!' exclaimed her aunt. 'Twill be a monstrous pity if you do not look favourably upon his suit. Such an *elegant* swain! So handsome!' She sighed, thinking doubtless of her own dim romance.

Now Marianna had no intention of thinking otherwise than favourably of the captain's suit; the memory of his blue eyes had lit her dreams ever since he had bidden her good-bye before his last voyage. But she did not choose that her aunt or the captain or any one else should know this. So she tossed her proud little head and pursed up her sweet red lips. 'La, la, aunt, to hear you talk one would think he was the only man in the world! Richard Allardyce is pretty well, but for my taste I am not sure that I do not prefer Mr Mortlake!'

'Fie, Marianna, for shame! Mr Mortlake is old enough to be your father! 'Tis his money attracts you, heartless girl!' Aunt Jane shook both her finger and her ringlets at her niece, and would have gone on with the lecture had not the captain returned, carrying with him a large bird-cage containing a gray parrot with a short, square, red tail. It was set down on a little round table amid screams of delighted admiration from the ladies.

II.

'I have trained him to talk like a companion,' said the captain; 'and he's such a wise old bird that I really believe he knows what he's saying.—Now, say something pretty to the ladies, Polly.'

The parrot, however, took no notice and remained silent, albeit he condescended to let the captain scratch his head.

'I got him from the bo'sun of a Dutch barquentine one time we were hove-to in the harbour of Rio Janeiro in Brazil, and the Dutchman told me he had got him from a native in Sierra Leone, so he has sailed the world a bit and seen life. Now I have

brought him to Templeton Manor to settle down.'

The two ladies expressed polite interest, and promised that every care should be taken of a bird that had sailed so far in the company of a captain of the queen's navy. Then suddenly, in a sepulchral voice—'*Gorblast my soul!*'

The poor man was horror-struck, and looked helplessly across at Marianna, but she, naughty girl, had hid her face behind her fan, so that he could not tell from her shaking shoulders whether she were laughing or shocked. Aunt Jane was overcome, nearly swooned, and had to be revived with smelling-salts and such like. Captain Allardyce scolded the offender, and vowed the wretched bird had kept bad company before his time, but the next remark that Polly essayed was even worse than the first.

'*Oh, Marianna, how I love you!*'

At this, Aunt Jane fairly picked up her skirts and ran into the garden, leaving the two discomforted and alone. But now the demeanour of Richard Allardyce underwent a subtle change. He came and stood in front of the girl, though he could see nothing of her face behind her fan. 'You heard what he said, Marianna? 'Tis true,' he said in his bluff sailor way.

Slowly, very, very slowly, the fan lowered itself until it allowed the girl's dark eyes to peep over the top. What she saw in his sea-blue eyes caused her to smile at him, very sweetly and tremulously. 'But, Richard, this is so sudden,' she murmured.

But whether it was or not, he took it for permission to sit down beside her, gather her, lavender-sprigged muslin and all, into his strong arms, and kiss her rose-bud lips and dancing eyes.

'*Pretty Poll! Pretty Poll! Give poor Polly a bone, then!*' said the parrot; and he went on talking like a blue streak. But nobody took any notice of him.

III.

It was a few days after the wedding invitations had been sent out that Mr Mortlake came on the scene to upset the course of true love. A tall, dour man, with plenty of money and an indomitable will. He had long since determined that Marianna Templeton and no other should grace the head of his table.

A waste of words for Squire Templeton to assure him that a match with Richard Allardyce had been arranged.

'Gadzooks, sir, it shall be disarranged!' was all the answer he got.

So it came about that Mr Mortlake strode into the parlour one day when Marianna was in a peevish humour with her Richard, some trifling lovers' quarrel that was only made for the sweetness of making it up again. And it amused her, flirt that she was and accustomed to men fighting for her favour, to be as sweet as sugar

to Mr Mortlake, who was clever enough to seize his opportunity.

Richard, not so clever, chose just the wrong moment to forbid his betrothed ever again to receive Mr Mortlake. Whereupon she set her teeth, and was sweeter than ever when Mr Mortlake called the very next day. So sweet was she that Richard, coming upon them unexpectedly, found Mr Mortlake's arm where his should have been—round his beloved's waist.

He, poor simple sailor that he was, knowing naught of the cursed contrariness of the female of the species, never dreamt that the offending arm was as little to Marianna's taste as to his own, and, in truth, had only been allowed when his step was heard, just to show him 'I can do as I please!' He flung out of the room in a rage, and Mr Mortlake departed with a sardonic smile on his face.

IV.

It was no make-believe quarrel that took place next time the lovers met. Aunt Jane met her niece running upstairs in tears, and hastened down to the parlour, to find Richard Allardyce pacing up and down as if he was on his own quarter-deck with a troublesome crew below; but no trouble at sea would have brought that curiously hard look into his kind blue eyes. All was over, he told her, and he was going to sea again. Nothing she could say would alter his decision.

'But, Richard, Richard, this is terrible! Oh! believe me, Marianna loves you!'

'*Oh! believe me, Marianna loves you!*' said a toneless voice beside them. It was the parrot, picking up the end of the sentence and adding his prayers to hers. But the captain only looked at the bird sadly.

He was as good as his word, and went to sea again. Marianna sobbed her heart out while she waited for him to come back or send her word. It was hard to say which moped for him most, she or the parrot. In the first few weeks after his going, the bird refused to eat, and sat ruffled up on his perch, staring with unblinking eyes in front of him.

It was a long time before Aunt Jane could pet him back to health again. Sometimes when Marianna was in the room, he would rap out '*Where's Richard?*' in a flat, toneless way that was uncanny. It was like the voice of conscience, and she used to fly from the room with her handkerchief to her eyes. Then he took to saying '*Richard's gone to sea, gone to sea, gone to sea!*' over and over again.

But Richard Allardyce neither sent word nor came back, and in due course Marianna Templeton, without the least intention in the world, found herself married to Mr Mortlake. She made him a dutiful wife, but her beauty faded and the sparkle went out of her eyes. She died soon after her first child was born.

[Christmas Number.]

with her love for the other man lying like a lead weight on her heart.

v.

Many long years afterwards, Allardyce came back to the Manor, a fat old admiral, with bushy white whiskers and a red face, to see the parrot, who said '*Shiver my timbers!*' and put out his head to be scratched, just as if Richard had been gone for twenty minutes instead of twenty years.

Gentle Aunt Jane and other contemporaries had long since been gathered to their fathers, so there was no one present who remembered that there had been a love affair between the admiral and Marianna Mortlake. But the parrot remembered, and suddenly came out with '*Oh! believe me, Marianna loves you—hoo-oo, hoo-oo!*'

Whereupon the admiral said, 'Tut-tut! God bless my soul!' and took a pinch of snuff, and stumped out into the garden all alone, down the gravel-path between the roses, that leads to the sun-dial at the end. On this, leaning for a moment, he read 'Gather ye roses whyle ye may, Old Tyme is still a-flying.' A belated bit of advice that gave him no more comfort than the parrot had done. So he stumped back again, and called for his carriage and went away. What must be, must be.

vi.

There were nearly always children at the Manor. When one lot grew up, they in their turn brought their babies home to visit or to live—sons and daughters, nephews and nieces, and grandchildren, they all came home to the Manor some time or other. And they all grew up looking upon the parrot as a family institution. He used to say funny things to make them laugh, and fluff out his feathers and turn somersaults on his perch. He seemed to like the sound of baby laughter.

'No, I really don't know exactly where he came from,' the mothers and fathers would say; 'we only know that he has been here always, ever since *we* can remember! . . . Oh yes, we are quite sure he knows what he's saying. He always swears so shockingly when we have tea-parties, especially when there are clergymen present; we think he does it on purpose!'

At times the parrot would scream fearful Spanish oaths, or strange words that sounded like Dutch; or he would tell of '*A choppy sea and a cloudy sky! We'll have a storm before morning!*' Days, sometimes weeks, would pass by when the parrot would keep his silence, and then, most unexpectedly, he would ring out at the top of his voice, '*Eight bells! All's well and lights burning brightly!*' Upon which the family would congratulate themselves and say, 'Polly's himself again—what a mercy! We thought his talking days were over!'

When the children grew up and became
1925.]

mothers and fathers, he still knew them as they had been, and called each one by his or her own name, much to their children's delight. '*Hullo, Ethel! Hoist your slacks and let's get to work!*' or '*Good old Freddie! Give us a quid, old man, do—hoo—oo!*'

Every now and again, someone heard him calling sadly, '*Richard's gone to sea—gone to sea—gone to sea!*' like a refrain. But they had forgotten who Richard was.

PHASE II.

I.

ON very hot midsummer days, they used to take the parrot out to sit on a perch by the lilac bush. The lilac still smelt as sweet, and the view of the garden from the parlour window (but they called it the drawing-room now) was just as beautiful as in the days when he first came to Templeton Manor. He had watched the world roll on a good many years since then.

The children wondered what he was thinking about when he sat hour after hour on his perch, immovable, unblinking. Perhaps of the sun-baked, steaming forests of his own native jungle back of Sierra Leone; maybe of the storms he had weathered round the Horn, or in mid-Atlantic; perhaps of sailors' songs and the clink of glasses in the galley, as the good ship lay heaving in the tropics. Spanish wines or Schnapps from Holland, good old English rum and Burgundy, the parrot knew all the songs that went with each.

Perhaps he was thinking of the many-coloured natives that lined the shore of some far-away port as they watched the ship dock, or the sing-song gabble of Lascar crews at the windlass. Who knows?

After the daffodils and wallflowers are over, down the gravel-path, come masses of larkspur, with a wide border of pinks shedding their fragrance on the air; and after these the roses are at their best, and the mignonette.

All these could the parrot see from his perch under the lilac bush, and he watched their blooming and their passing, even as he watched the generations come and go. Up that gravel-path came, one hot summer's day, another Marianna, of the Yorkes, a distant cousin of the Templetons at the Manor.

She had come, a poor relation, to pay them a long visit, and this afternoon she wore her best dress, for there was to be a tea-party. Her best dress was a pale blue organdie, with lace at the neck of the tightly-moulded bodice and a lace fall down the front; the sleeves were tight and shaped to the arms, with more lace falling over the wrists. The skirt was pleated from the knees to the ankles, and the upper part of it was gathered loosely round and tied behind to form

a sort of loose bustle. The skirt had a little train to it, of which Marianna was very proud; she swished it as she walked. She had very glossy dark hair, done low on her neck and waving softly over her ears.

She came into the drawing-room through the open window with her bunch of roses, and there she stopped short, staring. The first of the guests had arrived and stood there, with his back to the mantel-piece, looking at her. For the space of perhaps a minute—a minute that seemed a year—they stood stock-still like that, just looking at each other. It was not only that his eyes were the very bluest eyes that she had ever seen, but a queer sensation had petrified Marianna for the moment. She felt as though all this had happened before. Hurriedly she pulled herself together.

'How d'you do?' she said, a little breathlessly, because her heart was beating so. 'I think you must be Mr Allardyce from India? I know they were expecting you this afternoon!'

'I beg your pardon,' the young man said, as he came forward with outstretched hand. 'You must think I have rotten manners and all that, but, do you know, I had the funniest sort of feeling that I've met you before somewhere!'

But close on his words came Mrs Templeton, bustling into the room with her daughters, and conventional greetings put an end to further intimate conversation.

II.

The Templeton girls were always a little jealous of Marianna, because she was so much prettier than they were, and attracted all the young men. On the tennis-lawn or in the hunting-field, in the drawing-room, or at dances, it was just the same—always a little knot of admirers wherever Marianna was. Her aunt prophesied a bad end for her.

'You're a heartless little flirt, Marianna,' she would say severely. 'You just encourage a man for the sake of seeing him dangle after you. One of these fine days you'll do it once too often; it isn't always the girl with a lot of admirers who gets the best husband. I've known many a flirt end up an old maid!' And she looked fondly at her own two, while Marianna tossed her head and pursed up her pretty mouth.

'Oh, Marianna!' cried out one of her cousins, 'do you know that when you make that face, you look so like that funny old picture of great-aunt Marianna Mortlake in the dining-room? If you parted your hair in the middle and wore ringlets, you'd be the image of her!'

The parrot chose this moment to call out, 'Where's Richard?'

"Where's Richard?" indeed! remarked Mrs Templeton irritably. 'What are you blushing for, Marianna? I don't suppose Polly is thinking of Dick Allardyce!'

'But I'm not so sure, mamma,' put in one of the girls. 'When we took Dick to see the parrot, it was quite *extraordinary* how he seemed to know him! He lowered his head to be scratched, and said "*Shiver my timbers!*" just like he does to his oldest friends. Really he seemed to *know* Dick Allardyce; we all noticed it.'

In spite of all the chaff, there grew out of that first sight of one another, and grew quickly, something that was no mere flirtation between Marianna Yorke and Richard Allardyce of the Bengal Cavalry, whose great-uncle had been an admiral, he who had first brought the parrot to the Manor.

He spent most of his time where she was, and in a surprisingly short while after that first meeting, their engagement was announced.

'You know I have nothing but my army pay,' he told her anxiously; 'but I'm to get my captaincy after Christmas, and you must come straight out to India directly I cable. Do you think you can wait for me till then, Marianna?'

She smiled slowly into those blue eyes that looked into hers with such tender concern.

'Dick, I seem to have been waiting for you so long already,' she said, 'that I would go on waiting all my life, if I was sure you wanted me!'

And he drew her dark head down on his shoulder and told her with kisses, for the thousandth time, how much he wanted her.

III.

All through that golden summer, they made love in the garden; and the parrot caught glimpses of them out of his wise old eyes, and preened his gray feathers happily.

The roses faded and gave place to the phlox and the tall hollyhocks, and presently the chrysanthemums began to bud and there was a chill in the morning air. The parrot no longer sat out under the lilac bush, but stayed in his cage in the drawing-room, where they lit the fire early to keep him warm. It was nearly time for Richard Allardyce to return to India; his leave was almost up.

There was much talk and excitement about the Hunt Ball, which was to be held at the Town Hall, and at which the whole county was to be present. One, Sir Harry Preston, who was the most-sought-after young man in the district, came to call at the Manor the day before, and somehow prevailed upon Marianna to save three waltzes for him. Which, everyone must acknowledge, was tempting Providence for an engaged girl.

But, engaged or not, it made little difference to Marianna's numerous admirers on the night of the ball. They buzzed around her like flies, and she laughed and danced and flirted with them all, to the obvious discomfort of Dick

[Christmas Number]

Allardyce, into whose kindly eyes came a hard look as they met hers across the room.

Truth to tell, she was lovely enough to turn any man's head, with her mocking smile and sweet, sparkling eyes that contradicted it, a flush on her delicate little oval face, and dark hair piled so high on her head that the weight of it seemed almost too much for her head to hold without drooping a bit, like an anemone in the wind. Admiration was the wine of life to her, exhilarating, necessary; she had ever drunk deeply of it, and could not stop.

IV.

The morning after, of course, came the reckoning.

'Tell me, Marianna,' Richard asked, standing stiffly with his arms folded, 'does this Preston fellow mean anything to you?'

How could he know that the cold, hard look in his eyes chilled her heart so that she had to say things to hurt him back again, things she never meant? O man, will the generations teach you naught of women? She glanced at him, and looked away, not deigning to answer his question.

'If you loved me as you profess,' she replied, 'you would trust me.'

Manlike, he said exactly the wrong thing at the wrong moment.

'If you're going to marry me, you'll not let him or any other man—fool round you any more. And,' he went on, rather as if he were giving orders to one of his own troopers, 'you'll begin by breaking your appointment to ride to the meet with him to-morrow! You'll come with me to Whaddon Chase, instead!'

Marianna stood facing him, her fingers drumming on the table. How could he know, from her cool exterior, how she was aching for other tones in his voice, for his kisses, for the feel of his strong arms about her? That she longed to be able to whisper to him that all the Prestons in the world meant not so much to her as the little finger of Dick Allardyce? How could he guess, mere man that he was, that one little right word would change the flashing anger in her eyes to tears?

'I am not one of your troopers, Richard, to be ordered about! And I never break appointments!'

On the instant there was a scream behind them from the parrot. Following close upon it came, in his toneless voice, '*Oh! Marianna, how I love you!*'

If only she had laughed, all might have been well. But she was too near tears to laugh, so she just said—'Silly bird!' and went rather quickly out of the room. Richard stood immovable by the fireplace.

The parrot rocked himself to and fro on his perch. He seemed to be labouring under a stress of some sort. Presently he leant forward

and said, in a sepulchral hoarse whisper, '*Oh! believe me, Marianna loves you—hoo-oo, hoo-oo!*' It was the best he could do, poor bird.

Even preoccupied Richard looked up, startled. Then he laughed mirthlessly. 'Oh no, she doesn't, Polly; it's just that she wants me to play with, same as all the others!' With that he too went out of the room, leaving Polly huddled up on his perch, head sunk into his neck feathers.

V.

Not that Marianna ever thought of it all as anything but a passing quarrel, bitter enough while it lasted; but that it would pass she never had any serious doubt.

The next day, hounds met for the first of the cub-hunting, and, true to her word, she rode to the meet with Sir Harry Preston.

It was a brilliant morning in late September, and the sun lit up, gaily, the red coats of the huntsmen and the eager faces of scores who came to see, if not to participate in, the ancient sport of kings. The hounds gave tongue, and everyone talked and laughed in the very best of humours—all but two, whose hearts were as heavy as lead, though they also talked and laughed.

But within an hour, all was changed. People with shocked faces gathered in little groups about a field: men had turned pale, some of the women were sobbing audibly. There had been a terrible accident . . . young Richard Allardyce . . . that nasty hedge with a ditch beyond it, at the bottom of the twenty-five acre field below the Manor. . . . Yes, they were carrying him there—it was the nearest house. . . . A doctor? Of course, there had been one on the field, but—well, it had been instantaneous. That was a mercy, no pain. . . . Poor boy, so full of fun and life! Going to be married soon, too! Poor Miss Yorke, so sad for her! So altogether shocking for everyone! . . .

They carried him up the gravel-path, past the lilac bush, four men—hats off, muddy boots, set faces—and, laying him gently on the sofa, covered him with a sheet. And the parrot watched it all.

By-and-by came Marianna, with a face like marble and staring, tearless eyes. She knelt by Dick's side, who had once been warm and passionately tender, and tried to remember his blue eyes as she had loved them best. She stayed there, moaning a little, and the mid-day sun made patches on the carpet beside her. It was that same carpet that had come from the East India Company long ago, through Uncle William Simon, but the flowered border was very faded now, and there were still damp marks of muddy boots. . . . Poor little Marianna! They had difficulty in taking her away—they, who did not understand!

The parrot kept chanting, '*Richard's gone to*

sea—gone to sea—gone to sea!’ in a dirge-like way that got on the nerves of the whole household. They stopped it at last, by persuasion and bits of apple; but the bird was mopish, and did not speak again for many months.

Marianna never married. She fulfilled her aunt’s prophecy and remained an old maid, very quiet, very sober, in fact a little prim. She taught various nephews and nieces in return for a good home and a little pin-money—for the rest of her life.

PHASE III.

I.

IN these days, the children laughed more than ever when the parrot tried stiffly to turn somersaults for their benefit. He was getting so old, and his red tail-feathers were scraggy. He used to sit for hours and days and weeks without speaking now, and once somebody saw him fall off his perch, a most disgraceful thing for a bird to do.

He righted himself at once, of course, and looking round in a dazed kind of way, said, ‘*Poor Polly! What’s a matter, Polly?*’ But, as father said, ‘It’s a sign of age, Polly, a sign of age! You and I are getting old!’

Whereat Polly must have smiled to himself, having been old when father was first brought into the drawing-room to be exhibited to admiring relatives in his christening robe.

He had seen many fathers come and go, attain the headship of the house for a time, then pass away and give place to a successor. Whence they came, whither they passed, who knew? They came and went even as the ships in the harbours, as the captains on the ships, and the cooks in the galleys. Polly remembered every one.

II.

The present master of Templeton Manor was the father of three children, a boy and two girls, Pamela and Marianna. The latter strenuously objected to her name as soon as she was old enough to criticise it.

‘Fancy saddling a girl with an ugly, outrageous name like that!’ she cried. ‘I’m just going to be called “Marie.” Please remember!’

‘My child,’ was the paternal answer, ‘there have been Mariannas in the family ever since Queen Anne’s day, when a Templeton brought home a Spanish wife who thought the English names were ugly, and so invented a combination of them for her first baby.’

But the girl had her way, of course, as she always did. In time it was only the parrot who called her Marianna. She was as dark and vivacious as her sister Pamela was fair and serene. Marianna changed her mind half-a-dozen times in as many minutes, habitually said

what she did not mean and meant what she left unsaid, laughed and sang, teased and tormented the life out of her family, who, nevertheless, felt the house empty when she was not there.

Pamela was placid and inclined to be stately; she spoke slowly, and thought well before doing it. ‘As unlike sisters as ever I saw,’ people said.

‘Pamela takes after her mother’s side, but Marianna is a real Templeton,’ the father would reply. ‘You can see her likeness in the old pictures on the walls. There is that old painting of great-great-aunt Marianna in the dining-room, for instance, the one with the ringlets; she was the toast of the county in her day. That was soon after Queen Victoria came to the throne. Our Marianna is absurdly like her!’

But ultra-modern, short-skirted, up-to-date Marianna of 1923 objected to comparison with what she called the early-Victorian, simpering, beringleted Marianna of the early forties. So she bobbed her hair. This was when she was about eighteen. And she was more like her than ever.

III.

Round the time when the lilac bush by the window was filling the air with its scent, Mrs Templeton gave what her daughters called a tea-fight. On these occasions the parrot nearly always said loudly, ‘*Let us pray!*’ So many people gathered together reminded him of the time that some bygone Templeton of a religious turn had held prayers in the drawing-room. Only once, because the parrot had sworn at them obscenely and horribly, and they had taken care to have prayers in another room after that.

Marianna came in late as usual. She had been golfing, and her cheeks were still rosy from the spring winds. She stood for a moment, looking into the hubbub of laughter and talk, and people passing teacups and cake, and wondered whether she should join in or escape to her own room. As she stood there, she found herself looking into the eyes of a man on the other side of the room.

She didn’t know who he was, had never seen him before, yet it seemed quite natural for him to be there, smiling a welcome at her, and she smiled back at him. It struck her that he had the eyes of a sailor, with a hint of Scandinavian blue in them, also an expression that made her heart beat faster. She turned her back on him and began talking to someone else.

But not for long. Pamela was presently beside her, saying, ‘Marie, the Allardyses have brought their cousin over, the one in the navy; he’s a commander or something—rather swish! You remember, they are always talking of Dick Warden, who did so well at Zeebrugge? You’ve

[*Christmas Number.*]

got to come and say "How d'you do" to him!

And next moment, Marianna found her hand in his, warmly held. He was still smiling at her.

'Isn't it beastly hot in here?' she said, snatching her hand away. 'Do you like parrots? Come and see ours. He won't talk—he's too old; and he hates strangers!'

The commander laughed, and followed the girl over to the corner where the parrot sat, immovable, on his perch. 'Hullo, Polly!' he said cordially.

'*Shiver my timbers!*' the parrot answered immediately, bending forward his head to be scratched. '*Here's Richard!*'

'Well, upon my word!' exclaimed the man. 'How on earth did he know my name was Richard?'

'Why, that's the first time he's spoken for months,' cried Marianna. 'He must be mistaking you for one of us!'

'Perhaps he's prophetic!' said the man, softly, looking down at the girl as he scratched the parrot's head. The girl blushed, and was furious with herself for doing so.

IV.

'*Eight bells! . . . All's well and lights burning brightly!*' the parrot sang out with conviction.

'By Jove!' laughed Dick Warden, 'he must have belonged to a sailor-man one time, that's clear!'

Marianna, having recovered from her blushes, looked shyly up at him under her curling black lashes. There was something in the tones of his voice that stirred her all up inside. She found the same thing, in a more intimate degree, in his eyes, but they were looking into hers with a more serious expression now.

Then he said suddenly, 'Come, let's get out of this—into the garden!' and she led the way, obediently, without a word, feeling a little as though she were living in a dream. Or had she been dreaming all her life and only just wakened up? They went down the gravel-path to the sun-dial, and leant on it, tracing with their fingers those time-old words, 'Gather ye roses while ye may, Old Tyme is still a-flying,' half-grown over now, and yellow with moss and lichen.

'Do you remember——' the girl began presently, and then she stopped, knitting her brows in a puzzled way.

'Do I remember what?' asked the man.

'I don't know! I've forgotten now what I was going to say. I suppose I had that funny feeling one sometimes has for a moment—that everything has happened before. They say it's one half of your brain working before the other, or else it's indigestion!'

This time the commander did not laugh. 'I 1925.]

remember all kinds of things,' he said slowly; 'but I never remember being bowled clean over by a slip of a girl like you before.'

Voices called to them from the house. 'Ah! my cousins going, dash 'em! When can I see you again? To-morrow?'

But Marianna had disappeared.

V.

'I think you're the luckiest girl alive,' Pamela was saying, a few days later. 'A pearl and emerald ring at your age, with Dick Warden thrown in for luck! Just *imagine!* . . . And, he being a sailor, you won't ever get tired of him! Most of his people are in the army, but I believe he had a great grand-uncle who was an admiral, so perhaps he'll be one too, one of these days! How perfectly lovely it sounds—Admiral and Mrs Warden!'

'Oh, chuck it, old thing!' said Marianna, happily. 'I love the way one of his eyebrows goes up when he smiles; don't you, Pam?'

'Yes, but I should think his eyes could look pretty alarming when he was cross! So *you'll* have to mind your p's and q's, my child. You've met your match at last! No fooling round with other men now. Dick wouldn't stand it, I can see!'

At this, Marianna sat up. 'I'll live my own life; don't make any mistake about that! *I'm* not going to turn into an early-Victorian doormat, to be ordered about by any man!' she finished up, getting a little mixed. By which you will see that she needed spanking.

VI.

She needed it sorely enough later on, when the first flush of shyness had worn off, and her normal state of wilful waywardness had begun to assert itself again. There was an occasion when they had a quarrel, one of those lovers' quarrels that assume mountainous proportions for the two concerned, and sound so silly to outsiders.

Marianna sitting jauntily on the edge of a table, one leg swinging, hands in the pockets of her mauve silk knitted jumper, cigarette in her mouth. Richard Warden standing in front of her, arms akimbo, eyes very serious, mouth sternly set. A modern touch in that old-world room of a thousand memories, sweet with the scent of pot-pourri and lavender, bright with chintzes and sunshine. Even in the carpet, the same that had come through Uncle William Simon from the East India Company, there still glowed faintly some of the colours that had once delighted the heart of Aunt Jane, but it was now threadbare in patches. The parrot sat on his perch by the window and watched them.

'Look here, little girl, I can't have you accepting presents, even if it is only a box of

cigarettes, from all these young chuckleheads, now you're engaged to me, you know! You'll cut it out, won't you? Promise!

The girl tossed back her curls and looked up at him with flashing eyes. 'I'm dithered if I do!' she said curtly.

Never before had anyone tried coercing Marianna without suffering for it, good and plenty. She was far too pretty and far too clever to come out anything but triumphant in battles with her equals—and she had not yet met her superior. Now it was a battle of wills. 'How I shall hate you,' she was thinking, as her eyes challenged him, 'if you master me! But oh, how I shall despise you if you don't!'

A colder look came into those blue eyes that had looked so kindly down at her. 'I think you will find, Marianna,' he observed quietly, 'that you will hurt yourself far less by doing what I ask you in the beginning. You will have to in the long run, you know!'

This was sparks to gunpowder. She stared at him with teeth tightly clenched and all the rosy flush gone from her face. 'I think you'll find, Commander Warden, that you can't command Marianna Templeton!' She struggled with the ring on her slender finger. 'Here, take your ring and command someone else with it!' She threw it at him, and bounded off the table towards the window, standing open.

'Do you mean this, Marianna?' the man asked shortly.

Her heart was pounding, and with every throb it said to her, 'No! No! Of course I don't mean it; why can't I say so? Why can't I tell him that I love him more than ever at this very moment?' But the words would not say themselves. All that came was, 'Of course I mean it! I hate you now, and I hope I shall never see you again! Good-bye!' And she turned and went through the window, out into the garden.

VII.

Richard Warden stood looking after her, twisting the ring between his fingers. He stood like that, for some moments, lost in thought, until the movements of the parrot caught his attention. The parrot was dipping backwards and forwards on his perch, lifting his wings up and down, quite evidently labouring under some unusual excitement. Perhaps the old bird was going to have a fit, thought the man, absently. He shrugged his shoulders and walked towards the door.

'Oh! believe me, Marianna loves you—hoo-oo, hoo-oo!' It was the voice of the parrot behind him. The man stopped with his hand on the door-handle. Strange! Like the voice of conscience—perhaps as true. Queer coincidence, anyway! He wondered vaguely who had taught the bird to say that. Awful thing if

she did love him after all, and just out of a childish fit of cussedness. . . . Fancy Marianna, his little girl, marrying someone else!

'Oh! believe me,—' the parrot again. Was it his fancy, or was there really a note of entreaty in that flat, toneless voice? He took his hand off the handle and walked back to the bird's perch.

'—Marianna loves you—hoo-oo—' the words died away into a sort of hoarse whisper, and the bird sat huddled, with its bright eyes fixed on the man's face.

'Upon my word! Well—upon my word!' the man said, nonplussed. He felt a little creepy down his spine. 'I've a good mind to take you at your word, old sport. I'll have another try, for your sake!'

VIII.

He found her laughing and talking (rather more wildly than usual, he noticed) with her sister and two other men on the tennis-lawn. He wasted no time at all in words, but just picked her up in his arms as though she had been a baby, and without taking the least notice of her protestations, furious and otherwise, carried her, struggling wildly in his arms, back to the drawing-room sofa. There he kissed her, pinioning hands that would have prevented him, till she cried for breath.

'You're a dashed naughty little girl, and I'm going to spank you unless you say you're sorry before I count ten. One—two—'

'Let me go, you brute! How dare you use force on a woman like this!' More struggles.

'Three—four—five—'

'Richard, let me go—please let me go!' This last tearfully.

'Say "Dick, I love you more than ever," and I'll let you off the spanking!—six—seven—'

'Dick, stop! I—'

'Eight—nine—' She lay supine in his arms, quivering all over.

'Dick, I—'

'Say it!' His lips were so close to hers that there was scarcely room for words, but they came in the faintest whisper, '—love you . . . more . . . than ever!'

IX.

The parrot was losing vitality. There was no doubt about that; and the family was very much disturbed about it. No one ever heard him speak now, and he had quite lost his appetite.

'I really don't know what the bird lives on,' Mr Templeton remarked in a worried way. 'He was sitting there all huddled up when I came down to breakfast this morning, and I stroked him, but my fingers seemed to sink right in. He's nothing but a mass of feathers with a few bones in the middle!'

[Christmas Number.]

'Well, I do hope to goodness he'll live until after the wedding, anyway,' said his spouse; 'it'll be such an upset if he doesn't! Marianna is so fond of him, and so is Richard, too, for some reason!'

The wedding could not be till mid-November. They were all very particular about Polly's cage being protected with blankets through the cold nights, and there was a fire in the room all day. Polly lived on, but at the beginning of November he caught a cold and coughed himself to pieces. They tried every remedy under the sun, but they could not shut their eyes to the fact that Polly was dying.

'It's just as if he *wanted* to live till after the wedding was safely over,' one of them said. 'I don't know what else is keeping him alive!'

The bride and bridegroom came to say good-bye to him before they left. 'Thanks, old sport, I owe all this to you!' whispered Richard, and the parrot feebly drooped his head on one side to be scratched.

'What were you saying to him, Dick?' asked his wife.

'Oh, just good-bye! I've an idea we sha'n't see him again, you know!' And Marianna's eyes were misty with tears.

The day afterwards Polly was too ill to move. Pamela suggested taking him upstairs to her room, where she had a fire; it was a room

which got all the afternoon sun. So they moved him up there, placed him where best the pale rays of an English winter sun could fall on the cage, and propped blankets around it. Feebly, but gratefully, the parrot lifted up his head to meet the sun. Were there, behind those glazing eyes, dim memories of other suns?

Suns of sweltering Africa? Morning suns of tropic seas and parched Pacific ports? Noon suns that fell on pig-tailed Chinamen, courtly Spanish captains, and bluff Dutch sailors from the Zuyder Zee? Evening suns that lit up the faces of befrilled, beringleted ladies and whiskered gentlemen with high stocks, as they made love among the roses long, long ago? Who knows?

But a November sun is pale and endureth not. It sank to the west as its rays grew faint and shadowy. And as it sank, the parrot's head drooped. The leafless trees outside took on a blacker hue and braced themselves, stilly, to the promise of frost in a yellowing sky. The sun turned red and dipped slowly to the horizon. The parrot's head sank lower still.

Presently the sun, like a red ball of fire, went down behind the hills and the day was gone. A cold, gray light filled the room, like the inevitable disillusion of a cheer that had been. No light in the sky now, nothing but a gray mist, sombre and final. The parrot was dead.

CURSES COME HOME.

By G. F. BYRON.

I.

IT was only half-past three when Bill Smithers quietly emerged from his bed, taking care not to disturb his wife, who slumbered on. In spite of his care, however, he did not avoid knocking his toe against the leg of the bed, and he but partly stifled a curse as he rubbed the tender part; never thinking how unnecessary it was for him to add to the sum total of curses, whose home-coming was to cause him so much discomfort during the next few hours. Being August, it was quite light, and he curtailed his hours of rest without reluctance, as the night had been insufferably hot, and it had been with difficulty that he and his family had slept at all. He got into his socks and trousers, and, carrying his boots and other clothes, made his way silently to the scullery; where, having filled the kettle and put it on the gas-ring, he proceeded to wash himself at the sink.

Bill was an engineer in the service of the Bay Side Corporation, for whom he drove the steam-roller; and sometimes it was necessary for him to commence work at an early hour, 1925.]

so as to finish the road-work before the day's traffic became dense. On the present occasion, the roadway at an important junction of roads, immediately opposite the Monarch Hotel, was under repair, and the efforts of Bill and his mates were required to start early and to function expeditiously.

After making himself a cup of tea, Bill cut off a crust of bread, which he liberally smeared with margarine, and, while he completed his toilet, steadily munched the dainty. He conscientiously tidied up a little in the kitchen to save his wife trouble, and then tiptoed into the bedroom, looked affectionately at her as she peacefully slept; and, kissing the baby, Ann Dorothy, as she lay in his old tool chest, converted into a serviceable cot, he quietly left the room. He glanced into young Bill's room, where his fifteen-year-old son slept; crept down stairs, put on his boots, stealthily opened the outside door, and let himself into the street.

It was a beautiful morning, still very hot, with the prospect of another day of intense heat, but Bill glowed with conscious virtue, and whistled an air associated with the state of the

banana market, as he walked rapidly to the scene of his morning's work, basking in the warmth of his own self-approval: for he easily assumed that his wife's appreciation of his worth, the healthy development of Ann Dorothy, his son's successful school-career, culminating in passing the sixth standard, the general happy condition of his whole small world and circumstances, were in some indefinite way the outcome of his own merit and early rising.

II.

Bill was the first to arrive, and at once proceeded to strip away the tarpaulin under which his beloved steam-roller snuggled its massive charms. After stoking up its furnace, he devoted himself to lubricating its bearings, and with oily rags and cotton-waste cleaning its metal parts, polishing the brass and steel gadgets with metal polish; all with the loving care and attention that a mother bestows on her favourite offspring.

Bill's mates, when they appeared, betrayed no such enthusiasm, nor exhibited any eagerness to start work. They were more inclined to become absorbed in thought. It seemed unnatural to them to disturb the silence, which at that early hour was only beginning to be broken by the early pipe of birds; and when they spoke, it was solely to express a mild disgust at finding themselves the only workers in an otherwise slumbering world.

Not so Bill; like a charioteer he stood on the platform of his machine, firmly handling the controls and urging on his noisy and uncouth steed.

The roadway had been picked over, and layers of hard angular stones deposited on its scarified surface, to be ground and incorporated, by means of Bill's delicate manipulations of his heavy-footed juggernaut, into a solid and concrete whole. As the atoms lay loose and inchoate, it was delightful to Bill to train his rolling mass over their shifting angularities, and to hear their crunching, grinding, and straining under the process; to feel the pained writhing and the tortured compression of the hard and resisting stone was a joy to him. He would set his teeth, and, glaring at the road, he would come charging on his heavyweight roller as if to grind to fragments the bones of an enemy. The more noise—and the sound was terrible—the greater his delight. The more the stones shrieked and rent the air in frenzied despair, the more relentlessly he urged on his heavy beast to their destruction.

As gradually the stones felt the weight of Bill's argument, their cries subsided, and from agonised groans sank into a melancholy scrunch of woe and rumbling pain. While the roadway in parts became solidified as the process was completed, the noise became less; and as the

noise decreased, the movement of the suffering roadway grew more pronounced, until the earth shook and houses trembled; until windows rattled and doors banged, and water-jugs performed cellar-flaps as they stood in wash-basins, gas-brackets shook indignantly, and hitherto complacent coal, stacked uncomfortably in cellars, tottered and tumbled to flatter and easier positions. It was then that Bill felt akin to the Immortals, the god in the car; and the hand of Bill lay heavy on the earth.

III.

Some twenty guests of the Monarch Hotel lay on their beds, sweltering in heat of body and anguish of mind. In the evening of an oppressively hot day, some had sought forgetfulness of discomfort by playing bridge; and though little was lost in the way of stakes, a good deal was in the way of temper. Others had been climbing hills in search of a refreshing breeze rumoured to have been lurking in the neighbourhood, but had only discovered midges, and had retired to rest wiser and bitten men. What sleep they had had was suffered rather than enjoyed, and they were doomed not to indulge in repose even of inferior quality—Bill and his steam-roller saw to that.

Some twenty inadequately-paying guests turned and tossed on their beds as though on racks, while they thus partook of their rest-cure. They groaned in rage, they blasphemed, they cursed.

The colonel, who professed to be able to sleep through bombardments, and in the saddle when charging, and who had slept comfortably through the Great War what time he was in the War Office, was thoroughly awakened. He swore very completely, using English, French, German, Dutch, and drawing on many Indian dialects for colour and variety: he made a very good job of it. If the colonel's advice had any influence on destiny, Bill's future was provided for.

As for Miss Packer—who claimed to be suffering from a nervous breakdown, and whose treatment appeared to consist of buying hats, eating chocolates, and the constant application of face-powder—she violently beat her pillow, used the most unladylike language, and wished very fervently that her breakdown could be transferred to Bill and his instrument of torture.

The Rev. Hankin Swotbury, writhing under his moist and bedraggled sheet, so far forgot himself as to remember only that he was an Old Blue, and used appropriately-hued language. He called upon the vague and strange gods of his college days to visit, with dire pains and punishments, the corporeal being of that Caliban of the Corporation who controlled the perambulatory horror of a steam-roller.

The world-renowned tenor, Signor Pogorotti, tore savagely at his more permanent locks; but

[Christmas Number.

as that poor gentleman was suffering from temporary loss of voice, he was denied the relief of uttered malediction, and perforce had to be dissatisfied by the internal congestion of fury taking place low down in his diaphragm, where his best notes were apt to be produced. As he thought of the times when he had all but sung the crowns off most of the royal heads of Europe, he fervently regretted his inability to dislodge the head of the demon mechanic outside, who was making more noise than he, in his best form, was ever able to do.

Numerous other disgruntled gentlemen of various ages, and ladies of invarious ages, tossed about restlessly, furious with anger at the outrageous behaviour of Bill and his mates; and all, in their different ways, wished intently that unpleasant things should occur to Bill.

IV.

Things were not going so well with Bill as his cheery hopes and early enthusiasm had promised. Juggernaut was in a pesky mood and required humouring, and Bill's humour was not equal to the demand. Buffin, Bill's mate, was less adroit at his job than usual. He it was who distributed the stones over the correct spots before the oncoming machine; strewing, as it were, Juggernaut's path with votive offerings. Buffin's judgment became faulty; the fragments were not placed to Bill's liking.

'Can't yer pack it proper?' inquired Bill, sarcastically. 'Wot yer think it is—confetti? Spread out those there lumps and 'eave out that stone monument. Looks as if yer want to trip the old girl up.'

'It's your driving wot's gone off,' replied the insulted Buffin. 'P'raps you'd like a carpet put down for you, or some train lines to run on. Ought to chuck that crusher and shove a blooming bath-chair, you ought.'

Buffin swore at Bill. Bill swore at Buffin. Juggernaut jibbed, shied, staggered, and, after running over Buffin's toe, came to a standstill in an awkward and inconvenient angle.

Bill had to investigate Juggernaut's interior, and it was not the kind of jug he preferred to look into. Parts had to be unscrewed, taps tested, bearings examined, with no better result than the jamming of Bill's finger in some part of the annoyed mechanism.

The roadway was finished somehow by nine o'clock, and by the time the hotel visitors were served with their shaving water, they were at liberty to sleep. A melancholy procession of depressed mechanics accompanied the steam-roller to its yard: Bill nursing a damaged finger, Buffin dragging a crushed toe, and all throwing out an aura of weary disgust and disillusion. How different from the cheerful setting forth of the early morning! 'Never glad, confident morning again,' thought Bill, though he would have expressed it differently.

1925.]

Nor was Bill's depression lifted when he arrived home, to find that the baby had broken out in spots, that the bottom of the best kettle had burnt out, and that his promising boy had been sent home from school in disgrace for having a dirty neck.

The baby was fractious, his wife was bad-tempered, his boy was sulky, his finger was aching; peace, comfort, and contentment had departed from his home.

V.

It was after breakfast, and the hotel guests were grouped about the lounge and the entrance lobby, discussing the early morning's disturbance. Each was intent on emphasising his or her particular individual suffering. But they had all passed a bad night; and even Mrs Wodwool, who was all but stone deaf, complained that she had been greatly disturbed by someone in the hotel working a typewriter in the small hours.

The morning was lovely; a pleasant breeze had sprung up; already it was cooler, and the heat-wave of the last few days appeared to have broken. After the excellent breakfast the hotel had provided, they felt altogether in a better temper. The angry colonel's rage was assuaged. He was pleased to find the *Times* had actually printed his letter on the advisability of substituting red tape for buttons on soldiers' tunics. He had had less difficulty than usual in arranging his scanty locks to fall over his bald spot; and, in spite of his broken repose, he felt he looked at his best. He glowed with benevolent patronage.

Miss Packer's jumper had been admired by Mrs Wodwool. Mrs Wodwool had been asked by the pretty Miss Taddle where she had bought that sweet blouse, and other ladies had made remarks of approved puerile politeness suitable to any and every occasion; so that there was a temporary glow of good feeling uniting the lady guests of the hotel.

Signor Pogorotti had received so much sympathy from the ladies that he very nearly recovered his voice, or enough of it to take a limited part in the general conversation.

'They've certainly made a good job of it,' said the colonel, as, glass in eye, he critically examined the hard and even surface of the repaired roadway. 'Now it will be possible to draw the car up to the curb without upsetting the whole outfit on to the paving, or twisting the tires off. There was a time, early this morning, gentlemen, when I cursed that roller and its cont-roller—ha! ha!—very heartily indeed; and, if my remarks carried any weight with the department that attends to such affairs, that demon driver's body would now be blended with that paving, and the whole of his family housed in Hades.'

'Yes,' murmured the Rev. Hankin Swotbury,

'I fear we were all severely tried last night. I must confess that I had myself thoughts and wishes of a distinctly evil nature with regard to that inexpert mechanic; but I trust, in view of the intolerable nature of the nuisance, such thoughts and—eh—expressions, will be forgiven us.'

'Anyhow,' the colonel advised the company generally, 'I think we may now lift off our combined curses. The row is over and the work is finished. He was only carrying out somebody else's orders, and he's made a good job of it. So peace be with you, my noisy friend: and peace for *us* to-night!' he added, with a wink. 'Carry on.'

'Peace be it!' chimed in his reverence in his best pulpit manner. 'I look forward to our having a good sleep to-night, my friends.'

'Peace by all means,' the tenor succeeded in uttering, much to his pleased surprise. And the lounge echoed with the response, 'Peace, peace!' uttered by the guests assembled.

VI.

Bill was feeling better. He had made several disparaging remarks about his wife's family, which always afforded him a measure of relief when domestic affairs were not as easy-going as he liked. He had sent his son into the scullery, with orders to have a bath and not to show himself until he could appear without a blemish

on his person. His wife, after searching *Home Life's* baby-care column, under the head of 'Spots,' had applied the simple curative advised; and the exasperating condition of things was distinctly improved.

But happiness was not entirely re-established until Mr Johnson, Superintendent of Roads, looked in, and after expressing himself as well pleased with Bill's general performance, promised to put his name before the chief for advancement.

Bill's boy, coming into the room at the right moment, glowing and highly polished from his bath, impressed the superintendent so favourably by the cleanliness of his appearance, that after a few preliminary inquiries, and receiving intelligent answers to his questions from that youth, he proposed getting him a position in the office of the Corporation. As he remarked on leaving the house on his way to inspect Bill's work of the morning, 'If cleanliness is next to godliness, why, the Corporation could do with a bit of it.'

Later. Note received by Bill. 'Not your fault, but on inspection, I find the stones and ballast supplied you for roadway opposite Monarch Hotel too light and quite unsuitable. The whole will have to be raked up and re-rolled. How early can you start to-morrow? —J. JOHNSON.'

THE AUTOCRAT.

The policeman at the corner is very great and grand,
He stops the hugest motor-van by holding up his hand.
The driver of the tramcar and the lordly taximan—
They dare not try to hurry past until he says they can.

You'd think they'd take no notice, and just go on their way,
But somehow no one ever seems to try to disobey.
He's like a mighty wizard as he stands there all alone—
He only has to wave his arm, and lo! they're turned to stone!

And yet this splendid policeman, what do you think he'll do—
At least for me and Mary Ann?—though not, of course, for you!
He'll hold up all the traffic just to let us safely by,
And as we run across he smiles, and *winks his nearest eye!*

Sometimes there's Mr Hopkins, who is a millionaire,
Kept waiting in his grandest car—but little we two care!
The policeman at the corner is grander still, and he
Is quite an extra special friend of Mary Ann and me.

B. NOËL SAXELBY.

Volume XV. of the Seventh Series of CHAMBERS'S JOURNAL is now completed, price 15s. net. An Index, with Title-page, price 2d. net, has been prepared, and may be ordered through any bookseller. A cloth case for binding the whole of the numbers for 1925 is also ready, price 3s. 6d. net. Annual subscription, including postage to any address, either at home or abroad, 14s. 6d.

END OF THE FIFTEENTH VOLUME.
